Package 'EBSeq'

December 13, 2024

Type Package

Title An R package for gene and isoform differential expression analysis of RNA-seq data

Version 2.5.0

Date 2015-12-8

Depends blockmodeling, gplots, testthat, R (>= 3.0.0)

Description Differential Expression analysis at both gene and isoform level using RNA-seq data

License Artistic-2.0

LazyLoad yes

EBSeq_NingLeng-package

EBSeq: RNA-Seq Differential Expression Analysis on both gene and isoform level

Description

In 'EBSeq_NingLeng-package,' a Negative Binomial-beta model was built to analyze the RNASeq data. We used the empirical bayes method and EM algrithom.

Details

Package:	EBSeq_NingLeng
Type:	Package
Version:	1.0
Date:	2011-06-13
License:	What license is it under?
LazyLoad:	yes

EBTest, EBMultiTest

Examples

```
data(GeneMat)
GeneMat.small = GeneMat[c(1:10,511:550),]
Sizes = MedianNorm(GeneMat.small)
EBOut = EBTest(Data=GeneMat.small,
 Conditions=as.factor(rep(c("C1","C2"), each=5)),
 sizeFactors=Sizes, maxround=5)
```

`beta.mom` *Fit the beta distribution by method of moments*

Description

'beta.mom' fits the beta distribution by method of moments.

Usage

```
beta.mom(qs.in)
```

Arguments

`qs.in`	A vector contains the numbers that are assumed to follow a beta distribution.

Value

`alpha.hat`	Returns the estimation of alpha.
`beta.hat`	Returns the estimation of beta.

#param = beta.mom(tmp)
```

crit_fun *Calculate the soft threshold for a target FDR*

Description

'crit_fun' calculates the soft threshold for a target FDR.

Usage

```
crit_fun(PPEE, thre)
```

Arguments

PPEE	The posterior probabilities of being EE.
thre	The target FDR.

Details

Regarding a target FDR alpha, both hard threshold and soft threshold could be used. If the hard threshold is preferred, user could simply take the transcripts with PP(DE) greater than (1-alpha). Using the hard threshold, any DE transcript in the list is with FDR <= alpha.

If the soft threshold is preferred, user could take the transcripts with PP(DE) greater than crit_fun(PPEE, alpha). Using the soft threshold, the list of DE transcripts is with average FDR alpha.

Value

The adjusted FDR threshold of target FDR.

Examples

```
data(GeneMat)
GeneMat.small = GeneMat[c(1:10, 500:600),]
Sizes = MedianNorm(GeneMat.small)
EBOut = EBTest(Data = GeneMat.small,
 Conditions = as.factor(rep(c("C1","C2"), each=5)),
 sizeFactors = Sizes, maxround = 5)
PP = GetPPMat(EBOut)
DEfound = rownames(PP)[which(PP[,"PPDE"] >= 0.95)]
```

```
str(DEfound)

SoftThre = crit_fun(PP[,"PPEE"], 0.05)
DEfound_soft = rownames(PP)[which(PP[,"PPDE"] >= SoftThre)]
```

DenNHist *Density plot to compare the empirical q's and the simulated q's from the fitted beta distribution.*

Description

'DenNHist' gives the density plot that compares the empirical q's and the simulated q's from the fitted beta distribution.

Usage

```
DenNHist(EBOut, GeneLevel = F)
```

Arguments

EBOut	The output of EBTest or EBMultiTest.
GeneLevel	Indicate whether the results are from data at gene level.

Value

For data with n1 conditions and n2 uncertainty groups, n1*n2 plots will be generated. Each plot represents a subset of the data. The empirical estimation of q's will be represented as blue histograms and the density of the fitted beta distribution will be represented as the green line.

`EBMultiTest` *Using EM algorithm to calculate the posterior probabilities of interested patterns in a multiple condition study*

Description

'EBMultiTest' is built based on the assumption of NB-Beta Empirical Bayes model. It utilizes the EM algorithm to give the posterior probability of the interested patterns.

Usage

