4	Profile Likelihood	3
5	Summary	<b>5</b>

### 1 Introduction

This vignette contains the computations that underlie the numerical code of *vsn*. If you are a new user and looking for an introduction on how to **use** *vsn*, please refer to the vignette *Robust calibration and variance stabilization with vsn*, which is provided separately.

### 2 Setup and Notation

Consider the model

$$\operatorname{arsinh}\left(f(b_i) \cdot y_{ki} + a_i\right) = \mu_k + \varepsilon_{ki} \tag{1}$$

where  $\mu_k$ , for k = 1, ..., n, and  $a_i$ ,  $b_i$ , for i = 1, ..., d are real-valued parameters, f is a function  $\mathbb{R} \to \mathbb{R}$  (see below), and  $\varepsilon_{ki}$  are i.i.d. Normal with mean 0 and variance  $\sigma^2$ .  $y_{ki}$  are the data. In applications to  $\mu$ array data, k indexes the features and i the arrays and/or colour channels.

Examples for f are f(b) = b and  $f(b) = e^{b}$ . The former is the most obvious choice; in that case we will usually need to require  $b_i > 0$ . The choice  $f(b) = e^{b}$  assures that the factor in front of  $y_{ki}$  is positive for all  $b \in \mathbb{R}$ , and as it turns out, simplifies some of the computations. In the following calculations, I will also use the notation

$$Y \equiv Y(y, a, b) = f(b) \cdot y + a \tag{2}$$

$$h \equiv h(y, a, b) = \operatorname{arsinh} \left( f(b) \cdot y + a \right). \tag{3}$$

The probability of the data  $(y_{ki})_{k=1...n, i=1...d}$  lying in a certain volume element of y-space (hyperrectangle with sides  $[y_{ki}^{\alpha}, y_{ki}^{\beta}]$ ) is

$$P = \prod_{k=1}^{n} \prod_{i=1}^{d} \int_{y_{ki}^{\alpha}}^{y_{ki}^{\beta}} dy_{ki} \ p_{\text{Normal}}(h(y_{ki}), \mu_k, \sigma^2) \ \frac{dh}{dy}(y_{ki}), \tag{4}$$

where  $\mu_k$  is the expectation value for feature k and  $\sigma^2$  the variance.

With

$$p_{\text{Normal}}(x,\mu,\sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right)$$
(5)

the likelihood is

$$L = \left(\frac{1}{\sqrt{2\pi\sigma^2}}\right)^{nd} \prod_{k=1}^n \prod_{i=1}^d \exp\left(-\frac{(h(y_{ki}) - \mu_k)^2}{2\sigma^2}\right) \cdot \frac{dh}{dy}(y_{ki}).$$
(6)

For the following, I will need the derivatives

$$\frac{\partial Y}{\partial a} = 1 \tag{7}$$

$$\frac{\partial Y}{\partial b} = y \cdot f'(b) \tag{8}$$

$$\frac{dh}{dy} = \frac{f(b)}{\sqrt{1 + (f(b)y + a)^2}} = \frac{f(b)}{\sqrt{1 + Y^2}},\tag{9}$$

$$\frac{\partial h}{\partial a} = \frac{1}{\sqrt{1+Y^2}},\tag{10}$$

$$\frac{\partial h}{\partial b} = \frac{y}{\sqrt{1+Y^2}} \cdot f'(b). \tag{11}$$

Note that for f(b) = b, we have f'(b) = 1, and for  $f(b) = e^b$ ,  $f'(b) = f(b) = e^b$ .

### 3 Likelihood for Incremental Normalization

Here, *incremental normalization* means that the model parameters  $\mu_1, \ldots, \mu_n$  and  $\sigma^2$  are already known from a fit to a previous set of  $\mu$ arrays, i. e. a set of reference arrays. See Section 4 for the profile likelihood approach that is used if  $\mu_1, \ldots, \mu_n$  and  $\sigma^2$  are not

known and need to be estimated from the same data. Versions  $\geq 2.0$  of the vsn package implement both of these approaches; in versions 1.X only the profile likelihood approach was implemented, and it was described in the initial publication [1].

