

RImmPort: Quick Start Guide

Ravi Shankar

2022-04-26

1 Introduction

ImmPort study data is available for download in two formats currently: MySQL and TSV (Tab) formats. The RImmPort workflow is as follows: 1) MySQL formatted study data: User downloads one or more studies in MySQL zip files. Unzips the files. Loads local database instance. Connects to the database. Sets the ImmPort data source to the connection handle. Invokes RImmPort functions. 2) Tab: User downloads one or more studies in Tab format. Passes the folder where the zip files are located to an RImmPort function that builds SQLite database. Connects to the database. Sets the ImmPort data source to the connection handle. Invokes RImmPort functions.

User downloads study data of interest from the ImmPort website (<http://www.immport.org>) **. Depending on the file format MySQL or Tab the data is loaded into a local MySQL and SQLite database respectively. The user installs the RImmPort package, loads the RImmPort library, connects to the ImmPort database, and calls RImmPort methods to load study data from the database into R. Please refer to RImmPort_Article.pdf for a detailed discussion on RImmPort.

** User need to regisiter to the ImmPort website for downloading the datasets.

2 Initial Steps

- Download MySQL or Tab formatted data of studies of interest from the ImmPort website
- If working with MySQL-format, load the data in to a local MySQL database
- Install and load RImmPort package, and other required packages.

3 Load the RImmPort library

```
library(RImmPort)
library(DBI)
library(sqldf)
library(plyr)
```

4 Setup ImmPort data source that all RImmPort functions will use

4.1 Option 1: ImmPort MySQL database

4.1.1 Download zip files of ImmPort study data in MySQL format. e.g.'SDY139' and 'SDY208'

4.1.2 Load the data into a local MySQL database

4.1.3 Connect to the ImmPort MySQL database.

```
# provide appropriate connection parameters
mysql_conn <- dbConnect(MySQL(), user="username", password="password",
                        dbname="database",host="host")
```

4.1.4 Set the data source as the ImmPort MySQL database.

```
setImmPortDataSource(mysql_conn)
```

4.2 Option 2: ImmPort SQLite database

4.2.1 Download zip files of ImmPort data, in Tab format. e.g.'SDY139' and 'SDY208'

```
# get the directory where ImmPort sample data is stored in the directory structure of RImmPort package
studies_dir <- system.file("extdata", "ImmPortStudies", package = "RImmPort")

# set tab_dir to the folder where the zip files are located
tab_dir <- file.path(studies_dir, "Tab")
list.files(tab_dir)
```

4.2.2 Build a local SQLite ImmPort database instance.

```
# set db_dir to the folder where the database file 'ImmPort.sqlite' should be stored
db_dir <- file.path(studies_dir, "Db")

# build a new ImmPort SQLite database with the data in the downloaded zip files
buildNewSqliteDb(tab_dir, db_dir)

list.files(db_dir)
```

4.2.3 Connect to the ImmPort SQLite database

```
# get the directory of a sample SQLite database that has been bundled into the RImmPort package
db_dir <- system.file("extdata", "ImmPortStudies", "Db", package = "RImmPort")

# connect to the private instance of the ImmPort database
sqlite_conn <- dbConnect(SQLite(), dbname=file.path(db_dir, "ImmPort.sqlite"))
```

4.2.4 Set the data source to the ImmPort SQLite DB

```
setImmPortDataSource(sqlite_conn)
```

```
## [1] 1
```

5 NOTE: In rest of the script, all RImmPort functions will use the SQLite ImmPort database as the data source.

6 Get all study ids

```
getListOfStudies()
```

```
## [1] "SDY139" "SDY208"
```

7 Get all data of a specific study

The `getStudyFromDatabase` queries the ImmPort database for the entire dataset of a specific study, and instantiates the `Study` reference class with that data.

```
?Study
```

```
# load all the data of study: `SDY139`
```

```
study_id <- 'SDY139'
```

```
sdyl39 <- getStudy(study_id)
```

```
## loading Study ID = SDY139
```

```
## loading Demographics data...done
```

```
## loading Concomitant Medications data...done
```

```
## loading Exposure data...done

8 Get the list of Domain names.

Note that some RImmPort functions take a domain name as input.

```
# get the list of names of all supported Domains
getListOfDomains()
```

```
##           Domain Name Domain Code
## 1           Adverse Events       AE
## 2 Concomitant Medications       CM
## 3           Demographics        DM
## 4           Exposure            EX
## 5           Medical History      MH
## 6 Associated Persons Medical History APMH
## 7           Laboratory Test Results LB
## 8           Physical Examination PE
## 9           Protocol Deviations DV
## 10          Trial Arms            TA
## 11          Trial Visits          TV
## 12 Trial Inclusion Exclusion Criteria TI
## 13          Trial Summary         TS
## 14          Substance Use        SU

## 22             Nucleic Acid Quantification ZC
## 23             Titer Assay Results       ZD
```

```
?"Demographics Domain"
```

9 Get list of studies with specific domain data

The Domain name should be exact to what is found in the list of Domain names.

```
# get list of studies with Cellular Quantification data
domain_name <- "Cellular Quantification"
study_ids_l <- getStudiesWithSpecificDomainData(domain_name)
study_ids_l
```

```
## [1] "SDY139" "SDY208"
```

10 Get specific domain data of one or more studies

The Domain name should be exact to what is found in the list of Domain names.

```
# get Cellular Quantification data of studies `SDY139` and `SDY208`
```

```
# get domain code of Cellular Quantification domain
domain_name <- "Cellular Quantification"
getDomainCode(domain_name)
```

```
## [1] "ZB"
```

```
study_ids <- c("SDY139", "SDY208")
domain_name <- "Cellular Quantification"
zb_l <- getDomainDataOfStudies(domain_name, study_ids)
```

```
## loading Cellular Quantification data...loading FCS Results data...done
## loading ELISPOT Results data...done
## done
## loading Cellular Quantification data...loading FCS Results data...done
## loading ELISPOT Results data...done
## done
```

```
if (length(zb_l) > 0)
  names(zb_l)
```

```
## [1] "zb_df"      "suppb_df"
```

```
head(zb_l$zb_df)
```