```
EBMultiTest(Data, NgVector = NULL, Conditions, sizeFactors, uc = 0, AllParti = NULL, fast = T,
    Alpha = NULL, Beta = NULL, Qtrm = 1, QtrmCut = 0, maxround = 50,
    step1 = 1e-06, step2 = 0.01, thre = log(2), sthre = 0,
    filter = 10, stopthre = 1e-04, nequal = 2)
```

Arguments

`Data`	A data matrix contains expression values for each transcript (gene or isoform level). In which rows should be transcripts and columns should be samples.
`NgVector`	A vector indicates the uncertainty group assignment of each isoform. e.g. if we use number of isoforms in the host gene to define the uncertainty groups, suppose the isoform is in a gene with 2 isoforms, Ng of this isoform should be 2. The length of this vector should be the same as the number of rows in Data. If it's gene level data, Ngvector could be left as NULL.
`Conditions`	A vector indicates the condition in which each sample belongs to.
`sizeFactors`	The normalization factors. It should be a vector with lane specific numbers (the length of the vector should be the same as the number of samples, with the same order as the columns of Data).
`uc`	number of unceratin positions, unit levels
`AllParti`	user specified set of partitions, a matrix, with each row represent a partition
`fast`	boolean indicator whether to use fast EBSeq or full EBSeq
`Alpha`	start value of hyper parameter alpha
`Beta`	start value of hyper parameter beta

Qtrm, QtrmCut	Transcripts with Qtrm th quantile < = QtrmCut will be removed before testing. The default value is Qtrm = 1 and QtrmCut=0. By default setting, transcripts with all 0's won't be tested.
maxround	Number of iterations. The default value is 50. Users should always check the convergency by looking at the Alpha and Beta in output. If the hyper-parameter estimations are not converged in 50 iterations, larger number is suggested.
step1	stepsize for gradient ascent of alpha
step2	stepsize for gradietn ascent of beta
thre	threshold for determining the state of a position
sthre	shrinkage threshold for iterative pruning during the EM updates
filter	filterthreshold for low expression units
stopthre	stopping threshold for EM
nequal	when there is a chain of equal states with the number of equal states bigger than nequal, equalhandle algorithm will be used to further checking the homogeneity between the group means

Value

Alpha	Fitted parameter alpha of the prior beta distribution.
Beta	Fitted parameter beta of the prior beta distribution.
P	Global proportion of DE patterns.
RList	The fitted values of r for each transcript.
MeanList	The mean of each transcript (across conditions).
VarList	The variance of each transcript (across conditions).
QList	The fitted q values of each transcript within the two conditions
Mean	The mean of each transcript within the two conditions (adjusted by normalization factors).
Var	The estimated variance of each transcript within the two conditions (adjusted by normalization factors).
PoolVar	The variance of each transcript (The pooled value of within condition EstVar).
DataNorm	Normalized expression matrix.
Iso	same as NgVector
AllZeroIndex	The transcript with expression 0 for all samples (which are not tested).
PPMat	The Posterior Probability of following each pattern (columns) for each transcript (rows). Transcripts with expression 0 for all samples are not shown in this matrix.
AllParti	selected patterns
PPMatWith0	The Posterior Probability of following each pattern (columns) for each transcript (rows). Transcripts with expression 0 for all samples are shown in this matrix with PP(any_pattrn)=NA. The transcript order is exactly the same as the order of the input data.
Conditions	The input conditions.
NumUC	The number of uncertain positions at each unit

                    sizeFactors=MultiSize)
MultiPP = GetMultiPP(MultiOut)
```

EBSeqTest *EBSeq core*

Description

core function of EBSeq computation. Users are expected to use the wrappers, 2 conditions scenario, using EBTest, more than 2 condtiions, using EBMultiTest

Usage

```
EBSeqTest(data, conditions, uc, AllParti = NULL, iLabel = 1, sizefactor = 1,
  iter = 50, alpha = 0.4, beta = 0, step1 = 1e-06, step2 = 0.01,
  thre = log(2), sthre = 0.001, filter = 10, stopthre = 0.001, nequal = 2)
```