First, let us note that the likelihood (6) is simply a product of independent terms for different *i*. We can optimize the parameters  $(a_i, b_i)$  separately for each  $i = 1, \ldots, d$ . From the likelihood (6) we get the *i*-th negative log-likelihood

$$-\log(L) = \sum_{i=1}^{d} -LL_i$$
 (12)

$$-LL_{i} = \frac{n}{2}\log\left(2\pi\sigma^{2}\right) + \sum_{k=1}^{n} \left(\frac{(h(y_{ki}) - \mu_{k})^{2}}{2\sigma^{2}} + \log\frac{\sqrt{1 + Y_{ki}^{2}}}{f(b_{i})}\right)$$
(13)

$$= \frac{n}{2}\log(2\pi\sigma^2) - n\log f(b_i) + \sum_{k=1}^n \left(\frac{(h(y_{ki}) - \mu_k)^2}{2\sigma^2} + \frac{1}{2}\log(1 + Y_{ki}^2)\right) (14)$$

This is what we want to optimize as a function of  $a_i$  and  $b_i$ . The optimizer benefits from the derivatives. The derivative with respect to  $a_i$  is

$$\frac{\partial}{\partial a_i}(-LL_i) = \sum_{k=1}^n \left(\frac{h(y_{ki}) - \mu_k}{\sigma^2} + \frac{Y_{ki}}{\sqrt{1 + Y_{ki}^2}}\right) \cdot \frac{1}{\sqrt{1 + Y_{ki}^2}}$$
$$= \sum_{k=1}^n \left(\frac{r_{ki}}{\sigma^2} + A_{ki}Y_{ki}\right) A_{ki}$$
(15)

and with respect to  $b_i$ 

$$\frac{\partial}{\partial b_{i}}(-LL_{i}) = -n\frac{f'(b_{i})}{f(b_{i})} + \sum_{k=1}^{n} \left(\frac{h(y_{ki}) - \mu_{k}}{\sigma^{2}} + \frac{Y_{ki}}{\sqrt{1 + Y_{ki}^{2}}}\right) \cdot \frac{y_{ki}}{\sqrt{1 + Y_{ki}^{2}}} \cdot f'(b_{i})$$
$$= -n\frac{f'(b_{i})}{f(b_{i})} + f'(b_{i})\sum_{k=1}^{n} \left(\frac{r_{ki}}{\sigma^{2}} + A_{ki}Y_{ki}\right)A_{ki}y_{ki}$$
(16)

Here, I have introduced the following shorthand notation for the "intermediate results" terms

$$r_{ki} = h(y_{ki}) - \mu_k \tag{17}$$

$$A_{ki} = \frac{1}{\sqrt{1 + Y_{ki}^2}}.$$
 (18)

Variables for these intermediate values are also used in the C code to organise the computations of the gradient.

## 4 Profile Likelihood

If  $\mu_1, \ldots, \mu_n$  and  $\sigma^2$  are not already known, we can plug in their maximum likelihood estimates, obtained from optimizing LL for  $\mu_1, \ldots, \mu_n$  and  $\sigma^2$ :

$$\hat{\mu}_{k} = \frac{1}{d} \sum_{j=1}^{d} h(y_{kj})$$
(19)

$$\hat{\sigma}^2 = \frac{1}{nd} \sum_{k=1}^n \sum_{j=1}^d (h(y_{kj}) - \hat{\mu}_k)^2$$
(20)

into the negative log-likelihood. The result is called the negative profile log-likelihood

$$-PLL = \frac{nd}{2}\log\left(2\pi\hat{\sigma}^2\right) + \frac{nd}{2} - n\sum_{j=1}^d\log f(b_j) + \frac{1}{2}\sum_{k=1}^n\sum_{j=1}^d\log\sqrt{1+Y_{kj}^2}.$$
 (21)

