vottrans-package	<i>Voter Transfer Analysis</i>
------------------	--------------------------------

Description

Calculates the voter transfers between two elections

Details

```

Package:  vottrans
Type:    Package
Version:  1.0
Date:    2016-03-15
License:  GPL-3

```

'Vottrans' calculates voter shifts between the partys comparing two elections. Rn is the matrix with the results of the first election in total. Ro the matrix with the results of the second one. The first columns must contain the respective numbers of eligible voters.

vottrans *Voter Transfer Analysis*

Description

Calculates the voter transfers between two elections

Usage

```
vottrans(Ro, Rn, v = 1, nw = FALSE)
```

Arguments

Ro	Matrix containing the results of the first election in total. The first column has to contain the number of eligible voters.
Rn	Matrix containing the results of the second election in total. The first column has to contain the number of eligible voters.
v	Specifies how the entries are weighted. Version 1 calculates with the percentage values, but weights the residuals with the number of eligible voters per municipalities. Version 2 uses the percentage values without any weight. Version 3 calculates with absolute figures without any weight. (Default: v=1)
nw	Specifies whether the difference in the numbers of eligible voters between the two elections is added to the nonvoters of the second election or not. (Default=FALSE)

Value

Returns a matrix containing the percentage of voter shifts. The voter shifts from party 1 to party 2 are found in entry a_{1,2}

X1 *Example data X1*

Description

The package includes the official results of the state elections in Salzburg of 2009 and 2013. X1 contains the results of the election of 2009, Y1 the results of the election of 2013. Load `data(X1)` and `data(Y1)`; `'loesung(X1,Y1)'` calculates the voter shifts between the parties of the two elections. The example data set X1 contains the results of the following parties: SPOE, OEVP, FPOE, GRUENE, BZOE, OTHERS, NONVOTERS. Each row contains the result of one of the 119 municipalities.

Usage

```
data(X1)
```

Y1 *Example Data Y1*

Description

Official results of the state election in Salzburg 2013. The example dataset Y1 contains the results of the following parties: SPOE, OEVP, FPOE, GRUENE, TEAM, OTHERS, NONVOTERS. Each row contains the result of one of the 119 municipalities.

Y1

5

Usage

`data(Y1)`