Arguments

data	A data matrix contains expression values for each transcript (gene or isoform level). In which rows should be transcripts and columns should be samples. For single cell data, normalized counts are required
conditions	condition label for samples
uc	number of unceratin positions, unit level
AllParti	user specified set of partitions
iLabel	label for isoform, indicating how beta are shared among units

sizefactor	The normalization factors. It should be a vector with lane specific numbers (the length of the vector should be the same as the number of samples, with the same order as the columns of Data).
iter	maximum iteration step of EM
alpha	start value of hyper parameter alpha
beta	start value of hyper parameter beta
step1	stepsize for gradient ascent of alpha
step2	stepsize for gradietn ascent of beta
thre	threshold for determining the state of a position
sthre	shrinkage threshold for iterative pruning during the EM updates
filter	filterthreshold for low expression units
stopthre	stopping threshold for EM
nequal	when there is a chain of equal states with the number of equal states bigger than nequal, equalhandle algorithm will be used to further checking the homogeneity between the group means

Value

a list containing selected DE patterns and their posterior probabilities, values for alpha and beta, some moments of the data

---

EBTest *Using EM algorithm to calculate the posterior probabilities of being DE*

Description

Base on the assumption of NB-Beta Empirical Bayes model, the EM algorithm is used to get the posterior probability of being DE.

Usage

```
EBTest(Data, NgVector = NULL, Conditions, sizeFactors, fast = T,
    Alpha = NULL, Beta = NULL, Qtrm = 1, QtrmCut = 0, maxround = 50,
    step1 = 1e-06, step2 = 0.01, thre = log(2), sthre = 0,
    filter = 10, stopthre = 1e-4)
```

Arguments

Data	A data matrix contains expression values for each transcript (gene or isoform level). In which rows should be transcripts and columns should be samples.
NgVector	A vector indicates the uncertainty group assignment of each isoform. e.g. if we use number of isoforms in the host gene to define the uncertainty groups, suppose the isoform is in a gene with 2 isoforms, Ng of this isoform should be 2. The length of this vector should be the same as the number of rows in Data. If it's gene level data, Ngvector could be left as NULL.

Conditions	A factor indicates the condition which each sample belongs to.
sizeFactors	The normalization factors. It should be a vector with lane specific numbers (the length of the vector should be the same as the number of samples, with the same order as the columns of Data).
fast	boolean indicator whether to use fast EBSeq or full EBSeq
Alpha	start value of hyper parameter alpha
Beta	start value of hyper parameter beta
Qtrm, QtrmCut	Transcripts with Qtrm th quantile < = QtrmCut will be removed before testing. The default value is Qtrm = 1 and QtrmCut=0. By default setting, transcripts with all 0's won't be tested.
maxround	Number of iterations. The default value is 50. Users should always check the convergency by looking at the Alpha and Beta in output. If the hyper-parameter estimations are not converged in 50 iterations, larger number is suggested.
step1	stepsize for gradient ascent of alpha
step2	stepsize for gradietn ascent of beta
thre	threshold for determining the state of a position
sthre	shrinkage threshold for iterative pruning during the EM updates
filter	filterthreshold for low expression units
stopthre	stopping threshold for EM

Details

For each transcript gi within condition, the model assumes: X_gis|mu_gi ~ NB (r_gi0 * l_s, q_gi) q_gi|alpha, beta^N_g ~ Beta (alpha, beta^N_g) In which the l_s is the sizeFactors of samples.

The function will test "H0: q_gi^C1 = q_gi^C2" and "H1: q_gi^C1 != q_gi^C2."

Value

Alpha	Fitted parameter alpha of the prior beta distribution.
Beta	Fitted parameter beta of the prior beta distribution.
P	Global proportion of DE patterns.
RList	The fitted values of r for each transcript.
MeanList	The mean of each transcript (across conditions).
VarList	The variance of each transcript (across conditions).
QList	The fitted q values of each transcript within the two conditions
Mean	The mean of each transcript within the two conditions (adjusted by normalization factors).
Var	The estimated variance of each transcript within the two conditions (adjusted by normalization factors).
PoolVar	The variance of each transcript (The pooled value of within condition EstVar).
DataNorm	Normalized expression matrix.