Note that this no longer decomposes into a sum of terms for each j that are independent of each other – the terms for different j are coupled through Equations (19) and (20). We need the following derivatives.

$$\frac{\partial \hat{\sigma}^2}{\partial a_i} = \frac{2}{nd} \sum_{k=1}^n r_{ki} \frac{\partial h(y_{ki})}{\partial a_i}$$
$$= \frac{2}{nd} \sum_{k=1}^n r_{ki} A_{ki}$$
(22)

$$\frac{\partial \hat{\sigma}^2}{\partial b_i} = \frac{2}{nd} \cdot f'(b_i) \sum_{k=1}^n r_{ki} A_{ki} y_{ki}$$
(23)

So, finally

$$\frac{\partial}{\partial a_i}(-PLL) = \frac{nd}{2\hat{\sigma}^2} \cdot \frac{\partial \hat{\sigma}^2}{\partial a_i} + \sum_{k=1}^n A_{ki}^2 Y_{ki}$$

$$= \sum_{k=1}^n \left(\frac{r_{ki}}{\hat{\sigma}^2} + A_{ki} Y_{ki}\right) A_{ki}$$
(24)

$$\frac{\partial}{\partial b_i}(-PLL) = -n\frac{f'(b_i)}{f(b_i)} + f'(b_i)\sum_{k=1}^n \left(\frac{r_{ki}}{\hat{\sigma}^2} + A_{ki}Y_{ki}\right)A_{ki}y_{ki}$$
(25)

### 5 Summary

Likelihoods, from Equations (12) and (21):

$$-LL_{i} = \underbrace{\frac{n}{2}\log(2\pi\sigma^{2})}_{\text{scale}} + \underbrace{\sum_{k=1}^{n} \frac{(h(y_{ki}) - \mu_{k})^{2}}{2\sigma^{2}}}_{\text{residuals}} - n\log f(b_{i}) + \frac{1}{2} \sum_{k=1}^{n} \log(1 + Y_{ki}^{2})}_{\text{jacobian}} (26)$$

$$-PLL = \underbrace{\frac{nd}{2}\log(2\pi\hat{\sigma}^{2})}_{\text{scale}} + \underbrace{\frac{nd}{2}}_{\text{residuals}} + \underbrace{\sum_{i=1}^{d} \left(-n\log f(b_{i}) + \frac{1}{2} \sum_{k=1}^{n} \log(1 + Y_{ki}^{2})\right)}_{\text{jacobian}} (27)$$

The computations in the C code are organised into steps for computing the terms "scale", "residuals" and "jacobian".

Partial derivatives with respect to  $a_i$ , from Equations (15) and (24):

$$\frac{\partial}{\partial a_i}(-LL_i) = \sum_{k=1}^n \left(\frac{r_{ki}}{\sigma^2} + A_{ki}Y_{ki}\right) A_{ki}$$
(28)

$$\frac{\partial}{\partial a_i}(-PLL) = \sum_{k=1}^n \left(\frac{r_{ki}}{\hat{\sigma}^2} + A_{ki}Y_{ki}\right) A_{ki}$$
(29)

Partial derivatives with respect to  $b_i$ , from Equations (16) and (25):

$$\frac{\partial}{\partial b_i}(-LL_i) = -n\frac{f'(b_i)}{f(b_i)} + f'(b_i)\sum_{k=1}^n \left(\frac{r_{ki}}{\sigma^2} + A_{ki}Y_{ki}\right)A_{ki}y_{ki}$$
(30)

$$\frac{\partial}{\partial b_i}(-PLL) = -n\frac{f'(b_i)}{f(b_i)} + f'(b_i)\sum_{k=1}^n \left(\frac{r_{ki}}{\hat{\sigma}^2} + A_{ki}Y_{ki}\right)A_{ki}y_{ki}.$$
(31)

Note that the terms have many similarities – this is used in the implementation in the C code.