AllZeroIndex	The transcript with expression 0 for all samples (which are not tested).
Iso	same as NgVector
PPMat	A matrix contains posterior probabilities of being EE (the first column) or DE (the second column). Rows are transcripts. Transcripts with expression 0 for all samples are not shown in this matrix.
AllParti	selected patterns
PPMatWith0	A matrix contains posterior probabilities of being EE (the first column) or DE (the second column). Rows are transcripts. Transcripts with expression 0 for all samples are shown as PP(EE) = PP(DE) = NA in this matrix. The transcript order is exactly the same as the order of the input data.
Conditions	The input conditions.

f0 *The Prior Predictive Distribution of being EE*

Description

'f0' gives the Prior Predictive Distribution of being EE.

Usage

```
f0(Input, AlphaIn, BetaIn, EmpiricalR, NumOfGroups, log)
```

Arguments

Input	Expression Values.
AlphaIn, BetaIn, EmpiricalR	The parameters estimated from last iteration of EM.
NumOfGroups	How many transcripts within each Ng group.
log	If true, will give the log of the output.

Value

The function will return the prior predictive distribution values of being EE.

f1 *The Prior Predictive Distribution of being DE*

Description

'f1' gives the Prior Predictive Distribution of DE.

Usage

```
f1(Input1, Input2, AlphaIn, BetaIn, EmpiricalRSP1,
 EmpiricalRSP2, NumOfGroup, log)
```

Arguments

Input1	Expressions from Condition1.
Input2	Expressions from Condition2.
AlphaIn, BetaIn, EmpiricalRSP1, EmpiricalRSP2	The parameters estimated from last iteration of EM.
NumOfGroup	How many transcripts within each Ng group.
log	If true, will give the log of the output.

Value

The function will return the prior predictive distribution values of being DE.

`GetDEResults` *Obtain Differential Expression Analysis Results in a Two-condition Test*

Description

Obtain DE analysis results in a two-condition test using the output of EBTest()

Usage

```
GetDEResults(EBPrelim, FDR=0.05, Method="robust",
         FDRMethod="hard", Threshold_FC=0.7,
        Threshold_FCRatio=0.3, SmallNum=0.01)
```

Arguments

`EBPrelim`	Output from the function EBTest().
`FDR`	Target FDR, defaut is 0.05.
`FDRMethod`	"hard" or "soft". Giving a target FDR alpha, either hard threshold and soft threshold may be used. If the hard threshold is preferred, DE transcripts are defined as the the transcripts with PP(DE) greater than (1-alpha). Using the hard threshold, any DE transcript in the list has FDR <= alpha. If the soft threshold is preferred, the DE transcripts are defined as the transcripts with PP(DE) greater than crit_fun(PPEE, alpha). Using the soft threshold, the list of DE transcripts has average FDR alpha. Based on results from our simulation studies, hard thresholds provide a better-controlled empirical FDR when sample size is relatively small(Less than 10 samples in each condition). User may consider the soft threshold when sample size is large to improve power.
`Method`	"robust" or "classic". Using the "robust" option, EBSeq is more robust to genes with outliers and genes with extremely small variances. Using the "classic" option, the results will be more comparable to those obtained by using the GetPPMat() function from earlier version (<= 1.7.0) of EBSeq. Default is "robust".

`Threshold_FC` Threshold for the fold change (FC) statistics. The default is 0.7. The FC statistics are calculated as follows. First the posterior FC estimates are calculated using PostFC() function. The FC statistics is defined as exp(-|log posterior FC|) and therefore is always less than or equal to 1. The default threshold was selected as the optimal threshold learned from our simulation studies. By setting the threshold as 0.7, the expected FC for a DE transcript is less than 0.7 (or greater than 1/0.7=1.4). User may specify their own threshold here. A higher (less conservative) threshold may be used here when sample size is large. Our simulation results indicated that when there are more than or equal to 5 samples in each condition, a less conservative threshold will improve the power when the FDR is still well-controlled. The parameter will be ignored if Method is set as "classic".

`Threshold_FCRatio` Threshold for the fold change ratio (FCRatio) statistics. The default is 0.3. The FCRatio statistics are calculated as follows. First we get another revised fold change statistic called Median-FC statistic for each transcript. For each transcript, we calculate the median of normalized expression values within each condition. The MedianFC is defined as exp(-|log((C1Median+SmallNum)/(C2Median+SmallNum))|). Note a small number is added to avoid Inf and NA. See SmallNum for more details. The FCRatio is calculated as exp(-|log(FCstatistics/MedianFC)|). Therefore it is always less than or equal to 1. The default threshold was selected as the optimal threshold learned from our simulation studies. By setting the threshold as 0.3, the FCRatio for a DE transcript is expected to be larger than 0.3.

`SmallNum` When calculating the FCRatio (or Median-FC), a small number is added for each transcript in each condition to avoid Inf and NA. Default is 0.01.

Details

GetDEResults() function takes output from EBTest() function and output a list of DE transcripts under a target FDR. It also provides posterior probability estimates for each transcript.

Value

`DEfound` A list of DE transcripts.

`PPMat` Posterior probability matrix. Transcripts are following the same order as in the input matrix. Transcripts that were filtered by magnitude (in EBTest function), FC, or FCR are assigned with NA for both PPDE and PPEE.

`Status` Each transcript will be assigned with one of the following values: "DE", "EE", "Filtered: Low Expression", "Filtered: Fold Change" and "Filtered: Fold Change Ratio". Transcripts are following the same order as in the input matrix.

Out = GetDEResults(EBOut)
```

GetMultiFC *Calculate the Fold Changes for Multiple Conditions*

Description

'GetMultiFC' calculates the Fold Changes for each pair of conditions in a multiple condition study.

Usage

```
GetMultiFC(EBMultiOut, SmallNum = 0.01)
```

Arguments

EBMultiOut	The output of EBMultiTest function.
SmallNum	A small number will be added for each transcript in each condition to avoid Inf and NA. Default is 0.01.

Details

Provide the FC (adjusted by the normalization factors) for each pair of comparisons. A small number will be added for each transcript in each condition to avoid Inf and NA. Default is set to be 0.01.

Value

FCMat	The FC of each pair of comparison (adjusted by the normalization factors).
Log2FCMat	The log 2 FC of each pair of comparison (adjusted by the normalization factors).
PostFCMat	The posterior FC of each pair of comparison.
Log2PostFCMat	The log 2 posterior FC of each pair of comparison.
CondMean	The mean of each transcript within each condition (adjusted by the normalization factors).
ConditionOrder	The condition assignment for C1Mean, C2Mean, etc.

```

GetMultiPP *Posterior Probability of Each Transcript*

Description

'GetMultiPP' generates the Posterior Probability of being each pattern of each transcript based on the EBMultiTest output.

Usage

```
GetMultiPP(EBout)
```

Arguments

EBout	The output of EBMultiTest function.

Value

PP	The poster probabilities of being each pattern.
MAP	Gives the most likely pattern.
Patterns	The Patterns.

GetNg *Ng Vector*

Description

'GetNg' generates the Ng vector for the isoform level data. (While using the number of isoform in the host gene to define the uncertainty groups.)

Usage

```
GetNg(IsoformName, GeneName, TrunThre = 3)
```

Arguments

IsoformName	A vector contains the isoform names.
GeneName	The gene names of the isoforms in IsoformNames (Should be in the same order).
TrunThre	The number of uncertainty groups the user wish to define. The default is 3.

Value

GeneNg	The number of isoforms that are contained in each gene.
GeneNgTrun	The truncated Ng of each gene. (The genes contain more than 3 isoforms are with Ng 3.)
IsoformNg	The Ng of each isoform.
IsoformNgTrun	The truncated Ng of each isoform (could be used to define the uncertainty group assignment).

Examples

```
data(IsoList)

IsoMat = IsoList$IsoMat
IsoNames = IsoList$IsoNames
IsosGeneNames = IsoList$IsosGeneNames
IsoSizes = MedianNorm(IsoMat)
NgList = GetNg(IsoNames, IsosGeneNames)

#IsoNgTrun = NgList$IsoformNgTrun
#IsoEBOut = EBTest(Data = IsoMat, NgVector = IsoNgTrun,
# Conditions = as.factor(rep(c("C1","C2"), each=5)),
# sizeFactors = IsoSizes, maxround = 5)
```

GetNormalizedMat *Calculate normalized expression matrix*

Description

'GetNormalizedMat' calculates the normalized expression matrix. (Note: this matrix is only used for visualization etc. EBTes and EBMultiTest request *un-adjusted* expressions and normalization factors.)

Usage

```
GetNormalizedMat(Data, Sizes)
```

Arguments

Data	The data matrix with transcripts in rows and lanes in columns.
Sizes	A vector contains the normalization factor for each lane.

Value

The function will return a normalized matrix.

Ning Leng, John A. Dawson, James A. Thomson, Victor Ruotti, Anna I. Rissman, Bart M.G. Smits, Jill D. Haag, Michael N. Gould, Ron M. Stewart, and Christina Kendziorski. EBSeq: An empirical Bayes hierarchical model for inference in RNA-seq experiments. Bioinformatics (2013)

Examples

```
data(GeneMat)
str(GeneMat)
Sizes = MedianNorm(GeneMat)
NormData = GetNormalizedMat(GeneMat, Sizes)
```

GetPatterns *Generate all possible patterns in a multiple condition study*

Description

'GetPatterns' generates all possible patterns in a multiple condition study.

Usage

```
GetPatterns(Conditions)
```

Arguments

Conditions	The names of the Conditions in the study.

Value

A matrix describe all possible patterns.

Author(s)

Ning Leng

References

Ning Leng, John A. Dawson, James A. Thomson, Victor Ruotti, Anna I. Rissman, Bart M.G. Smits, Jill D. Haag, Michael N. Gould, Ron M. Stewart, and Christina Kendziorski. EBSeq: An empirical Bayes hierarchical model for inference in RNA-seq experiments. Bioinformatics (2013)

Examples

```
Conditions = c("C1","C1","C2","C2","C3","C3")
PosParti = GetPatterns(Conditions)
```

GetPPMat *Posterior Probability of Transcripts*

Description

'GetPPMat' generates the Posterior Probability of being each pattern of each transcript based on the EBTest output.

Usage

```
GetPPMat(EBout)
```

Arguments

EBout	The output of EBTest function.

Value

The poster probabilities of being EE (first column) and DE (second column).

Examples

```
data(GeneMat)
GeneMat.small = GeneMat[c(500:550),]
Sizes = MedianNorm(GeneMat.small)
EBOut = EBTest(Data = GeneMat.small,
 Conditions = as.factor(rep(c("C1","C2"), each=5)),
 sizeFactors = Sizes, maxround = 5)
PP = GetPPMat(EBOut)
str(PP)
head(PP)
```

GetSelectedPatterns *Get selected patterns in a multiple condition study*

Description

'GetSelectedPatterns' get selected patterns in a multiple condition study.

Usage

```
GetSelectedPatterns(EBout)
```

Arguments

EBout	Results from EBMultiTest

Value

A matrix describe selected patterns.

Likefun *Likelihood Function of the NB-Beta Model*

Description

'Likefun' specifies the Likelihood Function of the NB-Beta Model.

Usage

```
Likefun(ParamPool, InputPool)
```

Arguments

ParamPool	The parameters that will be estimated in EM.
InputPool	The control parameters that will not be estimated in EM.

Value

The function will return the log-likelihood.

Author(s)

Ning Leng

Examples

```
#x1 = c(.6,.7,.3)
#Input = matrix(rnorm(100,100,1), ncol=10)
#RIn = matrix(rnorm(100,200,1), ncol=10)
#InputPool = list(Input[,1:5], Input[,6:10], Input,
# rep(.1,100), 1, RIn, RIn[,1:5], RIn[,6:10], 100)
#Likefun(x1, InputPool)
```

`LikefunMulti` *Likelihood Function of the NB-Beta Model In Multiple Condition Test*

Description

'LikefunMulti' specifies the Likelihood Function of the NB-Beta Model In Multiple Condition Test.

Usage

```
LikefunMulti(ParamPool, InputPool)
```

Arguments

`ParamPool`	The parameters that will be estimated in EM.
`InputPool`	The control parameters that will not be estimated in EM.

Value

The function will return the log-likelihood.

Examples

```
#x1 = c(.6,.7,.3)
#Input = matrix(rnorm(100,100,1),ncol=10)
#RIn = matrix(rnorm(100,200,1),ncol=10)
#InputPool = list(list(Input[,1:5],Input[,6:10]),
# Input, cbind(rep(.1, 10), rep(.9,10)), 1,
# RIn, list(RIn[,1:5],RIn[,6:10]),
# 10, rbind(c(1,1),c(1,2)))
#LikefunMulti(x1, InputPool)
```

LogN *The function to run EM (one round) algorithm for the NB-beta model.*

Description

'LogN' specifies the function to run (one round of) the EM algorithm for the NB-beta model.

Usage

```
LogN(Input, InputSP, EmpiricalR, EmpiricalRSP, NumOfEachGroup,
 AlphaIn, BetaIn, PIn, NoneZeroLength)
```

Arguments

`Input`, `InputSP`	The expressions among all the samples.
`NumOfEachGroup`	Number of genes in each Ng group.
`AlphaIn`, `PIn`, `BetaIn`, `EmpiricalR`, `EmpiricalRSP`	The parameters from the last EM step.
`NoneZeroLength`	Number of Ng groups.

Author(s)

Ning Leng

Examples

```
#Input = matrix(rnorm(100,100,1), ncol=10)
#rownames(Input) = paste("g",1:10)
#RIn = matrix(rnorm(100,200,1), ncol=10)
#res = LogN(Input, list(Input[,1:5], Input[,6:10]),
# RIn, list(RIn[,1:5], RIn[,6:10]),
# 10, .6, .7, .3, 1)
```

`LogNMulti` *EM algorithm for the NB-beta model in the multiple condition test*

Description

'LogNMulti' specifies the function to run (one round of) the EM algorithm for the NB-beta model in the multiple condition test.

Usage

```
LogNMulti(Input, InputSP, EmpiricalR, EmpiricalRSP,
 NumOfEachGroup, AlphaIn, BetaIn, PIn,
 NoneZeroLength, AllParti, Conditions)
```

Arguments

`Input`, `InputSP`	The expressions among all the samples.
`NumOfEachGroup`	Number of genes in each Ng group.
`AlphaIn`, `PIn`, `BetaIn`, `EmpiricalR`, `EmpiricalRSP`	The parameters from the last EM step.
`NoneZeroLength`	Number of Ng groups.
`AllParti`	The patterns of interests.
`Conditions`	The condition assignment for each sample.

Examples

```
#

#Input = matrix(rnorm(100,100,1),ncol=10)
#rownames(Input) = paste("g",1:10)
#RIn = matrix(rnorm(100,200,1), ncol=10)
#res = LogNMulti(Input, list(Input[,1:5], Input[,6:10]),
# RIn, list(RIn[,1:5], RIn[,6:10]), 10, .6, .7,
# c(.3,.7), 1, rbind(c(1,1), c(1,2)),
# as.factor(rep(c("C1","C2"), each=5)))
```

`MedianNorm` *Median Normalization*

Description

'MedianNorm' specifies the median-by-ratio normalization function from Anders et. al., 2010.

Usage

```
MedianNorm(Data, alternative = FALSE)
```

Arguments

`Data`	The data matrix with transcripts in rows and lanes in columns.
`alternative`	if alternative = TRUE, the alternative version of median normalization will be applied. The alternative method is similar to median-by-ratio normalization, but can deal with the cases when all of the genes/isoforms have at least one zero counts (in which case the median-by-ratio normalization will fail). In more details, in median-by-ratio normalization (denote l_1 as libsize for sample 1 as an example, assume total S samples): hatl_1 = median_g [X_g1 / (X_g1*X_g2*...*X_gS)^-S] (1) which estimates l_1 / (l_1 * l_2 * ... * l_S)^-S. Since we have the constrain that (l_1 * l_2 * ... * l_S) = 1, equation (1) estimates l_1. Note (1) could also be written as: hatl_1 = median_g [(X_g1/X_g1 * X_g1/X_g2 * .... * X_g1/X_gS)^-S] In the alternative method, we estimate l_1/l_1, l_1/l_2, ... l_1/l_S individually by taking median_g(X_g1/X_g1), median_g(X_g1/X_g2) ... Then estimate l_1 = l_1 / (l_1 * l_2 * ... * l_S)^-S by taking the geomean of these estimates: hatl_1 = [median_g(X_g1/X_g1) * median_g(X_g1/X_g2) * median_g(X_g1/X_g3) * ... * median_g(X_g1/X_gS)] ^-S

Value

The function will return a vector contains the normalization factor for each lane.

PlotPattern *Visualize the patterns*

Description

'PlotPattern' generates the visualized patterns before the multiple condition test.

Usage

```
PlotPattern(Patterns)
```

Arguments

Patterns	The output of GetPatterns function.

Value

A heatmap to visualize the patterns of interest.

Patterns = GetPatterns(Conditions)
PlotPattern(Patterns)
```

PlotPostVsRawFC *Plot Posterior FC vs FC*

Description

'PlotPostVsRawFC' helps the users visualize the posterior FC vs FC in a two condition study.

Usage

```
PlotPostVsRawFC(EBOut, FCOut)
```

Arguments

EBOut	The output of EBMultiTest function.
FCOut	The output of PostFC function.

Value

A figure shows fold change vs posterior fold change.

Author(s)

Ning Leng

FC = PostFC(EBOut)
PlotPostVsRawFC(EBOut,FC)
```

PolyFitPlot *Fit the mean-var relationship using polynomial regression*

Description

'PolyFitPlot' fits the mean-var relationship using polynomial regression.

Usage

```
PolyFitPlot(X, Y, nterms, xname = "Estimated Mean",
 yname = "Estimated Var", pdfname = "",
 xlim =  c(-1,5), ylim = c(-1,7), ChangeXY = F,
 col = "red")
```

Arguments

X	The first group of values want to be fitted by the polynomial regression (e.g Mean of the data).
Y	The second group of values want to be fitted by the polynomial regression (e.g. variance of the data). The length of Y should be the same as the length of X.
nterms	How many polynomial terms want to be used.
xname	Name of the x axis.
yname	Name of the y axis.
pdfname	Name of the plot.
xlim	The x limits of the plot.
ylim	The y limits of the plot.
ChangeXY	If ChangeXY is setted to be TRUE, X will be treated as the dependent variable and Y will be treated as the independent one. Default is FALSE.
col	Color of the fitted line.

Value

The PolyFitPlot function provides a smooth scatter plot of two variables and their best fitting line of polynomial regression.

```

`PostFC` *Calculate the posterior fold change for each transcript across conditions*

Description

'PostFC' calculates the posterior fold change for each transcript across conditions.

Usage

```
PostFC(EBoutput, SmallNum = 0.01)
```

Arguments

`EBoutput`	The ourput from function EBTest.
`SmallNum`	A small number will be added for each transcript in each condition to avoid Inf and NA. Default is 0.01.

Value

Provide both FC and posterior FC across two conditions. FC is calculated as (MeanC1+SmallNum)/(MeanC2+SmallNum). And Posterior FC is calculated as:

Post alpha P_a_C1 = alpha + r_C1 * n_C1

Post beta P_b_C1 = beta + Mean_C1 * n_C1

P_q_C1 = P_a_C1 / (P_a_C1 + P_b_C1)

Post FC = ((1-P_q_C1)/P_q_c1) / ((1-P_q_c2)/P_q_c2)

PostFC	The posterior FC across two conditions.
RealFC	The FC across two conditions (adjusted by the normalization factors).
Direction	The diretion of FC calculation.

QQP *The Quantile-Quantile Plot to compare the empirical q's and simulated q's from fitted beta distribution*

Description

'QQP' gives the Quantile-Quantile Plot to compare the empirical q's and simulated q's from fitted beta distribution.

Usage

```
QQP(EBOut, GeneLevel = F)
```

Arguments

EBOut	The output of EBTest or EBMultiTest.
GeneLevel	Indicate whether the results are from data at gene level.

Value

For data with n1 conditions and n2 uncertainty groups, n1*n2 plots will be generated. Each plot represents a subset of the data.

QQP(EBOut)
```

QuantileNorm *Quantile Normalization*

Description

'QuantileNorm' gives the quantile normalization.

Usage

```
QuantileNorm(Data, Quantile)
```

Arguments

Data	The data matrix with transcripts in rows and lanes in columns.
Quantile	The quantile the user wishs to use. Should be a number between 0 and 1.

Details

Use a quantile point to normalize the data.

Value

The function will return a vector contains the normalization factor for each lane.
